RUSSIA COMPANY. This was a company formed by an association of London merchant adventurers (see ADVENTURERS, MERCHANTS), with the object of making discoveries for the promotion of trade. It had joint stock of £6000 in 240 £25 shares. Under the leadership of R. Chancellor, who was instructed by Sebastian Cabot, a trade route to Russia was opened, when a landing was effected near Archangel 1553, and Chancellor, proceeding to Moscow, received privileges for English merchants from the Czar. In 1554 the first charter of incorporation was granted by the crown for the discovery of lands, countries, isles, not before known or frequented by Englishmen (Macpherson, ii. 117). Under this the company was to be ruled by a governor (Sebastian Cabot for life) and a board consisting of four consuls and twenty-four assistants, appointed annually by the whole fellowship. Extensive privileges, including a monopoly of the trade with Russia and with any other country discovered by the company, were granted, while ample security for the protection of merchants was obtained from the Czar. In the course of a few years further discoveries resulted in the opening up of trade through Russia with Persia, but wars and other risks prevented any considerable development in this quarter. In 1566 the company, having suffered from the intrusion of interlopers, received parliamentary sanction (Hakluyt, i. 369, 10 Will. III. c. 6) and the monopoly of trade with Russia, Armenia, Media, Hyrcania, Persia, under certain conditions, while commodities were to be carried in English ships alone, manned with a majority of English mariners. Disappointed in his hopes of political alliance with England, the Czar suspended the privileges of the company in 1571, but these were restored through the intervention of Anthony Jenkinson. Fresh difficulties arose and repeated attempts to regain exclusive privileges failed, although, in 1583, lower customs than those paid by other nations were demanded of the company as the discoverer of the sea route (Camden, *Elizabeth*, sub an. 1583). The trade soon came to be on a precarious foot-

ing, owing to the fickleness of the Czar and the competition of the Dutch and Hamburgers, and by the close of the 16th century it was much decayed. Raleigh in 1603 states that but two or three ships had been sent in the previous year to Russia (*Observations touching Trade and Commerce with the Hollander*, ed. M'Culloch, p. 16). In 1598 the company began to engage in the whale-fishery off Spitzbergen (Macpherson, ii. 213); from 1612 difficulties arose owing to the attempts of the Dutch to take part in it. In 1613 the company obtained a charter from the crown excluding all others from sailing to Spitzbergen, and succeeded for a short time in driving out both foreign and English interlopers (Macpherson, ii. 273). In addition to the Danes and the Dutch the merchants of Hull and York disputed the company's claim to exclusive privileges, while a Scotch company chartered by James I. threatened to be a danger until its charter was revoked. In 1619 the Russia Company combined with the East India Company to form one joint stock for the whale-fishery (Macpherson, ii. 287), but the ill success of various undertakings led to the abandonment of the scheme. The company was heavily in debt at this time and unable to satisfy its creditors (Hewins, *English Trade*, p. 38). The struggle for the monopoly of the whale-fishery continued, and in 1654 the formation of a representative committee of management for the whale fishery was decreed by ordinance, but this did not lead to more satisfactory results. Attempts were also made to revive the trade with Russia by W. Prideaux in 1654 and by Lord Carlisle in 1663. Exclusive privileges could not be gained, and the company was merely permitted to trade on the same footing as the Dutch. The reorganisation of the company soon followed; henceforth it traded on a regulated and not a joint-stock basis, admission being granted to all who could pay the entrance and certain annual fees. By 10 Will. III. c. 6, the former was definitely fixed at £5, and under these conditions the company existed until the close of the 18th century. Throughout its early career it had to struggle against the competition of private traders at home and of the Dutch abroad, and its history is chiefly of interest as showing the gradual victory of the interlopers in breaking down the monopoly of an exclusive corporation.

## RUSSIAN SCHOOL OF POLITICAL ECONOMY.

1st Period, p. 336; 2nd Period, p. 338; 3rd Period, p. 340.

It is no easy matter to write the history of the Russian school of economics. There does not exist in Russian literature a single work on this important subject, nor even any complete bibliographical index of economic literature. Further, the compilation of such a chronicle as is needed is the more difficult because the greater part of the economic writings in Russian have appeared not as independent books, as is usual with such compositions in Western Europe, but as articles in periodicals, to trace which in the present position of Russian bibliography is almost impossible. It has been thought necessary to preface these remarks thus to explain the difficulty which has been encountered in preparing a statement which would satisfy both Russian economists and English readers.

*First Period (18th century).*—No economic literature appeared in Russia earlier than the commencement of the 18th century. Until the reign of Peter the Great (reigned 1689-1725), scarcely any secular literature existed, and such scanty cultivation as obtained was based on the meagre theological literature then current, and was influenced by an ascetic religious spirit. Among the important writers up to the time of Peter, the monk Sylvester, the chief counsellor of the Czar John the Terrible (reigned 1533-1584), who wrote *Domostroi* (*The Book of Household Management*), and the learned Galician, George Krizhanich (born 1617), one of the first teachers of Pan Slavism, should be mentioned. Both writers were dominated by religious feeling. The first confined himself to the inculcation of the order of life, which in his opinion ought to be established in every well-regulated private household; the second, in his work entitled *Politicks*, written partly in Galician and partly in Latin, and in his work *De providentia Dei*, written in Latin, described Russian life as he knew it, compared it with the life of other nations, discoursed on the wealth of the state and the wealth of the people, of trade, farming, industry, and at the same time had a perfectly clear idea of money, explaining the connection between it and value within the country, and hotly protesting against its debasement. Krizhanich's work, written in Siberia, whither he was exiled by the government of Moscow under the convenient pretence that his opinions were dangerous, was written in a language incomprehensible at the time even to the greater part of educated Russians. This explains why it had no perceptible influence on Russian economic opinion. Much greater importance had the work of a self-taught peasant, John Possoshkoff (born 1665), entitled *On Poverty and Riches*, and written in a fluent, imaginative style. The author was unacquainted

with the literature of Western Europe, and quite independently accumulated a body of opinions somewhat similar to those which bear the name of mercantilism. He insisted on the development of industry and agriculture in Russia, on the diminution of imports and the increase of exports in order to attract the precious metals into the country and to regulate the value of merchandise. The value of money altogether depends, in his opinion, on the will of the government, and being by principle an antagonist of the debasement of the gold and silver coin, he recommended the substitution of copper coin for the latter for domestic use, with an obligatory tariff. An abundance of coins, that is, of monetary tokens, appears to him a good thing. He considers that the consequences of this show themselves in the strengthening of industrial activity; for international trade he recommends the employment of bills of exchange guaranteed by a supply of gold and silver at the government bank. It is very remarkable that Possoshkoff clearly saw that the abolition of the system of Russian serfdom—which at the period when he lived was very detrimental to the prosperity of the country—was necessary. He publicly expressed the opinion that a rich peasantry made a rich emperor. These were his reasons for insisting on the abolition of the unjust poll-tax, and the division of the peasants' lands from those of their landlords.

Possoshkoff's ideas agree in many respects with those by which Peter the Great was guided in his practical work, but at the time they appeared they seemed so bold that their author was thrown into prison. It should be stated that during the first half of the 18th century printing in Russia was very little developed. Some kinds of economic ideas were disseminated through reading the government proclamations generally called *ukases* (edicts), in which complete economic doctrines were often expounded. The *ukases* of this class, promulgated by Peter the Great and Catherine II., are especially characteristic. Government guardianship, the leading idea in the *ukases* of the former, is replaced by ideas of economic liberty in the *ukases* of the latter. While Peter I. was convinced that no progress could be made except by the exertion of the power of the monarch, Catherine II. maintained that economic progress could only be reached by the removal of the interference of government. This progress she sought to increase and revivify by giving freedom to trade and industry, and by other incentives. In the interval between the reigns of Peter I. and Catherine II., a great intellectual change took place in Russian society under the influence of the intercourse with Western Europe.

The educated part of society became acquainted with the different ideas of French writers, encyclopædists, and PHYSIOCRATS, and

the empress Catherine II. herself stood at the head of this intellectual movement.

In 1765 she ratified the charter of a Voluntary Economic Society, which took its rise among those of the courtiers, lords, and ladies, who were well educated and who were intimate with the empress herself. This society was in consequence for a long time the centre of economic thought in Russia. The principal question that, through the initiation of the empress Catherine, interested this society almost from the very moment of its establishment, was that of "the peasantry and their state of servitude." In the year 1766 Catherine II. anonymously furnished the society with 1000 ducats to be given in prizes to those who had written the best essays on a theme formulated by the society in the following terms: "What would be most advantageous for the country; that the peasantry should own their land or that they should possess merely personal property, and how far should their rights with regard to property in land or to personal property, extend?" It is an interesting fact that soon after the offer of the prizes, 167 essays were sent in, 7 the work of Russians, the remainder of foreigners. The most remarkable of the former was one written by Polevoi, in which he argues that in comparison with serfs, peasant proprietors cultivate the soil better and therefore more profitably, this being equally advantageous to themselves and to the state. The question of "servitude" has never ceased since that time to interest the Russian economic mind. Such writers as Miller devoted all their energy to discussing the subject with the celebrated LINGUET, who maintained that servitude (serfdom) would lead to an amelioration of the lot of the working classes, and with the well-known publisher Radichtcheff, whose book entitled *A Journey from Petersburg to Moscow*, 1790, gives a striking description of serfdom in Russia, and at the same time eagerly protests against it. Thus it will be seen that the question of the peasantry was the central one of the economic literature of the time of Catherine II. It is true that the journals of the Voluntary Economic Society published not a few other economic articles, but by far the greater part of them dealt with the practical side of the question, almost without touching questions of theory. The tendency of the Voluntary Economic Society was shown at the very outset of its operations by its admission how necessary it was to study the position of rural economy in Russia. Hence acting on the suggestion of Clingstate, one of its members, it sent out questions on the subject to persons who had studied the matter, and on the receipt of the replies, printed epitomes drawn up from them. Of the editors of *The Transactions of the Voluntary Economic Society* during this interesting epoch, Stephen Junckowski (born 1762) should be specially

commemorated. He studied for a considerable time agronomy in France and England, and was one of the principal authors of the many-volumed work entitled *A New and Full System of Practical and Rural Economy*, published in 1807. During the reign of Catherine II. no Russian authors wrote on theoretic economics. The empress herself and those who were on familiar terms with her were well acquainted with the writings of French authors, the encyclopædists and physiocrats, and read them in the original. There were translated into Russian from French, VON BIELEFELD'S *Institutions Politiques*, by Prince Shakowski and Professor Bagroff, by order of the empress, 1768-1775. From the German, JUSTI'S *Die Grundveste zu der Macht und Glückseligkeit der Staaten*, by John Bogayeffski, 1772-78. The first part of SONNENFELS' *Grundsätze der Polizei, Handlung und Finanzwissenschaft* in 1787 by Garriloff, and besides these in 1780 a Russian translation was made (from French) by Popoff of MURATORI'S work, *Delta Publica Felicità*, 1749.

To complete the description of this period, it should be mentioned that in 1773 Reichal, history professor at the university of Moscow, included in his course of lectures some details of the economic description of other countries. These lectures were published in 1775 under the title *A Short Manual of Information on the Religious, Political, Economic, and Educational Condition of certain European States*. Besides this, between 1761 and 1769 the famous Schlatter lectured on the theory of statistics at the academy of science in Petersburg. Both of these were followers of the doctrine of Archenval, the historian of economic thought in Russia during the second period.

*The Second Period — First half of 19th century.*—The latter half of the reign of Catherine II. (died 1796) and the short reign of her son the Emperor Paul (reigned 1796-1801), were times of terrible reaction in Russia. Those who had lost confidence in Catherine's ideas of emancipation, of which she had dreamt in her youth, not only permitted no improvement in the condition of the peasantry, but even rendered serfdom more onerous and extended its influence through the whole of Little Russia. Radichtcheff's book, mentioned above, was kept out of the bookshops by the police, and he himself was subjected to a severe persecution. His book contained a plan for granting freedom to the serfs, for which he was condemned to death, a sentence afterwards commuted to exile to Siberia. The uprisings among the peasantry, which began in the reign of Catherine II.—one, especially violent, having taken place in 1774—under the leadership of Emilian Pugatcheff, continued up to the reign of Paul I., and were a perpetual source of terror to the whole empire. The liberal ideas of the PHYSIOCRATS which had been

diffused among the better educated Russians were pronounced dangerous by the government, which began to take strong measures for their extirpation. A very severe censorship of the press was instituted, though the newspapers were trifling in size, their contents were generally trivial, and in particular the writers on the condition of labour, not only in Russia but in other countries, were prosecuted. After the accession of the emperor Alexander I. (reigned 1801-1825) to the throne, economic thought began again to be active and to discuss questions of social life in Russia and the necessity of freedom for labour.

The education of Alexander I. was influenced on the one hand by the republican ideas of his Swiss tutor Laharpe, and on the other by the severe discipline of a soldier's life, which he had been strictly held to during the reign of his father. This accounts for the duality of his thought and action. At the beginning of his reign he advocated self-help and enlightenment, at the end he relapsed into mysticism and despotism tinged with asceticism. All this had a great influence on the development of economic thought in Russia, and it may be said to have made great progress. The beginning of the reign of Alexander I. was marked by an order from the minister Vasilieff to translate ADAM SMITH'S immortal work *The Wealth of Nations* into Russian. This translation was made by Nicholas Politkoffski, 1802-1806. Though it was not remarkable for exactness, especially in the definition of the term employed, it had a great influence on Russian students, who very quickly accepted the economic ideas of the great Scotchman. Through the lectures of Christian Schlötzer and his book, *Anfangsgründe der Staatswirtschaft oder die Lehre vom Nationalreichthum*, published in German and Russian 1805, Smith's ideas became known to the students at the Moscow university. Soon after they reached a wider circle, for, stimulated by the new teaching, the Voluntary Economic Society proposed in 1802 a competition for a prize for an essay on the subject, "What measures need be taken to rouse a spirit of activity, energy, and industry among the peasants?" Of those who wrote essays, Juncowski, whose work was referred to above, should be mentioned, and Professor Jakob of the university of Charkoff, who besides translating into Russian J. B. SAY'S *Principles of Political Economy* in 1805, published in 1807 *Grundsätze der Polizeigesetzgebung und der Polizeianstalten*, 2 vols. The economic ideas of ADAM SMITH were also introduced into the *Journal of Statistics* edited by the academician Germain, 1806-1808. Statistics continued to be a descriptive science, and Germain was known as the author of a popular manual of statistics, and a whole series of articles published in the journal he edited. There was also published

in this journal a work very remarkable at its date, written by Michael Balugienski, rector of the university of St. Petersburg, entitled *A Description of Different Economic Systems*, in which the author discusses in minute detail the ideas of the mercantile school, of the physiocrats, and of Adam Smith. Another contributor to the journal, Vurst, wrote in the same spirit as Smith, chiefly on the finance and trade of Russia. Count Valerian Stroinoſki may be described as a representative of the school of physiocrats. His book *The Universal Economy of Nations*, was written in Polish, but translated by the author into Russian and dedicated to the heir to the throne, the grand-duke Nicholas (emperor 1825-1855). Stroinoſki's work was based on QUESNAY's *Tableau Économique*, which had been translated into Russian in 1817 after the Russian public had become acquainted with STORCH's excellent *Cours d'Économie Politique*, published in French in 1815. This may be said to have done more than anything else to make Adam Smith's ideas popular in Russia. Well acquainted with English and French economic literature, and also with the state of agriculture in Russia, Storch was able to give his pupils, the grand-dukes Nicholas and Michael, most useful instruction on production, exchange, and taxation. He also wrote in six volumes a work containing much of historical and practical information. Those questions on which Storch differed from Smith are pointed out by Dr. Ingram, *History of Pol. Econ.*, pp. 188, 189.

Russian scholars will notice in particular those pages in Storch's work in which he explained to the grand-duke Nicholas, the future autocrat of Russia, that individual freedom and security of private property are indispensable to the development of the economic well-being of the country—a truth which it is often necessary for Russian scholars to defend even at the present time. This same truth is emphasized by two other economists of that epoch—Arsenieff, professor of statistics at the university of St. Petersburg, author of *A Sketch of the Statistics of the Russian Empire*, 2 vols. 1818, and N. T. Turgueneff, the son of the rector of the university of Moscow, whose work, entitled *The Theory of Taxation*, 1818, is still at the present day of great value. According to Turgueneff's own statement, he sought to prove in this book that freedom is the only true basis of economic theory as for the theory of administration. Turgueneff often quotes England as an example; to prove his theory he describes the free institutions of that country, asserting that these have built up her glory and wealth.

After the war of 1812 another period of reaction recommenced, and freedom both of speech and thought was suppressed. Arsenieff and Balugienski were persecuted by the director of the St. Petersburg educational system,

Runitch, who was considered, at the time, one of the most powerful supporters of civilisation. He declared the lectures of these professors to be dangerous and prejudicial to the well-being of society, as they maintained that freedom of labour and industry were essential to the economic development of the nation. There is little doubt that both Arsenieff and Balugienski would have been exiled had not the grand-duke Nicholas, who was personally acquainted with Arsenieff, interfered on their behalf. The affair ended with a large group of professors being deprived of their lectureships, and, in consequence, the almost entire disappearance, for the time, of economic literature in Russia. The accession of Nicholas I. to the throne (1825-1855) was, as is well known, accompanied by the political conspiracy of the "Decem-berists" and an uprising of the people in the streets of St. Petersburg. After the suppression of the latter by armed force, a period of severe persecution of the slightest indication of free theoretical thought commenced. At the same time the financial affairs of the country, already embarrassed by the wars with the first Napoleon, were in a serious condition. The paper circulation was so depreciated in value that four and a half roubles in bank notes had to be given for one silver rouble. When the discussion of questions bearing on the theory of economics was forbidden, Russian economists turned their attention to the study of the practical questions, as far as was possible under the severe censorship. It is characteristic of this period that the economists endeavoured to avoid discussing in their writings the then state of affairs in Russia, and took refuge in describing, historically, the economic conditions of bygone times. In this manner there arose that school of economic thought in Russia which ROSCHER has called the Russo-German school, regarding Storch (1766-1825) as its founder.

Among the followers of this school may be mentioned Orloff, author of a book entitled *On the Credit of the State* (1833).—Gagamester, who published in the same year his *Survey of the Finances of Ancient Russia*.—Afonasieff, author of *On Finance during the time of Peter the Great* (1848).—Gorloff, who was celebrated for his lectures at the universities of Kasan and St. Petersburg, on *The Theory of Finance* (1842), and *Economic Statistics* (1849).—Count Tolstoi, who published *The History of the Financial Institutions of Russia up to the Death of Catherine II.* (1848). This history was so much admired that Tolstoi was appointed minister of public instruction and of the home department. Vernadski, formerly professor at the universities of Kiev and Moscow, and author of *A critico-historical Investigation of Italian politico-economic Literature to the beginning of the 19th Century* (1849), and Butofski, who wrote *An Essay on National Wealth, or the Principles of Political Economy* (1847, 3 vols.). The principles of both the two

last-named authors, especially Butofski, were in accordance with those of the MANCHESTER SCHOOL. Generally speaking, they had no great success in Russia; their writings were commented on by a talented critic, the historian J. A. Milutin. His article, criticising Butofski's book mentioned above, printed in the *Contemporary* (1847), may be compared to Roscher's works on method and logic. Another member of the Russo-German school was Count Cancrin, by birth and education a German, and the author of several works of a theoretical and practical character. Among these we may mention *Weltreichthum, Nationalreichthum und Staatswirthschaft*, in which he discusses the financial policy of the minister Gurier. Cancrin was, however, chiefly known through his practical work. During his ministry a great reform in financial affairs took place, and in a short time the metallic currency was re-established.

*Third Period—Second half of 19th century.*—Alexander II., ascending the throne in 1855, at a time of complete disorder in the national economy of Russia,—the close of the Crimean war, which had so clearly revealed the deficiencies of the government, the absence of the rights of the people, and the despotism of the nobility and of officials, began to reform some of the evils he found, and first of all to abolish serfdom. In 1856 a secret committee was established to consider the question of serfdom, the emperor himself being president. In 1858 the committee was reorganised; it was called the principal committee for discussing the affairs of the peasantry, and Russian society was called on to accomplish one of the grandest of the peaceful reforms of the century. Instead of 22,000,000 enslaved people, a free peasant class was created, with considerable power of self-administration, within the limits of their community and *volost*. The rights granted by law in 1861 to those peasants who were servants of the nobles were by degrees extended to all other peasants. A consequent result of the peasant reform was the appearance of an extensive literature, both of a theoretical and a practical nature, which was encouraged by the sympathy of the government. In a short time, between 1855 and 1861, Russian economic literature was enriched by works of a theoretical character. Babst, a professor at Moscow, and author of an excellent work on *John Law and the Financial Crises in France* (1852), published in 1857 his lectures *On some Conditions contributing to the Augmentation of the National Capital*, and in 1860 *A Public Lecture on Political Economy*. In 1857 he undertook the editorship of a journal entitled *The Economic Guide*, which gave information as to the state of economic science in Europe and England. In this journal were published the writings of Vernadski's wife, Marie Vernadski, describing investigations on women's labour, which were very important considering the time when they were written. The work of Tengoborski, *Études sur les forces productives de la Russie*, in which may be found a highly circumstantial description of different views of industry in Russia, was translated into Russian in 1858, and in 1859 a dissertation by the present professor at the Charkoff university, Gregory Tsekanovetski, was published, entitled

*The Significance of Adam Smith in the History of Political Economy*, in which the author, giving due credit to Adam Smith's work, reproaches him with rationalism, and with not regarding the life of the people from the historical point of view. He also cautioned practical workers from being carried away by the idea of unconditional freedom in economic matters. This warning was the more necessary as the advocates of the cause of the freedom of the peasantry respecting the division of their land, based their arguments on the principle of unconditional freedom. In the same year, 1859, there appeared an excellently written and copious *Principles of Economics* by Professor Gorloff, written in accordance with the teaching of J. B. SAY, and free from extreme views as to labour. This work is in great esteem as a university textbook. No detailed account of the extensive literature which sprang up after the issue of the ukase announcing the imminent liberation of the peasantry can be given here. These essays occupied the greater part of the monthly periodicals of the time, which devoted a part of their pages to the discussion of the condition of the peasantry both from a political and an economic point of view. It is enough to state simply that these writings were permeated with the idea of the necessity of the emperor's protection of the poorer classes of his subjects, reserving to him the right to promote the free development of economic industry. "The common affairs of the whole nation are the private business of each of its members," wrote the contributors to the economic journal of the Slavophiles, *Rural Reorganisation*, published in Moscow under the editorship of Koshiloff, the intimate friend of Prince Toherkasski and G. Samarin, his colleagues. The following periodicals were imbued with the same spirit:—*Native Notes*, *The Reading Library*, the latter being in opposition to the *Russian Messenger*, edited by Katkoff, which held retrograde views, and in particular *The Contemporary*, for which one of the most distinguished of Russian economists worked, Tchernychevski, who was unfortunately exiled to Siberia under suspicion of being a member of a secret revolutionary society. Tchernychevski may be called the founder of scientific socialism in Russia. His economic novel, *Que faire* (see NIHILISM), and his *Remarks on the Principles of Political Economy of J. S. Mill*, which had been translated by him into Russian in 1860, were afterwards prohibited in Russia. They have been republished abroad, but are still not allowed to be circulated in Russia. In the period from 1861-75 all the most important economic works in English and German were translated into Russian, and new university regulations published, by which the teaching of political economy was established at the universities. The consequence of this was that the science became very popular in Russia, and at the present time there is not a single periodical in the country which does not contain articles of an economic nature. The following questions have been discussed with particular interest in Russian economic literature since the reform in 1861 to the present time:—(1) The agrarian question. Thanks to the excellent work of the local self-governing bodies, the Zemstvos, the economic statistical investiga-

tions effected in the course of the last twenty-five years in Russia provide rich materials for study both with regard to the agrarian question and other points of economic interest. Passing over the enormous amount of journalistic literature treating on this subject, the chief works devoted to it may be mentioned. As early as 1877, Janson, author of the best work in Russia on theoretical statistics, and a professor at the university of St. Petersburg, published *An Essay on the Peasants' Land and Taxation*, in which he explains the incompatibility between the portion of land given to the peasants by their former masters and the charges on it, and he attributed this to the legislation of 1861. In 1879 the founder of the economic statistical bureau in the government of Moscow, V. Orloff, published his *Forms of Peasant Land-Holding in the Government of Moscow*, an inquiry which may be regarded as classical, on the question of the common land-holding of the peasantry of the central parts of Russia, and the economic view of the subject. A year earlier, 1878, the present editor of the liberal paper, *The Russian Gazette*, Posnikoff, then a professor at the Odessa university, published a book entitled *The Common Ownership of Land*, in which he maintains, after comparing the English, German, and Russian system of land-holding, that this form was superior to all others. At the same time John Kaisler published his excellent work in German, *Zur Geschichte und Kritik des bauerlichen-Gemeinde-Besitzes in Russland*, the last volume of which only appeared in 1877. *Land-Possession and Agriculture in Russia and other Countries*, by the wealthy landowner prince Vassilitchikoff, was published in 1881. Professor Hodski's work, analogous in its contents, but far less able than the last-named, appeared in 1891, it is entitled *The Land and the Agriculturist*, the second volume dealing with the study of the economy of the recently emancipated serfs. The four following important works relating to the agrarian question deserve mention:—V. Posnikoff's *South-Russian Peasant Economy* (1891).—*The Common Good of the Peasantry*, by Dr. Vorontsovi, the author of many works on economic subjects; his book gives a careful revision of the materials gathered together by the Zemstvos on the subject of the welfare of the peasants. Professor Karisheff's book presents a similar detailed revision of peasant leases other than those granted to the emancipated peasants by their masters in 1892; and lastly, Danielson wrote *Outlines of our Reformed Economy* (1895), in accordance with the teaching of Karl MARX, whose book on CAPITAL Danielson translated into Russian. The following writers have studied the agrarian question as it exists in other countries:—Maxime Kovalevski, formerly professor at Moscow university, whose book, *The Common-Holding of Land, the Causes, Course, and Consequences of its Decline*, has a widespread reputation throughout western Europe; and Mannilov, the assistant professor at the same university, who has devoted himself to the study of *Rents in Ireland* (1895).

The peasant reform of 1861 caused, at the same time, a reform of the whole economic organisation of Russia. During the last thirty years Russia has become intersected by a wide-spreading net-

work of railroads; a considerable number of banks have appeared both for commercial and for agricultural credit. Industrial works and factories have sprung up on her plains in increasing numbers. At the same time the indebtedness of the land-owners have considerably increased, as have also the taxes levied on the people. The national debt has reached the proportions of 2,278,894 thousand roubles (roubles converted as 6.25=£1) (£364,623,040), and the constant fluctuation in the value of paper money, while it could not be exchanged into gold, has caused periodical crises in the national economy of the country. It is not therefore wonderful that the study of the science of economics in Russia has been concentrated on the above-named questions. Some of the principal works of interest in connection with these questions may be mentioned here. As early as 1861 the academician, Bezobrazoff, published his work entitled *Landed Credit and its Contemporary Organisation in Western Europe*, a book which for a long time was the recognised authority on the various banks for land-credit which arose at that time. Ten years later, in 1871, another work appeared equally authoritative on this point, entitled *Credit, Banks, and the Currency*, by Kaufmann, a professor at St. Petersburg university. Both of the last-named economists follow the teaching of the Manchester school. The tenets of ROBBERS and the socialists found an adherent in Tchaslavski, whose book *On the Question of Landed Credit* appeared in 1881, and also in a degree, in Hodski, author of *Landed Credit in Russia and its relations to the Peasant Land-owners* (1892).

Railway economics have been carefully examined by Tsekanovetski, professor of the Charkoff university, who wrote *Railroads and the State*, 1869; by Tchuproff of the Moscow university in *Railway Economy*, 1875; by Golovatchoff in *History of the Railway System in Russia*, 1881; by Pickno of Kieff university, in *Railway Tariff*, and by Witte, the present minister of finance (1897), in *Principles of the Railway Tariff*, 1884. These works had an immediate effect on the progress of railways in Russia. As is well known, the greater part of the railroads have been bought by the government, which also controls the tariffs of those lines which still belong to private companies.

The question of the currency in Russia has been much before the public there during the last ten years; an impetus being given to this through the work of Adolph H. Wagner, then professor at Dorpat, afterwards at Berlin, on Russian paper money, *Die russische Papierwährung, eine volkswirtschaftliche und finanzpolitische Studie nebst Vorschlägen zur Herstellung der Valuta*, Riga, 1868. This book was translated in 1871 into Russian, by Professor N. Bunge of the Kieff university, afterwards minister of finance. To Bunge the honour must be ascribed of having placed Russian finance on a sound footing. Under his influence, and in view of the imminent reform of the money currency, the work of Prof. Antonovich of Kieff, afterwards deputy-minister of finance, entitled *The Theory of Paper Money, Currency, and Government Notes*, 1888, was published,

Antonovich did not sympathise with Witte in the question of the money reform, and was obliged to leave his post as deputy-minister. The book by Brant, *The Theory of Rates of Exchange*, 1892, closely analyses the phenomena of the rates of exchange. Prof. Sudaikin, of the St. Petersburg university wrote on *The Government Bank*, 1891. This work is important as explaining the Russian money currency and the arrangements of the bank. Prof. Alexander Miklashevsky of Dorpat wrote *Money: An Attempt to Investigate the Main Positions of the Classical School of Economic Theory in connection with the History of the Question of Money* (Moscow), 1895 (see *Economic Journal*, 1896, pp. 234-37); this book forms an exhaustive treatise on the theory and history of money.

The greater number of Russian economists have been mono-metallists. Of the bimetallists two only deserve attention—Sokalsky, professor of statistics at the Charkoff university, recently dead, who published in 1896 a pamphlet entitled *Reforms in Terms*, and Prof. Isaieff of the St. Petersburg Lyceum, who has written several articles in journals advocating a money reform at the present time.

Our economists have assigned, comparatively speaking, very little place in their researches up to the present time to questions concerning the condition of large manufactories, as also to the labour question in Russia, perhaps because the system of home industries has prevailed. The growth of large industries working for a large market which profit in Russia by a highly protective tariff, has not yet been thoroughly studied. But at the present time the questions of free trade and protection, and whether it is indispensable that Russia should pass through the same phases of economic development as Western Europe, while there is no need that she should do so, divide Russian economists into several groups, antagonistic among themselves. The merchants and manufacturers are strong partisans for protection, as an apologist for which should be named the celebrated Russian chemist, Mendelaieff, whose book *A sensible Tariff or an Investigation of Industry in Russia in connection with her general Customs' Tariff*, published in 1897, supplies much interesting information about the natural riches of the country, and the growth of its industries, but it is marked at the same time by highly doctrinaire views. Landowners and that vast class of persons who live on their private means are in Russia the partisans of free trade. It falls to the lot of these classes to bear all the expensiveness of the products of the large Russian industries. The book by Noffikoff, *Protection*, 1891, may be set against that of Prof. Mendelaieff as an eager defence of the idea of free trade. The studies of Prof. Yanschull of the Moscow university are altogether objective and impartial in character. He wrote *English Free Trade*, 2 vols. 1876-82, in which, having traced its history, he describes those circumstances which have made free trade an economic necessity in England. Prof. Yanschull is one of the most industrious among Russian economists. When during the administration of Bunge, as minister of finance, an

inspectorship of factories was established in Russia, Yanschull was appointed inspector for the Moscow district, and his *Reports*, even at the present time, serve as a valuable text-book for the study of the condition of factories in Russia. Of a whole pile of writings by this same scholar on various questions, we may mention here his extensive course of lectures on finance, 1895, and "Industrial Syndicates or entrepreneurs unions for the regulation of production especially in the United States of America," St. Petersburg, 1895, which are described in the journal *Revue d'Economie Politique*, 1896. Prof. Isaieff, previously mentioned, has also applied himself to the study of questions of industrial economics—he wrote the best treatise on *Theoretic Economics in Russia*, 1st ed. 1895, and a treatise on *Industrial Societies in France and Germany*, 1879. A socialist in his views, Prof. Isaieff has very attentively studied that common form of industrial co-operation in Russia known as workmen's associations (see ARRÉL), and also the peasant trades of the government of Moscow. These vast researches appeared in 1877 and 1881. Isaieff believes in a future development of the welfare of the peasant class through productive associations, thus approximating to the group of economists which appropriates to itself the appellation nationalist; seeking thus to connect itself with the idea of the nation, it favours collectivism and the management of industries by the state, and trusts to do this by means of workmen's associations, founded on the principle of the general possession by the workmen of the instruments and results of production. Among well-known representatives of these opinions are Dr. Vorontsovi, Prof. Karisheff, and also Fortunatoff, the professor of statistics at the institute of rural economy at New Alexandria, the author of numerous works on the statistics of rural economy in Russia, and Kablukoff, assistant-professor at Moscow university, author of *The Question of the Working Class in Agriculture*, 1884, in which he looks into the significance of hired labour in English rural economy and studies the influence of its present organisation and the condition of the working class on production. This group of writers have their organ, the journal *Russian Wealth*, published in St. Petersburg. One must acknowledge that writers of this school have the merit of studying attentively the economic condition of the peasants, but one cannot also avoid reproaching them with the want of originality of their theoretical and in particular of their philosophical views. The followers of the teaching of Karl MARX form another division of Russian economists: as philosophers these are economic materialists. As the best example of this mode of thought, Ziber, the late professor of the Kieff university, may be cited. His works, *Outlines of primitive Economic Culture*, 1883, and *Ricardo and Karl Marx in their socio-economic Researches*, 1885, may be compared with the best works of the writers of Western Europe, both for the fulness and brilliancy of their exposition and for the width of the study they evince. Among the latest writers of this school may be named Tugan Baranoffski, assistant professor at St. Petersburg university, author of an able enquiry into in-

dustrial crises in England (1895)—a fellow-labourer who is publishing at the present time, in Russia, a large encyclopædic dictionary, and who is the author of several pamphlets—Struve; and the Russian political exile, Plechanoff. This school published its own organ, a journal entitled the *New World*, in St. Petersburg.<sup>1</sup> This school believes that economic development in Russia will follow the same lines as it has done in Western Europe; that no workmen's associations, and no peasant communities will save Russia from the calamity of the supremacy of capitalistic economy—that in the development of manufacturing industries the systems of small industries now connected with agriculture will disappear, that the peasantry in the future will change into a landless working-class, and that the sooner this wearisome process comes to an end the sooner will it be possible to enter on the organisation of a working class of society which thus belongs altogether to the future. Unfortunately the present state of this working class of society is far from bright, and is very imperfectly studied. No works thoroughly investigating the condition of the working-class exist, probably because the censors would not allow such works to pass. Meanwhile in spite of facts, expressed sometimes in the form of immense strikes, which constitute, according to existing legislation, a serious capital crime, it is asserted in competent circles, and by the conservative press, that the labour question does not exist in Russia at all, and that the relations between the working people and employers are altogether of a patriarchal character. A little information concerning the condition of the working-class in Russia is, however, scattered through journalistic literature. Amongst these are some remarkable articles by the historian, Semevski, on the working-people and gold-mines in Siberia—some is to be found in the reports of factory inspectors, who unfortunately have ceased to publish them for general information, and some in certain publications of the trade and factory department of the minister of finance. In 1895 the assistant professor of the St. Petersburg university, Yarotski, published his work, *The Insurance of Workpeople in connection with the responsibility of Employers*, more theoretical than practical.

The historical school of political economy has but few representatives in Russia. Among them is Korsak, whose book *On Forms of Industry in General and of the Signification of Home Production in Western Europe*, 1861, is still important. Aristoff, the author of a valuable work, *The Industry of Ancient Russia*, 1866. Professor Yanschul and Professor Tsekanovetski previously mentioned, and Tchuproff of the Moscow university, author of a text-book on political economy and its history, used throughout the Russian universities. Levitski, professor at Charkoff university, wrote on the problems and method of the science of national economy 1890, and Ivan Miklashevsky, who wrote in 1894 an *Investigation into the History of Rural Economy and the Colonisation of Southern Russia*. In conclusion, it should

be mentioned that during the last ten years the Russian ministry of finance and agriculture has published very valuable researches on different questions of economy, prepared by the officials of these departments. Such for instance is the collection of information on different phases of industry in Russia published by the ministries in Russia and England on the occasion of the exhibition at Chicago 1893, and of that of Nijni-Novgorod in 1896 and many others. The present head of the ministry of agriculture in Russia, Jermoloff, is the author of a valuable investigation of systems of agriculture, 3rd ed., 1895. Of economists who have studied the questions of finance and taxation the following deserve notice: Bloch, the author of a four-volumed work on *The Finances of Russia during the 19th Century*, furnished with extremely exact statistical data, 1882, and such details regarding their history that the work was not allowed to be sold; the professor of the university of Kasan, Levoff; of the St. Petersburg university, Lebedeff; of the Moscow university, and also the historian, Mihoukoff, at present professor at Sophia (Bulgaria); and Lappo Danileffski, professor of the St. Petersburg Historio-Philological Institute. The first published, 1892, a full investigation entitled *The State Economy of Russia during the first quarter of the 18th Century and the Reforms of Peter the Great*, the second is known for his work *The Organisation of Direct Taxation in the Government of Moscow in the 17th Century*. Both the above named works are founded on careful study of still unpublished materials among the archives of Russia.

I. M.

RYOT (literally "protected") denotes an Indian cultivator whether he is under a ZEMINDAR or, as in Bombay and most of Madras, independent in his relation to the revenue authorities. It is in the latter capacity that he is usually referred to and will be described here.

Where land is settled on the "raiyaťwári" system, as it is called, the land of some ryot is taxed field by field according to its soils, position, and irrigation, but so as not to exceed 50 per cent of the net produce. The settlement holds, usually, for thirty years. The waste is not "settled." Extracts from the settlement register are used as title-deeds. The ryot may give up his holding and also his liability for revenue. About 85 per cent in Bombay may be called owners, and they own on the average 24 acres each. Assam and Burma are "settled" on similar lines.

In "raiyaťwári" districts an overlord in receipt of what may be called fee farm rents from the ryot, and joint ownership of a ryot and other members of his family, are sometimes present. Again, "Zamindari" tenures of individuals, and of landlord groups of villagers, and "raiyaťwári" tenures, have passed in historical times one into the other; for all this the fiscal corresponds to a real

<sup>1</sup> This journal is now (1898) forbidden by the government.

distinction something like ours between a district of MANOR, the MARK SYSTEM, and PEASANT PROPRIETORS respectively; but in India taxation, in Europe ownership, is the root of the distinction. The differentia of the "raiayatwari" district is that there is a "headman" of each village, whose holding is usually free of land tax, and he is never responsible for his co-villagers' land taxes. The other

officers of the village are also usually rewarded with free holdings.

[See ZEMINDAR where authorities are specified. Yule, *Hobson-Jobson*—R. Jones, *Peasant Rents* (1831), rep. in *Economic Classics* (1895), classes peasant rents thus: (1) serf or labour; (2) metayer; (3) ryot; (4) and cottier rents. He does not sufficiently keep European ideas of ownership out of the Indian discussions. J. D. R.

S. W., GENT. (W. Smith, according to W. C.<sup>1</sup> *England's Interest Asserted*, 1696, p. 19), wrote *The Golden Fleece wherein is related the English Wools in its Manufacture* (1656), in which he urged the restoration of searching and measuring powers wielded, before 4 James I. c. 2, § 22, by the royal AULNAGER, whose office he overvalued as MALYNES did that of the Royal Exchanger (see EXCHANGER, ROYAL). His arguments are mainly derived from J. May (1613) and the title recalls Sir W. Vaughan (1626). He also (like W. SCOTT) urged strict apprenticeships; and his wish to limit the export of wool started the famous controversy in which FORTREY (1663), CHILD (1667), and W. C. (1669), took part. J. D. R.

SADLER, MICHAEL T. (1780-1835), a vigorous opponent of MALTHUS (*q.v.*) and "the political economists," was M.P. for Newark 1829-1832. Though concerned with continuing controversies, his two books *Ireland, its Evils and their Remedies*, London, 1828, 8vo, and *The Law of Population*, London, 1830, 8vo, are little help to the modern reader. Great as has been the influence of MALTHUS's essay on subsequent thought, the essay itself is little read—much less the answers it called forth. Sadler's two remedies for Irish ills were a poor law, enacted a few years after the issue of his book, and a tax on absenteeism. More interesting was his attitude on other questions. In opposing the reform bill of 1831 he anticipated a line of argument, afterwards used by Disraeli, that the bill, establishing a uniform middle-class franchise, was largely an anti-democratic and disfranchising measure. A bill he introduced the same year is interesting in the light of subsequent history. Cottages were to be rebuilt, and garden allotments granted to agricultural

labourers. The deserving were to be rewarded by the opportunity of keeping a cow, to be depastured on a general allotment. Rightly does the author of his *Memoirs* characterise his system as "paternal." He was more practical in espousing the cause of the factory children. His labours as chairman of the committee on the subject—session of 1831—probably shortened his life. He was the Parliamentary leader of Factory Reform, and it was only when he lost his seat that Lord Shaftesbury (Lord Ashley) was pressed into the front place. This deserves commemoration, as the Factory Acts struggle may be regarded as the occasion when LAISSEZ FAIRE received its first serious blow. He was a strong advocate of the corn laws and protection; he opposed the new poor law, and, on currency questions was in favour of inconvertible paper money. But the man was himself of more importance than his opinions. His speeches contain passages of undoubted eloquence; and he may be remembered as the most disinterested and guileless of tory democrats.

[*Memoirs of the Life and Writings of Michael Thomas Sadler*, London, 1842, 8vo]. H. E. E.

SAINT-AUBIN, CAMILLE (1758-1820) born in the duchy of Deux Ponts, died at Paris. A German by birth, he was attracted by the revolution, and threw in his lot with France. During the reign of Terror he was imprisoned, but liberated on 9th Thermidor, an ii. (27th July 1794), was appointed professor in one of the central schools (colleges of secondary education) established under the directory, then after the *Coup d'État* of 18th Brumaire, an viii. (9th Nov. 1799), he entered the *Tribunat* on 4th Germinal, an x. (25th March 1802), whence his opposition spirit caused him a few months later to be expelled. Up to that date he had written many pamphlets, all on subjects of the day, but too often paradoxical. This caused J. B. SAY to nickname him the *bouffon* of political economy, but at times his works were full of good sense and truth—during the empire he devoted himself to education, in particular to a course of instruction in finance, and wrote a pamphlet on the *Monopoly of Tobacco*. He died soon after, leaving behind him a translation of J. BENTHAM's *Rewards and Punishments*.

His best work from an economic point of view is his pamphlet *Les Banques Particulières* (an v.

<sup>1</sup> W. C. was William Carter, a busy informer and writer of pamphlets against exporting wool, e.g., *Brief Advertisement*, 1672; *Full and clear Answer to a Paper intitled Reasons for a limited Exportation*, 1677; *Summary of certain Papers*, 1685; *Proceedings against Transportation*, 1693; *Abstract of Proceedings*, 1688, 1694; *Usurpations of France*, 1695, cp. J. Smith, *Memoirs of Wool*, 1757, v. i. pp. 162, 168 n., 179, 199; *Cal. of State Papers*, Dom. Ser., 1671-72, pp. 155, 156. His writings are dull, and owe much to W. S., and assume that no wool can be manufactured unless wholly or partly British or Irish. Possibly the same W. C. wrote *Trade's Destruction . . . or Excise decry'd*, 1659; and *A broadside against the Window Tax*, 1695.

1797), in which he speaks in favour of a free issue of notes to bearer by certain banks to be cashed in specie on demand.

Besides DU PONT de Nemours, he is the only writer we know of at that date in favour of the freedom of banks, though, to be exact, there was also the president of the Bank of France, Lecoulteux-Canteleu, whom the emperor contrived to replace by a governor nominated by himself, when, in 1806, he granted the monopoly of issue to that great house of business. A. C. f.

SAINT CHAMANS, VICOMTE AUGUSTE DE (1777-1861), born at Paris, died at Châltrait (Marne). A deputy, 1824-27, then councillor of state till the restored monarchy came to an end.

His works are based on two erroneous views which corroborate each other:—the MERCANTILE SYSTEM and PROTECTION. He was the most distinguished of the upholders of the theory of the BALANCE OF TRADE. Just as the Spartans held out the drunken slaves to their sons as warnings to them against intoxication, let us give, for those who now deride free trade, the titles of St. Chamans' books, which, in their day, had some reputation. *Du Système d'impôt fondé sur les principes d'économie politique*, 8vo, 1820.—*Nouvel essai sur la richesse des nations*, 8vo, 1824. These two books, revised, formed the foundation of his *Traité d'économie publique*, 3 vols. 8vo, 1852. In this last work the following sentence appeared. We will give it without comment, to be admired by the veteran adherents of protection. "*Bénéissons les obstacles que la cherté du combustible oppose chez nous à la multiplicité des machines à vapeur*" ("Let us be thankful to the obstacles to the increase of steam-power in applied machinery, which are caused by the dearth of fuel in France"). It should be added that these works are examples of good literary power, and their author has always held the esteem of the public. A. C. f.

SAINT HAIPPY, M. DE. See LOTTIN, A. P.

SAINT PÉRAYVY (JEAN NICHOLAS MARCELLIN GUÉRINEAU DE) 1732-1789; author of novels, comedies, and books on social and economic topics, he was a contributor to the *Journal de l'Agriculture et du Commerce* of DUPONT DE NEMOURS.

In 1767, his *Mémoire sur les effets de l'impôt indirect sur le revenu des propriétaires de biens-fonds*, printed the following year in Paris, received a prize from the Royal Agricultural Society of Limoges in competition with GRASLIN, who only obtained a *mention honorable*. TURGOT wrote *Observations* (*Œuvres*, ed. Daire, i. pp. 416 *et seq.*), on the papers of both; Saint Pérayvy closely followed QUESNAY's views on the *produit net* exclusively yielded by land, whilst Graslin maintained that wealth was derived from labour. In a note reprinted by DAIRE (p. 416), Dupont de Nemours remarks that both papers cannot be read without difficulty, owing, amongst other causes, to an affectation of metaphysics common to both rivals. E. ca.

SAINT-PIERRE, CHARLES IRÉNÉE CASTEL, Abbé de (1658-1743), born at the château of

St. Pierre-Église near Barfleur (Manche); was a man who formed many plans, generally acknowledged at the present day as likely to succeed, and some of them even have been realised. He always kept the interest of the public before him as his aim, never his own. He was a man of strong character; as an example of this, he allowed himself to be expelled from the French Academy of which he had been a member since the year 1695, because he would not give Louis XIV. the title of the "great." He was moved to this by the misery of the people during the last years of that king's long reign—we will not call it that great reign.

His *Projet de paix perpétuelle*, 3 vols. 12mo, 1713, has, perhaps, more than anything else, made people regard him as a visionary.

In our time, however, international arbitration has had some success, which makes us think the dream of the Abbé de St. Pierre may perhaps one day be at least partially realised. His *Discours sur la Polysynodie* (1718, 4to; 1719, 12mo), is some kind of plan for a political and administrative constitution. Like the disciples of St. Simon a century later, he maintained that the Golden Age was in the future, not in the past. One work of his, less known though perhaps better worth knowing, is *Annales politiques*, a contemporary public history of the period 1658-1739, containing original thought and, very often, the signs of good sense and consequently of a sober and impartial judgment. The works of this "*homme de bien*," as he was called in his time, are rare and difficult to collect, sometimes they are heavy reading.

M. Gustave de Molinari has devoted a volume to the Abbé de St. Pierre, entitled *L'abbé de Saint-Pierre, sa vie et ses œuvres*, 18mo, 1857, in which, after a concise account of his life, he gives some extracts—those most worth knowing—from his works. A. C. f.

ST. SIMON (ST. SIMONISM), CLAUDE-HENRI, COMTE DE (1760-1825). The count de St. Simon was descended from the younger branch of the family of the Duke de St. Simon, the celebrated author so well known as connected with the court of Louis XIV. He was very proud of his noble birth and relates that his servant had orders to call him every morning with the words, "Rouse yourself, Monsieur le Comte, you have great things to accomplish to-day." In the same spirit he made it a rule "to lead, while his strength lasted, the most original and most active life possible." And he adhered strictly to this maxim; first he served in the war of American Independence, then he made a plan for cutting the Isthmus of Panama, was imprisoned during the revolution, travelled in England and Germany, played the part of a grand seigneur, was ruined, fell into the most terrible want, attempted to commit suicide in 1823 only a short time before his death from natural causes, and finally, after his death, was regarded as the apostle of a new religion.

It was not till 1817, and therefore when he

had attained a considerable age, that he brought out his first works—among these was his celebrated *Parabole* (1819), a bitter satire directed against the governing classes, against whom he inveighed as parasites. For this he was prosecuted by the government, but their opposition made him famous. His principal work is *Du Système Industriel* (1821). But it was only after his death that the influence of St. Simon became at all considerable. This was principally due to his two pupils BAZARD and ENFANTIN, who were the founders of the St. Simonian School. They set on foot a systematic course of promulgating their doctrines in different quarters of Paris, established many journals of which the best known was the *Globe*, and finally established a community almost resembling a religious house, at Ménilmontant, a suburb of Paris; this, however, was broken up by the law prohibiting such associations. The influence exercised by St. Simon and his followers was incredible, it was a perfect fascination. Almost every one who is well known of the generation which dates from 1830 belonged more or less to the school of St. Simon. It is enough to mention here, besides the most illustrious of all, Auguste COMTE, economists like Michel CHEVALIER, socialists like LEROUX, engineers like Lesseps, financiers like E. PEREIRE, politicians like Hippolyte Carnot (the father of the late president of the French republic), artists like the musician Félicien David, historians like Augustin Thierry, and many more. This influence, more than the personal fascination so extraordinary but so very real, exercised on their contemporaries by St. Simon and Enfantin—le Père Enfantin, as he was called—can be explained as follows. The doctrine of St. Simon, highly aristocratic in reality, since he would entrust the government only to “the most worthy,” marked a reaction against the French Revolution—against the idea of an absolute, a “brutal” equality. It marked, also, a still more absolute reaction against the martial and military spirit of the Napoleonic period, and announced—as Herbert Spencer did later—the substitution of the industrial for the military régime. Thus it was admirably adapted to entrap *savants*, manufacturers, and artists to whom it promised sovereign power. On the other hand, it professed to carry on and complete the work of the revolution by abolishing the privileges of birth. Privileges of birth had been abolished by the Revolution only in matters relating to public functions, but not in matters relating to economic functions, those of the employer, for example, or the landed proprietor. These powers still, as formerly, fell to the recipient by the chances of heredity, no matter how incapable or unworthy he might be. St. Simonism sought to suppress the last and the most import-

ant heritages—hereditary wealth and hereditary poverty. The abolition of heredity, to have its due effect, was to involve, if not the abolition of the absolute right of property, at least its transformation into a life-interest, forming a kind of public trusteeship. According to St. Simon the landed proprietor, the manufacturer, and the merchant should all become really “public functionaries,” employing the instruments of production confided to their charge to the best possible advantage for the interest of society—as the captain with his warship or the artilleryman with his gun.

The basis of all this is the theory taught at the present time by various schools, and especially by that of CHRISTIAN SOCIALISM, that the proprietor and the employer should consider themselves as exercising a social function, and should make the most of what has been entrusted to them as in the lesson contained in the parable of the “talents.” But the followers of St. Simon were not content with a simple metaphor. They drove the idea of association to its extreme limits, even as far as assimilation, and refused to admit that a social function might be hereditary without any guarantee of capacity. Their doctrines were briefly and clearly summarised in a letter dated 1st October 1830, which we give here, addressed to the president of the Chamber of deputies and signed Bazard and Enfantin: “The followers of St. Simon believe in the natural inequality of men, and look on this inequality as the basis of association, as the indispensable condition of social order. All they desire is the abolition of every privilege of birth without exception, and as a consequence the destruction of the greatest of all these privileges, the power of bequest, the effect of which is to leave to chance the apportionment of social advantages, and to condemn the largest class in number to vice, ignorance, and poverty. They desire that all instruments of labour, land, and capital, which now form, subdivided, the inheritances of private owners, should be united in one social fund, and that this fund should be operated on principles of association and by a hierarchy, so that each one will have his *task* according to his *capacity*, and *wealth* according to his *work*” (*Doctrine de St. Simon*, vol. i.).

But who is to regulate this hierarchy? Who is to distribute to each his duty, the idea of descent being abolished! By what sign is the most worthy to be recognised? On these points the teaching of the followers of St. Simon is very vague. They say that the *chef-industriel* in each city, whom they term the mayor (*maire*), “will distribute to each one his duties according to capacity and not according to birth, give to each tools for work, regulate the remuneration, the income of the employment,” but they do not tell us by whom these

*chefs-industriels* themselves will be chosen. *Quis custodiet ipsos custodes?* However, they tell us in enigmatical form, that this care will devolve "on him to whom social destiny is most dear" (*Doctrine de St. Simon, Exposition*, 7<sup>me</sup> Séance in note), that is to say, on him whom he calls "the priest," and on whom sovereign power is conferred. Thus the St. Simonian organisation becomes a real theocracy, St. Simon and Père Enfantin being the true priests of its mysteries. The ruin of the school of St. Simon was brought about by its pretensions to found a new religion,—“Moses, Jesus, St. Simon, are the three living laws,”—and also by its doctrine on the relations of the sexes, which tended to a sort of mystical eroticism, and led to a schism in the school. Of the doctrine of St. Simon there remain, however, some ideas which the socialists of the present day have availed themselves of to their advantage, for instance,—the idea that rights of property, inheritance, and individual liberty ought to be subordinated to social utility, and that the actual economic organisation, which is founded on individual liberty, rights of property, laws of inheritance and competition is anarchical, and finally that the only means of remedying this is to subordinate all these individual rights to social utility as the primary base.

*Œuvres de St. Simon*, 2 volumes, 1832, edited by his pupil Olinde de Rodrigues, containing not all, but his principal publications. *Doctrine de St. Simon*, 2 vols. 1831-32, containing an explanation of the doctrine by Bazard in a series of conferences, and re-edited by him with the help of Enfantin and Hippolyte Carnot.

S. Mill, *Autobiography*]. C. G.

**SALE OF GOODS.** The law as to the sale of goods has been codified by the Sale of Goods Act 1893. This act is divided into six parts, of which the first deals with the formation of contracts for the sale of goods, whilst the second, third, fourth, and fifth respectively relate to the effects of such contracts, their performance, the rights of unpaid sellers, and actions for breach of contract; the sixth part is supplementary. In the first part a distinction is drawn between contracts which have the effect of passing the property to the purchaser and mere agreements to sell; and the rules are given as to the formalities prescribed in respect of the formation of contracts for the sale of goods. As a general rule such a contract may be made in writing or by word of mouth, or partly in writing and partly

by word of mouth, or may be implied from the conduct of the parties; but a contract for the sale of any goods of the value of ten pounds or upwards is not enforceable by action unless the buyer has accepted the goods or has paid part of the purchase price, or unless the party to be charged has signed a written contract relating to the sale. This part of the act also deals with the conditions and warranties generally implied on the sale of goods and their effect.

The second part contains rules for ascertaining the intention of the parties as to the time when the property passes, and also deals with the effect of sales by persons not being owners of the goods. As a general rule the buyer acquires no better title to the goods than the seller had, unless the owner of the goods is by his conduct precluded from denying the seller's authority to sell, but this rule is subject to certain exceptions among which those arising under the provisions of the FACTORS ACTS (*q.v.*) and the case of sales in market overt according to the usage of the market, are the most important.

The third part, besides containing rules as to time and place of delivery and the risk of transit, also defines what constitutes a final "acceptance" of the goods. "The buyer is deemed to have accepted the goods when he intimates to the seller that he has accepted them, or when the goods have been delivered to him and he does any act in relation to them which is inconsistent with the ownership of the seller, or when, after a lapse of reasonable time, he retains the goods without intimating to the seller that he has rejected them."

The rights of unpaid sellers, as laid down in the fourth part, consist of a right to retain possession of the goods until payment (*vendor's lien*), and also of the right, in the event of the purchaser becoming insolvent, to stop the goods before they have actually been delivered to the purchaser (*stoppage in transitu*). The fifth part enumerates the seller's and buyer's remedies in case of breach of contract. The seller who has delivered the goods has an action for the price of the goods; if the goods have not been delivered, and the purchaser wrongfully neglects or refuses to accept them, the seller is entitled to damages, the measure of damages being, as a general rule, the difference between the contract price and the market price of the goods at the time fixed for delivery.

If the seller wrongfully neglects or refuses to deliver the goods to the buyer, the buyer is entitled to damages, the measure of damages being the same as in the case of an action against the buyer; but if the contract related to specific or ascertained goods, the court may, on the plaintiff's application, order SPECIFIC PERFORMANCE (*q.v.*) without giving the defendant the option of retaining the goods on payment of damages. The term "goods," as

defined by the act, includes all CHATTELS (*q.v.*) not being chattels real, choses in action, and money.

The Sale of Goods Act, besides being of direct interest in itself, is also remarkable as an excellent specimen of the art of codification, being the work of Sir M. D. Chalmers, the author of the Bill of Exchange Act.

As to the sale of land, see VENDOR AND PURCHASER. E. S.

SALE AND PURCHASE. See VENDOR AND PURCHASER.

SALE AND RESALE. See INTEREST AND USURY.

SALMASIUS (CLAUDE DE SAUMAISE) (1588-1653) at Saumur en Auxois (Burgundy). He studied at Paris and Heidelberg, and became a lawyer practising before the parliament of Lyons in 1610, and succeeded Scaliger as Professor at the University of Leyden in 1632, where, with short intervals, he remained till his death in 1653. He died at Spa.

Salmasius received many honours from several governments of his time, and passed some time at the court of Christina of Sweden.

His writings on interest are the most important of his economic works, and on this subject he held many eager discussions with his contemporaries.

These writings are: *De usuris liber*, L.B., 1630; *De modo usurarum*, L.B., 1639; *Dissertatio de foenore Trapezetico, in 3 libros divisa*, L.B., 1640; *Diatriba de mutuo: non esse alienationem, adversus Coprianum quendam juris doctorem auctore Alexio a Massalia*, L.B., 1640; *Responsio ad calumniatorem epistolam Cloppenborgii*, 1640; *Brevis confutatio notarum larvati cujusdam Theologi in excerpta dissertationis de trapezitis*, L.B.; *Disquisitio de mutuo qua probatur non esse alienationem auctore S.D.E.*, L.B., 1645.

Salmasius in these works defends the taking of interest, not only by explaining the passages in the Bible that seemingly forbid it, but also as a matter of principle. Interest, he argues, being a remuneration for the use of money, is nothing else but an indemnity to the person who lends it out; for, when using it himself, he could get fruits from it; though this might not be directly, nevertheless it would be obtained by buying productive objects. Public banks for advances, *montes*, he disapproved of, but argued that competition would lower the rate of interest.

[Böhm Bawerk, *Geschichte und Kritik der Kapitalzinstheorien*, 1884, pp. 37, 40-45.]

A. F. V. L.

SALMOUR, RUGGERO G., count of (d. 1878), was born in Paris. He was a deputy of the sub-alpine parliament; secretary-general in the ministry of finance, 1855; senator of the kingdom of Italy, 1860.

Salmour wrote very able monographs on landed

and agrarian credit, and its organisation in the Sardinian states and in Italy. He studied carefully the organisation and results of these institutions in other countries, and the conditions on which it might be advisable to adapt them to Italy.

[*Dell'ordinamento del credito fondiario negli Stati Saradi*, Turin, Chirio, 1853.—*Del credito fondiario e del credito agricolo in Francia ed in Italia*, Turin, Paravia, 1862]. U. R.

SALT DUTIES. See GABELLE; SALT, TAXES ON.

SALT, TAXES ON. Salt has long been a favourite object of taxation. In both republican and imperial Rome, as under the French monarchy (see GABELLE), it was regarded as a peculiarly lucrative source of revenue. Even at present most countries—Great Britain, where the salt duty was repealed in 1825, and the United States, are significant exceptions—impose heavy duties on it. Thus since 1806 France has had a salt tax, freed from the worst faults of the old GABELLE, yielding about £1,300,000 annually. The German empire obtains £2,250,000 from a combined custom and excise on salt. In Italy a state monopoly has been created. Both branches of the Austro-Hungarian empire follow the same method. But British India affords the most remarkable case of a high return being obtained by salt taxation. The different methods of state monopoly, excise duties and customs, are employed to suit the several provinces, and by these combined agencies a revenue of (1904-5) £5,355,000 at present exchange is collected, placing salt next to the land tax and the duty on opium as the third in productiveness of the branches of the revenue system.

The economic objections to this form of taxation are obvious, for (1) it falls on a necessary of life, and therefore, presses unduly on the poor, and more especially trenches on the MINIMUM OF SUBSISTENCE; while (2) it affects an important constituent of some manufactures, and seriously hinders their development.

For these reasons it was one of the first English taxes repealed in the fiscal reforms of the present century, and where other productive forms of revenue are available, the continuance of such a comparatively burdensome impost is undesirable.

The benefit to the English chemical and glass industries of the repeal was evident and considerable, not merely by the reduction of charge, but also by the decrease in the supervision required. For a poor population the pressure of what is equivalent to a poll-tax is heavily felt and often produces grave discontent. But it must be remembered that in many cases fiscal policy can be only a choice of evils; that the necessity for procuring revenue is too great to allow of any productive duty being abandoned; and that the salt tax may be the least inequitable and oppressive mode by which the

needful contributions of the poorer classes can be secured. Thus the attainment of the position at which this tax can with prudence be given up marks a stage in advance, as its necessary retention is an indication of national poverty and financial need.

[Adam Smith, *Wealth of Nations* (ed. Nicholson), p. 369.—P. Leroy-Beaulieu, *Science des Finances* 5th ed.), vol. i. pp. 653-661.] C. F. B.

**SALTSILVER.** One penny paid at the feast of St. Martin by the tenants of some manors, in the middle ages, in commutation of the service of carrying the lord's salt from the market to his larder.

[Cowel, *Interpreter*.]

### SALVAGE.

Civil Salvage, p. 349; Military Salvage, p. 349;  
Insurance Salvage, p. 349.

**SALVAGE.** There are three kinds of salvage: (1) civil salvage; (2) military salvage; and (3) insurance salvage.

1. *Civil Salvage.*—A service which saves or helps to save maritime property, e.g. a vessel, its apparel, cargo, or wreck, or the lives of persons belonging to any vessel when in danger at sea, or on the shore, or in tidal waters; such service being voluntary and not due to legal obligation, self-preservation, or official duty. The word salvage is often used to denote the reward as well as the service rendered. The right to salvage may arise out of an actual contract; but it does not necessarily do so. "It is a presumption of law, arising out of the fact that property has been saved, that the owner of the property, who has had the benefit of it, should make remuneration to those who have conferred the benefit upon him, notwithstanding that he has not entered into any contract on the subject," Sir J. Hannen, in the case of the *Five Steel Barges*, 15 P.D., at p. 146. Sir Robert Wiseman, a judge of the admiralty court, in his *Law of Laws*, London, 1657, refers the origin of salvage to the Roman law doctrine of *negotiorum gestio* (*Dig.*, bk. iii. tit. 5), which gave an action to a person who had acted for another without any mandate (see Hunter's *Roman Law*, p. 661). Sir Christopher Robinson, in the *Calypso*, 2 Hagg. 209, adopted the same view, and showed that both military and civil salvage "resolved themselves into the equity of rewarding spontaneous services rendered in the protection of the lives and property of others." The reward is not, however, measured by the benefit derived by the shipowner, public policy is also taken into account, and to this extent the Roman law doctrine has been considerably extended. "Salvage is governed by a due regard to the benefit received, combined with a just regard for the general interest of ships and marine commerce," Dr. Lushington, *The Fusilier*, Br. and

Lush., at p. 347. On rendering the services the salvor acquires a lien in respect of his reward, and such lien takes precedence previously attaching to the subject matter. The lien can be enforced in a court of admiralty. The amount of the reward is within the discretion of the court, and depends on value of the property saved, the value of the property employed in the salvage service, the danger involved and the skill shown, the expense or delay incurred, and all other circumstances that appear to be material.

[Sir W. R. Kennedy, *The Law of Civil Salvage*, London, 1891.]

2. *Prize or Military Salvage.*—When a ship captured by the enemy is retaken it is restored to the owner on his paying the captor a reward for the expense and trouble of the recapture. This principle was recognised by the *Consolato del Mare*, and is discussed in detail by Bynkershoek, *Quaestiones Juris Publici*, l. i., cc. iv. v. The chief maritime states have embodied the principle in their legislation. In England the Prize Act 1864, 27 & 28 Vict. c. 25, provides that the owner is to pay as prize salvage a sum to be decreed by a prize court, not exceeding one-eighth the value of the prize; but where special difficulty or danger is involved, the salvage may exceed one-eighth but not one-fourth.

In the United States, the Act of Congress of the 3rd March 1800, c. 14, fixed the amount of salvage at one-eighth of the value if the recapture was by a public ship, and one-sixth if by a private ship.

[For the English and United States practice see Story's *Notes on the Principles and Practice of Prize Courts*, edited by Pratt, London, 1854.

Phillimore's *Commentaries on International Law*, vol. iii., contains a summary of the principles followed by the chief European states. For France, see Pistoye et Duverdy, *Traité des Prieux Maritimes*, Paris, 1855. For other European states, see De Marten's *Essai sur les Armateurs*, translated by Horne, London, 1881.]

3. *Insurance Salvage.*—The word salvage is applied to denote the residue of goods that remain unburned or partially burned after a fire, and in respect of which the insurance has to pay the sum insured. When a loss occurs by a fire, and goods are materially injured, it is usual to ascertain the amount of damage by a sale by auction, with the consent and for the benefit of all parties. The difference between the value of the goods at the time of the fire and the proceeds of the sale is then made good by the insurers.

[Bunyon, *Law of Fire Insurance*, London, 1875.] J. E. C. M.

**SAMPLE.** A portion of a large quantity of goods tendered or shown as evidence of the quality of the whole. In the case of a sale by sample there is an implied warranty that the

bulk will correspond with the sample in quality and condition.

[Chalmers on the *Sale of Goods*, London, 1894.]

J. E. C. M.

**SAMPLING (CONDITIONING)** is the testing commodities offered for sale. Sample is an abbreviation of *ensample*, a specimen. It is common in modern industry for travellers to go round to likely customers, carrying with them samples of the merchandise they have for disposal. This class of dealers, formerly called bag-men, now commercial travellers, has much increased of late, owing to more urgent competition and increased facilities of locomotion. In other instances sampling is performed at the places where the goods are actually made or sold.

**SANCTIS, M. A.** See **DE SANCTIS**.

**SANCTUARY, ECONOMIC ASPECTS OF.** The privilege of sanctuary, i.e. of securing protection by taking refuge within a church or other consecrated ground, and sometimes in other places also, is common to continental as well as to English law, and goes back to remote periods. In England the practice was in vogue in A.S. times. Ina, Alfred, Athelstan, all recognised the temporary immunity thus afforded, for the privilege did not remit but lessened the severity of the penalty and excluded death or mutilation. In the so-called laws of Edward the Confessor, it is for the first time connected with that essentially English institution "abjuration" so admirably described by M. Réville ("L'abjuratioregni" in *Revue historique*, l. pp. 1-42). It is there mentioned in connection with thieves, but during the 12th century the usage seems to have extended to criminals also; and in the 13th we get a clear view of the working of the system. The fugitive having made a confession of guilt before the coroner, might take an oath to abjure the kingdom within a limited period, usually forty days, and was helped by officials to carry out this purpose. But if he failed to take the oath, the sanctuary might, after forty days, be surrounded, and the victim, if unable to effect his escape, would be slowly starved into surrender. In the earlier period it is not easy to see what may have been the economic effects of this custom, and the recorded cases are fewer than might be expected (Réville, p. 23). But from the 14th century onwards the privilege of sanctuary was abused by debtors of all sorts, and frequent complaints are met with in the rolls of parliament on the subject. Thus in 1347 the citizens of London petitioned for redress against a debtor who, by fleeing into sanctuary, defrauded his creditors (Rolls, ii. 187 b); in 1376 it was decided that enfeoffment to friends followed by flight on the part of debtors to sanctuary, should be void as against creditors, if it could be shown that the debtor had profited (Rolls, ii. 369 a). The abuse was so

grave that in response to a petition the opinion of justices and doctors of both laws was taken in 1387 as to the limits of the privilege. Their verdict was that it only covered cases of life and limb (Rolls, iii. 87 b, 51 a). Wiclif laid a memorial before the parliament of Gloucester in 1378, which may have been the formal opinion presented by the experts. The circumstances are described in his *Tractatus de ecclesia* (c. vii. *et seq.*), from which some idea of the system may be obtained. This he vehemently denounces, and notes that the extension of the privilege to debtors was a recent innovation (*Tractatus*, p. 243). It was not, however, abolished, but in 1379 protection was given against debtors who having made "feigned" conveyances, fled to sanctuary; such were henceforth to appear, on proclamation, to the suits of their creditors, or be liable to an execution on their lands and goods (2 Ric. II. st. ii. § 3). Complaints of such conveyances continued (Rolls, vi. 110 a), and although, in 1487, Innocent VIII. by bull took away the privilege from fraudulent debtors, this was an ineffective measure, and it was found necessary early in Elizabeth's reign (1558-1603) to attach certain conditions to the privilege at Westminster with a view to preventing the admission of such debtors (Stow, *Survey*, ii. bk. vi. p. 39).

Early in the 15th century the Commons complained that apprentices and servants living in London, or resorting thither, fled to the sanctuary of St. Martin's-le-Grand with their masters' goods and lived safely; also that the inhabitants of the sanctuary purchased from citizens, and had conveyed to them through their friends, goods for which payment was procurable; and the sanctuary was described as harbouring murderers, traitors, clippers of coin, thieves, and others who hid by day and went forth to do evil deeds by night (Rolls, iii. 504 a). To check the grave disorders at St. Martin's, an ordinance was passed in 1457 which somewhat limited the freedom of the inhabitants, and excluded pickers of locks, forgers, and counterfeiters of various commodities from its privileges, while artificers were forbidden to work on Sunday or feast days (Stow, i. bk. iii. p. 104). Merchant aliens apparently sometimes obtained merchandise, and fled with it into sanctuary without making payment; this led to an enactment that ready money alone should be taken from aliens (Rolls, iv. 360 b).

The sanctuary system, though maintained, was gradually modified by the Tudors. New openings for adventurous spirits, easier means of communication, more definite knowledge of distant lands—all these contributed to make voluntary exile a not unpleasant way of evading justice, and many abjured the realm. This was felt to be a serious danger from several points of view. It led not only to a diminu-

tion of the able-bodied population available as skilled mariners or soldiers, and thus lessened the defensive force of the realm, but it provided the enemies of England with apt instructors in the practice of archery, who moreover divulged secrets of considerable importance. It was therefore enacted that, in future, men fleeing to sanctuary for murder, robbery, or felony—such offences alone are mentioned in the statute—should, after confession and abjuration, proceed to some sanctuary within the kingdom and remain there to the end of their lives, but without being under any special discipline (22 Henry VIII. c. 14). The lightness of the punishment proving an incentive to crime, irksome rules for the daily discipline of sanctuary men, certain limitations on their independence, both enforced by the authority given to “governors of sanctuaries” of whom we hear for the first time, were adopted in 1535 (27 Henry VIII. c. 19). Even this more stringent supervision did not check the evil; in 1540 the privilege of sanctuary was limited to churches, cemeteries, and a few definite places, and certain only of the offences punishable with death received immunity (32 Henry VIII. c. 12). The restrictions were practically repealed by Edward VI. with the elaboration of milder punishments. With the increased ability of the state to deal with offenders against justice all need for a system which had its use in times when the central authority was more or less powerless to protect individuals had passed away, and during the reign of James I. all statutes affecting sanctuaries were repealed (1 Jac. I. c. 25; 21 Jac. I. c. 28). Certain of the notorious London sanctuaries long remained the haunt of debtors, and successfully evaded the law; effective legislation did not touch them until the 18th century (8 & 9 Will. III. c. 27, § 15; 9 Geo. I. i. c. 28, § 1; 11 Geo. I. c. 22, § 1).

[For the privilege of sanctuary, see Shakespeare. Rich. III.—*Rolls of Parliament* (Record Commission).—Réville, A., “L’abjuration regni” in *Revue Historique*, l. (1892), a most valuable contribution.—Wiclif, J., *Tractatus de ecclesia*, ed. J. Loserth (1886).—Bulmerincq, A. von, *Das Asylrecht* (1853).—Stow, J., *Survey of London*, ed. J. Strypey (1720)].

E. A. M.

SANDELIN, PIETER ALEXANDER (1777-1861), a Belgian judge. At the time of the Belgian revolution (1830) his house at Bruges was burnt by the mob on account of his fidelity to the Orange dynasty. He narrowly escaped with his life, fled to Holland, and was made, in 1844, a councillor of state of the kingdom of the Netherlands.

He wrote on industry and the patent law, *Considérations sur la situation actuelle de l'industrie, du commerce, et de la législation des brevets d'invention*, 1846; also a general syllabus of economics, *Répertoire général d'Economie Politique ancienne et moderne*, 6 vols. Hague, 1846-48, com-

prising amongst other things, reprints from leading periodicals and reviews.

[Van der Aa, *Biographisch Woordenboek*, Haarlem, 1874]. E. Ca.

SANDER (or SANDERS), NICHOLAS, D.D., (about 1527-1582), was a Roman Catholic writer on controversial theology.

He wrote, *A briefe Treatise of Usurie*, 1568, published at Louvain. His views are those general in his age. Starting from the standpoint that a loan is a free gift for a limited time, he condemns all loans made in the expectation of profit; and assuming that no man will lend to a richer than himself, he argues against usury as oppressive to the poor—only the poor requiring and receiving loans. Usury in fact is a “gentlemanly theft.” He draws a distinction between the loan of (a) property which can be returned, e.g. a horse, and that of (b) property, e.g. food, immediately consumed by use so that only something similar can be returned. In the former the loss, if any, falls on the lender, in the latter on the borrower. In the first class hiring-out for profit is regarded as lawful, but money, being classed with food because the identical coins will not be returned, must not be put out at interest. Shifting his ground, he next argues that as it is not usual to expect more goods to be returned than were lent (forgetting the hire of a horse for profit), so money, which merely represents goods, is barren, and cannot really produce interest. Yet in one place he allows business profits to be legitimate; and though he does not dwell on the consideration that men will not lend without interest because repayment of the principal is uncertain, he yet suggests that those who are not sure of repayment need not lend.

The confusion of his ideas is shown by the fact that, in several passages, rent is considered as equivalent to interest, and from first to last his arguments rest on the assumption that loans were instituted for the good of the borrower, and on the inference that they ought not to be turned to the good of the lender.

[Cunningham, *Industry and Commerce*, *Modern Times*, p. 83.—*Dictionary of National Biography*.] E. G. F.

SANDYS, THOMAS. See INTERLOPERS.

SAN SALVATORE (Di), PADRE ANTONIO—one of the regular clergy (17th century), wrote a treatise on exchanges, in answer to the critique on *cambi colla rincorsa*, by Padre Giustiniani. The latter maintained that these exchanges (see GIUSTINIANI) were not lawful, according to the doctrines of canonists, because they were not real, but fictitious, exchanges, serving to conceal usury. San Salvatore, being asked by merchants to give an opinion on the subject, supports the lawfulness of this class of transaction, observing that it is possible to have banking-houses in several places which can be relied on, and maintaining that, the different legal points involved in the transaction being lawful, it must as a whole be lawful. All this is merely a play upon words, a quibble, which was attempted to justify a transaction

that could not in reality be justified according to the doctrines of the canonists; a quibble employed to resist a doctrine which no longer corresponded to the requirements of the day.

*Trattato della ricorsa e continuazioni dei cambi fatte a se' stesso, e di quei che si fanno da fiera a fiera*, Milan, 1623.

[Gobbi, *L'economia politica negli scrittori italiani del secolo XVI.-XVII.*, Milan, Hoepli, 1889.]

U. R.

SANSOVINO, FRANCESCO (1521-1586), was the son of the celebrated Italian sculptor and architect.

In his book *Del governo dei regni e delle repubbliche così antiche come moderne* (Venice, 1561), he describes the administration of ancient and contemporary states, and may, in some respects, be considered as one of the forefathers of statistics. He mentions with praise More's *Utopia*, "an agreeable fiction written in order to teach men how to live honestly"; he also describes the foundation and working of the Bank of St. George in Genoa. His *Concetti Politici* (Venice, 1578) refer to wealth, taxation, dearths, etc.

[U. Gobbi, *L'economia politica negli scrittori italiani del secolo XVI.-XVII.*, pp. 12 and 65 (Milan, 1889).]

E. Ca.

SARCHIANI, GIUSEPPE (1746-1835), was born at San Cassiano in Tuscany. He was one of the most active and able co-operators in the extensive and liberal economic reforms made by Pietro Leopoldo I., grand duke of Tuscany (1765-1790). Sarchiani was director of the diplomatic archives in Florence and secretary of the academy of the Georgofili.

With the view to convince the public of the usefulness of freedom in trade and labour, and to prepare them for the abolition of corporations (abolished in Tuscany, 1770), Sarchiani, by order of the minister Tavanti, translated a pamphlet by Abbé Coyer (a species of satirical romance showing the absurdities of corporate regulations), he then wrote several anonymous articles illustrating the advantages of liberty and free competition, and the defects of the corporations. In his treatise on commerce he gives the history of Tuscan arts and crafts. His articles on the guilds of the goldsmiths and the silversmiths, of the shoemakers and the leather-makers, are full of spirit and advocate the abolition of all privileges.

Sarchiani, like other Tuscan authors of the day, accepts the doctrines of the PHYSIOCRATS, whose influence on the Tuscan statesmen, who carried out the Leopoldine reforms, is undeniable; his work on public taxation contains a clear and detailed explanation of the doctrine of the physiocrats on the subject of the single tax. Sarchiani supports the claims of the physiocrats to the honour of establishing in theory the basis of a true and fair system of taxation, advocating, with them, a single tax on land, criticising all other forms of taxation, and advising gradual reform in taxation as desired by the physiocrats.

U. R.

SARPLER (OF WOOL). See MEASURES AND WEIGHTS.

SARTORIUS, GEORG FRIEDRICH (1766-1828), was born at Cassel, and became in 1783 a student of theology at Göttingen, but soon directed himself to the study of history. From 1792 he lectured as *privat-docent* on the history of the 18th century and on politics. In 1797 he became extraordinary, and in 1802, ordinary professor of philosophy in his university. He succeeded SCHÖZER in 1814 as professor of politics, and at Goethe's suggestion was employed by the grand duke Karl August of Weimar as a sort of confidential adviser of the representatives whom he sent to the congress of Vienna. From 1815 to 1817 he was a member of the Hanoverian assembly of estates, and thenceforward devoted himself exclusively to his academic labours. In 1827, in consideration of his scientific services, he was ennobled by the king of Bavaria as Baron of Waltershausen, to enable him to hold a noble estate which he had purchased. He died after thirty-one years of activity as a teacher in the university of Göttingen.

Sartorius was a man of real eminence, and did much for the education of the people of Germany. That he exercised a powerful and healthy influence on the young men of promise with whom he was in contact, is testified alike by men so different as Heinrich Heine and J. F. Böhmér. His importance in the history of political economy lies in the fact that he was the first to introduce the teaching of Adam Smith at a German university. "Convinced that the doctrine was true, he felt it his duty," he says, "to contribute to its diffusion." He published accordingly a series of extracts from the *Wealth of Nations* for use in academic lectures. His most important original work on economics is his *Abhandlungen die Elemente des National-Reichthums und die Staatswirthschaft betreffend*, 1806, in which, whilst adopting Smith's views in the main, he differs from him on several points; where he diverges from him he has been followed by the great majority of later German economists. Acknowledging free-trade as the general rule, he admits exceptions, and holds that the government must interfere in economic life to prevent private interest from compromising the public weal. Sartorius saw the value of historical studies in relation to politics, and, in particular, to economic politics. He was himself the author of three approved histories—of *The German Peasant War*, 1795; of *The Hanseatic League*, 1802-1808; and of *The Ostrogoths in Italy*; this last won a prize offered by the French institute, 1811. His widow, a gifted and highly-cultivated woman, wrote

memorials of him—*Zum Andenken an G. Sartorius*, which have been reprinted with additions by his son, also known as an economist, and who, after having filled a chair at Zürich, became a professor in the university of Strasburg.

SASINE (SCOTS LAW). In Scotland, under the forms of the feudal system, the root idea of land transfer is actual delivery, analogous to the English livery of seisin (see LIVERY). In early times this was carried out by the appearance of the granter and the grantee upon the lands: the granter gave the grantee "heritable state (estate) and sasine" by a ceremony of handing over to him earth and stone or other appropriate symbol. The grantee was then said to be infeft in the lands; and the transfer, or the ceremony, was called infeftment (see FEOFFMENT). It soon became the practice for a notary to accompany the parties and draw up an authenticated narrative of the facts, to be retained by the grantee, and to serve him as written evidence of the transaction; and this was called an "instrument of sasine." Subsidiary complexities soon arose through the growth of a custom under which the granter and grantee did not appear personally on the lands, but sent their representatives. Then a deed had to be drawn up, specifying the grant and directing the granter's representative, or baillie, to give sasine on behalf of the granter to the grantee's attorney. Between these representatives the symbolic ceremony had to be gone through, and the notary again drew up his instrument of sasine; but now he had better material at hand—the granter's written deed—than he had had when all proceedings were oral; and he was therefore able to make his instrument of sasine precise, and to give a clear account of any limitations or conditions or reservations to which the grant was subject. Thus the notarial instrument of sasine became a means of proving title to redeemable rights (mortgages) and limited titles as well as absolute legal titles. As time went on, it became the custom for the granter to draw up a formal deed of grant or DISPOSITION, in the course of which he directed his representative to give sasine as before, but left the name of his representative blank: this deed was handed to the purchaser, who had thereafter to appoint some one to act as the vendor's representative and give sasine to his, the purchaser's, own attorney. We may now look at the purchaser's right in three successive stages: (a) when he had made a contract with the owner to give him a grant, at which time he had a personal right, founded on contract, as against the owner, but had as yet no right in the land, his right being only to lead an adjudication in implement, that is, to go to the

court to help him in an action against the owner, by giving him the land in execution, which would be done in terms of the contract if no third party had acquired a right in the meantime; (b) when he had received his deed of grant or "disposition" but had not yet gone through the ceremony of taking sasine, at which time he had a right, but a merely personal right, in the lands, liable to be defeated by some other grantee getting sasine before him; and (c) when he had taken sasine of the land on the land, at which time his right had become a real right, properly feudalised by infeftment in the lands themselves, and he was the lawful owner of the lands. In the first of these stages he had to go back to his vendor to receive his deed of grant; in the second he had got it, and it was his own fault if he did not go on and complete his title, for the whole matter was in his own hands; and in the third he was fully vested in the rights which had been conveyed to him. The same principles of law still apply under the altered formalities of the present day. The conclusive document was then the instrument of sasine, which showed that the third stage had been reached; and this was the title-deed to the lands. This scheme of transfer was simple though somewhat cumbrous, but was found to be open to abuse in respect that there might be fraudulent concealment of latent rights affecting the lands, for a man might show an intending purchaser his instrument of sasine and yet fail to disclose the existence of reversionary rights or mortgages. Therefore in 1617 an act was passed by the Scots parliament enacting that all instruments of sasine, and generally all documents of title to rights affecting land, were to be registered within sixty days (see LAND REGISTRATION), and that unless registered they were to be ignored by the courts so far as they might be prejudicial to third parties acquiring just and lawful rights. This act was not completely obeyed, and in 1693 and 1696 other acts were passed under which all sasines were declared preferable according to the date and priority of registration, and no sasine or other writ (*i.e.* deed) affecting land was to be of force against any but the granter and his heirs unless duly booked in the register, so that if not booked within sixty days they became mere nullities as against third parties. After these acts there were therefore five steps: (1) the bargain and the obligation to convey; (2) the delivery of the deed of grant to the purchaser; (3) the purchaser securing infeftment by taking sasine of the lands; (4) the drawing up of a notarial instrument of sasine; and (5) the purchaser hastening to get this instrument of sasine registered so as to secure priority and prevent his sasine being reduced to a nullity as against third parties by the lapse of the sixty days. Thus things went on until 1845, in which year

the ceremony of taking sasine was rendered unnecessary and the sixty days limit was extended to the lifetime of the grantor, while registration of the instrument of sasine was made equivalent to infeftment. The steps in the transfer were therefore reduced to (1), (2), (4), and (5), above. In 1858 a further simplification was introduced by abolishing step (4), and from that year onwards in place of step (5) the deed of grant or disposition was to be registered directly. All traces of the ceremony of taking sasine on the lands thus disappeared, and registration is now the effective mode of completing title to land or of affecting land with any securities over it. In practice the purchaser sends his conveyance forthwith to get it registered as soon as it is executed. There is nothing to be gained by not doing so, and he may lose his priority if he neglects to do so. The only exception to the rule that priority of registration confers priority of right arises in cases where the holder of the title has acted in bad faith in taking a title, as for example where the purchaser has bought land which he knew his vendor, a trustee, had no right to sell to him; in such a case the court will annul the conveyance, and its judgment will be entered on the register. But the rule is adhered to with some pertinacity: mere knowledge that another person has acquired a right to get a CONVEYANCE is not sufficient to overcome it; following up one's legal rights, even against a blundered sasine or registration, is not bad faith; and generally a purchaser in good faith is protected and may rely on the registers without making further enquiry, for unrecorded conveyances, including mortgages, are absolute nullities as against him and his representatives, and the rule of priority of right being conferred by priority of registration, operates to keep him safe.

[See Montgomerie Bell's *Conveyancing—Menzies's Conveyancing*.—Begg's *Conveyancing Code*.—Duff on *Feudal Conveyancing*.] A. D.

SASSETTI, FILIPPO (1540-1588), a Florentine merchant who wrote a treatise on commerce between Tuscany and the Levant, showing briefly and clearly the advantages of foreign trade and the influence on it of freedom from restriction. He analysed minutely the advantages which merchants obtained from trade with the east, and advocated that the state should remove every obstacle to this trade and favour its development in various ways. Its importance was well understood by him, and greatly appreciated throughout an active commercial life, and in the long journeys which he made to the remotest regions of the east.

Sassetti proposed to abolish custom duties, or at least to diminish them greatly.

The actual scientific importance of the defence in theory of free exchange which Sassetti made in times when restrictions in trade were prevalent,

is not so great as it appears to be, because similar ideas were based by him and other writers of that period on the interests of the commercial classes alone, and also that he discussed only trade with the east, that is to say, trade in products which could not compete with the industries of his own country. Sassetti said plainly that the greatest benefit was connected with the export trade, which, by favouring the arts, increases wealth; he cannot therefore be fairly classed among the precursors of the modern theory of free trade.

*Ragionamento sopra il commercio fra i Toscani e i Levantini* (written in 1577; published in the *Lettere edite ed inedite del Sassetti*, Florence, 1855).

SATIETY PRICE. The fact that human beings have varied tastes becomes of considerable importance in putting a limit to their consumption of individual commodities. A point may be reached where further reduction of price would result, not in additional purchases of the same commodity, but of a transference of some part of the purchasing power to some other object. Such a point, where further reduction of price brings no increase of demand, is the satiety price for the commodity in question to the individual considered. If a whole community could reach such a condition in regard to the commodity, what has been stated of the individual would be true of the community. It is difficult to conceive, for most commodities in general use, of any price above zero, which would be a satiety price to the whole of a nation such as those of Western Europe. In special cases, however, the conception is possible, and in reference to individuals, represents a sufficiently common experience (cp. LAWS OF POL. ECON.; LAW OF SATIABLE WANTS).

A. W. F.

SATURATE. In any case where, for an individual or for a community, the price of any commodity has reached the point defined as the SATIETY PRICE (*q.v.*), the demand of that individual or community for the commodity in question may be said to be saturated.

A. W. F.

SAUNDERS, N. See SANDER, N.

SAUNDERS, ROBERT (end of 18th century):—

Author of two pamphlets, *Observations on the Present State and Influence of the Poor Laws, founded on Experience by Robert Saunders, Esq.*, 1799. Preface 15 pp., 173 pp.; and *Abstract of Observations on the Poor Laws with a Reply to the Remarks of the Rev. James Nasmyth, D.D.*, by Robert Saunders, Esq., 1802, preface 4 pp. and 43 pp.

The author was interested in promoting a school of industry, and in connection therewith became, in 1796, an overseer of the parish of Lewisham.

The office of overseer, he says, is an unworkable medley of high and uncontrolled responsibility and menial duties, such as "no person of respectability and independence can accept to execute *literally*." The sweets of office reconcile the less desirable sort of overseer to his work. He suggests as remedies the separation of the assessment and collection of the rate from the administration of relief, and an effective system of audit. The miscarriage of Pitt's proposals for remodelling the poor law convince him that parliament is unfit to legislate in detail. "If there be a great national subject . . . that requires the superintendence and controul of a board of commissioners more than any other . . ." it is the poor law. He prefers a "supreme board in the metropolis" to county or local central control proposed by Pitt, and embodied in Gilbert's Act, though he quotes these as precedents. His argument thus anticipates the commissioners' report of 1834, and the suggestion of central control is apparently original. In 1834 his pamphlets seem to have been forgotten, but their prescience and sagacity deserve a brief record. The author dates his pamphlets from South End, Kent, but no other particulars regarding him have been recovered.

T. M.

SAVARY FAMILY. — SAVARY, JACQUES, the father (1622-1690), born at Doué (Maine-et-Loire), died at Paris. He published *Le parfait négociant ou instruction générale pour ce que regarde le commerce des marchandises de France et des pays étrangers* (1st ed., 1675; last ed. 2 vols. 4to, 1800), which long had a well-deserved popularity in the business world. He also helped to draw up the celebrated trade decree of 1673, and later the model of the French commercial code (see CODE NAPOLÉON).

JACQUES SAVARY DES BRULONS (1657-1716), the youngest of his sons, followed his father's example and training, and also devoted himself to the science of trade. Appointed in 1686 inspector-general of customs, he formed the idea of writing his *Dictionnaire universel de commerce, d'histoire naturelle, d'arts et métiers* which death prevented him from finishing.

THE ABBÉ LOUIS PHILÉMON SAVARY, his elder brother (1654-1727), finished this work and published it in two volumes, folio, in 1723; the third, a supplement, appeared in 1730. This work, with some alterations and numerous supplementary remarks, went through several editions, in 1726-32 it appeared in 4 vols. 4to, in 1748-50, 3 vols. folio, and finally in 1759 in 5 vols. folio.<sup>1</sup> MORELLER, who should have known what labour was involved, since he had worked twenty years without finishing a similar work, reproaches him with errors in the principles, and of only attending to technical details. At all events, it had the merit of being the first of its kind published in France. It was

valued on account of the facts, especially in the later editions, which were contributed by men holding the highest places as manufacturers, traders, and government-officials. A. C. F.

SAVIGNY, FRIEDRICH CARL VON (1779-1861), was a descendant of well-to-do Protestant immigrants from Lorraine, a native of Frankfurt on the Maine, a student at Marburg and Göttingen, professor of Roman law at Berlin (1810-42), member of the Prussian council (1817), and of the appeal court for Rhenish Prussia (1819-42), and Prussian minister for the revision of laws (1842-48).

He wrote (1) *Das Recht des Besitzes*, 1803, translated by Perry, 1848, as *Treatise on Possession*, 1848, in which he first crossed this *poms asinorum* of Roman law; (2) *Ueber den Beruf unserer Zeit für Gesetzgebung und Rechtswissenschaft*, 1814, translated by Hayward, 1831, as *On the Vocation of our Age for Legislation and Jurisprudence*, in which he likened codifiers to those who, in their haste, set up a golden calf in the place of the yet invisible tablets of the law; (3) *Geschichte des römischen Rechts im Mittelalter*, 6 vols., 1815-31, vol. i. translated by Cathcart, 1829, as *History of the Roman Law during the Middle Ages*, in which he put the relation of mediæval to ancient and modern history in its true light for the first time; (4) *System des heutigen römischen Rechts*, in seven books, bks. i.-iii., 1840-51; bk. v., called *Obligationenrecht*, 1851-53, and the rest unwritten; bk. i., translated by Holloway, 1867; bk. ii., by Rattigan, 1884; bk. iii., by Guthrie, 1869, 1880; "modern Roman law" meant such elements of Roman law as were then, either in their pure or in a modified form, the common law of Germany and other states; (5) helped by Eichhorn and Göschen, he founded the *Zeitschrift für geschichtliche Rechtswissenschaft*, 1815, his preface to which, denouncing unhistorical jurists and claiming to found a "historical school" of jurisprudence, is epoch-making. His contributions to this and other periodicals are contained in his *Vermischte Schriften*, 5 vols., 1850. His ideas are the same as those of his contemporaries at Berlin. Thus Schleiermacher too tried to form schools of co-operative thought, and the Hegelian system, in which "the history of philosophy became for the first time an integral part of the system of philosophy . . . was exactly the right philosophy for the historical school of law" (Erdmann, *Hist. of Philosophy*, translated by Muirhead, vol. iii. p. 328). When he refers to language he recalls W. v. Humboldt, and his historical sense reflects that of Niebuhr. His central thesis is that law does not merely consist of laws any more than language does of writings; and you will not find its essence either in a remote past or a remote future or in the present, but in the character of a nation, *Volks-Geist*, as revealed in its complete legal history. Invention, conquest, contract, individual whim, *Willkür*, and blind custom may modify but cannot create nor develop law; for it is a spontaneous growth of the entirety, *Gesamtheit*, of the nation. With him *Willkür* stands for the false, *Gesamtheit* for the true. The "natural right" of ignorant dreamers, the didactics

<sup>1</sup> A Dissertation on the Plan, Use, and Importance of the Universal Dictionary of Trade and Commerce, translated from the French of the late Monsieur Savary, was published in London 1749; see also POSTLETHWYTT, ROY, and M'CULLOCH, Preface to 1st ed. of Commercial Dict.

of ill-digested pedantry, the attempt of a half-educated present to dictate to the future by means of codes are resented as a sin against *Gesamtheit*, and although "customary law" most vividly illustrates *Gesamtheit*, he hates the word because it suggests an origin in *Willkür*, and after that *inertia*.

Critics of Savigny forget that he only used philosophic theory sufficiently for his purpose, he did not formulate a philosophy. Von Ihering calls Savigny romantic because he said that law grows by "the silent working of inner forces," whereas fighting made and keeps it alive (*Battle for Right*, translated by Ashworth, 1883). C. Menger says Savigny looked on money as inexplicable and independent of individual volition (*Öbl.* i. 406), instead of as the *tertium quid* resulting from the different things which A and B do and intend to do (*Untersuchungen*, p. 173). Both criticisms are right in so far as they supplement Savigny, for Savigny never investigated the exact process by which many individual efforts produce one collective result, although he invariably traced the latter to the former. The accusation that he identified the systematisation and history of law is borne out by one passage (*V. S.*, vol. v. p. 2) and refuted by another (*S. des h. r. R.* p. xiii.), and his greatest work is called "system," his second greatest "history"; not but what the systematisation and history of thought are always very nearly akin. Members of the historical school are often denounced for holding that whatever is right, and for minimising the sphere of legislative innovation; but permanence is one test of right. How far this accusation hits Savigny it is difficult to say, as his greatest work is expressly confined to private law, and therefore his principle that legislation must adjust law to "changed morals, views, and needs," found little application.

He rarely went outside this bare minimum of indispensable philosophy, or jurisprudence, or legal history, but there are (at least) two exceptions. In one place he summarised Hufeland, Helferich, and Hoffman's exposition of the value of money, and inferred that the market value of money is the best standard for deferred payments (*Öbl.*, i. p. 404 *et seq.*). In another he described progress thus: "bei steigender Cultur nämlich sondern sich alle Thätigkeiten des Volkes immer mehr, und was sonst gemeinschaftlich betrieben wurde, fällt jetzt einzelnen Ständen anheim," etc. (*Ueber den Beruf*, p. 12). This may be represented in H. Spencer's language, "as civilisation advances all the national activities are differentiated more and more, and pursuits which were formerly homogeneous are now heterogeneous." Savigny adds that the link between the pursuit which has now become technical, and the entirety of the nation, is henceforth political.

[A. F. Rudorff, *F. C. von Savigny, Erinnerung an sein Wesen und Wirken* (1862). Translations have made the *System* say that social growth is "independent of individual will" (Holloway, p. 14), have misled the *Edinburgh Review* (*Philological Museum*, vol. i. pp. 196-200), and have made Savigny make mistakes about mediæval money (*Atti e memorie della r. deputazione di storia patria* (1894), pp. 140, 295), so that they must be used with care].

J. D. R.

SAVING, PRODUCTIVE AND UNPRODUCTIVE. See PRODUCTIVE, THE TERMS.

SAVING in the case of an isolated individual, or in the case of a communistic society, obviously means the action of producing in a given period of time a surplus of goods over and above those consumed during that period. Thus Robinson Crusoe "saved," when in addition to providing for his daily needs he managed to build himself a boat. The boat was the addition to his capital which he "saved." A communistic society, too, would "save" when it added to its capital any useful material object, such as a house, a mill, or a ship. In a community recognising private property and practising exchange, the process of saving is just the same. The savings of any particular period appear at the end of that period in the form of additions made during it to the capital or stock of useful material objects in existence. The savings of the United Kingdom, for example, since 1830, include the whole of the railways therein. This is clear enough as regards the community in general, and the fact that the individual saver reckons his "savings" in money which he "invests," must not induce us to believe with Adam SMITH, MALTHUS, and J. S. MILL, that what is saved is spent or consumed. The individual who has an income of £1000 a year has the power of annually consuming commodities and services to the value of £1000. If he "saves £500" it simply means that he decides that he will take £500 worth of goods, not in the form of commodities for his personal consumption, but in some form, say, for example, a cycle factory or telephone wires, in which they will constitute an addition to his capital and that of the community.

[The old view will be found expressed in Adam Smith, *Wealth of Nations*, bk. ii. ch.iii.—Malthus, *Political Economy*, 1820, pp. 31, 32.—J. S. Mill, *Principles*, bk. i. ch. v. §§ 4-6. It is criticised in Cannan, *Production and Distribution*, 1893, pp. 71-74, 100, 103-105, and shown to be based on a confusion between the income of the saver which is saved and not consumed (being taken in the form of non-consumable commodities) and the wages or income of the persons employed to produce the additions to the capital. See Irving Fisher, "What is Capital?" and "Senses of Capital," in *Economic Journal*, Dec. 1896, June 1897. A good idea of what the actual concrete additions to the capital of a modern community really consist of may be obtained from Giffen, *Growth of Capital*, 1889].

E. C.

SAVINGS BANKS. See BANKING.

SAY, HORACE EMILE (1794-1860), eldest son of J. B. SAY (*q.v.*). He spent several years of his youth in business in the Brazils, and founded in 1818 in Paris a commission firm for trade with South America. He was successively a member of the *Tribunal de Commerce* and of the municipality of Paris, and was for some time a councillor of state (1849-

1851). In 1857 he was elected a member of the *Académie des Sciences morales et politiques*.

In 1830 he wrote his *Histoire des relations commerciales entre la France et le Brésil*, but afterwards devoted himself to the study of the administration and of the industrial interests of Paris, publishing, in 1846, his *Études sur l'administration de la ville de Paris et du département de la Seine*, and a few years later the *Statistique de l'industrie à Paris*, the outcome of an extensive inquiry which he himself led as president of the *Chambre de Commerce*, during which 64,816 heads of firms were heard, and their evidence noted, 32,000 manufactures and workshops visited in detail, in the midst of the uproar and troubled times of the second republic.

Horace Say was the devoted follower of his father's economic doctrines, and his house was ever open to students of the conditions of social welfare. One of the founders of the *Société d'Économie Politique*, of the *Journal des Économistes* and of the *Journal du Commerce*, to both of which he was a frequent contributor, he also wrote several articles for the old *Dictionnaire d'Économie Politique*, and he gave a decided impulse to the popularisation of economic literature in France, when he assisted Guillaumin in founding, in 1840, his well-known publishing firm.

[*Nouveau Dict. d'Éc. Politique* and *Annales de la Société d'Économie Politique*, vol. iv. pp. 135-145.—Bonar, *Ricardo's Letters to Malthus*, p. 91.]

E. Ca.

SAY, JEAN BAPTISTE (1767-1832), belonged to a Protestant family which had been obliged to flee from France at the revocation of the Edict of Nantes, but which returned towards the middle of the 18th century. He was the head of a complete dynasty of economists,—his brother Louis SAY, his son Horace SAY, and his grandson Léon SAY.

J. B. Say remained inconspicuous during the French revolution. Napoleon, while first consul, appointed him a member of the tribunal of 1799, but he fell into disgrace through his liberal opinions and the publication of his *Traité d'Économie Politique*, 1803. He then occupied himself with business. At the fall of the empire in 1815 he opened at Paris a gratuitous course of lectures in political economy—the first given in France; and occupied in succession a chair at the *Conservatoire des Arts et Métiers* (1819) and at the *Collège de France* (1830) but a short time before his death.

His most important work is his *Traité d'Économie Politique* which passed through many editions and has been translated into many languages. It was the first really popular treatise on political economy ever published in France; his main divisions and his terminology have become classical and have served as a model for innumerable subsequent treatises. Another more fully developed treatise in six volumes was published in 1828-29 under the title of *Cours Complet d'Économie Politique Pratique*. It is the

reproduction of the course of lectures given at the *Conservatoire des Arts et Métiers*, but is inferior to his first book. His other works are of little importance.

J. B. Say is usually ranked, with A. SMITH and RICARDO, amongst the fathers of economic science. He is very inferior to the first as regards historical and philosophical knowledge, and to the second in originality and depth of view, but it would be unjust to consider him a mere populariser. He was in the true sense of the word the leader of a school—of the liberal and optimistic school, the influence of which was so great in France, particularly during three quarters of a century, and is even now felt. It is he, more than any other writer, who impressed on political economy the character of a natural science, as is clearly shown in the subtitle of his book *Simple exposition de la manière dont se forment, se distribuent et se consomment les richesses*, meaning by that, that riches are formed, distributed, and consumed spontaneously, without the necessity of any intervention; and in reference to this he criticises the definition of political economy given by Adam Smith at the beginning of bk. iv. of the *Wealth of Nations*. No one has insisted more than he on the natural laws of political economy, these laws “which are derived from the nature of things, just as certainly as the laws of the physical world; they are not imagined—they are found; they govern those people who govern others, and can never be violated with impunity” (*Discours Préliminaire*). Far more than Smith is he the representative of the liberal school in his aversion to the state “whose intervention is always objectionable even when it is indispensable,” and again “as to its benefits one cannot praise them without being open to the charge of folly; what benefits can an administration distribute without causing expense to the people administered?” (bk. i. ch. vii. note).

It is true that nowadays these doctrines are generally discarded, but they have none the less exercised an enormous influence. Besides this J. B. Say contributed fundamental ideas which will always be highly valued in the science. The following are the most important:

(a) Tripartite division of political economy; *production; distribution; consumption*. It is true that a fourth has been added since—*circulation*, but the suitability of this improvement may be questioned, and J. B. Say, who included *circulation* in *production*, appears to be more logical.

(b) The method of inquiry based on observation of facts was doubtless previously practised by A. Smith, but J. B. Say is perfectly justified in opposing this to the method of the physiocrats, “who commence by assuming abstract generalities called axioms,” and to

that of Ricardo, who, "drawing all his results from a small number of principles, putting or leaving aside all others, arrived at results different from the real state of the case," and even to the mathematical method, which he had anticipated before it actually existed. "It is not enough," he said, "to make facts the basis only, it is necessary to place oneself in the midst of them, to march with them, and to constantly compare the results deduced from them with the facts observed" (*Discours Préliminaire*).

(c) In the same way that the merit of having shown the part that *land* plays in production belongs to the *Physiocrats*, and the part taken by *labour* to Adam Smith, to J. B. Say belongs the honour of having shown the part of the third factor of production—*capital*, and, still more, of having analysed its three essential and classic elements—*instruments*;—continued means of subsistence during the process of production;—*raw materials*; of having shown that capital only lasts on condition of being continually destroyed by reproductive consumption; and again, of having said, long before J. Stuart Mill, "that the industry of a nation is not confined by the extent of its territory, but by the extent of its capital" (bk. i. ch. v.).

(d) J. B. Say first employed the well-chosen term *Entrepreneur* to designate that most important economic function of the man who collects in his hands the productive forces of capital—labour and natural agents,—and whom English economists designate by the equivocal name of "capitalist." Also as he cleverly said, "English economists almost always confuse, under the name of *profit*, the return that the *entrepreneur* obtains from his industry and his talent, and that which he derives from his capital. This imperfect analysis prevents them from giving a faithful representation of the facts" (bk. ii. ch. v.).

(e) Of all the theories of J. B. Say, that to which he himself attached the most importance was the *théorie des débouchés*. He said proudly, "It is the theory of heat, of the lever, of the inclined plane, which have put all nature at the disposal of man. It is the theory of exchange and openings for trade (*débouchés*) which will change the policy of the world" (*Discours Préliminaire*).

The theory of openings for trade consists simply in this, "each producer seeing that the rarer the products of his industry are, the better he sells them, has, by generalising from his experience, drawn the conclusion that over-production is an evil." Say denies this, and claims that on the contrary each product can only be exchanged against other products, and can be exchanged so much better in proportion as the other products are the more abundant and the more varied, thus there is advantage for all—not only for consumers, but also for

producers,—to him whose products are as abundant as possible.

Say does not deny that excess of production in a special class of goods would lead to a reduction in price of these goods, but the sole remedy for this evil is the proportional multiplication of other goods, "whence, what at first seems to be a paradox is deduced, namely, that production opens new channels to the goods produced" (see his *Traité d'Économie Politique*, bk. i. ch. xv. and art. *DÉBOUCHÉS, THÉORIE DES*).

It is an exaggeration to believe, as Say does, that this theory would change the policy of the world. Its optimism and the idea that individual and general interest are necessarily or naturally harmonious, both tend to the general well-being. The impression of this optimistic spirit evidently inspired the whole of the French school; but, it cannot be denied that there was not in the theory thus expressed any clear idea on the position of the questions of free trade and crises at the present day.

A reference, though brief, must also be made to J. B. Say's views on the distinction between science and art in economic teaching, on utility as the basis of value, on immaterial products, on the superiority of thrift over luxury from the point of view of social interest, and on almost every point of political economy.

The *Works* of J. B. Say form volumes ix. x. xi. and xii. of the *Collection des Principaux Économistes*, published by Guillaumin (1840-41-48); Ricardo's *Letters to Malthus*, *passim*.

A small volume of selected works has also appeared with an introduction by M. Baudrillard in the *Petite Bibliothèque Économique*, published by Guillaumin. c. g.

SAY, LÉON (1826-1896), son of Horace E. SAY and grandson of J. B. SAY (*q.v.*), was one of the most prominent statesmen of the third French republic; under the second empire, he became known by his powerful criticism of the financial administration of Paris in the *Journal des Débats*, of which he was one of the proprietors. After the *Commune*, he was appointed prefect of the department of the Seine, and reorganised the administration of Paris; a little later, although well known as a staunch free-trader, M. Thiers, president of the republic, himself quite as staunch a protectionist, summoned him to the ministry of finance. In this office he directed the payment of the enormous war indemnity to Germany, probably the most colossal financial operation of our century; his official *Report*, reprinted as an appendix to the 2nd edition of his translation of Mr. Goschen's *Theory of Foreign Exchanges* (1st ed. 1866, 2nd, 1892) is a masterpiece of clear and lucid exposition. As minister of finance, he created a new type of French stock: the *rente 3 per cent amortissable* (redeemable consols). In 1880 he was sent as ambassador to England to negotiate a new treaty of commerce, but he

was thwarted in this by the rising influence of the French protectionist party. After a fresh, but transient period of office as finance minister, he resumed his seat in parliament, first in the Senate and then in the House of Deputies, where he became the leader of the free-trade party, and where his brilliant and incisive speeches against protection and socialistic legislation were listened to with eagerness, even by his opponents. He was also elected a member of the *Académie des Sciences morales et politiques* and of the French academy.

As an economist Léon Say neither left any large work nor created any new school, but he remained to the end of his life faithful to the opinions of his grandfather J. B. SAY, and a sincere and intelligent advocate of the liberal theories of the English school of the middle of our century. Present at the banquet offered in 1846 to COBDEN in Paris, he ever after expressed a warm admiration for, and a steady adherence to, the tenets maintained by the Cobden Club. But he could do justice to other schools, and acknowledge for instance that the German *Kathedersocialisten* (see SOCIALISTS OF THE CHAIR), have performed "admirable scientific work."

He was a frequent speaker on the most varied subjects at the meetings of the Paris Société d'Economie Politique, see the Index of the *Annales de la Soc. d'Ec. Pol.*, vol. xvi. pp. 340-342. His speech at the annual dinner of the British Economic Association (25th March 1896) made shortly before his death, enabled his English friends to admire his brilliant eloquence and the cheerful optimism that looked forward to the ultimate triumph of sound economic doctrine. He also delivered lectures at the *Cercle Saint Simon*, a literary and historical club, and at the *École des Sciences Politiques*. These lectures were printed under the respective titles of *Le Socialisme d'État* (1884), and *Les Solutions Démocratiques de l'Impôt* (2 vols. 1886). In the former he analyses the particular drift of socialistic tendencies in England, in Italy, and in Germany, and comes to the conclusion that "state socialism is a German system of philosophy; . . . legitimate in Germany, it is spurious anywhere else."—*Soc. d'État*, p. 3. The *Solutions Démocratiques de l'Impôt* are directed against the proposal to use taxation as a means of social equalisation; the author maintains that the basis of taxation ought ever to be *real* and never *personal*, i.e. should take no account of the personality of the owner of the thing subjected to taxation. The method used is often historical; thus he gives at the end of the first volume a very interesting picture of the democratic systems of taxation prevalent in Florence from the 14th to the 16th century. Both books, and the excellent biography of TURGOR in the *Collection des Grands Écrivains Français* (1887), are characteristic of the author's habit of mind: the literary charm of his style, his wide range of thought, and the extent of his knowledge both of theory and history. The standpoint from which this calm-minded thinker, who never was a radical, contemplated the social problems and the development of the present time may be exemplified by a few extracts

from his *Socialisme d'État*: "Democracy is not a fact to be judged, to be discussed, to be blamed, or to be praised; it is an atmosphere, an existing medium. . . . Men who do not understand democracy have nothing to teach us; they do not belong to the world of the living" (pp. 14-15). The aims he pursued were in fact an alliance, if not of love, at least of reason, between liberty and democracy, and will be best expressed in the words used by himself when referring to Mr. Goschen in England, and Signor Luzzatti in Italy: "They perfectly know what democracy may call into life, and what it may destroy; they take it as it is. What they want to demonstrate, is that liberty, individual self-help, and foresight are able to find a principle of development and to breathe in the very atmosphere of democracy."

Besides the above writings, Léon Say published the following books and pamphlets: *Histoire de la Cuisse d'Escompte* (1848).—*La Ville de Paris et le Crédit Foncier*.—*Observations sur le système financier de M. le Préfet de la Seine* (1865).—*Examen critique de la situation financière de la ville de Paris* (1866).—*Les Finances de la France* (1883).—*David Hume* (in the *Petite Collection Guillaumin*).—*Dix jours dans la Haute Italie* (an account of Italian popular banks), and *Contre le Socialisme* (1896). Since his death, his work *Les Finances*—a description of the mechanism of the French ministry of finance,—has appeared. He also edited the *Nouveau Dictionnaire d'Economie Politique* (1892) and the *Dictionnaire des Finances*, and was a frequent contributor to the *Journal des Économistes*. Under the title of *Léon Say (Liberté du Commerce; Finances Publiques)* a selection of his works has been published in Guillaumin's *Petite Biblioth. Ec.*, 2 vols. 1896, with a complete bibliography. See *Journal des Économistes* (April to June 1896), pp. 161-169, the *Economic Journal*, vol. vi. pp. 318-323, and *Annales de l'École des Sciences Politiques*, 15th November 1896. E. C.

SAY, LOUIS AUGUSTE (1774-1840), a brother of J. B. SAY, and founder of two great sugar refineries at Nantes and Paris.

He wrote several works on economics: *Considérations sur l'industrie et la législation* (1822); *Études sur la richesse des Nations et Réfutation des principales erreurs en Économie Politique* (1836); *Principales causes de la richesse des peuples et des particuliers* (1818); *Traité élémentaire de la richesse individuelle et de la richesse publique* (1827).

A severe and uncompromising critic, he insists on the necessity, "if one wants to be clear and well understood, to call each thing by its name," and inveighs against the looseness and fluctuation of the terminology of ADAM SMITH and RICARDO. He also accuses the former of exclusively prizing things "after the fashion of merchants" who only care about the price at which an article can be sold. "His book contains highly interesting parts and a great deal of valuable information, but his theory of value has done much harm to the progress of theory." Louis Say considers his brother's book as "having above all previous works presented in the best way the greatest number of useful truths"; still he reproaches him with having too often forgotten the leading

principle "that there can be no production of wealth without a creation or increase of utility." He steadily and repeatedly states that "a thing is only wealth in proportion to its degree of utility"; the question of its *value in exchange* is quite a secondary matter.

[See Bonar, *Ricardo's Letters to Malthus*, p. 211 and note.] E. Ca.

SCACCIA, SIGISMONDE (17th century), a Roman jurist. His classical treatise on commercial law contains points of importance to economists; among these is an explanation of the then prevailing ideas on value and price, which, according to CANON LAW (*q.v.*), were not to be determined by the contracting parties but by rules fixed by law in order to maintain the *Iustum Pretium* and to establish objective justice in a contract. Hence, it was the monarch who fixed the price; failing this, Scaccia considered a fair price to be the one for which similar things can generally be obtained, and it may be high, medium, or low according to circumstances.

Scaccia also gives a clear and accurate description of the manner in which exchanges were effected at that period.

On the subject of loans, though he still adheres to canonical law, he endeavours to reconcile them to the movement of thought in his time, to diminish their severity, and to encourage comparatively liberal ideas. Scaccia, as well as other authors of his day, feels the necessity of justifying certain credit operations of undoubted economic utility, and of modifying the theory of the illegality of usury so as to meet the requirements of trade.

Thus, without denying that doctrine, he justifies certain contracts whose usefulness was patent (see DRY EXCHANGE).

SCAET. See SCEATTA.

SCARUFFI, GASPARO (1519-1584). Born at Reggio Emilia, of an ancient family of bankers, was a merchant and banker. He was assayer of the mint at Reggio in 1552, which work he carried on for some time. Later on, he held other public and civil appointments, at the same time carrying on his banking business.

Between 1575 and 1579 he compiled his book on money, published in 1582, which gave him an important place in the history of economic science. Scaruffi entitled his work *Alitimonfo*, a strange name derived from the Greek, signifying *true light*, and taken from his desire to spread true light on the subject of money.

Scaruffi's work is a theoretic treatise on money; it does not contain any systematic

statement; it is a practical treatise written with the object of formulating suggestions intended to improve the monetary system, then in a state of great confusion, owing to alterations in the money, a multiplicity of coins, bad coinage, and abuses of every description.

The author's suggestions are bold, especially for those times; and on the whole, his general ideas on money are accurate and clear.

Scaruffi distinguishes the two principal uses of money—a measure of value and a general means of exchange. He is of opinion that the value of money should be independent of the will of the monarch, who, he says, only confirms it, and that the coining money should not be a source of income to the state, but merely a service to the public.

Scaruffi, in order to get the monetary circulation of his day, then in a condition of great confusion, into order, proposes the adoption of bi-metallism with a fixed ratio of 1 to 12. Owing to the scarcity of metals at that period, and the large number of coins of both metals then in use, bi-metallism became a necessity, and mono-metallism practically inconceivable, and the ratio of 1 to 12, proposed by Scaruffi, corresponded very fairly with the real one of the day. At this point it is necessary to note the error into which Scaruffi fell in determining this relation. He believed it to be natural and invariable, attributing the variations which had taken place to the confusion in the monetary systems, and not to the natural and variable causes which influence the value of gold and silver.

Scaruffi made many practical suggestions for the adjustment of the circulation, proposing the adoption of a monetary unit, the imperial *lira*, which was to be used as a current coin as well as a money of account. He further made suggestions on the name, weight, and manner of coining money to prevent its alteration, and discussed the organisation of mints, maintaining that the expenses of coinage should not be deducted from the coins by attributing to them a higher value than their intrinsic value,—this in his day was a source of serious inconvenience. All these suggestions of Scaruffi's led up to another proposal of his, showing a breadth of ideas and a high-mindedness far superior to his times, namely, the establishment of a universal mint, the adoption of one uniform coinage throughout Europe, based on bi-metallism, with the same shape, weight, and name in every country, "as if the world were one city and one monarchy," to quote Scaruffi's own words. He acutely observes that, with this monetary union, the less valued metal could not go out of circulation because it could not be sent profitably to other countries.

This proposal of Scaruffi's is indeed surprising and wonderful for its depth and boldness, and for the scientific arguments with

which he illustrates it, considering the political and monetary conditions of the times, the great number of small states, all clinging to their vast number of different coins.

Scaruffi's works are commented on by a fellow-citizen and contemporary, Bernardino Pratisuoli, and they are reprinted in the Custodi collection (*Scrittori Classici Italiani*, Parte Antica, tomo ii., Milano, 1804.)

**SCEATTA.** (SCEAT, SCEATT, SCAET, pl. SCEATTAS. The word denotes a part, division, or tribute, as well as a coin.) The most ancient of Anglo-Saxon coins. They are mentioned in the laws of Æthelbert, king of Kent. A.D. 565-616 (Wilkins, *Leges Anglo-Sax.*, p. 6). The types are numerous and rude, the earlier being less debased in art than later specimens; they often include Christian emblems. The earlier legends are sometimes Runic, sometimes unintelligible imitations of those on Roman coins. Weight from  $7\frac{1}{2}$  to 20 grains of silver, but the average is 17. In the laws of Æthelstan (Wilkins, p. 64), 30,000 *sceattas* are said to be equal to 120 pounds; but difficulties arise on this point, and nothing reliable can be stated as to their current value. Gold *sceattas* are sometimes found. These average 19.9 grains, like the Merovingian *trientes*, but one of the British Museum specimens is of the same type as a silver *sceatta* (Hawkins, No. 554) in the same collection.

[Ruding, *Annals of Coinage*, i. 108.—Hawkins, *Silver Coins of England*, ed. Kenyon, p. 24.—R. L. Kenyon, *Gold Coins of England*.—*Proceedings of Soc. of Antiq.*, xiv. (2nd series), p. 313.] R. H.

**SCHILLING** or **SKILLING**. The German, Dutch, or Scandinavian name for a silver coin, generally of about the same value as an English shilling.

The recent decimalisation of currency, however, in the countries where this ancient coin circulated, has involved the removal of the schilling, both as a coin and a money of account, from the currency systems now legally in force. As a denomination of account in common use it nevertheless survives in much

the same way as the GUINEA (*g.v.*) does in England.

The following is a list of various schillings formerly current, showing at the same time the modern currency of the countries enumerated:

	Modern currency.
SWEDEN AND NORWAY— 4 stivers=1 skilling } 48 skillings=1 daler }	100 öre=1 kronor
DENMARK— 16 skilling=1 mark (daler) 6 marks or 96 skilling=1 }	100 öre=1 kronor
HOLLAND— 5 cents=1 stiver 6 stiver=1 Flemish schilling }	100 cents=1 florin or gulden
HAMBURG AND LUBECK— 12 pfennige=1 schilling } 16 schilling=1 mark }	100 pfennige=1 mark

F. E. A.

**SCHLETTWEIN**, JOHANN AUGUST (1731-1802), regarded as the chief of the PHYSIOCRATS in Germany, was born at Weimar, studied CAMERALISTIC SCIENCE at Jena, where, from 1756 onward, he published his first writings on cameralistic and philosophic subjects. In 1763 he was invited to enter the service of Margrave KARL FRIEDRICH of Baden. Besides his official duties in Karlsruhe, he lectured on cameral science and, in 1765, founded an economic society to interest a wider circle in reform. Schlettwein, however, was not a physiocrat any more than was the Margrave, at whose court, a few years before, the Scotch refugee and mercantilist James STEUART had stayed long as a guest and had worked at his *Inquiry*. The state archives at Karlsruhe show that Schlettwein at that time was still a strong Cameralist.

Probably the margrave and the professor were converted simultaneously to QUESNAY's teaching by the ÉPHÉMÉRIDES Du Citoyen, published from 1767 by BAUDEAU, and later by DU PONT. In 1769 distress was felt in the village of Dietlingen near Durlach. It was resolved to counteract it by the measures recommended by the physiocrats. Schlettwein was entrusted with the execution of the reforms, which were started in 1770 with the assistance of some ladies of rank, among whom was Schlettwein's future wife Fräulein von Gersau. The earliest description of the measures taken was given by Schlettwein in his book *Les moyens d'arrêter la misère publique et d'acquitter les dettes des États*, 1772. It was written, or rather finished, the year before in Paris, whither the Margrave had gone in company with Schlettwein, to confer personally with the leaders of the physiocratic school, especially with MIRABEAU. Already at that time an estrangement seemed to have arisen between the Margrave and Schlettwein, which caused the latter to resign his office in October 1773 and to go to Vienna. His hope of finding a place in the imperial administration was not realised, and after a year's absence he

returned to Karlsruhe, where he tried in vain to be appointed again. At this time (1775) his marriage took place. In the autumn of 1776 he settled with his friend and co-physiocrat, Isaac ISELIN (*q.v.*), editor of the *Ephemeriden der Menschheit*, at Basle, where he received permission to give lectures at the university. In 1777 F. K. von MOSER, minister of state at Hesse-Darmstadt, offered him a professorship in the newly founded *Oekonomische Fakultät* at the university of Giessen.

As early as 1772 he had published his work on the physiocratic system, under the title *Die wichtigste Angelegenheit für das ganze Publikum; oder die natürliche Ordnung in der Politik überhaupt, besonders aber die allgemeine Freiheit im Handel und Wandel*, etc. 2 vols. He now wrote the second of his principal works: *Grundveste der Staaten oder die politische Oekonomie*, 1778, which he made the basis of his lectures. He then edited one of the many periodicals devoted to physiocratic ideas: *Archiv für den Menschen und Bürger in allen Verhältnissen*, 6 vols. of which appeared between 1780 and the end of 1784. Certain views in it gave offence to his colleagues at the university and also at the Hessian Court, and in order to avoid difficulties he resigned his professorship in 1785 and withdrew to the estate at Besseritz in Mecklenburg which his wife had inherited. Here he continued his periodical under the title *Neues Archiv für den Menschen und Bürger*, from 1785-1788 in 5 vols. In the 3rd vol. he began a copious history of his experiments on physiocratic principles undertaken in Baden: *Vollständige und beurkundete Nachricht von der im Jahre 1770 geschehenen Einführung des Physiokratischen Staatswirthschaftsystems in dem Badendurlach'schen Orte Diellingen, und von den Wirkungen dieser politisch-ökonomischen Reformationen*. The treatise was not finished, as the periodical was definitely given up in 1785. In Besseritz, Schlettwein abolished serfdom, on which account he was at strife with his neighbourhood; he separated from his wife and emigrated to Greifswald, where he is said to have lectured at the university as *Privat-docent*. His daughter was the mother of ROBERTUS.

Schlettwein may be described as the most zealous, but also as the most one-sided physiocrat. He resembles in some ways the Marquis MIRABEAU, whose rhetorical pathos he shared as well as his wilfulness in matters of doctrine. If QUESNAY had described an "ordre positif" besides the "ordre naturel," of which the latter should have an absolute, and the other, because referring to practice, a relative character, this distinction entirely disappeared with Schlettwein.

Like Mirabeau he held most rigidly the dogma that the "evidences" of natural order must instantly and without restriction be brought into practice. When his early friend, Schlosser, to whose district the villages Theningen and Bahlinger belonged, where the introduction of the physiocratic régime was introduced, wrote, that with the introduction of the new freedom, the abolition of the guilds might be gradually proceeded with, Schlettwein answered: "No. If

there is anything injurious to human society, slothful hesitation to remove it is not becoming in a wise and good man: only children would act thus." A violent doctrinaire, he was an extreme champion in the literary dispute which arose in Germany towards the end of the 18th century over the merits and demerits of the physiocratic system (see GERMAN SCHOOL OF POLITICAL ECONOMY).

SCHLÖZER, AUGUST LUDWIG VON (1735-1809), was born at Jagstadt, studied history, medicine, and oriental literature at Wittenberg, Göttingen, and Upsala, became in 1761 private secretary of the Russian historiographer Müller at St. Petersburg, and in 1764 professor of history in the Petersburg academy. In 1769 he quitted the Russian service, and accepted an invitation to fill the chair of philosophy at Göttingen. On ACHENWALL's death, in 1772, he succeeded him as professor of politics, European history, and statistics, became a Hanoverian Hofrath in 1782, and was ennobled by the emperor Alexander in 1804.

Schlözer is classed among the "liberal eclectics" of his century. His principal strength lay in the combination of history with political philosophy. He preached the doctrine, now universally accepted, that history has to deal with something more than military or diplomatic transactions "after the manner of the Anno-Domini men," and should present a view of the whole life of a people, and, in particular, of its economic conditions at different epochs, and of the economic consequences of political acts. This idea he expressed epigrammatically by saying that he thought a history of tobacco as interesting as that of Tamerlane or of the ancient Assyrians, if the importance of events were measured by their influence on world-changes, and that the introduction of tea, coffee, and sugar had wrought as considerable effects in Europe as the invincible Armada or the war of the Spanish succession. But he wanted the highest historic capacity—the power of entering into the spirit of different times and stages of culture. As an economist, he is mercantilist in his general views, following in the track of Sonnenfels; like him he exhibits partial leanings towards free trade, and does not entertain the exaggerated estimate of the importance of a large population which was one of the reigning prejudices of his period. In statistics he was the most remarkable of Achenwall's disciples, and the principal representative of the Göttingen school in that department. He regarded statistics as a part of politics, to which it was related as the knowledge of the human

body to therapeutics. He defined history as statistics in motion, statistics as history at rest. There is yet another character, in which he is specially memorable as the "founder of publicity" in Germany. As editor of the periodical publications entitled *Staatsanzeigen* and *Briefwechsel*, he exercised a great, and sometimes a formidable, influence—exposing abuses in public life, and contending against tyranny and repression of opinion, especially in the petty principalities, where mediæval institutions, restrictions on the press, and arbitrary interferences with personal liberty still prevailed. He is said by his criticisms to have led even powerful sovereigns like Maria Theresa and Joseph II. to carry out some of the reforms with which their names are associated.

[Frensdorff in *Allg. Deutsche Biogr.*—Lippert in *Handw. der Staatswissenschaften.*—Roscher in *Gesch. der N. O.*, p. 582]. J. K. I.

SCHMALZ, THEODOR ANTON HEINRICH (1760-1831), born at Hanover, studied theology and philology at Göttingen from 1777 to 1780, and, returning to that university in 1783, devoted himself to jurisprudence. He became professor of law at Rinteln in 1788; and was called to fill the corresponding chair at Königsberg in 1789. He was appointed assessor in the East Prussian war-and-domains chamber in 1793, and in 1801 was made chancellor and director of the university. He was transferred to Halle in the same capacities in 1803; and when that city became incorporated in the kingdom of Westphalia, he resigned his functions, and went to Frederick William III. at Memel, to represent to him the propriety of removing the university of Halle to Berlin. The king preferred the plan of a new foundation for his capital, but meantime employed Schmalz as a lecturer in Berlin, and conferred on him high judicial office; when the university of Berlin was established in 1810, he made him its first rector, as well as ordinarius of the faculty of law. Schmalz died at Berlin. He was brother-in-law of Scharnhorst, the military re-organiser of Prussia. In political opinions he was an absolutist; he opposed the creation of representative institutions, and rejected the principle of the separation of the legislative, executive, and judicial powers. In 1815, by a pamphlet on political societies, directed against the Tugendbund and later bodies of a similar kind, he sounded the note of reaction against the men who had taken the lead in the war of liberation, and, in particular, against H. F. K. vom STEIN. This tract produced a great sensation, and was answered by Niebuhr, Schleiermacher, and others. The king of Prussia after a time forbade the continuation of the controversy.

In economics, Schmalz has been called "the last of the physiocrats." Though he criticised Adam Smith severely, he was opposed to protective duties. He compared Colbertism to the Ptolemaic, physiocracy to the Copernican system of the world, Smith being the Tycho Brahe holding an intermediate position between the two. The doctrines of

Quesnay, he was convinced, would ere long everywhere triumph. He is a graceful and versatile, rather than a profound, writer. Most of his publications related to law, in which he builds on the doctrine of the *JUS NATURÆ*. Of his economic, or partly economic, writings may be mentioned a commentary on the Prussian emancipating edict of 9th October 1807; *Handbuch der Staatswissenschaft*, 1808; and *Staatswirtschaftslehre in Briefen an einen deutschen Erbprinzen*, 1818 (translated into French by Jouffroy).

[Landsberg in *Allg. Deutsche Biogr.*—Schmidt in *Handw. der Staatswissenschaften.*—Roscher, *Gesch. der N. O.*, p. 498]. J. K. I.

SCHMEITZEL, MARTIN (1679-1747), was originally professor of history, geography, and philosophy in the university of Jena, and after 1731 of history and political law in Halle. He used the word *statistics* much earlier than his pupil ACHENWALL (*q.v.*), who is sometimes credited with having coined it. Thus, in 1725, he advertised in Jena his *Collegium Statisticum*, where he intended to lecture on the state of the nations of Europe. In fact, the adjective *statisticus* seems to have appeared for the first time in 1672 in the title of Helenns Politanus's *Microcosmum Statisticum*. By a happy stroke Schmeitzel introduced it in the official vocabulary of universities, and thus launched it into scientific circulation, but he did not employ it in the title of his *Einleitung zur Staatswissenschaft*, Halle, 1732. Achenwall, however, followed to a great extent, in his teaching, the lines adopted by his master.

[Article Schmeitzel in Conrad's *Hdbuch der Staatswissenschaften*, vol. v. p. 582.—Roscher, *Gesch. der Nat. Oekonomie in Deutschland*, p. 466, note 1, and *Allgemeine Deutsche Biographie*]. E. CA.

SCHMIDT, CASPAR. This writer was best known as STIRNER, MAX (*q.v.*).

SCHÖN, HEINRICH THEODOR VON (1778-1856). His father, who was a pupil and friend of KANT, sent him to study jurisprudence and politics at the university of Königsberg, where he came much under the influence of the philosopher. In economics KRAUS was his teacher; "he mastered me entirely," says Schön himself; "I followed him without reserve." And, as Kraus was a thorough-going disciple of Adam SMITH, he imbued his pupil with the doctrines of the *Wealth of Nations*, and, in particular, with free-trade ideas, which profoundly affected his public action in his maturer years. In 1793 he became Referendarius under Von Schrötter, ober-president of East Prussia. In 1796-98, by desire of his official chief, he travelled in Germany and England, keenly observing, as his diary shows, the social condition and character of the populations. He was an ardent admirer of the institutions and people of England; he said in after-life, "through England I first became

a statesman." In 1800 he was attached to the general directory at Berlin, and became prominent after the Prussian catastrophe of 1806. He had a considerable share in the Stein-Hardenberg legislation, though, as Professor Seeley and others have shown, not so large a share as in later years he claimed. He was a member of the Immediate commission appointed under Hardenberg's ministry, which prepared the reforms of 1807, and he drew up the report of 17th August of that year, in which is embodied the substance of the emancipating edict. But to the contents of this report Stagemann, Altenstein, and probably Hardenberg himself, contributed quite as much as Schön. When the edict was being framed, he desired to push the principles of free-trade to an extreme, proposing that the lord should be at liberty to dispose of his land at will, unrestrained by the hitherto existing prohibition of the diminution of the number of peasant holdings. But Stein wisely introduced provisions to protect the small tenants, which prevented the absorption of their farms, and softened the transition to the new system. When Stein finally retired, Schön was put forward by the patriotic party as candidate for the office of finance minister; but the king by Hardenberg's advice preferred Altenstein, and Schön was placed at the head of the department of trade and manufactures. Stein's political testament was written by Schön, though of course the substance of it is not his. When Hardenberg came into office as chancellor, he had in contemplation bold financial projects, which, however, were disapproved by Schön and Niebuhr and also in some degree by Stein, whom Hardenberg acknowledged to be his master in finance; hence these projects were only partially carried out. In their modified form they included, besides other things, forced loans on the domains and on Protestant and Roman Catholic ecclesiastical property, with the announcement of a future sale of the domains and disendowment of both churches and of the Order of St. John. Schön was made president of Lithuania in 1809. He was sincerely patriotic in sentiment during the war of liberation, though in some cases he impeded the national movement through exaggerated caution and a pedantic legality. He was appointed president of East Prussia in 1816, and in 1824 was placed at the head of the united provinces of East and West Prussia. In these governments he showed great ability, exercising an enlightened despotism, and holding himself very independent of the ministry at Berlin; he improved the means of communication, extended public instruction, and promoted the progress of agriculture. Strange to say, he opposed the foundation of the Zollverein.

His great weakness was vanity, and in his later years, thinking his services not to have been duly recognised, he looked with suspicion as well as envy on his eminent contemporaries, and in particular sought to belittle Stein, for whom, when actively engaged at his side, he had expressed the warmest admiration. He retired from office in 1842.

Though Schön was too abstract and absolute in his economics, his official reports and other state papers prepared or matured many important measures. The collection entitled *Aus den Papieren Schöns* (4 vols. 1875-76) contains much autobiographical matter, which, with due deduction for his exaggerated estimate of his own work, is very instructive, especially for the critical period of the Prussian revival.

[Pertz's and Prof. Seeley's Lives of Stein.—*Ranke's Memoirs of Hardenberg*.—Maurenbrecher in *Allg. Deutsche Biogr.*—Roscher, *Gesch. der N. O.*, p. 712]. J. K. I.

SCHRÖDER, WILHELM FREIHERR VON (d. 1689) was, after J. J. BECHER and P. W. von HORNECK, the third of the eminent cameralists (see CAMERALISTIC SCIENCE) who flourished during the reign of the emperor Leopold I. (see GERMAN SCHOOL OF POLITICAL ECONOMY). Like his two colleagues, he was by descent neither Austrian nor Roman Catholic. The year of his birth is unknown. As son of the chancellor of the Duke Ernest of Gotha, he appears to have been for a time in the service of the duke. He was also a zealous alchemist. In the last capacity he passed (1668), soon after his father's death, into the employ of Charles II. of England, in whose laboratory in London he, according to his tract, *Unterricht vom Goldmachen*, was occupied many years. In 1670 he presented to the king, as a new discovery, a drinking vessel of red glass which he had prepared. He was also for some time in Holland. In 1674 he entered the Austrian service, with which his becoming a Roman Catholic was connected. More on this point is unknown. At first Schröder had been appointed to the chamber at Odenburg; he then became Becher's successor as director of the *Kunst und Manufakturhaus* which had been established at the Tabor, near Vienna. But Schröder was destined to have as little good fortune in this as his predecessor. In 1683 the house which was to have been a training school of arts and manufactures was burnt at the siege of Vienna by the Turks. The attempt to recall this institution again to life in 1685 failed.

In 1636 Schröder was offered an administrative place in Hungary. He completed in the same year his celebrated work dedicated to the emperor, *Fürstliche Schatz- und Rentkammer*. Later on some of his earlier treatises were added as supplements, the *Disquisitio Politica vom absoluten Fürstenrecht*, the treatise *Nothwendiger Unterricht vom Goldmachen*, and the *Dissertatio*

de Ministrissimo vom Ober-Staatsbedienten. The publication of his *Oesterreichs entdeckte Wunden*, which he was preparing, was prevented by his sudden death in 1689.

In his cameralistic views Schröder was in accordance with BECHER and HORNECK. He also made use of the works of foreign authors, as of MUN's *England's Treasure by Foreign Trade*, and of P. de la COURT's *Het Interest van Holland*.

ROSCHER has rightly blamed him for not mentioning his indebtedness to Mun's work. But Roscher goes too far in placing Schröder among the rigid mercantilists in the sense of confusing money and wealth. Schröder held that it is "not the import and export of money, but the equilibrium of the different trades which causes the wealth or poverty of a country." He even approaches the opinion that coin can be dispensed with, and replaced by a bank-note issued from a *landesfürstliche Wechselbank*, under the immediate authority of the prince. As the chief authority over the exchange operations of the country, the prince could dispose of the whole of the capital of his subjects, for whose business he provided the circulating medium. He would thus become the "belly" from which all the members of the body, that is, of the state and nation, derived their nourishment. Of the three productive classes of the people, the peasants, the mechanics, and the merchants, the merchants were regarded as the "hands and feet of the state," because external movement results from them. On the other hand, he suggests that they should not be chosen as advisers for the economic welfare of a country, as they are more "cives orbis quam urbis," whence it must be regarded as an "axiom that a merchant thinks of his own advantage and not of the prosperity of the state." To discover what is of service to a country, Schröder recommends the preparation of a general inventory of home manufactures after the pattern of one that had been prepared under the direction of his former master, Duke Ernest of Gotha. By drawing up tables of the imports and exports of a country, it was certainly possible from such an inventory for a statesman to form an accurate idea of the condition of home products and what was needed for their improvement. He characterised this, which he called the "spectacles of the state," as the "strongest pillar of a state," as the "great arcanum status" by which "the whole system of government, both theory and practice, may be mechanically managed." Schröder was amongst the earliest of the German cameralists who distinctly supported the balance-of-trade theory which he had derived from Mun. "Free trade" (see FREE TRADE, EARLY HISTORY OF) was regarded by him as "the principal and the best means whereby a country may become rich." But assistance must be given by a suitable system of duties, as through duties "the whole clock-work of commerce and manufacture can be set to go fast or slow." The principal rule of the policy of the government must be that "nobody be allowed to wear anything not produced in the country." Schröder emphatically declared himself in favour of the absolute sovereignty of princes. Every restriction of the rights of the sovereign was

opposed to God's law, and was not binding for princes.

Hatschek, *Das Manufakturhaus auf dem Tabor in Wien*, 1886.—*Allgemeine deutsche Biographie*, art. "Schröder."] A. O.

SCHULZE-DELITZSCH, FRANZ HERMANN (1808-1883), was born at Delitzsch in Prussian Saxony. His family name was Schulze simply, but he took the suffix Delitzsch, or others gave it to him, when he became a member of the national assembly, to distinguish him from other Schulzes, and the addition continued to be used after his connection with the locality had ceased. He studied jurisprudence at Leipzig and Halle, 1826-29, and afterwards filled several judicial posts. In 1848 he was elected to the national assembly as representative of his native place, and in 1849 was a member of the second chamber. He was one of those who in that year were put on their trial for refusing to pay taxes, and conducted his own defence and that of the other accused persons with brilliant ability and success. At a later period he was a member of the Prussian landtag and the imperial diet. In 1851 he resigned his official position under the government in consequence of a conflict with the minister of justice. He was the originator of the co-operative movement in Germany, and in the creation, guidance, and extension of these associations he laboured with voice and pen to the end of his life with unwearied assiduity. His self-sacrifice in this cause impoverished him, and his friends and admirers in 1863 presented to him a gift of £7500, of which, however, he accepted only a small part for himself, devoting the rest to an institution for the furtherance of his social plans.

It is as a sagacious and energetic practical worker that Schulze-Delitzsch is memorable. As a theoretic economist he has no claim to distinction. He borrowed his fundamental principles in the main from BASTIAT. He was an advocate of free-trade and unlimited competition, and maintained the policy of self-help as against state-help. He was thoroughly acquainted with the condition and wants of the small producers and traders, and it is possible that his schemes were better adapted to their needs than to those of the proletariat. LASSALLE assailed him with gross abuse, on the ground that his programme of self-help was of no value for those who could not help themselves, and only tended to lead the working classes into wrong paths. Lassalle's culture and dialectic skill gave him the advantage in the controversy, but the violence of his attack was unjustifiable. Whatever we may think of

co-operation as a solution of the labour problem, we cannot deny to Schulze-Delitzsch the praise of having wrought out a useful partial reform, and of having exhibited remarkable courage, perseverance, moderation, and good sense in the disinterested pursuit of a social end. In 1881 he was able to announce the existence in Germany of 3481 co-operative associations of consumption (*Consumvereine*) or credit (*Vorschussvereine*). The latter, under the name of People's Banks, form a special feature of Delitzsch's scheme. Something of the same kind was originated for the rural population by RAIFFEISEN, but both reformers seem to have devised their respective foundations independently of each other.

There is a German biography of Schulze-Delitzsch by A. Bernstein, 1879, and an *Esquisse biographique* by B. Rumpal, 1874.

Of his very numerous publications, which had usually an immediate object, and therefore only a temporary interest, the following may be mentioned: *Kapitel zu einem deutschen Arbeiter-Katechismus*, 1863; *Soziale Rechte und Pflichten*, 1867, and *Die Entwicklung des Genossenschaftswesens in Deutschland*, 1870.

SCIALOJA, ANTONIO (1817-1877), was born at San Giovanni a Teduccio (Naples). As a youth he studied at Naples the writings of the older Italian economists as well as the more modern Italian and foreign economists. At twenty-two, in the year 1840, he published his *Principii di economia sociale*. This work had a great success in Italy and elsewhere, went through many editions, and was translated into French (1843). In 1846, Scialoja was summoned to Turin to occupy the chair of political economy, then established there. After two years he resigned this post and became minister of Ferdinand II., king of Naples, when the latter for a short time pretended to pose as a reformer and a liberal. After this, Scialoja was imprisoned by the reactionary Neapolitan government and condemned to a long term of imprisonment; this sentence was commuted into exile in 1852. After three years' imprisonment, Scialoja took refuge in Piedmont, where he enjoyed the friendship of CAVOUR; then, again, he became minister of finance in Naples, when Garibaldi was dictator there; minister of finance of the kingdom of Italy in 1865, and at a very critical time he was obliged to establish the *Corso forzoso*; later on he became minister of public instruction. Scialoja's book, *I principii d' economia sociale*, is, considering the date when it was written, a very noteworthy work. The author discusses broadly the principal arguments of economics and finance, following in the footsteps of English economists and in their temperate but eclectic views. In this, as in his other works, Scialoja stoutly upheld the principles of liberty, at a date when Naples was

the stronghold of absolutism and protection. In the *Principii*, he asserts the importance of mathematics in economic researches, and recognises the expediency of using them, especially in the theory of value.

His work, *Carestia e Governo*, written in the style of BASTIAT, sparkles with controversial vivacity. Another of his works on the finances of the kingdom of Naples made a great stir in his time, through the comparison instituted between Sardinian and Bourbon administration.

As a minister of Italy he made a special study of the land tax, advocating, in opposition to others, the theory of "consolidation."

He desired to establish a fixed minimum land tax, which he thought would become consolidated and for which an authorised rate of redemption would be allowed, also an individual tax on agricultural industries as part of the tax imposed upon all returns.

SCIENCE, ECONOMIC, AS DISTINGUISHED FROM ART (see *supra* ECONOMIC SCIENCE AND ECONOMICS). The distinction between political economy as a science and as an art has been discussed at length by J. S. MILL, SENIOR, F. A. WALKER, Cossa, and Sidgwick. The last-named writer points out the causes of the "widespread confusion—or at least fusion"—of these two standpoints, that must strike the student of economic literature. They must be sought in the conditions of social existence, and in the evolution of thought and language. In the social state, however men may discuss and theorise concerning the nature of social phenomena, the problems arising in relation to the most effective methods for satisfying wants and securing government are ever pressing for solution. Practical considerations, therefore, have been the historical *præius* in economic literature. The science of political economy has only in this century ceased to be ancillary to them. Again, specialisation in "moral" philosophy or science, whether as to subject-matter or method, is of recent growth. The term "political economy" is itself an instance of relatively undifferentiated thought. And it is but yesterday that the word "science" stood for any body of truths or reasoned thought, with or without a view to practice, which, in Mill's words, had "acquired a collective denomination." Economists may now insist with him that their subject, *quæ* science, has nothing to do with the "do this; avoid that"

of art, yet M'CULLOCH, no less than SMITH, speaks of a practical "object" for the "science," while De LAVELEYE so fused the two standpoints as to define political economy as "the science which determines what laws men ought to adopt," etc. Besides these more general causes of confusion, a special circumstance in the history of economic thought has been pointed out by Professor Sidgwick. The principle of *laissez faire* for trade advocated by the PHYSIOCRATS as the logical corollary of their optimistic philosophy—involving their whole social standpoint—tended to identify the "ought to be" of subsequent economic doctrine with the "natural" or existing organisation of society. STUART'S "great art" of political economy melted gradually, at least in this country, into a view of economic phenomena best described by the title of SMITH's immortal treatise. And finally, the repudiation by economists of any essential standpoint beyond that of scientific analysis and prediction, has been to some extent one of self-defence against the attacks directed by ethical writers at the apparently anti-social "teachings" of their "dismal science." Their ambiguous definitions and methods, as well as the want of scientific training in their assailants, led the latter to see precepts where, more or less, only statements of cause and effect had been formulated.

With the growth of lay intelligent interest in economic inquiries, and the improved clearness in methodological procedure in experts, it is neither to be feared nor desired that political economy should limit itself overmuch in range or treatment, or reserve the term "art of political economy" for questions of revenue, or what the *laissez faire* spirit has termed the "interference" of a central government. There is no question relating to the satisfying of wants under a social mechanism that may not be legitimately discussed from the economic point of view, whether it be by way of analytical or historical inquiry into economic phenomena, or of more or less abstract theory pure or applied, or of social ideals in their economic bearing. The advantage of the German term *Lehre* in the term *Volkswirtschaftslehre* lies in this combination of lore and doctrine, of science and art. Thus while the Schönberg *Handbuch* and the Jena *Handwörterbuch* assert that the *Lehre* of national economics as taught in Germany is a science of investigation into social functioning, it is also insisted that out of these inquiries into the development of national life, and on its behalf, ideals are by "political economy" both to be extracted and propagated.

C. A. F.

SCIENCES, MORAL AND POLITICAL. It is usual to group the sciences under two principal heads, the moral and the physical. The external or sensible world, including the human frame, is the subject of the physical or natural sciences. The internal or invisible world of thought and will is the subject of the moral sciences. The moral sciences are supposed to imply, the natural sciences to exclude, the idea of freedom or self-determination. The natural sciences deal with blind force, the moral sciences with reason more or less conscious. Both the natural and the moral sciences assume a rational order in the phenomena under investigation. But, so to speak, in the one case the rational order is imposed from without, while in the other it is evolved from within. The law of gravitation is equally fulfilled in the case of an apple falling from a tree and a man jumping from a wall. But the apple has no choice as to falling, and passes no judgment on the results of its fall. The man chooses whether to jump or no, and is satisfied or dissatisfied with the result as may happen. As a mass of matter descending he is an object of physical science. As a thinking and willing agent he is an object of moral science. The physical sciences range from mathematics, the science of pure number and extension, to sciences dealing with the most subtle and complex forces, such as physiology. The moral sciences are also many, and their boundaries are even more difficult to trace with precision. The science of psychology is concerned with what we may term the natural history of the mind or soul, the description and classification of its various faculties. The science of logic is concerned with the action of the speculative faculties, with the process of knowledge. It seeks to solve the problem how man comes to know. The science of ethics is concerned with the action of the practical faculties, with the process of conduct. It seeks to explain the meaning of moral good and evil, of duty, conscience, and virtue. The moral sciences thus far enumerated concern themselves primarily with man as an individual. But man is also a member of society. We cannot fully understand man as an individual unless we understand society, for society is the outcome of the needs and capacities of the individual, whilst these needs and capacities are in turn transformed by the action of society. The science of society is a great and indispensable part of moral science. For the science of society we have not, unfortunately, any appropriate name. To the Greeks it was known as politics. But our conception of the

study of society has been so much enlarged as to include much that lies outside the Greek conception of politics, whilst the term politics has been so much narrowed and degraded as to have lost nearly all its scientific associations. The term sociology, invented by A. COMTE, is a barbarous hybrid, but it is the only term which has found wide acceptance of late years.

The science of society is in fact a group of sciences. Thus it includes politics proper, the science of that highly complex form of society which we call the state or the commonwealth. What are the conditions of the rise, duration, and decay of the state? What is its essence? What are its possible forms? What are the possible relations between the governing and the subject elements in the state. These are some of the principal inquiries included in the science of politics. But before the rise of anything that can be called the state there existed more elementary forms of society based solely on kinship or religious ideas. These elementary forms of society come within the scope of anthropology. Even after the rise of the state there are numberless forms of association other than the strictly political one. Human beings combine for domestic life, for worship, for intellectual advancement, for pleasure, for the accumulation of wealth, and for many other objects which cannot be fully attained but by combination. Each of these modes of association has peculiarities of its own, and may be studied to some extent in isolation from the rest. As regards political economy, we must remember that, although the desire for material well-being is an individual appetite, the production, the distribution, and consumption of wealth on any but the smallest scale are possible only in and through society. Hence political economy is a branch of the science of society. The epithet political, indeed, implies something more. The economists of the mercantile school (see MERCANTILE SYSTEM) studied wealth primarily as an element in the power of the state. Even their great adversary, ADAM SMITH, entitled his treatise the *Wealth of Nations*. But his successors, obeying the impulse which he had given to the study of free individual activity, tended to regard wealth as the means of individual happiness. This tendency is best exemplified, perhaps, in the writings of J. S. MILL. But whichever view be preferred, it is man in society that is the subject of economic study. PLATO and ARISTOTLE were therefore right in regarding economics as a branch of politics in the very wide sense which they gave to that term. Men associate, Aristotle said, at first in order to secure life, and afterwards in order to secure a good life. In either case wealth is the indispensable means to the end for which society exists, and the science of society includes the science of wealth.

F. C. M.

SCIRE FACIAS. As a general rule a judgment against a corporation cannot be executed against the members of the corporation. There are, however, certain companies (including companies incorporated under the Companies' Clauses Consolidation Act, but *not* including companies governed by the Companies Acts), with respect to which judgments obtained against the company may, subject to certain conditions, be enforced against the shareholders. According to the former practice a proceeding in the nature of a new action and known by the name of "Scire Facias" had to be instituted by a creditor who wished to avail himself of this right; this procedure has not been abolished, but as the same object may now be obtained by proceedings under the rules of the Supreme Court, order 42, rule 23, which are much simpler, "Scire Facias" proceedings are no longer resorted to.

[See Lindley, *The Law of Companies*, 3rd ed., 1889, pp. 276-292.] E. S.

SCOLA, GIOVANNI (18th century), was the author of a treatise on taxation; of this Scola distinguishes three,—personal taxes, those imposed on articles of consumption, and those imposed on property and interest-bearing funds. He analyses the first two, showing the difficulty of imposing equitably, and dwells especially on the third, maintaining it to be the greatest and most certain source of public revenue. He studied the CATASTRO, especially criticising the method on which it was organised, and proposes a new system for general taxation, not only on land and buildings but also on manufactures and trades. His ideas on the basis of taxation are, however, somewhat vague and undefined.

*Saggio sopra le pubbliche imposte*, Venice, 1787.

[See Ricca Salerno, *Storia delle dottrine finanziarie in Italia*, Rome, 1881.] U. R.

SCOT AND LOT. To "scot and lot," or "to be in scot and lot," is a common phrase in mediæval town records, and means to be subject to rates and taxes. Some writers say that "scot" refers to taxation, while "lot" refers to the active duties of a burgess, above all, to the holding of office. This view is untenable as regards the middle ages; the distinction made by some writers between "paying scot" and "bearing lot" is a modern and erroneous interpretation of the mediæval phrase. There is abundant evidence in municipal records to show that "to be in scot and lot" meant merely to participate in assessments or pecuniary charges (tallages, aids, etc.). "Scot" and "scot and lot," are often employed as synonyms, and both are used interchangeably with other words denoting money contributions or pecuniary burdens.

[Fry, *On the Phrase Scot and Lot*, in the transactions of the Philological Society, 1867, pp. 167-197.—Gross, *Gild Merchant*, i. ch. iv.] C. G.

SCOTT, WILLIAM, a London "draper," *i.e.*

cloth merchant (see Ashley, *Economic History*, ed. 1893, p. 212), wrote *An Essay of Drapery or the Complete Citizen* (1635), which, may be compared with Defoe's *Complete English Tradesman*. For theological point of view see the *Ayenbite of Inwyrt* (a translation from the French work: *Le Somme des Vices et des Vertus*). Scott's attempted reconciliation of his two axioms that "the end of trade should be the good of both parties," and that buying cheap and selling dear is "a common vice," leads to curious casuistry, of which we give two samples. "Men are not apt to take so exact notice of spiritual blessings . . . unless temporal blessings be added to them; therefore, labour for them" (p. 115). "In some cases my citizen may mingle profit with honesty, and enter into a composition with both; he must never turn his back to honesty, yet sometimes go about and coast it, using an extraordinary skill" (p. 137).

J. D. R.

SCRIP. This is the name given to the provisional certificates which on a new issue of government bonds or debentures or shares are handed to the subscribers and are subsequently exchanged against definite certificates. They may be issued to bearer, in which case they are treated as negotiable securities.

[Palmer, *Company Precedents*, 6th ed. p. 700.]

E. S.

SCROFANI, SAVERIO (1756-1837) a Sicilian priest, originally professor of agriculture at Venice, lived, after the destruction of the Venetian republic, several years in Paris, where he was chosen a member of the Institute of France. In 1814 he was appointed director of the statistical department at Naples, but on account of his liberal tendencies was obliged to resign in 1822.

Strongly imbued with the ideas of the French *Physiocrats* (*q.v.*), Scrofani regarded landowners and agriculturists as "the only possessors of future wealth," and "those who essentially compose the nation." On this basis he maintained the necessity of freedom of trade in corn in particular and of free-trade in general. His views are stated in his *Memoria sulla libertà del commercio dei grani della Sicilia* (included in Custodi's *Scrittori classici italiani dell' ec. pol. Parte moderna*); in his *Elogio del Granduca Pietro Leopoldo di Toscana* (reprinted in Gianni's *Raccolta degli economisti Toscani*, vol. i., Florence, 1848); and in his *Memorie di economia politica* (Pisa, 1826); in the latter he also treated on ancient and modern systems of taxation, and discussed Italian manufactures. Towards the end of the last century a memorial in favour of free trade in corn, founded on facts collected in Tuscany, was presented by him to the king of Naples under the title of *Riflessioni sopra le sussistenze, risvegliate da fatti osservati in Toscana*, and printed as an appendix to Biffi Tolomei's *Confronto della ricchezza dei paesi che godono libertà nel commercio frumentario* (1795). An adaptation of his early works was published in French under the title of

*Essai sur le commerce en général des nations de l'Europe avec un aperçu sur le commerce de la Sicile en particulier* (Paris, 1802).

[U. Gobbi, *La concorrenza estera e gli antichi economisti Italiani*, pp. 268-269 (Milan, 1884).]

E. Ca.

SCROPE, G. POULETT (1797-1876) economist and geologist, was originally called Thomson, but took the name of his wife on marrying the heiress of the Scrope family. After travelling extensively, he published in 1824 his *Considerations on Volcanoes*, in which he combated the Wernerian theory of the aqueous origin of all rocks. In 1827 appeared his *Geology and Extinct Volcanoes of Central France*, and at a later date he issued a monograph against Von Buch's theory of elevation craters.

But it was as a political economist that Scrope was most widely known. From 1833 to 1868 he sat in the House of Commons for Stroud, and both in parliament and through the press he inculcated his economic theories. He was known as "Pamphlet Scrope" from the number of his tracts on banking and currency questions, the poor laws, the condition of the agricultural labourers, and various questions of political economy. He was one of the first persons in England to advocate the use of INDEX NUMBERS (*q.v.*).

In 1833 Scrope published an able pamphlet entitled *An Examination of the Bank Charter Question, with an Inquiry into the Nature of a just Standard of Value*. The arguments in this treatise were embodied in his *Principles of Political Economy*, 1833. A second edition of the work appeared as *Political Economy for Plain People*, London, 1873. In this work, ed. 1833, p. 406, Scrope "proposed to correct the legal standard of value, or at least to afford to individuals the means of ascertaining its errors by the periodical publication of an authentic price-current, containing a list of a large number of articles in general use, arranged in quantities corresponding to their relative consumption, so as to give the rise or fall, from time to time, of the mean of prices; which will indicate, with all the exactness desirable for commercial purposes, the variations in the value of money; and enable individuals, if they shall think fit, to regulate their pecuniary engagements by reference to this *Tabular Standard*."

This he proposed should be published "by competent authority." Scrope further argued, p. 423, in favour of "the substitution of the ancient silver standard in use previous to 1773, for the far more vacillating and inconvenient gold standard first established as the sole legal standard of value in 1816," considering that "the rejection of silver as our standard of value in conjunction with gold has raised the value of the standard" by about eight per cent.

Many of Scrope's writings had for their object the refutation of "that most pernicious dogma which has long been palmed off on the public as the fundamental axiom of political economy, viz.

“the tendency of population to exceed the procurable means of existence.” He sought to demonstrate that man’s deficiency of subsistence was his own wilful fault, and that in his aggregate capacity he had always had everywhere within reach the sources of an abundant supply for the satisfaction of all his reasonable wants. Scrope’s free trade principles were exemplified in such tracts as *Don’t Tax, but Untax* (1850); *The Rights of Industry* (1848).

[*Transactions of the Royal Society*, 1876; Jevons’s *Investigations in Currency and Finance*, 1884; Scrope’s *Principles of Political Economy*, 1833; and his various pamphlets.] G. B. S.

SCUDINO, a gold coin of Modena current in the last century and equal to 9 lire.

[*Kelly’s Cambist*, s.v.] C. A. H.

SCUDO (from *scutum*, a shield) was the name of various coins, all doubtless springing from the same original, in different parts of Italy. It was in common use during the last century in various principalities, not only as a coin, but also as a money of account. It is found combined with various distinctive expressions, usually indicating use as money of account, e.g. scudo d’oro, scudo di cambio, scudo corrente, the complete differentiation of which would require a considerable treatise.

The coin varied in value in different capitals, e.g. scudo of Bologna=4s. 5·6d.; scudo of Sardinia=3s. 9d. (approximately); scudo of Sicily=4s. 0d. (do.), and the number of lire which were reckoned to it, varied from 5 to 9 in different principalities.

The scudo was also the original standard of the old Maltese coinage.

The word “escudo,” found in Spanish currency, is of exactly the same origin.

[*Kelly’s Cambist*, index s.v., *passim*.—Chalmers’ *Colonial Currency*, p. 307.] C. A. H.

SCOUTAGE. See KNIGHT’S SERVICE.

SCYTHE-PENNY. Supposed to be a payment to the lord of the manor for every scythe; *dabant etiam denarium pro falce quod Anglice dicunt sithpeni* (*Customale Roff.*, ed. J. Thorpe, p. 4, a). Vinogradoff (*Villainage in Engl.*, p. 291) regards this and similar payments as original taxes, and not as quit-rents or commutation rents. But doubt is raised by the words *qui non habet falcem debet falcatoribus qd.* in the *Customals of Battle Abbey* (Camden Soc.), p. 89, and similar entries in other records.

R. H.

SEARCH, RIGHT OF. A right accorded by general consent of international law to belligerent powers to stop and search vessels sailing under neutral flags on the high seas and in territorial waters. It must be exercised only by commissioned vessels; otherwise it becomes an act of piracy.

This right is considered essential to determine the neutrality of a vessel, and it is a corollary of the right to seize an enemy’s property, or any contraband of war.

It is also called “right of visit,” sometimes “of visitation.”

[See all the treatises on *International Law*, e.g. Wheaton, pp. 685-86, and note thereon for authorities, Hall, 4th ed. p. 746.] C. A. H.

SECKENDORFF, VEIT LUDWIG VON (1626-1692), born near Erlangen, the scion of a Franconian family ruined by the religious wars, was leader of the Protestant branch of the Cameralists after the thirty years’ war divided into two “confessions” (see GERMAN SCHOOL). As a boy he was received at the court of Duke Ernest of Saxe-Gotha, whose assistance enabled him to study at the university of Strasburg. In 1646 he entered the service of the duke, and gradually rose (1663) to be chancellor. In 1664 he was invited to pass into the service of Duke Maurice of Saxe-Weitz, where he remained until the duke’s death in 1681, when he retired into private life and moved to his estate at Meuselwitz.

He had published in 1656 his famous work *Der teutsche Fürstenstaat*. He now made use of his leisure to finish his supplementary work, *Der Christenstaat* which appeared in 1685. A year later, 1686, he published his *Teutschen Reden*. Seckendorff had been counsellor to princes of all the reigning houses into which Saxony was then divided. In 1692 he was invited by the elector of Brandenburg to undertake the chancellorship of the proposed university at Halle. But he did not live to see the opening of this institution. The title of the “great Seckendorff” given him by his contemporaries, has not been confirmed by later times. Seckendorff had indeed a quick eye for the movements of practical life, but he was no philosopher. His writings are deficient in originality. In the *Fürstenstaat* he confines himself to a brief description of a German state of his time, in order, as he says, to give young statesmen some insight into their duties. He announced that he did not write as a reformer, but merely to give descriptions—the question, which kind of government was the best, appeared to him as a private individual, “too delicate.” Notwithstanding the *libertas philosophandi*, he would give no opinion on this point. Seckendorff opened a new era for political science in Germany by writing in his native tongue instead of writing in Latin. He is in this respect the father of scientific terminology in Germany. The expression “state” was first used by him in its modern meaning. He apologised for not having been able to find a better expression. Seckendorff as a teacher holds with Luther. This appears especially in his later work *Der Christenstaat*, where he defended the writings of the reformers against the attacks of Roman Catholicism on the one side, and of atheism on the other side.

The “sovereign” is by right the holder of the secular and the spiritual power, but still, this power is to be neither despotic nor absolute; on the contrary the prince is bounded on two sides, on the one by the emperor, on the other by the estates of the realm. The title “By the grace of God” he might only use in his dealings with

his subjects, not with reference to the emperor. In the matter of taxation (*jus collectandi*) he would levy no impost without the consent of the estates. The main object of public policy is the "numbers of the subjects"; this is regarded as the "true wealth of the country." The government has to see "that all its subjects should, through their industry, find a livelihood." For this all raw material should be worked up in the country, so that the inhabitants should lose no opportunity of employment. Foreign goods, except in the case of an absolutely necessary article, are to be kept out by high duties. Seckendorff, however, did not insist on the theory of the balance of trade. In internal trade the greatest possible freedom of production should prevail, which would cause the reduction and ultimate disappearance of the privileges of corporation of artisans. On the other hand, Seckendorff was strongly in favour of the introduction of compulsory education for the people. Not only was the general prosperity raised by this, it also provided a good weapon for the struggle with evil. Seckendorff was, moreover—and it was very characteristic of him, considering the ideas prevalent in his time,—an opponent of alchemy. He calls it a "rash tempting of God." Only honest labour has been promised a heavenly blessing in the scriptures. The centre of gravity in the *Fürstenstaat* is the discussion as to the sources of income to the treasury. Seckendorff preferred the EXCISE (*g.v.*) to direct taxation. By this, the rich might be favoured more than the poor. But that was no injury to the state, as the well-being of the upper classes caused more employment for the masses.

Besides the works named above, Seckendorff published the following treatises in Latin:—*Schola latinisati ad copiam verborum et notitiam rerum comparandam, usui paedagogico accomodata*, 1662.—*Justitia protectionis in civitate Erfurtensi*, 1663.—*Compendium historice ecclesiasticæ*, 1666.—*Repetita et necessaria defensio justæ protectionis*, 1669.—*Jus publicum Romano-Germanicum*, 1687.—*Commentarius historicus et apologeticus de Lutherianismo, seu de Reformatione*, 1688-1792.

SECRÉTAN, CHARLES (1815-1895) was professor of philosophy in the university of Lausanne, and as a philosopher was held in high repute. His great work, *La Philosophie de la Liberté* (1849), seeks to reconcile reason and religious faith, by showing that the fundamental dogmas of Christianity are the best philosophic explanation of the origin and destiny of man.

As he grew older Secrétan turned his attention to social problems, and devoted himself wholly

to these; the reference to him in these pages is taken only from this point of view.

Of his writings on this subject *Civilisation et Croyance* (1887) was the earliest. This treated the question from the side of philosophy. It was followed by more works in a more popular style in rapid succession. *Les droits de l'humanité* (1890)—*Études sociales* (1891)—*Mon Utopie* (1892). Secrétan was an advocate of liberty and opposed to COLLECTIVISM, but he did not rank himself as one of the adherents of the MANCHESTER SCHOOL. While he held that, in principle, liberty should be the only solution of the social question; he also held that in practice this is impossible, because the economic order now existing is not the product of liberty. He considered the land as a usurped possession, and that this usurpation—justified as it was in some respects by the advantage resulting to the community—still required as just compensation the recognition of the right of the needy for assistance. He regarded property and the system of labourers' working for hire, etc., as institutions which drew their historical origin from the abuse of the right of the strongest. Hence these cannot be considered as the ultimate stage in human progress, and it becomes necessary to modify the social organisation from its base to bring it into conformity with justice. As Secrétan would not permit, even in order to attain these ends, that anything contradictory to justice should be employed, because "good that is obtained by coercion is no longer good," there are no other means but free association, co-operation, and profit-sharing.

This shows that the doctrines which Secrétan held were very close to those of the Christian Socialists (see CHRISTIAN SOCIALISM), who, half a century since, had so large a share in the co-operative movement in England, and of those who at the present time advocate the nationalisation of the land. Secrétan, however, gave this theory a more original and a more solid character by basing it on solidarity and by showing that solidarity is the real basis of Christianity. Even allowing for the apologetic character of this doctrine, it has none the less exercised a considerable influence over the younger school of economists who take solidarity for their motto (see SOLIDARITY). C. C.

SECURITIES. As ordinarily understood, securities are the written or printed documents which secure to a holder his right to any property. They may include certificates of consols, or any other government or municipal stock; exchequer bonds or bills, foreign government bonds or scrip; railway shares or bonds; and debentures or share certificates of any other companies. As against advances the securities held may also include deeds of freehold or leasehold property, mortgages, dock warrants, bills of lading, or any other

document of title, and bills of exchange. In legal language the term "security" must always have reference to a loan. Thus a trustee who is authorised to invest in real securities is entitled to take mortgages but must not purchase land.

R. W. B.

SEGNI, GIOVAN BATTISTA (17th century). Was a canon at Bologna. In his treatise on famines, Segni upholds in the most absolute form the *annonario* system of dealing with the food supply, which at the beginning of the 17th century constituted a complete system of political economy. This system, which originated in the desire to provide an abundance of corn, in reality only injured the internal production of the country and absolutely hindered trade.

In his book, written in the form of a dialogue, Segni gives a terrible description of the famine that devastated a great part of Italy in 1602; he attributes this famine principally to the manner in which the corn trade was conducted, this he vehemently attacked. In reality, if the corn merchants did not cause the famine, they often took advantage of the scanty means of transport in those days, and monopolised the corn trade. Segni explains the arrangements adopted at that date by governments to prevent famines, and suggests highly restrictive measures. He would altogether stop trade in the means of subsistence; he would have the bakers buy corn direct from the producers at fixed prices, and would entirely prohibit the export and monopoly of articles of food, and even demands that foreigners who consumed the corn which should serve to feed the inhabitants be expelled from the cities, as was done by the grand-duke of Tuscany in 1590.

Segni's works are inspired partly by principles of ecclesiastical and moral law, partly by the conditions of the times; he invokes energetic action on the part of the state in favour of the poorer classes; asserting that, in times of famine, rulers should compel the rich to distribute their superabundance among the poor. His book is *Trattato sopra la carestia e fame, sue cause, accidenti, provvisioni, reggimenti*, Bologna, 1602.

U. R.

SEIGNORAGE. Royal revenue obtained by means of charges imposed for coinage.

The word seignorage, also spelt seigneurage, seigneurage, and seigniorage, is of Norman-French origin. Under the feudal system the right of coinage was an exclusive privilege of the king or seigneur. This personage not unnaturally took the opportunity of exacting a fee when the mint was employed in the coinage of metal belonging to his subjects. The money thus raised was retained by the king for his own use, and it was to this portion of the royal income that the title seignorage was applied.

The seignorage charge varied considerably from time to time, being apparently governed not so much by the exigencies of trade, as by the sovereign's wants, avarice, or caprice. A high charge for coinage, however, deterred merchants from sending bullion to the mint, but this difficulty was often surmounted by the issue of a proclamation calling in for recoinage the coins already in circulation, thus necessitating a new issue. Such recoinages caused much inconvenience, and in some instances the king was induced to adopt an alternative method of increasing his revenues, namely, the imposition of a triennial tax called *moneyage*, on the understanding that frequent and unnecessary recoinages should not be insisted upon. Moneyage does not appear to have been exacted in England before the time of William the Conqueror, and it was abolished as early as the reign of Henry I.

The total amount paid by merchants for the privilege of having their bullion converted into coin, was the sum of two charges, one of which went to the king, and the other to the officers of the mint. The first was the *seignorage*, the second the *BRASSAGE*, but as this latter term has never been generally used in England, it seems preferable to refer to it under the head of *mint-charge* (see MINT) or charge for coinage.

These two charges were fixed at a sum per pound calculated on the gross weight of coin produced from the bullion sent in, and their amount was collected by a deduction from the coin delivered to the merchant. Thus we find that in the reign of Edward III. (1345) the deduction made at the mint from gold coins delivered to the public was at the rate of £1 : 3 : 6 per lb., of which £1 went to the king as his seignorage, and 3s. 6d. to the mint to defray the cost of coinage. In the same year the charge for coining silver was fixed at 1s. 3d. per lb., of which 9d. went to the officers of the mint, and 6d. to the exchequer.

The total sum collected in charges at the mint is frequently referred to as the seignorage, and this use of the word can be upheld on the ground that both charges were fixed under the authority of the king, either by act of parliament or mint indenture, and that the subsequent division of the money between the sovereign and the officers of his mint is a matter of but slight importance. On the other hand it seems more correct to restrict the use of the word seignorage to that portion of the revenue derived from coinage which actually formed a part of the king's income. The latter view is supported by the following quotation from a statute of the ninth year of Henry V. c. 2, in which the charges collected at the mint are expressly stated as covering both the coinage and seignorage charges. This act directed that persons bringing worn coin to the mint "should within eight days receive the full value of what they brought, paying for the seignorage and coinage of gold after the rate of 5s. for the pound of the

Tower, and for the seignorage and coinage of silver fifteen pence for the pound and no more."

The revenue directly raised by the seignorage charge was at various times supplemented by one or both of the following means: (a) the use of the Tower pound; and (b) advantage taken of the Remedy, or Shere, allowance to issue coins uniformly short of their full legal weight (see REMEDY).

The Tower pound was equal in weight to 11 oz. 5 dwt. troy, so that 16 lbs. Tower=15 lbs. troy. Metal sent to the mint for coinage was received by troy weight, but given out to the coiners by Tower weight. The legal number of pieces per pound was then coined from this diminished weight of metal. The king thus added to his revenue a sum equal to the value of one-sixteenth of all the metal brought to the mint for coinage, while he derived the same amount from the seignorage charge as if the coin had been weighed and delivered by troy weight, this charge being based upon the number of *Tower* pounds of coin produced. The use of the Tower pound in the mint was abolished in 1527 by a proclamation of Henry VIII.

The various rates of seignorage from the year 1345 onwards are given by Ruding, in his *Annals of the Coinage*, and the maximum and minimum charges imposed by each sovereign, which are set forth in the annexed table, have been taken from that record:—

Charles II.	..	Free coinage introduced.			..

Seignorage and coinage charges on both gold and silver were abolished by the act of 18 Charles II. c. 5, and all further possibility of profit from coinage operations seemed to be at an end. On this point Ruding writes: "We know that the coinage act which was originally passed in the eighteenth year of Charles II., and was made perpetual by the 25th chapter of a statute in the ninth year of George III., has deprived the state

"	..	Free coinage introduced.			..

of all possibility of profit from the mint, while on the other hand we possess from undoubted authority accounts of the expenses of working the same, commencing from the beginning of the year 1777."

From 1666 to the present time (1898), the coinage of gold in England has been undertaken by the state free of charge (see FREE COINAGE), an importer of bullion to the mint receiving gold coin of precisely the same value as that of the metal sent in. Not only, therefore, has seignorage on the gold coinage ceased to exist, but all expenses of the manufacture of these coins have been borne by the state for the last 230 years; while since 1891, the whole cost of the loss due to the wear and tear of gold coin in circulation has also been defrayed by the government [see LIGHT GOLD AND SILVER COIN, WITHDRAWAL OF.]

Gold was adopted as the standard of value, and gold coins became the "only legal tender" to an unlimited extent, by the act of 1816 (56 Geo. III. c. 68). Section 9 of this act, however, also granted power to the king to issue a proclamation appointing a day after which silver coin and bullion might be brought to the mint to be coined at the rate of 66s. per lb. troy of standard silver, of which 62s. were to be returned to the importer of the bullion, and 4s. retained by the mint. Section 10 enacted that sums of money arising from this allowance of 4s. per lb. "shall in the first place be applied in and towards the payment of the expenses of the coining of such silver, and the surplus thereof (if any) after the payment of such expenses shall be carried to and made part of the consolidated fund." Thus, after a lapse of 150 years, statutory provision was made by which, in given circumstances, seignorage on the silver coinage might have accrued. The proclamation, however,

upon which this revival of seignorage would have been based was never made, and no coinage of silver on behalf of private persons has been undertaken since the adoption of the single gold standard. That change in the currency system of the country necessarily relegated coins of any metal other than gold to the position of tokens, though the inclusion in the act of 1816 of the above provision for the coinage of silver seems to indicate that this fact was but imperfectly realised at the time. Now, however, owing to the great fall in the price of silver, no further demonstration of the subsidiary function performed by the silver currency is needed than the mere fact that the metal contained in the coins is of less than half the value at which they circulate, and that this is so not only without loss to individual holders of the coins, but with great gain to the national exchequer.

Profit derived from the difference between the nominal and currency values of token coins is dependent in amount upon the market price of the materials of which the pieces are composed, and is not a seignorage resulting from any royal charge for coinage. It seems open to question, therefore, whether the use of the word seignorage can be justified in connection with any revenue obtained from coinage since 1666. Nevertheless, the title has been generally applied to the profit on the token silver coinage, and has for many years been used in this sense in official documents. It is interesting, however, to notice that at the same time the gain to the state on the coinage of bronze, accruing in a precisely similar manner to that on the silver coinage, has never been referred to as anything other than "profit."

On the 25th August 1895, a statement was made in the House of Commons by the parliamentary secretary of the treasury, to the effect that "perhaps it" [the use of the word seignorage] "is not wholly justifiable for a token coinage." Since that date the word profit has appeared in mint reports in many places where seignorage was formerly used, and it now seems likely that the profit on the modern token silver currency will no longer be referred to as seignorage. In view, however, of the long period during which this use of the word has prevailed, a table is here appended showing the amount of revenue derived from the issue of token silver coins since the year 1861:—

SEIGNORAGE (PROFIT) ON THE COINAGE OF  
TOKEN SILVER, 1861-1905.

Period.	Profit on the coinage of silver.			Average price per ounce of standard silver.
	Total.	Annual average.	Rate of profit per cent.

F. E. A.

**SEIGN PRIVÉ.** Written documents, embodying contracts or promises in countries governed by French law, are divisible into two classes, being respectively called *actes authentiques*, and *actes sous seign privé*. An *acte authentique* must be executed before a public notary, whilst an *acte sous seign privé* is binding if signed by the party or parties liable under the contract or promise without any further formality. Deeds of gift, marriage contracts, and mortgages are invalid unless they are evidenced by an *acte authentique*, but mercantile contracts may be validly made by *acte sous seign privé*, and in many cases even by word of mouth.

[Code Civil, §§ 1317-1321, 1322-1332, 1834; Code de Comm. § 109.] T. L.

**SEISIN.** The possession of a freehold estate in land, *i.e.* of a fee simple, of a fee tail, or of a life estate. The doctrine of seisin and the principles connected with it enter deeply into the law of real property in England.

[Challis on *Real Property*, London, 1892.—Maitland, "The Beatitude of Seisin," *Law Quarterly Review*, vol. iv. pp. 24 §§, 286 §§.] J. E. C. M.

**SELF-INTEREST.** The importance which economic writers have attached to self-interest as a source of economic activity has changed from time to time.

T. MUN recognised it in the well-known passage in which he distinguishes between "the gain of the kingdom, and the profit of the merchant," and suggests a possible antagonism between these and the treasure of the king. (*England's Treasure by Foreign Trade*, London, 1664, ch. iii.).

Defoe (*Mercator*, No. 27, London, 1713) states clearly that "Gain is the Design of Merchandise: Trade is a Commutation of Merchantable Commodities between one Country and another, and for the mutual Profit of the Traders. The Language of Nations one to another is, *I let thee gain by me that I may gain by thee.*"

This very definite recognition of the power of self-interest was not confined to English writers. TURGOT, writing of GOURNAY in 1759, said "Tout ce prétendu système était appuyé sur cette maxime, qu'en général tout homme connaît mieux son propre intérêt, qu'un autre homme, à qui cet intérêt est entièrement indifférent" (Turgot, *Œuvres*, Paris, 1844, 2 vols. p. 270), and Turgot himself said "La morale et la politique dépendent de l'amour de soi, réglé par la justice" (Neymarck, *Turgot et ses doctrines*, Paris, 1885, vol. 2, p. 28).

There has been much controversy as to how

far ADAM SMITH based his *Wealth of Nations* on this doctrine. He attributes great importance to a love of barter, innate in mankind, but proceeds immediately to point out that the barter can only be affected by an appeal to either affection or self-interest, and maintains that the latter is probably the more effective; "He will be more likely to prevail if he can interest their self-love in his favour and show that it is for their own advantage to do for him what he requires of them" (*The Wealth of Nations*, 1776, bk. i. ch. ii.). In another place he wrote, ten years earlier, "Regard to our own private happiness, and interest too, appear upon many occasions very laudable principles of action; attention and application of thought are generally supposed to be cultivated from self-interest motives" (*Theory of Moral Sentiments*, 1766, p. 336). An excellent summary of the discussion on Adam Smith's dependence on the doctrine is given by Prof. Hasbach in his article on Adam Smith, *Political Science Quarterly*, December 1897.

WHATELY bases the theory elaborated in his lectures at Oxford in the year 1833 entirely on the foundation of self-interest. Quoting Archbishop Sumner, he says: "The first, who having enclosed a plot of ground, has taken upon himself to assert, *This is mine*, and has remained undisturbed in possession of it, gives a new aspect to society" (*Lectures on Political Economy*, London, 1855, lecture vi.). This supreme belief in the universality of the doctrine was eminently characteristic of the economists of that time; every one appears to have accepted it as unquestionable in spite of the criticisms of CARLYLE. His essay in the *Edinburgh Review* in 1829 was an attempt to shake the universal faith, a severe criticism of the prevalent belief.

J. S. MILL began with a more or less complete acceptance of the universality of the doctrine, but under various influences he gave it up gradually in later life. It is noteworthy that in his *Principles* he attempts to argue the case for LAISSEZ-FAIRE, based on "the popular dictum that people understand their own business and their own interests better, and care for them more than the government does, or can be expected to do." However, in a later portion of his work he practically abandons the position and admits large provinces of social life which may advisedly be regulated by government. Professor Edgeworth's article on J. S. MILL (vol. ii. p. 756) may well be consulted.

Since Mill's time the doctrine has developed in two directions. The altruistic school (see ALTRUISM) appear to attach more weight to the pleasure derived from observing enjoyment in others than to that derived from individual enjoyment. The hedonistic school (see HEDONISM) attempt to establish a calculus of pleasure to the individual. At present no satisfactory

means has been suggested whereby the gulf between the individual and the community may be bridged (see Edgeworth, *Mathematical Psychics*, 1882).

It should be observed that it is one thing to take self-interest as the principle on which society is founded, and work this out as some economists have done; another to assert that society is actually composed of people who live for self-interest and nothing else. The hypothetical character of the principle was quite clearly seen by some economists, though not by others. Popularly it was supposed that economists meant it as actual. Had they made their meaning clear, "they would have escaped many grievous misrepresentations. The splendid teachings of Carlyle and Ruskin as to the right aims of human endeavour and the right uses of wealth, would not then have been marred by bitter attacks on economics, based on the mistaken belief that that science had no concern with any motive except the selfish desire for wealth, or even that it inculcated a policy of sordid selfishness" (Prof. Marshall, *Prin. of Ec.*, 2nd ed. 1891, p. 76).

[During the last quarter century many writers, JEVONS, CAIRNES, F. A. WALKER, Sidgwick, Marshall, and others have criticised the doctrine and contributed to its elucidation. These contributions will be found summarised in Walker's *Political Economy*, § 16, London, 1887; and, for influence of Hegel, Bonar, *Philos. and Pol. Econ.* ch. iv.]

J. M'K.

SELKIRK, THOMAS DOUGLAS, FIFTH EARL OF (1771-1820), Baron Daer and Shortleugh in the Scotch peerage, was the seventh and youngest son of the fourth earl, and the intimate friend of Sir Walter Scott.

His unexpected accession to the earldom in 1799 enabled Selkirk to contemplate the realisation of those long-matured plans of colonisation which had resulted from a personal study, in 1792, of the social and economic evils from which the small Highland tenantry were suffering. Undismayed by the lukewarmness of the government, Selkirk secured the island of St. John in the gulf of St. Lawrence (now Prince Edward's Isle) and in the summer of 1803 established there a colony of 800 selected emigrants. He himself visited them more than once. In 1805 he was obliged to defend himself against the calumnious reports as to his colonising motives; and to this end he published his previous conclusions under the title of *Observations on the present state of the Highlands of Scotland, with a view of the causes and probable consequences of Emigration* (London, 1805, 8vo, 2nd ed., Edinburgh, 1806). He ascribed the economic distress and discontent of the cottars, crofters, and tacksmen to the disbanding of the clans after the '45, with the inevitable and consequent dissolution of the ancient feudal tie between the landlord and his free tenant whose war service and partisanship had hitherto been accepted in full quittance of rent.

Side by side with the upbreking of these relations came the change in the agricultural aspect—the substitution of pasture for cornland caused precisely that demand for cattle-grass

which the Highland landlord was well able to supply. Consequently the landlord's choice was limited: either to sharing the poverty of his tacksmen and cottar tenantry or to dispossessing them in favour of the well-to-do graziers who bid for his farms. The eviction of the old tenantry was socially dangerous and economically embarrassing, and it was for the better class of these Highland-bred peasants, indisposed by training to the irksomeness of industry and a town life, that Selkirk sought to find an outlet in emigration. The author (p. 116) quotes Malthus in support of his theory that emigration is no bar to permanent population. Referring to the bill of 1803 for the transport of emigrants, he finds the Highland Society's report of the causes of emigration to be:—(1) over-population; (2) the removal of tenants from farms; (3) the seductive accounts of the advantages to be gained in America. The book closes with an account of the planting and progress of Selkirk's own colony.

In 1806-7 Selkirk was chosen one of the sixteen representative Scotch peers. Among his various parliamentary speeches that of 10th Aug. 1807, *The Defence of the Country*, was immediately published in pamphlet form, second ed. same year. He advocated the encouragement of the volunteer establishment, side by side with a new local militia, in a volume *On the Necessity of a more effectual System of National Defence*, London, 1808, 8vo; republished by Sir J. Wedderburn, London, 1860, 8vo. In 1809 Selkirk wrote and published a *Letter addressed to J. Cartwright, Esq., on the subject of Parliamentary Reform*, 1st and 2nd ed., London, 1809, 8vo; another ed. Manchester, 1816, 12mo.

But Selkirk did not allow political controversies to divert him from his great colonising plans. In 1810, having by his large purchase of stock practically acquired the directorate of the Hudson's Bay Company, he applied for a further grant of land, which he proceeded to colonise. His settlers, however, came into violent contact with the North-West Company's people, and after a territorial warfare of many years, Selkirk himself had to take a body of men to their rescue. The victory cost him dear, and, worn out by troubles and annoyances, he retired to the south of France, where he died. His settlement is now represented by the province of Manitoba, where his name survives in the town and county of Selkirk.

Besides the works mentioned above, Selkirk published *A Sketch of the British Fur Trade in North America, with Observations relative to the north-west Coast of Montreal*, London, 1816, 8vo.

A. L.

SELLA, QUINTINO (1827-1884), was born at Mosso (Biella-Piedmont). A manufacturer like the rest of his family, he was also an eminent geologist, skilled in mineralogy, an orator, a financier, and a statistician. He was a deputy; minister of finance for the kingdom of Italy in 1862, from 1864 to 1865, and again from 1869 to 1873. His work as minister of finance, in most critical times, has left traces which still survive.

A supporter of strict and rigid finance, he was not afraid of facing unpopularity; he converted the tax on grinding corn into a powerful instrument of financial improvement (see MACINATO), and employed the *corso forzoso* as a temporary method, painful but necessary, of avoiding loss in payment of interest on loans raised for useful purposes. Through his efforts the Italian budget was made to balance. Italy owes her post-office savings banks and the increase of professional schools to Sella.

Sella left behind him many scientific works; his numerous parliamentary speeches, collected in five volumes, are of economic and financial importance. *Discorsi parlamentari di Quintino Sella*, raccolti per ordine della camera dei deputati, Rome, 1887-90.

[See Alessandro, Guiccioli Quintino Sella, Rovigo, 1887].

U. R.

SEMPERE Y GUARINOS, JOSÉ (1754-1839), Originally royal attorney in the high court of chancery in Granada, and member of the council of finance, he took an active part in the political events of 1812, and was compelled to leave Spain after the restoration of king Ferdinand VII. He then remained about fifteen years in Bordeaux.

His *Biblioteca Económico-Política* (Madrid, 4 vols., 1804-1821) gives extracts from the most important old Spanish writers on economic subjects from the 15th to the end of the 17th century, besides some contributions of his own on the poor, the Spanish poor laws, etc. A learned economic historian of his country, his best-known works are his *Historia del Lujo y de las Leyes Sumptuarias de España* (History of the Spanish sumptuary laws), Madrid, 1788, and the *Historia de los Vínculos y Mayorazgos* (History of Entails and Majorates), Madrid, 1801. His views on economic reform may be described as those of a liberal, admitting the necessity of reform, but desiring to proceed with caution.

E. Ca.

SEN, a Japanese coin, the hundredth part of a yen (see YEN).

SENAC DE MEILHAN, GABRIEL (1736-1803), *intendant* of several provinces of France in succession, was put at the head of the general commissariat of the army in 1775, but soon lost this high position. During the revolution he retired to Russia, where he received a pension from the Empress Catherine; at her death he settled first in Venice, then in Vienna, where he died.

His book *Considérations sur les richesses et le luxe* (Paris and Amsterdam, 1780 and 1787), was mainly directed against the abbé Terray and NECKER. Brilliantly written, but rather superficial, this work wants depth and precision.

[On Sénac as an official, see Legrand, *Sénac de Meilhan et l'intendance du Hainaut et du Cambrésis sous Louis XVI.*, 1868].

E. Ca.

SENECA, LUCIUS ANNEUS, son of Marcus Annaeus Seneca the rhetorician, born about 4 B.C. He was tutor to Nero, and afterwards one of

his chief advisers. Though he used his position to obtain vast wealth, it is believed that he was a restraining influence over the emperor. New favourites, however, machinated against him, and he retired from Rome; but being suspected of complicity in Piso's conspiracy, he was forced to kill himself in A.D. 65. In addition to ten tragedies, many of his philosophical and moral treatises are extant, as are also a series of letters on varied subjects, from which valuable hints may be gathered as to the rural and urban industries and the economic condition of the Roman empire at a period of extreme luxury. He developed the Tironian shorthand, as to which see the *Notae Tironis et Senecae* in the appendix to Gruter's *Inscriptiones Antiquae*, 1603. A good text of his prose works is supplied by Haase (Teubner, 1872).

R. H.

SENEUIL, JEAN GUSTAVE COURCELLE, (1819-1892), Seneuil being only the additional name taken from his native place in the department of the Dordogne, studied law in Paris and was admitted to the bar in 1835, but returned to his native province in order to manage iron works; at the same time, owing to his friendly relations with the leaders of the republican party under Louis Philippe, he became an active contributor to their newspapers. During the second republic he was for a short time director of the public domains; after Prince Napoleon's *Coup d'Etat*, he went over to South America, where he lectured for several years on economics in Santiago de Chile. He returned to France in 1863, and was made a councillor of state under the third republic.

His *Traité théorique et pratique d'économie politique* in two volumes was first published in 1858; a second edition was issued in 1867. Courcelle is certainly one of the most thoughtful and scientific among French economists, he is put by JEVONS in the class of those "who have not at all attempted mathematical treatment in an express or systematic manner, but who have only incidentally acknowledged its value by introducing symbolic or graphical statements" (Preface to the 2nd ed. of the *Theory of Pol. Econ.*). One of these, for instance, he applies to the law of population (vol. i. p. 120, ed. 1867). Courcelle rejects none of the methods in use, and in another work (*Préparation à l'étude du droit*, p. 365) he declares that the inductive and deductive, analytical and synthetical, historical and experimental methods are all to be used within properly determined and rational limits. The most striking feature of his *Traité* is the rigid division he maintains between theoretic economics or PLUTOLOGY, and applied economy or *ergonomy* (see APPLIED ECONOMICS); to several branches of the latter he devoted special works, the *Traité théorique et pratique des entreprises industrielles, commerciales, et agricoles* (1854), and his *Traité théorique et pratique des Opérations de Banque* (1852), a seventh edition of which has recently been reprinted under the supervision of M. André Liesse (1896). An-

other characteristic feature of the theoretical part of his *Traité d'écon. pol.* is that he studies the *production* of wealth in strict interdependence with its *consumption*, making man rather than wealth the central object of his investigations, although giving an ample space in the second subdivision of vol. i. to its *distribution* or *appropriation*. On the whole, Courcelle belongs to the liberal school; for instance, he is in favour of the unlimited liberty of banks, but he admits practical derogations from his principle, such as public assistance on a local basis, and is against all abrupt passages from the system of authority to the system of liberty.

He always took a lively interest in social and political questions (*Études sur la science sociale*, 1862; *Liberté et socialisme*, 1868; *L'héritage de la Révolution*, 1871; *La société moderne*, 1892); writing from the standpoint of an independent and discriminating adherent of Republican doctrines, he never condescends to curb his own independent judgment before the *idola* of the tribe. He translated into French, Graham Sumner's *Duties of Social Classes*; and with Dussard, J. Stuart Mill's *Principles of Political Economy*. He wrote numerous articles in the old and new *Dictionnaire d'économie politique*, and was for almost half a century an active and untiring contributor to the *Journal des économistes*.

[The best general account of his career will be found in M. Juglar's *Notice sur la vie et les travaux de J. G. Courcelle-Seneuil*, read before the *Académie des sciences morales et politiques*, of which Courcelle had been a member. See also *Journal des économistes*, July 1892, pp. 73-81.]

E. CA.

SENIOR, WILLIAM NASSAU (1790-1864), was called to the bar in 1819. In 1825 he was appointed to the newly-constituted Drummond chair of political economy at the university of Oxford. He was a member of the royal commission of 1832, to whose labours is mainly due the reform of the poor law (see POOR LAW). In 1836 he was made a master in chancery. From 1847 to 1852 he served a second term of office as professor at Oxford. He was also examiner for political economy at the university of London, and presided over the economic section of the British Association at their meeting in Oxford in 1860. Although Senior's economic writings were not large in bulk, their influence has been considerable. He was the first distinctly to formulate the ABSTINENCE (*q.v.*) theory of capital. ADAM SMITH and RICARDO had taught that labour alone creates value; LAUDERDALE had asserted for capital an independent productive power, and MALTHUS had explained profit as a constituent part of the costs of production. Senior recognised that it was impossible to square either the first or the last view with facts, while capital could not be a simple original instrument, inasmuch as it was itself the result of the co-operation of labour, natural agents, and abstinence. Abstinence is defined as "that agent, distinct from labour and the agency of nature, the concurrence of which

is necessary to the existence of capital, and which stands in the same relation to profits as labour does to wages." Senior himself expressly states "mere abstinence can produce nothing." By abstinence he meant such a postponement of immediate gratification as may allow the law of INCREASING RETURNS (*q.v.*) to operate. This law that the power of the instruments which produce wealth may be indefinitely increased by using their products as the means of further production, is stated to be among the four elementary propositions of political economy, which are "the result of observation or consciousness." It is in the field of actual capitalist production that the explanation must be sought of Senior's views. The exchange value of goods depends partly upon their usefulness, partly on the limitation of their supply. Where monopoly does not come in, the limit of supply is regulated by the sacrifice involved in their production. The costs of production must be divided into the costs of production of the seller, and the costs of production of the purchaser. These latter are "the amount of the labour and abstinence which must be undergone by those to whom a given commodity or service is offered for sale, if, instead of purchasing, they themselves . . . were to produce it" (Senior, *Pol. Econ.* ed. 1854, p. 101). We thus find that the costs of production of the seller are equal to the minimum and those of the buyer to the maximum of price. Abstinence must then always be a constituent part of the costs of production, and the value of goods must be great enough to leave a compensation for this abstinence. (For a statement and criticism of Senior's position, see Böhm-Bawerk, *Capital and Interest*, trans. by W. Smart, 1890, bk. iv. ch. i. and ii.). It would thus seem clear that Senior must be ranked with the "cost of production" school of political economists, and not with the "utility" school (see EXCHANGE, VALUE, HISTORY OF THEORY). Although his general definition of value as depending upon utility and limitation of supply appears to be pointing to the conclusions of the later school (cp. Léon WALRAS's definition of value as the "rare," *i.e.*, what is both useful and limited in quantity. *Éléments d'économie politique*, 1874; and *Théorie de la Monnaie*, 1886) Senior is not included in the bibliography of writers leading the way to Jevons's theories contained in the 1879 ed. of Jevons's *Theory of Political Economy*.

Mention has been already made of the law of increasing returns as stated by Senior. The contrast between the DIMINISHING RETURNS (*q.v.*) of agriculture and the increasing returns of manufacturers had been noticed by previous economists, but it was elaborated by Senior. The theory was in great measure a generalisation from the leading position of England in commerce and industry in the middle of the century. "The only check by which we can predict that the progress of our

manufactures will in time be retarded is the increasing difficulty of importing materials and food." Granted, however, the truth of the view, which modern economists will only admit under serious limitations (see INCREASING RETURNS), the argument it lends to the fostering of home industries is at once apparent. In his *Letters on the Factory Act*, Senior himself had said "the more our rivals produce the cheaper they will be able to produce"; and it may plausibly be maintained that protection to native industries is justifiable to give the law of increasing returns time to come into force (see Prof. Marshall's *Presidential Address at the Economic Section of British Assoc.*, 1890).

On the theory of INTERNATIONAL TRADE (*q.v.*) Senior, in his *Lecture on the Cost of Obtaining Money*, took the first step beyond RICARDO. "The portableness of the precious metals and the universality of the demand for them renders the whole commercial world one country, in which bullion is the money, and the inhabitant of each nation forms a distinct class of labourers" (see C. F. Bastable, *Theory of International Trade*, 1903). On the question of the WAGES FUND (*q.v.*) Senior occupies a half-way position between the view of a fixed wage fund and more modern theories on the subject. It appeared to him almost self-evident that wages depend upon the extent of the fund for the maintenance of labourers compared with the number of labourers to be maintained; but this view does not amount to a statement of the wage-fund theory, because the principal means by which the fund for the maintenance of labourers can be increased is by increasing the productiveness of labour (see E. Cannan, *History of Theories of Production and Distribution*, 1893). Senior was the first English economist who definitely formulated principles of economic method. After recognising in his *Introductory Lecture*, 1826, a practical side to political economy, Senior in his *Outlines* regarded it exclusively as a theoretical, abstract, and deductive science. It is a science not an art, and its conclusions are theorems of fact not precept (see *The Scope and Method of Political Economy*, by J. N. Keynes, 1897). Those conclusions are not hypothetical. So far as they relate to the nature and production of wealth they are universally true, and, although those which relate to distribution are affected by disturbing causes, the natural state of things can be laid down as the general rule, and anomalies can be afterwards accounted for. The more advanced state of society may fairly be called the natural. "A situation of society, if it can be called society, without the intervention of exchanges, neither deserves nor requires scientific investigation." It was this side of Senior which doubtless led Professor Bastable (in his *Presidential Address to the Economic Section, British Assoc.*, 1894) to speak of Senior as the typical representative of the strong and weak points of the

English orthodox school of political economists, "undue insistence on the omnipotence of purely material motives, a somewhat cynical disregard of the moral forces that influence human action in respect to wealth, and a certain love of paradox." But, in fact, at the age of five-and-twenty Senior formed the determination to reform the condition of the poor of England. He expressly states at the beginning of his course *On the rate of Wages* that inasmuch as "the labourers form the mass of every community, the inquiry into the causes affecting wages is the most important branch of political economy," and, in striking contrast with his theory, he everywhere displays a close grip of contemporary fact, and a power of pertinent illustration, which recall the writings of Bagehot. He is found continually quoting the evidence of practical men. His dislike of trades unions and combinations, and the drastic measures with which he proposed to combat them (Webb, *History of Trades Unionism*, 2nd ed., 1896, p. 124), were due not to any *a priori* theory as to wages, but to the actual cases of intimidation which had come under his notice when sent to investigate the facts by Lord Melbourne in 1830. (His report was never published, but the substance of it is embodied in vol. ii. of Senior's *Historical and Philosophical Essays*, 1865) In the same way the curious statement (*Letters on the Factory Act*) that the whole net profit in cotton factories was "derived from the last hour," was founded on an analysis of actual returns, and were in no way the issue of mere theory. Upon the whole it is clear that his views in favour of *laissez-aller, laissez-faire* (see LAISSEZ-FAIRE) were based rather on his experience of the working out of a contrary system in the case of the old poor law, and of the corn laws, than on any doctrinaire or cynical bent in Senior's own method of regarding things. In actual life Senior was a busy lawyer, and man of affairs, to whom economic studies were of necessity more or less of a "parergon." Under the circumstances it is surprising that he should have achieved as much as he did in advancing political economy. Apart from this the merit of his work is found in the practical improvement of the life of the people silently and steadily carried out.

Besides numerous works in the province of politics and belles lettres, Nassau Senior was the author of *An introductory lecture on Political Economy, delivered before the University of Oxford the 6th Dec. 1826*, London, 1827, 8vo.—*Three lectures on the transmission of the Precious Metals and the Mercantile Theory of Wealth, delivered in June 1827*, London, 1828, 8vo.—*Two Lectures on Population, delivered in Easter Term 1828*, to which is added a correspondence between the Author and the Rev. T. R. Malthus, London, 1831, 8vo.—*Three Lectures on the cost of obtaining Money, and of some effects of Private and Government Paper Money, delivered in Trinity Term 1829*,

London, 1830, 8vo.—*Three Lectures on the rate of Wages delivered in Easter Term 1830, with a Preface on the Causes and Remedies of the present Disturbances*, London, 1831, 8vo.—In 1836 there was published in Paris, *Principes fondamentaux de l'économie politique tirés des leçons éditées et inédites de N. W. Senior*, by J. Arrivabene, 8vo. This book contains six of the published lectures, viz. the introductory one, enlarged and modified, the three on the transmission of the precious metals, and the two on population, together with the substance of nine MS. lectures furnished by Senior to the French editor. The whole forms a more methodic work than do the separate English lectures.

In 1836 Senior contributed "An outline of Political Economy" to the *Encyclopædia Metropolitana*, which was republished in 1850, London, 8vo.—*Four introductory Lectures delivered before the University of Oxford*, appeared London, 1852, 8vo.—On the poor law, Senior wrote: *A letter to Lord Howick on a legal provision for the Irish Poor*, 3rd. ed., with a preface *Containing suggestions as to the measures to be adopted in the present emergency*, London, 1832, 8vo.—*Statement of the Provision for the Poor . . . in a considerable portion of America and Europe, being a Preface to the Foreign Communication contained in the Appendix to the Poor Law Report*, London, 1835, 8vo.—*Remarks on the opposition to the Poor Law Amendment Bill*, by a guardian, London, 1841, 8vo.—Senior also published *Letters on the Factory Act as it affects the Cotton Manufacture*, London, 1837, 8vo, and contributed an able summary of the ambiguities in the terms of political economy to Whately's *Logic*, showing the very serious effect on the national welfare which has sometimes resulted from these ambiguities.

[*Annual Register*, 1864, p. 203; see also ref. to Senior in art. on POLITICAL ECONOMY.]

H. E. E.

**SEPARATE ESTATE.** At common law a married woman could not take or enjoy real or personal estate independently of her husband. The courts of equity, however, laid down the doctrine that a wife could hold real and personal estate as if she were unmarried, and such estate came to be called separate estate. The power to hold separate estate may be reserved to a wife by marriage articles, or an actual settlement made before marriage, and may be conferred by a will. All that is required is the use of words indicating a desire that the wife shall have the property for her own use and benefit. Gifts made by a stranger, and profits made in trade, where such trade is carried on apart from the husband, will be regarded as separate estate. A wife could dispose of her separate estate, but in the case of fee simple or fee tail estates she required the concurrence of the persons in whom the legal estate was vested, in order to convey the legal as well as the equitable estate. The deed or settlement giving the separate estate might contain a clause prohibiting a married woman from alienating

the *corpus* of the property whilst the marriage lasted.

In 1870 an act was passed to empower married women to hold and dispose of certain kinds of separate estate. By subsequent acts the principle was extended, and now, by the Married Women's Property Act 1882, a married woman holds all real and personal property accruing to her as if she were a *feme sole*, free from the legal control of her husband.

[J. R. Griffiths, *The Married Women's Property Acts*, London, 1891.] J. E. C. M.

**SEQUESTRATION.** The method of enforcing execution against a beneficed clergyman. *Bona ecclesiastica* cannot be touched by a lay hand, but a writ can be issued to the bishop of the diocese, ordering him to enter into the benefice and hold the same; the judgment is satisfied out of the profits. The bishop sends out a sequestration of the profits, directing the churchwardens to collect the profits and satisfy the judgment.

[Stephen's *Commentaries on the Laws of England*, vol. iii., London, 1890.] J. E. C. M.

**SEQUIN** (or **ZECCHINO**). A gold coin circulating in Italian countries before the formation of the modern kingdom of Italy.

Zecchino of Venice,	3.49 grammes,	993/1000 fine.
„ Milan,	3.46 „	990/1000 „
„ Genoa,	3.46 „	995/1000 „

R. E. A.

**SERF** (**SERFDOM**). This term is often treated as the equivalent of *slave* (see **SERVUS**), whereas it should only be applied to a peasant who renders obligatory personal service in return for the land on which he is bound to dwell. The English villein (see **VILLANUS**) is typical of the partly unfree class in western Europe, for the French *vilain* paid a fixed rent in produce, gave a fixed amount of labour, and had a better position before the law.

Serfdom, unknown in Normandy after the 11th century, gave way early in northern France. The main emancipation had been effected by the beginning of the 14th century; but the peasants still had feudal rents and payments to make, chiefly in produce, and performed **FORCED LABOUR** (*g.r.*) (see also **CORVÉE**) on the roads. From these duties they were not freed until August 1789. The German serfs had in some parts obtained their liberty towards the end of the 13th century, in others they remained unfree until the present century. M. de TOCQUEVILLE, *France before the Revolution*, ii. c. i., states that in no part of Germany, at the close of the 18th century, was serfdom quite abolished, and in the greater part of the country the people were still *ascripti glebæ*. The end certainly came late; in Baden not till 1783, in Prussia not effectually until 1809. In Saxony serfdom lingered up to 1832, and in one other principality till 1833. Austria had completed the abolition in 1811. In Denmark, where there had been, as in the Scottish cases of 1799, a lapse from early freedom, it ended in 1804.

Serfdom had quite disappeared from Italy by the beginning of the 15th century. In Spain, in Castile, under Alphonso XI. (1312-50), the serf was irremovable so long as he paid fixed dues, and his holding became hereditary. In Russia the history of serfdom is one of the gradual lapse of slaves, free peasants, and small farmers into one class of serfs, from whom the Tsar Boris Godunóv (1598-1605) took away the right of migration. Once tied to the soil, they gradually lost their rights, and the power of their owners to sell them apart from the land became recognised late in the 17th century. The poll-tax, imposed by Peter the Great, led to proprietors being made responsible for their serfs, who, if not attached to a commune or a lord, were treated as vagrants. A peasant war broke out in the early days of Catherine II., but it failed. A reaction, however, began under Paul I. (1796-1801), who tried to limit the peasants' work to three days in the week, but it was not until after the Crimean war that effective measures were taken. These ended in the final abolition of serfage on 3rd March 1861. The dues of the Russian serf were, as usual, labour, money, and farm produce, and he was, in some cases, the victim of cruelty and oppression; but Mr. Wallace remarks that a serf might often die at a ripe age without ever having been conscious that serfage was a burden. The same writer observes that a serf's natural defences were passive resistance, flight, arson, and murder. War seldom availed him much. The revolt of the Spartan Helots in B.C. 464, and the slave wars of republican Rome, had their milder counterparts in England in 1381 and 1450; but the latter appear insignificant beside the peasants' revolts in Germany in the 15th and 16th centuries. These were fearfully sanguinary, and so far from improving the condition of the serfs, greatly delayed their emancipation.

Mr. Seeböhm observes that the discovery of silver in the New World did not benefit the French or German serf. The produce in which the Frenchman paid his dues increased in value just as his land did, and the German had to work just as much in each week as before; but the English peasant, who had commuted his services and paid 4d. in 1500, still paid 4d. in the year 1600, so that his rent had fallen to  $\frac{1}{4}$ th or  $\frac{1}{3}$ th of the burden it had formerly been.

[The literature of the subject is enormous, being unduly mixed up with that of **SLAVERY**; and the list of authors appended to the article "Slavery" in the *Encyclopædia Britannica* (9th ed.) will be found valuable. Three articles by Canon Brownlow on the "Abolition of Serfdom in Europe" in the *Month* for 1891 (vol. lxxi. p. 239 and p. 537; and vol. lxxii. p. 73) give a slight but useful sketch of the subject, and cite recent authors. F. Seeböhm, *The Era of the Protestant Revolution*, 1874, gives a masterly account of the peasants' wars, and of serfdom in France, Germany, and England, giving due prominence to the economic side of the question. Sir D. Mackenzie Wallace, *Russia*, 2nd ed., 1877, is invaluable for eastern Europe.] R. H.

**SERJEANTY, PETIT** (*parvum servitium regis*) is a rare kind of free socage or freehold tenure (see **SOCAGE**), in which the tenant holds his land of the king, "yielding" therefor a

bow, sword, or "other small thing belonging to war." The "yield" is annual, fixed, and, like rent, non-personal. Other incidents, if any, of this tenure were taken away by 12 Car. II. c. 24. The Dukes of Marlborough and Wellington have, since their creation, held lands in *petit serjeanty*, the annual "yield" being a flag.

[Co. Littl. 108 a. b.] J. D. R.

SERRA, ANTONIO (17th century), was born at Cosenza; nothing is known as to his life except that he wrote his treatise on the abundance of money in the prison of the Vicaria at Naples, where he was imprisoned on a charge of coining. This treatise, unnoticed by his contemporaries, had no influence on the condition of the kingdom of Naples, where the contrary opinions of his adversaries prevailed, but was at a later date highly appreciated by economists, and its importance is such as to place Serra in the foremost ranks among the economists of his day. The importance of Serra's work was exaggerated and misunderstood by many who believed that he studied the theory of international trade, whereas he was only considering the actual balance of reciprocal international engagements. Some considered him a free-trader because he advocated free trade in money, without observing that he in no way deduced this doctrine from the consideration of international trade; others, again, accused him of mercantilism, but, though he over-estimated the value of money, he did not go so far as to confound it with actual wealth.

Serra, whose attention was occupied by the great scarcity of specie which was then the source of much distress to the kingdom of Naples, studied this feature as a monetary phenomenon independent of its economic significance. He combated the opinion of DE SANCY that the high rate of exchange caused a scarcity of money, forming a theory of his own on payments between one country and another. He perceived that the rate of exchange is merely the sign of debt contracted outside the country, and was thus induced to examine into the true causes which induced money to flow into a country. Excluding the indigenous production of minerals, the kingdom of Naples produced no precious metals. These causes have their basis in international trade, in those transactions which render one country the creditor of other countries.

Serra describes these conditions—the superabundance of the produce of the land for exportation; the quantity of manufactured goods which can also be exported; the enterprising character of the population, which does not content itself with carrying on industries at home, but establishes and carries them on abroad, bringing home the profits; and, lastly, the profit to be made by a country acting as an intermediary in trade between other countries. Serra, however, stops short here; and being unacquainted with the theory of international

trade, he confines himself to the more limited question of payments.

Serra's ideas on the value of money deserve notice; they are based on the conception that the value of each coin is connected directly with the amount of pure metal it contains, and depends on the conditions of the market and not on legal regulation. But he ignores the quantity theory of money, though he admits that an abundance of the precious metals is an absolute benefit to a country. Serra advocates permission for free export of money, but he cannot be called a free trader in the present acceptance of the word. He holds that the export of money becomes necessary if debts abroad exceed the credits; and that as long as this state of matters lasted it was useless and injurious to prohibit the export of money. On the other hand, he maintains that the government is entitled to interfere and to influence the exchanges in order to stimulate the export of national products, and thus to cause the balance of international credit to be favourable, especially by protecting and encouraging the development of national industries.

Serra's writings contain powerful and minute criticism on every subject he discusses; he supplies proofs of several elementary truths, though he neither originated nor perfected any distinct economic theory.

## SERVICES.

Material and Personal, p. 381; Predial and Military, p. 383.

**MATERIAL AND PERSONAL.** A service is an action performed by a person or body of persons for the benefit of another person or body of persons. The giver of the service is generally not the same as the receiver of the service. In exceptional cases, however, the giver and receiver are identical; e.g. a professional vocalist may sing for his own entertainment, a consulting physician may treat his own case, or a man may mend his own clothes. We exclude from the scope of the term *economic service* such personal relations as affection, admiration, and confidence, because a man cannot choose at will to render such services to one person rather than to another, and moreover his dispositions and sentiments towards one person do not neces-

sarily interfere with similar dispositions and sentiments towards another. An economic service can be more exactly defined as a beneficial action which can be rendered according to choice for the benefit either of one person or of another, and can therefore enter into any mutual agreement between man and man. In this sense, all economic services may be said to be *transferable*. Owing to their transferability, services may come to have an *EXCHANGE VALUE*. Economic science is mainly concerned with those services only which, being transferable, have also an exchange value. Such a service must be looked at from two points of view, viz. what it means for the giver and what it means for the receiver. To the giver of the service, the action is a *DISCOMMODITY* (negative wealth); to the receiver of the service, the action is a *COMMODITY* (positive wealth). We need not, however, assume that the discommodity in the one case and the commodity in the other case are measured by the disutility and utility respectively involved in the action. The terms discommodity and commodity are to be measured objectively by their exchange value. The correlated disutility and utility are measured subjectively. In fact, the total effect on the performer may be positively pleasurable, and perhaps the total effect on the receiver may be positively painful.

It is obvious that services must be included in any enumeration of the things on which the income of an individual or community may be spent. A considerable portion of a man's income may be spent on such services as *advice*, *entertainment*, *instruction*, etc. We must, however, distinguish the *ability* to perform a service from the actual performance; as well as the *benefit* derived or expected to be derived from the service from the actual receipt of the service. For the ability to perform a service comes under the head of personal capital possessed by the giver; and in many cases the benefit conferred on the receiver is also a purely personal non-transferable good.

On the side of the receiver we may distinguish between material services and personal services. A material service is one which provides a utility embodied in matter; such as the service of cleaning or repairing articles, of conveying goods from place to place, of working up raw materials in the processes of manufacture, etc. Material services cover practically the same ground as labour, including most forms of domestic labour, as understood in economics. The immediate effect of an employé's work is to confer a service upon his employer; and this service is manifested in the increased value of the employer's material goods. It is for this increased value that wages are paid. Two kinds of service may be here distinguished—a *production-service* and a

*consumption-service*; the former adds to the value of the employer's production-goods, the latter to that of the employer's consumption-goods. Compare the employment of *factory hands* with that of *gardeners* in a private family. So far we have considered material services. A personal service is one which provides a utility embodied in a person, such as the service of advice or instruction. For instance, medical advice may be expected to restore the patient's health, professional instruction may be expected to increase the pupil's knowledge. But here it must be noted that the pupil or patient does not *purchase* knowledge or health; these are non-transferable personal utilities. He purchases merely the services of instruction or advice, which have been called transferable goods. One important case of rendering a service is that involved in handing over the *goodwill* of a business or professional practice. Strictly speaking, the goodwill cannot be bought; for it is a personal non-transferable possession analogous to reputation or knowledge. What is bought is the service of introduction and possible diminution of interference from competition, etc.; and what secures a price for this service is the expectation that the "custom" of the business or practice will be maintained under new hands (see *GOODWILL*).

Turning from the receiver to the giver of a service, we have already observed that the power to perform a service is a species of personal wealth or personal capital, which is non-transferable. The personal possession is a durable good, which may be either a production-good or a consumption-good. So far as the ability is used for the direct enjoyment of the owner, it is a consumption-good. So far as it is used for other ends beyond direct enjoyment, it is a production-good. In the latter case, the work comes under the head of economic labour; and we define a production-good as that which is utilised by an expenditure of economic labour. Another distinction must be drawn according as the ability to perform a service is a free gift of nature or the result of previous labour and expense. In the former case, the return for the service is partially of the nature of rent, in the latter of the nature of interest.

The more exact consideration of the distinctions between rent, quasi-rent, interest, and profits will apply to the employment of personal capital just as to the employment of material capital. A fundamental distinction will however remain between wages in its broadest sense on the one hand and interest and rent on the other hand. The earnings of labour will always include, not only a return for natural advantages and past expenses of training or education, but besides this a recompense for the exertion of effort and loss of leisure actually incurred in the work itself (see also *GOODS, CLASSIFICATION OF*).

## SERVICES, PRELIAL AND MILITARY.

Predial, p. 383; Villein, p. 383; Free Tenant, p. 383; Military, p. 384.

1. PRELIAL.—These differ greatly in degree, when they form the return made by a villein to his lord for his holding on a manorial farm, or when they are done by SOCMEN or LIBERE TENENTES. The latter usually worked at the harvest PRECABLE and on a few other days, and then only by deputy; but they were bound to be present with rods and to keep the actual labourers up to their work, and they provided their stipulated number of men.

The villein (see VILLANUS) was bound to WEEK-WORK (*q.v.*) all the year round with few intermissions. Ploughing, harrowing, and hoeing, with the further duty of providing seed in some cases, were one main form of predial service. *Bedripes* (*i.e.* bidden reappings), the reaping and mowing of corn or grass, formed a second variety, but to these were added ploughing and reaping *precariae*. A third principal class of labour consisted of *averagia*, or the carrying of crops from, and manure to, the fields. Beyond these there was miscellaneous farm work such as hedging, ditching, threshing, washing and shearing sheep, thatching, cutting brushwood, and guarding sheep-folds. Most of these, with the *prestations* or offerings of poultry, eggs, sucking-pigs, and the like, were in course of time commuted for money payments. Matters of this kind are recorded with such minute care in manorial extents that this would alone tend to show that lords could in practice only claim a stipulated portion of the time of men who in strict law were absolutely their chattels. The exact nature of these predial services can scarcely be realised without actual examples from the records, and the following compressed translations from the *Ramsey Cartulary* (i. 287, ii. 47) will show the general work exacted from tenants of different classes about A.D. 1340:—

*Free Tenant.* Andrew, son of William the free man, holds a VIRGATE and a half, and for it owes suit of the hundred and county courts as well as of the manorial. He finds two men at the first *precaria*, whom the abbot must feed, and he himself goes among the reapers with his rod and eats with the *servientes*. He pays as much HIDAGE and scutage as belongs to his holding and he pays *Heved Penny*, which excuses him from attending the halimote more than twice a year (i. 369). *Workmen, etc.* William, the carpenter, holds a toft for 32d. and *ben* and *bedripe* (ploughing and reaping *precariae*). John, the shepherd, a toft for 20d. and *ben* and *bedripe*. Gilbert, the reeve, a toft for 2s., and *ben* and *bedripe*. The workmen and manorial officers were at Ramsey allowed the corn from three acres and a similar amount of barley (i. 351). *Villein.* Richard atte Green holds one virgate for which he pays 12d. annually *ad heusyre* (house-hire), and for the aid of sheriff and hundred 43d. At Christmas he brings one fowl

and one bushel of wheat called *benesed*, and one ring of oats for *foddercorne*, and 3d. in Lent as *fissilver* (in lieu of fish), and twenty eggs at Easter. He pays also TALLAGE, hidage, PONTAGE, PANNAGE, MERCHET, HERIOT, fine on marriage of a daughter, and wodehac (fuel money). Once a year he shall find a man to work for a day in the vineyard until sunset, or pay 1d. to the vine-master. From Michaelmas to Whitsuntide he shall alternately work for four days and plough on the fifth in one week, and work on two days and plough on the third in the next week. From Whitsuntide to Michaelmas he shall work for four days and, if necessary, plough on the fifth every week, but will be excused on festivals. If he has to do task-work he will thresh twenty-four sheaves of corn and thirty of barley, beans, or oats, as one day's work. He shall gather in the wood and carry one bundle of brushwood to the farmyard or one bundle of thorn, and if he makes an enclosure with thorns he shall be quit of the day's work if the bundle is large; if it is small he must go back to the wood and get another. He shall enclose by task-work one and a half or two rods (per day) fetching the thorn. On level ground he shall dig a (ditch) of 16 feet long, 5 feet wide at the top and 2 at the bottom, and 2 *spadegrafes* or more in depth. In an old ditch he shall dig 32 feet of the depth of one *spadegrafe*, and shall trim the sides well so as to make the ditch as wide as it was at first, to the satisfaction of the *serviens* or the reeve. He shall gather three bundles of brushwood and trim them and cart them to the farmyard. He shall scatter manure over one acre strip, and shall harrow at sowing-time with the harrow he uses on his own land from morning till sunset without interval. He shall also hoe from morning till evening with a short time for food, also he shall mow from morning till evening with one able-bodied man, who will have food at noon and at once return to the mowing; and at evening he shall have one bundle of grass as much as he can lift on his scythe, but without breaking the scythe or touching the ground, or he will lose the bundle. Also he shall mow half an acre of meadow and shall unite with others for the work of one day, and he and his fellows shall have one measured acre of meadow called Sythaker. In every week of the year, except thirteen days at Christmas, he shall plough one acre strip with as many oxen as he has in the team, and besides that ploughing, at wheat-sowing he shall plough one acre strip for a *lovebone*, which ploughing shall reckon as a day's work. At oat-sowing he shall come to all the ploughing *precariae* as he is ordered, and the abbot shall feed him. At the first autumn *precaria* he shall find four labourers, of whom two shall have three loaves, beer, fresh meat, and one portion of cheese. And if that *precaria* shall be taken, through the forwardness of the season, before 1st August, on the morrow of the *precaria* he shall work with one man as a recompense for the dinner of the preceding *precaria*. If the *precaria* is taken after 1st August he shall find two men for labour in the same way as before. At the second *precaria* he shall provide three men, and two men shall have three loaves as at the first *precaria*, and six

herrings, cheese, and water; and on the morrow he shall find one man for the work allotted to him. And if a third *precaria* is necessary he shall work with one man without food. This shall reckon in place of one day's work. He shall cut the straw or bind it as often as he is told throughout one day as a day's work, having a short time for eating. Jointly with another virgate-holder he shall do cartage for a whole day in autumn with a cart, two men, and two horses, with a short interval for food. This is to reckon as one day's work. And if he does this before 1st August on the morrow he will be quit of work, but on the next day he, with one man, shall do what the bailiff orders. Similarly he and another virgate-holder shall find a cart with two horses and two men to carry hay. They will have one knight's loaf of bread and beer, but the cartages will not reckon (as a day's work). Also he shall gather one *calligata* (perhaps one quarter bushel) of nuts as one day's work. If he does it on a festival he shall do a day's carrying at the abbot's will within or without the county. And he and another virgate-holder shall do a day's carrying within or without the county which shall not reckon as a day's work. Each load will be one ring of corn or six bushels of barley or oats. He shall take one ring of corn to the mill, which a cottar shall safeguard until it is ground to flour, and then Richard shall take it to Ramsey. Also he and another *virgatarius* shall take one load of cheese or bacon and shall have for each load a loaf and ale the day before Good Friday and on Tuesday in Easter week. He shall gather twigs and make from them one screen nine feet long as one day's work, or one partition between the booths at St. Ives for two days' work. As often, too, as he shall watch as a guard over thieves he shall be quit of work on the morrow of that night. If he shall fall sick, for the whole time of his sickness up to the end of a year and a day, he shall be quit of all work except ploughing, and if his illness lasts longer he shall thenceforward do what pertains to his holding. If he dies before his wife, his widow shall give 5s. as a heriot, for which she shall be quit of all work for thirty days. And if he shall die unexpectedly, leaving no will, the abbot shall have SEISIN of his houses and chattels to dispose of at his pleasure, which houses the widow cannot enter or stay in except with the assent of the abbot. On the day on which he ploughs upon the abbot's land he ought not to be distrained by taking the beasts that are that day in his plough-team, but the distraint should be put off till the morrow.

The above is an instance of a rather exacting lord; but there are, of course, variations of all kinds from the specimen here given. The punishments inflicted on manorial tenants who failed in any of these duties may be read *passim* in Prof. Maitland's *Select Pleas in Manorial Courts*.

There are many curious varieties of minor exactions, such as *unlaweneath* and *godlesebene*, which speak of hardness and unreason; for lists of them, accompanied by such interpretations as can be given, see Vinogradoff's *Villainage in England*.

**MILITARY.**—These services, so far as concerns

the higher ranks of the army, are fully discussed under KNIGHT'S SERVICE; but the FYRD which, with the mercenaries, furnished all the infantry in early feudal times, requires a short notice.

The *Assize of Arms* of 1181 (*Benedict*, i. 278) orders the *communa* of free men to supply themselves with a coat of mail, head-piece, and lance. These were of course men-at-arms; but this is only a portion of the matter, for records show that the villein class went to the FYRD with their reeve at their head. But the REEVE was generally a VILLEIN himself, and a better equivalent of the modern non-commissioned officer seems to be suggested by the presence of the *servientes*, in French *serjanz*, who have given us the name now used for the class. The early PIPE ROLLS contain numerous entries respecting knights and *servientes*, which as Mr. Round shows, prove that the former were paid 8d. and the latter 1d. *per diem*. The roll for LI Hen. II. p. 85, has an entry as to wounded men juxtaposed with one as to the payment of *servientes rustici*, who were of course villeins, but no doubt trained for military service. These "sergeants" often existed in large numbers, the abbot of Abingdon alone supplying Henry II. with as many as 100. Jordan Fantosme (fl. 1200-1242) shows them in battle "*les meillurs serjanz k'unkes barun retint*," but gives no clue to their position or duties; and yet these paid sergeants going out with the *villani* to the fyrd could scarcely have dropped altogether the authority which manorial records show they had over the same *villani* in the harvest field. We must not go into more details of the military matters of this period. Gradually the ancient fyrd system was transformed by the assize of arms, and, lasting through other changes, survives in the modern militia.

R. H.

**SERVICIO** (or PEDIDO). An aid or subsidy (see AID, AUXILIUM); granted (*servido*) by the cortes of Castile to the king, who had demanded (*pedido*) it in extraordinary emergencies.

[Piernas Hurtado, *Tratado de la Hacienda Pública*, vol. ii. p. 47 (4th ed., Madrid, 1891), and Canga Arguelles, *Diccionario de la Hacienda* (London, 1826), under the word *Pedido*.] E. C. A.

**SERVITUDE, NATURAL.** Servitudes fall into two classes: (1) those granted by landowners; (2) those created by law. The latter class are sometimes called "natural servitudes." [Goddard on *Easements*, London, 1891.]

J. E. C. M.

**SERVITUDES.** The *servitudes* of the Roman law. These were certain rights over the property—not only upon lands but also upon cattle, furniture, and slaves—of another person which could be enforced by legal remedy. They are usually classified as (1) *personal*, when given to a particular person, such as, *Usus* (q.v.) and *Usufructus*, *opere servorum*, and *opere animalium*; (2) *predial*, when associated with the ownership of something (the *res dominans*) by right of which the servitude was enjoyed over something else (the *res serviens*). This section included (a) *urban servitudes*, such

as *jus tigni immittendi, stillicidii, projiciendi*, and several others; and (b) *rustic*, as for example the *jus cundi*, or right of way on foot or on horseback; and *aque ductus*, the right of passage for water.

[*Institutes of Justinian*, bk. ii. tit. 3-5.—T. E. Holland, *Jurisprudence*, 1893. As to Servitudes in English Law, see EASEMENT.] R. H.

SERVITUS signifies in Roman law (1) slavery, (2) the subjection of a thing, *i.e.* the relation which arises from a thing belonging to the person, being subject to a limited extent to one right of another, such right being either for the benefit of a particular person, a personal servitude, or for the benefit of neighbouring property, a real or predial servitude. The right to a servitude cannot be separated from the person or thing it is intended to benefit, *i.e.* the right itself is inalienable. A servitude is a right available against all the world, which entitles a person either to interfere positively with the property of another, as by walking over his land, or to prevent another from dealing with his property, as he otherwise might have done, as from building his house above a certain height (see SERVITUDES and EASEMENT).

E. A. W.

SERVUS (Roman law). The class of slaves was chiefly recruited by captures in war, prisoners being usually sold after a battle to the slave dealers who followed the Roman armies. Cæsar (*De Bell. Gall.*, iii. 16), mentions that after the war with the Veneti he sold the sea-board people *sub corona*, that is, into slavery. Servile birth, evasions of military service or public taxation, and debt, increased the number. In legal theory the master had complete power, even of life and death, over his slave; but in the early days slaves were, as Plautus shows, kindly treated on the whole. In the times of corruption and debasement, restraining laws had to be passed against killing them, and Antoninus Pius enabled them to obtain some protection from cruelty, yet even in the days of Justinian the slave had acquired no legal rights. He could not, according to strict law, hold property and could not marry. Custom was, however, as usual in direct opposition to strict legal theory. The slave was generally permitted to accumulate earnings, and his *peculium* was often allowed to become the means of procuring his manumission. He was encouraged to learn trades, and the artisans and even teachers and physicians of Rome were often slaves. Indeed, they frequently kept their masters in affluence by their skill. The slave's *contubernium* was, in effect, viewed as marriage; and in sales of property there was a rule of law against separating near kindred. It was not in the power of a private slave to bequeath by will—though even this took place in fact—or to make valid contracts for his own benefit. Any advantage.

from such contracts enured to his master. On the other hand, manumission could be gained by many exceptional methods, such as the revelation of plots, detection of crimes, and military service, as in the Punic wars. The punishment of slaves by whipping and branding was common, while crucifixion was the fate of those condemned to death.

Romans of the wealthiest class, under the emperors, often owned thousands of slaves, and the war of Spartacus testifies to the large numbers of the class at an earlier date. They were employed in large gangs in agricultural work; but many were reserved for domestic duties and the cruel service of the arena. To the Roman villa there was usually attached an *ergastulum*, part of which was an underground prison in which the more dangerous slaves, who worked in chains, were kept at night, while those who were reliable lived in the upper part of the building.

There were, however, two main classes of slaves, public and private. The former were in a far better condition, and were employed as minor public officials. The fact that they could leave half their *peculium* by will marks a real difference in their position.

(*Medieval*.) The story of the English youths in the slave market at Rome in A.D. 578, connects the mediæval with the Roman traffic in human beings. In the laws of Ina (about A.D. 688), the sale of persons whether bond or free, to be taken out of the realm, is forbidden (Wilkins, p. 17); but Domesday Book (i. 26) contains a reference to the trade (Tolls at Lewes, *de homine, viij. d.*), and William of Malmesbury (*Vit. S. Wulfstani*, Wharton, ii. 258) describes its prevalence at Bristol under the Conqueror, mentioning the cruelties and immoralities which accompanied it. Some were sent to Denmark (*W. of Malm.*, i. 245); but they were chiefly exported to Ireland, though the Irish bishops strove to stop the traffic (Gir. Cambr., *Expugn. Hibern.*, i. c. 18).

Bishop Stubbs classifies the slaves of the early Anglo-Saxon times as the *theow* or slave simple, whether *wealth*—that is of British extraction—or the descendants of the slaves of the first colonists; the *esne* or slave who works for hire; and the *wite-theow* reduced to slavery for debt, or self-sold into slavery to avoid starvation. They had no *werigild*, no credibility, no legal rights; but there are traces of a practice which was better than the legal theory, and it was possible for a slave to save up money and buy his freedom.

Domesday Book enumerates 25,156 slaves, nearly one half being in Gloucestershire, Wilts, Dorset, Somerset, Devon, and Cornwall, and very few in the northern half of England. Although the strongly Danish eastern counties contained 3672, the concentration was on the Celtic side of England, and the Danelagh was

comparatively free. There is thus some ground for believing that the ancient Celtic population furnished the bulk of the *servi*. The Hundred Rolls of 1279 contain many entries of *servi*, but though many of these (e.g. ii. 825, where the *servi* hold virgates) are careless designations of *villani*, Vinogradoff points out such expressions as *ut villani*, *ut servi*, *ut libere tenentes* (ii. 690, 691), which are clear, and yet, as these men held small plots of land, they were slaves more in name than reality. In legal theory even a *villanus* was a slave; but in such documents as the *Liber Niger* of Peterborough (circa 1125), or the Ramsay cartulary, i. 281 (1251), there is no trace of a genuine *servus*, and Professor Ashley is probably right in saying that absolute slavery disappeared in less than a century after the Conquest (*Economic Hist.*, i. 18).

[Smith, *Dict. of Greek and Roman Antiq.*—Stubbs, *Constit. Hist.* i.—Cunningham, *Growth of Eng. Industry and Commerce*, i. 81.] R. H.

SESTERTIUS (Latin for  $2\frac{1}{2}$ ). Roman silver coin, first struck 269 B.C., weight 288 to the lb. or 17.5 grains, later 15 grains, original value = the "libral as" of 250 scruples, i.e.  $2\frac{1}{2}$  4 oz. asses of that period. Soon after 269 B.C. it became, and whether silver, or, under the empire, bronze, remained the monetary unit until Diocletian, when the "follis" took its place as coin. 100 sesterces = 25 denarii = 1 aureus. Obverse, female head helmeted and winged, and IIS (=  $2\frac{1}{2}$ ); reverse, Dioscuri on horseback.

[S. M. Stevenson, *Dictionary of Roman Coins*, (1889).] J. D. R.

SET-OFF. The right of set-off is the right of a debtor, from whom the amount of the debt is claimed, to deduct any amount which his creditor owes him. This right is not a common-law right, but was introduced by statute 2 Geo. II., c. 22, § 13, and is now recognised by the rules of the supreme court (order 19, rule 3), and also by the Bankruptcy Act 1883 (§ 38), subject, however, to the reservation that a person, who at the time of giving credit to a person to whom he is indebted, had notice of any act of bankruptcy committed by the latter, forfeits his right of set-off. In such a case the person so giving credit must pay to the trustee in bankruptcy the whole amount owing by him to the person to whom he gave credit, and must prove in the bankruptcy for the amount of the debt owing by the bankrupt to him.

SETTLED LAND ACTS. See ENTAIL, LAW OF; SETTLEMENT.

#### SETTLEMENT.

Settlement (Land), p. 386; Settlement, Poor Law, p. 387.

A settlement is defined in Sweet's *Dictionary of English Law* as "an instrument by which

property, or the enjoyment of property, is limited to several persons in succession." The usual object of a settlement is to provide for the wants of a family. Property can scarcely be turned to the best account by any but an absolute owner; but it may be lost altogether by his folly or misfortune. Its safety is ensured by giving only a restricted interest to each of those individuals whom it is intended to benefit. A settlement may be made by deed, by will, or even by a private act of parliament. In the majority of cases it is made by deed, and on the occasion of a marriage (see MARRIAGE SETTLEMENT).

Settlements differ chiefly as the property settled is personality or realty. Settlements of personal property are comparatively simple. The common law recognises no restricted interests in chattels corresponding to *estates* in lands. In order, therefore, to secure the enjoyment of personality to several parties in succession, it is necessary to create a trust (see TRUST; TRUSTEE). The fund is vested in trustees, who have many of the powers of an owner for preserving and administering it, but who are bound to pay the income arising from it, and eventually to distribute the principal according to the directions contained in the settlement. The conception of a trust was due to the court of chancery, and trusts are still enforced by the chancery division of the high court of justice. Settlements of personal property are comparatively modern; for most of those kinds of personal property which produce a permanent income, such as stocks and shares, were unknown till comparatively recent years.

Settlements of real estate have a longer history. From the earliest time down to a time comparatively recent, land was immeasurably more important than all the other forms of wealth put together. The great majority of civilised men derived their living and their social position from the land which they held. Hence the frequency of restraints on the alienation of land imposed in the interest of the owner's family. Such restraints appear to have existed among the German peoples who invaded the Roman empire. With the development of feudalism (see FEUDALISM) the power of alienation was yet further restricted. Each man's political and military duties were determined principally by his relation to the land. Landed property assumed a public character. The same causes which tended to produce a rigid rule of succession to kingdoms tended to produce a rigid rule of succession to private estates. That estates should be inalienable and indivisible might seem conducive to public order; it certainly prolonged the greatness of families, and assisted the overlord in enforcing his feudal claims. In England the power of making a will of lands disappeared after the

Norman conquest, except in a few places where it was preserved by tenacious custom (see WILL, BEQUEST BY). The Statute of Westminster the second, *De Donis Conditionalibus*, 1285, took away the power of alienating an estate tail (*i.e.* an estate given to a man and the heirs of his body). Thus every entailed estate was placed in perpetual settlement. Much inconvenience ensued, but the statute, instead of being repealed, was evaded. Unable to dispose of the land itself, men disposed, by will or otherwise, of the use or beneficial interest in the land, and the chancellor gave effect to their dispositions. The Statute of Uses (1536) was designed to prevent the creation of such interests, but failed of its object, giving rise to new and unprecedented methods of dealing with land. The courts of common law encouraged the collusive actions known as fines and recoveries, whereby it became possible to bar entails so as to get rid of the restraint on alienation imposed by statute. It was laid down that a tenant in tail could not by any means be deprived of his right to have recourse to these actions. To protect estates from the exercise of the power of alienation thus obtained, settlements of realty were gradually developed. By the middle of the 17th century these settlements had taken the form which they kept for more than two hundred years.

As the common law has always recognised limited "estates" in land, it is not necessary to a settlement of real property that the land should be vested in trustees. Those who are to take the land will have legal and not equitable estates. By means of the application made of the Statute of Uses these legal estates can be made to arise or to shift from one person to another in a way which would have been impossible in the middle ages. The settlement usually gives an estate for life in possession to a particular person followed by estates tail in remainder to his children. A tenant for life had no power of alienation at common law, and a tenant in tail in remainder cannot bar the entail without the concurrence of the tenant for life. When the eldest son of the tenant for life comes of age, the land is usually re-settled, and his interest cut down to a life estate, estates tail in remainder being granted to his children. Thus, by means of settlement and re-settlement, the land is hindered from ever becoming subject to an estate tail in possession which might be barred by the sole will of the tenant in tail. It therefore became inalienable until recent legislation. By means of an intricate legal mechanism a settlement of real estate also provided for the widow and younger children of the tenant for life, and vested in trustees such powers of selling, exchanging, leasing, etc., as were deemed necessary to the proper management of the estate. But\*the main purpose of such settlements, to

make the settled land inalienable, has been entirely defeated by the Settled Land Acts. Under these acts the tenant for life has powers of dealing with the land little inferior to those of a tenant in fee simple, and in particular has a power of alienation which is all but unlimited, and which he cannot by any means bind himself not to employ. The proceeds of the sale of settled land must be invested for the benefit of the persons entitled under the settlement. A settlement of real estate can no longer ensure the indefinite retention of the same land by the same family. It can only ensure the preservation of a fund which may take the form of land or of certain other investments, and must descend as though it were land.

The time during which property, real or personal, could be tied up by the provisions of a settlement is restricted by the rules against perpetuities (see PERPETUITIES), which were gradually worked out by judicial decision. No interest in such property can be created which would not necessarily take effect within a life or lives in being at the time of the settlement or twenty-one years after. In addition to this the statute 39 & 40 Geo. III. c. 98, commonly known as the Thellusson Act, because occasioned by the unreasonable will of a Mr. THELLUSSON (*q.v.*), forbids the accumulation of the income of settled property for any time exceeding the life of the settler and twenty-one years after.

In conclusion it may be said that settlements as the means of making particular objects of property inalienable are likely to disappear altogether. They are not favoured by economists, and they conflict with modern ideas. But settlements as the means of making provision for parties about to marry, and their children, are likely to become more common with the growth and diffusion of wealth.

ENTAIL, LAW OF.] F. C. M.

SETTLEMENT, POOR LAW, means the place liable, or which, where there is irremovability (see below), may again become liable for a person's maintenance, should he become destitute. Settlement is often dated from the act of 1662; but, in fact, the principle had been generally recognised in previous legislation. The earliest English laws enforced the responsibility of the community for its members,—stranger and outlaw were, in the beginning, almost synonymous terms. When, with the industrial revolution of the 15th century, the evils of vagrancy grew to a head, the attempted remedy was the vagrant's removal to his birth-place (12 Rich. II. c. 7 and 8; 19 Hen. VII. c. 12, 1 Ed. VI. c. 3). In the numerous

statutes which culminated with the great act 43 Eliz. c. 2, the burden of relief is always recognised as falling on the parish. A person was considered settled in the parish where he was born, or in which he had dwelt for the last three years (1 Ed. VI. c. 3), or in some cases one (39 Eliz. c. 4). A mass of settlement law had accumulated, and quarter-sessions and assizes were continually occupied with the decision of these cases (Inderwick, *Interregnum*, 1891, 8vo, p. 91). Moreover, the mischief was practical. The administration of the poor law differed widely in different parishes. In many, rates were not levied for thirty or forty years after the passing of the act of Elizabeth (tract quoted by Eden, *State of the Poor*, vol. i. p. 144); and cases were frequent of able-bodied men leaving their homes and wives and children chargeable upon the parish (7 Jas. I. c. 4, § 7). In these circumstances, the settlement act in effect enacted that forty days residence within a new parish conferred a settlement; but that, in the interval, the new comer should be removable to his birthplace. Whatever its intentions, the results of the act were disastrous. If it did not forge the fetters of the labouring poor, it fastened them afresh, when they were dropping off. Under a new name the working classes became once more *ascripti glebæ*. On this one point critics of the poor law were agreed; theorists and practical men were at one. The assailants of the system included Adam SMITH and PRYT. A striking picture of its effects is found in Arthur Young's *The Farmer's Letters to the People of England*, 1767, 8vo, p. 173. "The prodigious restrictions thrown on their settlement tends strongly to prevent an increase of their numbers." Landlord and farmer carried on "an open war against cottages," thus widening the breach between employer and labourer which was sufficiently open before. "Nor is the hardships of removals less: a man is resident in a parish, where by his connection or nature of his business he is much better able to maintain himself than in any other place—this circumstance often is as three to one; he marries, immediately he receives notice to quit . . . and his example hangs in *terrorem* to prevent others from being guilty of the folly of marrying." (See also *Wealth of Nations*, ed. by McCulloch, 1863, pp. 62-65.) In spite, however, of protests, no substantial alteration was made in the law until 1795 (35 Geo. III. c. 101), when it was enacted that persons should only be removable *on becoming actually chargeable*. Henceforth, the main evils of settlement law lay in its complexity and costliness, rather than in its interference with the mobility of labour (see LABOUR, MOBILITY OF); and it will here be sufficient, without endeavouring to trace each step of progress, to give a brief summary of the existing law.

Settlement is obtained (1) *by birth*: *Prima facie*, a person's settlement is his birthplace, and this rule applies to children (Coleridge, J., 14 Queen's Bench, p. 219). (2) *By parentage*: legitimate children follow the settlement of the father, and illegitimate that of the mother (sec. 71 of act of 1834), if such settlements can be shown, sixteen being the age of emancipation for both classes (Lord Watson, 14 Appeal Cases, p. 484, interpreting the obscure 35th sec. of 39 & 40 Vict. c. 61). (3) *By marriage*: The wife follows the husband's settlement, if he have one; otherwise, she retains her maiden settlement. A widow keeps her late husband's until she acquires a new settlement (Common Law and 49 Geo. III. c. 124). (4) *By residence*: Settlement is obtained by three years' residence "without break," but a short absence, where there is *animus revertendi*, does not constitute such break (39 & 40 Vict. c. 61, § 34, and cases decided on § 8 of 28 & 29 Vict. c. 79). By this section, residence for one year "without break" gives irremovability, and the distinction between settlement and irremovability is often overlooked. Wherever settlement by residence takes the place of birth settlement, the effects of irremovability continue only while residence lasts, e.g. A has V for birth settlement; he acquires a settlement in X by three years' residence. He afterwards resides a year in Y, and is, for the time, irremovable. Afterwards, he goes to Z for some months, but returns to Y, and becomes there chargeable, before the expiration of a year from his return. His settlement is X, although, while he was irremovable in Y, that settlement was in abeyance. (5) *By apprenticeship*: Settlement is obtained by indenture or other deed, if the apprentice, in pursuance of the deed, reside forty days in a particular place (3 W. and M. c. 11, § 7). (6) *By estate*: Settlement by estate sprang from the rule that a man could not be removed from a parish where he had an estate of land, coupled with the effect of the act of 1662, giving settlement after forty days' residence. When the estate is by purchase, the consideration must be at least £20 (9 Geo. I. c. 7, § 5). (7) *By payment of parochial taxes*: The tenement must be *bonâ fide* rented for at least £10 a year, for the term of one whole year. The rent must have been paid and the premises actually occupied for at least one year (6 Geo. IV. c. 57, § 2). Settlement even now is limited to the parish, but this has become immaterial since the passing of the Union Chargeability Act 1865 (28 & 29 Vict. c. 79), which substitutes the union for the parish in respect of the poor rate.

The foregoing summary shows that the history of settlement is an admirable example of English methods of legislation. Practical inconvenience has been remedied, while logical symmetry has suffered. Numerous committees

of the House of Commons have recommended the total abolition of removals; a bill embodying this proposal was introduced by the president of the poor-law board more than thirty years ago; there is complete unanimity among all versed in the subject. But parliament has not yet found time to legislate, and the costs and technicalities of removals still go on. Meanwhile, it has been suggested that a partial remedy would be, to make compulsory the provisions of § 12 of 14 & 15 Vict. c. 105, which gives power to boards of guardians to submit disputes as to settlement to the central board.

With respect to the aged poor, the royal commission, 1895, recommended that legislation should be introduced, enacting "that persons over sixty-five years of age shall not, in general, be liable to removal." "The whole law of settlement," they reported, "is in its working exceedingly costly and complicated, and is one of the first questions needing attention in the general arrangement of the poor law. As regards the aged . . . there is a consensus of opinion that, if rigidly applied, it involves considerable hardship."

[The most exhaustive discussion of the history and theory of the question is in the *Report to the Poor-Law Board*, by G. Coope, 355 pp. Parliamentary papers, 1851 (675), vol. xxvi. The appendix contains a detailed examination of the reasons given for the introduction of the act of 1662, and valuable extracts from various authorities on settlement. See also Eden's *State of the Poor*, 3 vols., 1797.—Nicholls' *History of the English Poor Law*, 2 vols., 1854, 8vo.—Cunningham's *Growth of English Industry in Modern Times*, 1892, 8vo, p. 206.—*The Report of the Royal Commission on the Aged Poor*, 1895. The provisions of the existing law will be found in Symonds' *Handbook on the Laws of Settlement and Removal*, 3rd ed., 1891, 8vo; and Archbold's *Poor Law*, 14th ed., 1885, ed. by Glen.

Consult for whole subject Glen's *Poor Law Statutes*, vols. i. and ii. 1873; vol. iii. 1879. An admirable treatment of settlement will be found in Aschrott's *The English Poor Law System*, trans. by Preston Thomas, 1888, 8vo.] H.E.E.

**SETTLING DAY.** On the London stock exchange, bargains, except when expressly stipulated as being for cash, are made for the "settling" or end of the "account"—the "account" being a period of about a fortnight. The transactions of the account are closed in the last three days, *i.e.* for the first half of the month, from about the twelfth to the fifteenth; and for the second half, from about the twenty-fifth onwards. The first day is "contango" day, when arrangements are made for carrying over, or continuing bargains to the next account; the second is "ticket" day, when brokers pass tickets and names for stock and shares they have to receive; and the third day is "settling" day, for payment and delivery of cash and stocks.

**CONSOLS' SETTling DAYS** occur only once in each month, generally during the first week in the month.

**SPECIAL SETTLEMENTS.** In the case of new shares or stocks, bargains are sometimes made for the "coming out," *i.e.* for settlement upon the issue of certificates in the new company, but in the majority of cases bargains are first made for the special settlement, which takes place upon a day appointed by the stock exchange committee.

On foreign stock exchanges the periods of settlement differ. In Paris they take place once a month; in New York there are no fixed settling days. R. W. B.

**SEYD, ERNEST (1833-81)**, was born at Elberfeld in Prussia. At an early age he visited the United States, and subsequently went to Paris, and was present during the revolution of 1848. Returning the next year to Germany, he took an active part in the revolutionary movement which resulted in the congress of Frankfurt-on-Main, and the present German constitution. He was afterwards engaged in banking and exchange business in Paris, San Francisco, and London. On the adoption of the gold standard by Germany in 1873, he protested in the strongest manner against the change to a single gold standard, and foresaw with wonderful prescience the monetary dislocations that have since taken place. In his remarks on this subject E. Seyd's opinion coincided with, while it preceded, that of Prof. Walker, as to the prejudicial effect of the action of Germany on the trade of the world (*Walker, Money, Trade, and Industry*, 1880, p. 191). Ernest Seyd was also asked by the United States congress to report on the American Coinage Bill of 1873 then pending. Seyd's writings on banking, bullion operations, and kindred subjects are well known, and his persistent advocacy of the use of silver as a standard, and his opposition to the policy of demonetisation of that metal, constitute him a leading, if not the principal pioneer of the present "bi-metallic" movement in England.

Ernest Seyd had great influence in the arrangements of the German bank act of 1875. The provisions in §§ 9-10 under which the Reichsbank is allowed to exceed the authorised limit of issue on payment of a tax of 5 per cent on the excess, is believed to be due to his initiative. This plan has many advantages over that of the English bank act of 1844 (see German bank act of 1875. *Journal of Statistical Society*, 1875, also art. on *BANK NOTE*).

His principal works are those in English, all published in London:—*California and its Resources*, 1858.—*Bullion and Foreign Exchanges Theoretically and Practically Considered*, 8vo, 1868.—*The Question of Seigniorage and Charge for Coining*, 8vo, Effingham Wilson, 1868.—*The Depreciation of Labour and Property which would Follow the Demonetisation of Silver*, 8vo, 1869.—

*Letters to the Times.* See the *Gold Coinage Controversy*, reprinted for private circulation by the Bank of England, 1869.—*Enquête sur la Question Monétaire*, published by the French government.—*Die Münz-Währungs und Bankfragen in Deutschland*, 8vo, Bädeler, Elberfeld, 1871.—*Suggestions in Reference to the Metallic Currency of the United States of America*, 1871.—*The London Banking and Bankers' Clearing House System*, 8vo, 1872 (translation in French, E. Guyot, Rue de Pacheco 12, Brussels).—*Reform of the Bank of England Note Issue*, London, 1873.—*The Decline of Prosperity; its Insidious Cause and Obvious Remedy*, 1878.

Ernest Seyd, son of above, is the author of *Bi-metallism in 1886, and the Further Fall in Silver*.—*The Silver Question in 1893*.

**SHAREHOLDERS.** A person who owns one or more shares in a company is called a shareholder in the company. The management of a company, except in very small private companies, is generally entrusted to a board of directors elected by the shareholders, but the latter have certain rights of control, which they exercise at general meetings or otherwise in accordance with the provisions of the articles of association. E. S.

**SHARES.** The capital in limited companies (except in the case of companies limited by guarantee, which in practice are of very small importance) must be subdivided into shares of fixed and equal amounts, which cannot be converted into Stock (*q.v.*) until they are fully paid up. In some foreign countries a minimum amount is fixed for shares so as to prevent small investors from risking their savings in taking shares of speculative companies; thus in Germany the minimum amount of a share as a general rule is 1000 marks (£50). In France the minimum was formerly 100 francs (£4) in the case of companies having a capital of not more than 200,000 francs (£8000), and 500 francs (£20) in the case of larger companies; but since 1893 it has been reduced to £1 in the first-mentioned case and £4 in the last-mentioned case. In the United Kingdom a share may be of any amount from a farthing upwards. E. S.

**SHEFFIELD, JOHN BAKER HOLROYD**, Earl of (1741-1821), the friend and executor of Gibbon, wrote copiously on the poor and corn laws, Ireland, the slave trade, and other economic questions of his day.

He entered the army in 1760, but in peace intervals farmed his extensive lands at Sheffield Place, Sussex. As member for Coventry in 1780, he took a prominent part in the suppression of the Gordon Riots of that year, at the close of which he was created Lord Sheffield in the Irish peerage. As member for Bristol he vehemently opposed the abolition of the slave trade. On this as on the Corn Laws, Lord Sheffield's views were extremely definite, but hopelessly insular and short-sighted. In

advocating free trade with Ireland, and the Union, he proved himself, however, to be more than abreast of his times. He wrote:—

*Observations on the Manufactures, Trade, and Present State of Ireland* (1st ed., 2 pts., also 3rd ed., London, 1785, 8vo; another ed., Dublin, same year). After disproving the aspersions cast on the Irish character and industry, Lord Sheffield proceeds to deprecate all trade jealousies between the sister countries, showing how injurious to both a war of tariffs would be, since England takes the whole manufacture of Irish linens, while Ireland provides a valuable market for British woollens. The increase (p. 12) of the woollen manufacture in Ireland need not alarm British manufacturers; at the same time, the Irish are warned against irritating England by the attempted exclusion of her woollens from Irish markets. The volume closes with a lengthy commentary on the cattle produce, fisheries, and manufactures of Ireland.

Fourteen or fifteen years later, Lord Sheffield is consistently advocating the same economic policy, both in his *Speech of 2nd April 1799, . . . upon the subject of the Union with Ireland* (London, 1799, 8vo), as in his *Observations on the Objections made to the Export of Wool from Great Britain to Ireland* (London, 1800, 8vo). He concludes by re-advocating the Union from the point of view of commercial advantage, remarking that "as an Irishman, he was highly gratified by the liberality of giving the turn of the scale in almost every instance to the weaker country."

*Observations on the Commerce of the American States* (1st, 2nd ed., London, 1783, 8vo; 3rd to 6th ed., London, 1784, 8vo; new ed., Dublin, 1784, 8vo), which ran to six editions the second year of publication. The work is chiefly statistical, being a sort of comparative export and import calendar for the two countries, Britain, including the West Indies, and the American states. It contains fifteen tables; of these tables I. and II. give the amount of the American and West Indian staple commodities imported into or exported from Great Britain during the prosperous year 1773, and the disastrous 1782. III. The total of these exports and imports during a period of ten years, showing their fluctuations in peace and war, and the bad effect of war on commerce. IV. American imports from South Europe, Africa, and the West Indies. V. and VI. Exports from America to all parts. VII. The number and tonnage of the vessels employed by the colonies before the revolt. VIII. The state of the Newfoundland fishery before the war of 1744. IX. Imports and exports of South Britain from and to all parts. X. and XI. The value of all imports and exports of England and Scotland from 1780-1782. XII. The total of the imports and exports of South Britain from 1771-1782. XIII. The total imports and exports of South Britain to and from all North America from 1771-1782. XIV. The total imports and exports of South Britain to and from the United States from 1764-1782. XV. The imports and exports of South Britain to and from the British West Indies for twelve years, 1771-1782.

In his *Observations on the Project for Abolishing the Slave Trade and on the Reasonableness of*

attempting some practicable mode of relieving the *Negroes* (1st ed., 1790, 8vo; 2nd ed., with additions, 1791, London, 8vo), Lord Sheffield considered the disposition professedly of a great part of the community to relieve negroes from slavery "so inconsiderate that it disgraces the national character of good sense."

In 1791 appeared *Observations on the Corn Bill now depending in Parliament*. Lord Sheffield strongly opposed the bill on the ground that nothing could be more dangerous than the dependence of a kingdom such as this on other countries for subsistence. He decries the notion that England is a highly cultivated country, pointing out that not one-fourth of it was worthy of such a description. He advocates a higher and steadier price of corn, to be secured by closing the ports to foreign corn, and bringing more inferior land under tillage instead of using it for pasture; and expresses the curious economic doctrine that a high price of corn is advantageous to our manufactures. He prefers to depend on other countries for clothing than for food. "Why should we give a monopoly of the supply to the manufacturers of wool, and not to the manufacturers or tillers of land?" This pamphlet is written in a protectionist spirit, in the interest of the farmer and landowner rather than in that of the consumer.

Lord Sheffield held the same views to the close of his life. *Letter on the Corn Laws, and on the means of obviating the mischief and distress which are rapidly increasing* (London, 1815, 8vo; 2nd ed., 1815). In this publication he deprecates the application of general principles to the political economy of this country, considering its actual taxation and the price of labour. He would protect the British farmer by an absolute prohibition of import until the price of wheat rises to 80s. the quarter; then a high duty till it is at 90s.; and a lower high duty till it is at 100s.; then open the ports and let it enter duty free.

Lord Sheffield's *Strictures on the necessity of inviolably maintaining the Navigation and Colonial System of Great Britain* (London, 1804, 8vo; new ed., with appendix, 1806, 8vo), point out that the NAVIGATION LAWS had been suspended by recent temporary legislation; and the danger of such a course "because such suspension must render England a free port, of the consequences of which," Lord Sheffield conceives, "neither the legislature nor the country are sufficiently aware" (p. 11). He further shows the violation of the navigation laws to be "injurious to every branch of our marine; discouraging to seamen, and to the ship-building trade; and adverse to the prompt equipment of a great naval force." He comments on the extraordinary decline of British, and the increase of American tonnage (p. 15); and (p. 33) differs totally from the opinion of M. GENTZ, that the navigation laws are "commercially injurious," but "politically wise."

Lord Sheffield's presidential addresses at the wool meetings of Lewes were collected and published in a volume *On the Trade in Wool and Woollens, including an exposition of the Commercial Situation of the British Empire* (London, 1813, 4to). He notices the diminution of export of British manufactures to the American states;

defends the ORDERS IN COUNCIL promulgated in answer to the BERLIN DECREES prohibiting English goods on the continent; and tries to show how little the trade of the country depends on a direct traffic with the American states; the English and colonial markets being, he says, quite sufficient to consume the greater part of our manufactures. He advocates the importation of Spanish sheep for breeding purposes.

*Observations on the impolicy, abuses, and false interpretation of the Poor Laws, and on the Reports of the two Houses of Parliament* (London, 1818, 8vo). In it he strongly condemns the present management of the poor as a disgrace to the policy and political economy of the country. In many parishes the heavy onus of the poor rate has so ruined the small tradesman as to have added to rather than relieved the existing number of paupers. He advocates the abandonment of the whole system, not patching it up; the separation and classification of paupers, the education of pauper children, and their separation from criminal parents. He would further apply to agricultural employment the surplus of the pauper population. In the following year Lord Sheffield published his *Remarks on the Bill of the Last Parliament for the amendment of the Poor Laws, with observations on their impolicy* (London, 1819, 8vo).

A. L.  
SHERBROOKE, VISCOUNT (Robert Lowe), (1811-92), was educated at Winchester and Oxford, taking a first-class in classics and a second-class in mathematics. He was called to the bar, but in 1840 went out to New South Wales. The colony was in its infancy; gold had not been discovered, and only the rudiments of representative government existed. Lowe speedily took part in every public movement in the colony, and after holding for a time a seat in the legislative council he resigned this to become member for Sydney. He interested himself in all social, political, and industrial movements. After playing a conspicuous part in the development of the colony, he returned to England in 1850, and two years later was returned to the House of Commons for Kidderminster.

He quickly made his mark as a debater, and as a sleepless critic of the administrative departments. In a short time he became vice-president of the board of trade—an office which he held for three years—and one of the joint secretaries of the board of control. This part of his official life was not without results bearing upon the trade and economic conditions of the nation. Though we do not owe to him the full adoption of the principle of limited liability, he introduced measures which led up to the act of 1862. Few clearer or more cogent arguments for reform have been presented to parliament than that contained in his speech in 1856, introducing the Partnership and Joint-Stock Companies Bills.

In 1859 Lowe was returned for the borough of Calne by the influence of the Marquis of

Lansdowne; and he represented London University from 1868 until he went to the Upper House in 1880 as Viscount Sherbrooke. During 1859-64 he was vice-president of the education board—and virtual minister for education. In this capacity he made several changes in our educational system. In 1860 he brought forward the revised code, and the system of payment by results, on the merits of which he never ceased to insist, but which is being rapidly obliterated as practically unworkable.

In constitutional matters Lowe inclined towards the school of Canning and Peel. He held the office of chancellor of the exchequer in Gladstone's first liberal ministry. The post, however, was one for which he was ill-fitted, owing to his doctrinaire views. These led him to remove the registration duty on corn, and to express the opinion that a chancellor of the exchequer was one who pays out the public funds, not one who controls the expenditure. It was in 1870, during his tenure of the office, that the Coinage Act of 1816 was annulled. This act contained a clause authorising the crown at any moment, by order in council, to reopen the mint to the public for unlimited coinage of silver, subject to a seigniorage of 4s. an ounce. His decision that the income-tax should be paid in advance, helpful for the finance of the year when instituted, has remained a permanent inconvenience. Yet his first ingenious budget was received with considerable favour in the outset, and his annual surpluses proved to be large, almost beyond example. He exerted himself to keep down the public expenditure, but his brusque treatment of all claimants on the public funds brought him no little unpopularity. This odium was accentuated by his ill-starred proposal for a match tax, an impost excellent in theory, but practically impossible owing to the popular feeling aroused against it. This was somewhat aggravated by the classical dictum, "Ex luce lucellum." He was also the author of an unsuccessful plan for establishing SEIGNIORAGE on the coinage.

To the last Lord Sherbrooke was an active member of the Political Economy Club.

[*Biographies of Lord Sherbrooke*, by Patchett Martin and J. F. Hogan, 1893; *Annual Register*, 1892; *Chambers's Encyclopædia*, vol. ix.; *The Times*, July 28th, 1892.] G. B. S.

**SHERIFF.** In Anglo-Saxon time the sheriff, or shire-reeve, was the royal officer in the shire, and was always appointed by the king. His chief function was to look after the interests of the crown, and especially to collect the proceeds from demesne lands and the royal share in the profits of justice. The Norman Conquest witnessed a great increase of the powers of the sheriff. Hitherto the ealdorman had been the presiding officer in the shiremoot and the leader of the military forces of the shire. This office was now abolished, and its

functions added to those of the sheriff or *vicecomes*. Henceforward the sheriff became the chief military, judicial, and financial officer in the shire. He was responsible for the collection of all taxes, though many of the older dues he was allowed to farm and to pay in a fixed sum twice a year. The office was now of such importance that it was often held by powerful barons, and in the reign of Stephen many sheriffdoms were practically hereditary. The kings now found it necessary to impose limitations on their too powerful servants. The EXCHEQUER was organised to supervise their financial administration, and twice a year, at Easter and Michaelmas, the sheriffs had to appear at Westminster to pay in and to give a strict account of their receipts. In 1170 a great inquest or inquiry was held into the conduct of the sheriffs, and Henry II. seized the opportunity to get rid of the baronial holders of the office, and to fill their places with his own trained servants. During the same reign regular circuits were instituted of itinerant justices, and one of their chief functions was to check and supervise the local administration of the sheriffs. From this time the powers of the office steadily declined. In Magna Charta (art. 24) the sheriffs were forbidden to hold pleas of the crown. Their judicial and police duties were gradually curtailed by the appointment of conservators, and later of justices, of the peace. In 1258, by the Provisions of Oxford the office was made annual, and for a time under Edward I. the freeholders of the shire obtained the right of election. But this was only temporary, and under Edward III. the modern practice was instituted of nominating the sheriffs every year in the exchequer. The last great diminution in their powers took place in the reign of Queen Mary (1516-58), when the control of the militia was taken from them and entrusted to lords lieutenant. From this time, in spite of the dignity and precedence to which a sheriff is entitled during his year of office, the post has come to be regarded rather as a burden than a privilege. Its chief duties are the reception of the justices of assize, and the responsibility for enforcing judicial sentences within the shire. The sheriff also has, either in person or through his under-sheriffs, to make all arrangements for parliamentary elections during his terms of office. Although the sheriff is strictly and etymologically a shire officer, the city of London obtained from Henry I. the right of appointing sheriffs, and several of the older boroughs, such as Norwich and Oxford, still have sheriffs of their own.

[Stubbs, *Constitutional History*.—Gneist, *Englische Verfassungsgeschichte*.] R. L.

**SHILLING.** English silver coin of the value of twelve pence, first struck in the reign of Henry VII.

The following list gives the weights of the various shillings issued since that time:—

Reign.	Year.	Weight.	Finess.	Value in silver 925 fine at 5s. 6d. per oz.
		grs.		
Henry VII. . .	1504	144	925	1/7½
Henry VIII. . .	1543	120	833-3	1/2½
Edward VI. . .	1547	120	333-3	/6d.
Edward VI. . .	1549	80	233-3	/4d.
Edward VI. . .	1552	96	925	1/1½
Mary . . .	1553	96	921-25	1/1
Elizabeth . . .	1560	96	921-25	1/1
Elizabeth . . .	1601	92½	925	1/0½
James I. to George III. } George III. and subsequently }	1603 to 1816 1816 onwards }	92½ 92½ 87½	925 925 925	1/0½ 1/0½ 1/

The origin of the word shilling is obscure, but it appears to have been handed down from Anglo-Saxon times, when fourpence equalled a scill or soilling.

F. E. A.

**SHIP-MONEY.** From 1629 to 1640 Charles I. endeavoured to govern without a parliament. In order to avoid exceptional expenditure, it was necessary during these years to keep England out of the great struggle which was going on in Europe. But though England was neutral, Charles was constantly negotiating in the hope of obtaining the restitution of the palatinate to the dispossessed elector. And to give weight to his diplomacy it was necessary to make some parade of English strength, while the growing naval power of France and Holland made it imperative for England to take some steps in the same direction. This was prescribed both by the motive of self-defence and by the desire to maintain the sovereignty of the seas which Charles claimed for this country. Under these circumstances the king and his ministers sought to devise some means of obtaining money for naval expenditure without having to appeal to parliament for supplies. Noy, the attorney-general, suggested that under the Plantagenets, and as late as 1626, it had been customary for the crown to call on the sea-ports to man and equip ships for the defence of the realm. Acting on this hint, the council issued a writ on 20th October 1634, ordering the authorities of the coast towns to assess on the inhabitants the money necessary for fitting out and maintaining for six months a certain number of ships and the requisite crews.

This writ departed from earlier precedents only in two points: (1) it demanded money instead of actual services, and thus imposed something nearly akin to a tax, whereas by the petition of right the king was pledged to levy no taxes without consent; (2) previous levies had been made in time of actual warfare, while this was to meet a prospective danger which

might be very variously estimated. However, the writ met with no resistance, except from the citizens of London, and they had to give way. This success emboldened the crown to take a much more serious step in the next year. By a writ dated 4th August 1635, the sum of £208,900 was demanded, and this was to be collected, not only from the dwellers on the coast but from the whole community, on the ground that all were equally interested in the defence of the country. The last assertion was difficult to contest, but it was felt that it was put forward to defend a wholly novel expedient, and it was difficult to perceive that there was any danger so pressing that it must be met before parliament could be consulted. Thus the second writ of ship-money provoked much more general opposition than the first, and in spite of the zeal of sheriffs and justices of the peace, it was difficult to carry out the work of assessment and collection. In order to justify compulsion, the king obtained a written opinion signed by ten out of twelve judges to the effect that when the kingdom was in danger the charge of defence ought to be borne by the whole kingdom, and further that of such danger the king was the only judge.

Meanwhile the fleet that had been equipped had effected nothing, the royal diplomacy was as far from its end as ever, and more than £20,000 of the money due under the last writ was still unpaid. Charles determined to persist, and the third writ of ship-money was issued again to the whole kingdom on 9th October 1636. This was a practical assertion that ship-money was not a mere temporary expedient to meet a passing danger, but that it was to be an annual charge on the community. It might be true that the sums hitherto collected had been spent on the navy, but there was no security that this would continue, and if the king could raise a secure revenue at will, there need never be another parliament. Many of the peers were not prepared to entrust the crown with such absolute power, but their remonstrances, instead of weakening the king's resolution, only impelled him to extort a favourable opinion from the judges, so that they might be pledged to decide in favour of the crown any case that might be brought before them. The judges again affirmed—(1) that in time of danger the king may command all his subjects to provide and furnish such number of ships and for so long as he shall think fit; and (2) that the king is the sole judge of the danger and the means of meeting it.

Thus the decision of the judges was a fore-gone conclusion when, in 1637, the question of the legality of ship-money was brought before them in the case of John Hampden. Hampden's counsel argued that the king's control over the

persons and property of his subjects could only be exercised in a normal way through parliament; they admitted that in an extraordinary crisis the crown could act without waiting for parliament, but denied that in the present case there was any evidence of such pressing and immediate danger. The crown lawyers replied that the question of fact was not before them, that the king was in law the sole judge as to when an emergency arose, and that behind the king's judgment the court could not go. As a matter of strict law this contention was probably sound, but under the circumstances it was opposed to the common sense of the community. However, seven out of twelve judges decided in favour of the king, and some of them, notably Chief Justice Finch, went out of their way to magnify the royal prerogative. But the victory of the crown, complete as it appeared at the time, was very short-lived. In 1641 the Long Parliament declared ship-money illegal, and impeached the judges who had decided against Hampden.

[Gardiner, *History of England*, vols. vii. and viii. State Trials.] R. L.

SHODDY<sup>1</sup> is the name given to the waste of various manufactures, as for instance to that of coal or iron; but the term has become particularly associated with the re-manufactured refuse of cotton and woollen yarn. This refuse consists of the tangled or broken remainders of cotton or woollen yarn which are left by the weaver upon the reels, and are commonly referred to as "cop-bottoms" or "cop-refuse." As this "refuse" cannot be further utilised in the manufacture of fine woollen or cotton cloth, it is sold in the mass by the Lancashire or Yorkshire manufacturer (it is occasionally sent from the Indian factories) to the manufacturers of shoddy, and is by them re-converted into "shoddy cloth" by a wonderfully ingenious mechanical process.

The whole mass is first thrown into a series of "tearing" cylinders, filled with toothed rollers of graduated fineness, which, revolving at high speed, tear the yarn refuse back into a substance closely resembling, and only to be distinguished by an expert from, the original American bale cotton. By this tearing process, however, the original cotton fibre is wholly destroyed, and the artificial fibre thus produced is at once too short and too fragile to permit of it being drawn out for purposes of fine spinning. It is therefore "carded" and spun into a coarse yarn, and then used merely as the "wett" in the manufacture of "shoddy" cloth or calico, as owing to its fragile and artificial nature it will not bear the strain necessarily put on the "warp" in the weaving process.

The "warp" of shoddy cloth has therefore to be supplied by yarn spun from pure American

cotton, such as is used in ordinary weaving; and it is the stoutness of this "warp" which gives strength and endurance to the woven "shoddy" material.

"Cotton" shoddy is manufactured chiefly in Lancashire, in the district of Rochdale, Haslingdon, Bolton, Bacup, and Crawshaw-Booth. Woollen shoddy is manufactured at Bradford, in Yorkshire. The material is warehoused as taken from the loom, and sold to dyers and printers for the home trade. In the same factory various qualities of shoddy are produced, from the heavy habit and cheap tailoring cloths to the coarse sheetings, and cheap shirtings, largely in demand among dock labourers. Some of this "shoddy" calico is specially woven and dressed for the Levant trade, where the coloured shawls made from it find a ready market. The manufacture of "shoddy" also creates a further "refuse" from which, by a similar process to the one described above, the "cops" are again broken up into an artificial fibre, then spun into a very coarse yarn, and woven into the well-known cheap Bolton quilts and coverlets. A. L.

SHORT, THOMAS (1734-1772), M.D., was a physician and meteorologist:—

He "collected, with incredible labour, extracts from the mortuary and baptismal registers in a great many market towns and country parishes of England, chiefly in the northern counties, and in almost every variety of soil and situation, and reduced them into tables in various ways so as to enable him to draw useful inferences from them" (Milne, *Ency. Brit.*, quoted in McCulloch's *Literature of P. E.*). The result of these labours appeared in *New observations, natural, moral, political, and medical, on city, town, and country bills of mortality* (London, 1750). This consists of statistical tables of respective parishes with their registers of births, deaths, marriages, their soil and situation, and average death-rate. Also *A Comparative History of the Increase and Decrease of Mankind* (London, 1767). A. L.

SHORT EXCHANGE. The rate for cheques or drafts at sight, or payable within a day or two. There being no question of interest involved, the variations of the short exchanges above or below the MINT PAR (*q.v.*) is the measure of the momentary balance of trade, including therein the movement of floating capital. R. W. B.

SIGHT (= DEMAND). Formerly, it was customary to claim and allow three days' grace upon bills drawn "at sight," but they are now payable immediately, as if they were drawn "on demand." Bills drawn at any period after sight require presentation for acceptance before the term begins to run. R. W. B.

SILIO, GUGLIELMO (end of the 18th century), a Sicilian mathematician and economist who advocated the application of the calculus to the solution of the most important economic problems. Following BECCARIA, who had already

<sup>1</sup> For economic use of such articles, see RESIDUAL AND WASTE PRODUCTS.

attempted a mathematical inquiry on smuggling, he prepared a series of problems to determine the best means for suppressing smuggling. Silio demonstrates, by means of a mathematical analysis, the error of supposing that a constantly increasing revenue would be obtained by continually raising the customs duties, and that moderate duties would yield a better financial result and would diminish smuggling, increase consumption, and stimulate foreign trade.

### SILVER.

Silver, as Standard, p. 205; Silver, Discoveries of, p. 396; Silver Legislation in the United States, p. 401.

**SILVER AS STANDARD.** Wherever silver coins are full legal tender and constitute the money in which commercial exchanges and values are measured, and where other coins are rated in their relation to silver coins, the silver standard may be said properly to exist. A still further condition is really necessary, namely, that the mints of a country having the single silver standard must be open to the free coinage of silver. These conditions were very generally fulfilled in all countries during most of the period from the middle ages down to the beginning of this century. Gold was also used, of course, as money, but its position in coinage was an undetermined one, and it was mainly considered as to its value measured in silver.<sup>1</sup>

Great Britain began the race for gold in adopting the gold standard in 1816, and to-day the above named conditions are imperfectly fulfilled, and that only in a few of the countries where silver was in use a century since. (see SILVER, DISCOVERIES OF). Many of the leading nations have passed through, or are still in an intermediate stage of monetary development in which there is officially a double standard combining gold and silver according to some established legal ratio. In recent years, however, the conditions affecting the production and consumption of the precious metals have, by their differing variations, made the task of maintaining both metals in circulation so difficult that the so-called double standard countries have nearly all suspended entirely the coinage of full legal-tender silver coins, and have taken all sorts of steps to pro-

tect and add to their stock of gold. Within the year 1897, just closed, Japan, Chili, and Salvador have adopted the gold standard. India is on a fiat-money basis, and has closed her mints to silver and is trying to introduce gold payments at a parity of 1s. 4d. as the exchange value of the rupee. Russia has officially adopted the gold standard, but has a depreciated paper circulation based on silver, which she now agrees to maintain at a fixed ratio in gold, and is making an effort to secure enough gold. The Indian government has discussed the possibility of doing the same.<sup>2</sup> Strictly speaking, China never has had any other than a copper standard so far as the legal conditions for a standard are concerned, though of course silver has been, and still is, the basis of exchange values in all her dealings with foreign countries.

The great revolution therefore that has taken place in the monetary status of silver, and the completeness with which the whole civilised world has discarded it as a standard, are facts which will doubtless be considered as the most significant in the general economic history of this century. This movement has been chiefly confined to the period since 1873. The results of it are still a matter of grave doubt, and they have certainly given rise to considerable debate and have produced an enormous supply of economic literature on monetary topics.

The first and perhaps most direct result of the abandonment of the silver standard and of the greatly increased demand for gold for monetary uses in recent years, has been a considerable appreciation in the value of gold. The supply of gold has increased materially, however, and may continue to increase so as to partially neutralise further tendencies towards appreciation. It is claimed that the general downward tendency in wholesale prices has been due in part to this appreciation; and in further support of such claim, it is stated that prices in silver-standard countries, up to recent times, remained steadier than in gold-standard countries. This point is, however, disputed. It does seem to be true that the fluctuations have not been so great in silver-standard countries, but it may be true that in those countries other than monetary causes affecting prices, and tending to lower the general level of prices, have been proportionately absent or inoperative. A mass of evidence, on this point, with complete statistics of prices in eastern countries, is to be

<sup>1</sup> In the 17th century "silver" and "money" may be regarded as synonymous, and the expression "argent" for "money" is familiar. Thus Locke, *Further Considerations of the lowering of interest and raising the Value of Money*, says "that the fittest metal to be the money of account and contract and the measure of commerce in any country" is silver."

<sup>2</sup> Both India and Russia are really on a "flat-money" basis so long as the respective governments are holding silver in the one case and paper currency in the other at a fixed parity with gold by legal enactment. Russia is, however, accumulating a stock of gold, and both seek to secure the gold standard in the future. For account of recent legislation, see Lexis, articles on "Papiergeld," and "Münzwesen," in Conrad's *Handwörterbuch, Zweiter Supplementband*, Jena, 1897; and H. P. Willis, "Monetary Reform in Russia," art. in *Journ. of Pol. Econ.*, June 1897, Chicago.

found in the report, minutes of evidence, and more especially in the appendices, of the Indian Currency Committee. In an English consular Report on China, and one dealing particularly with the effect of the fall in value of silver on prices of commodities in China (Foreign Office, 1893, Miscel. Series, No. 305), we note the following statement in commenting on the tables of statistics: "As regards articles which are both produced and consumed in China, silver prices have on the whole tended to decline (during last twenty years). There is a moderate rise in a few articles, principally food stuffs, but all over there is a decline of about 9 per cent. As regards articles of native origin exported to foreign countries, the silver price has not advanced with the fall in exchange. Prices on the whole are almost exactly on the level of the years 1870 to 1874. As regards articles of foreign manufacture or production imported for sale in China, the average price in silver has declined very considerably."

The second and main argument concerning the effect of the fall in the gold value of silver refers to the fact that the falling rate of exchange, especially in relation to long-period contracts, has acted as a bounty on exports and as a protective tariff on imports for the silver-standard country. The argument in favour of this position is stated strongly by Mr. E. Held in his volume on *The Joint Standard* and finds some support in the evidence presented to the Indian Currency Committee. That its general effect on the condition and prosperity of India has been greatly exaggerated is also amply shown by evidence from the same sources. Most contracts are not long-time contracts, and, while credit may have been somewhat curtailed as a result of this cause, there were really no serious commercial fluctuations after the banks began to balance exchanges and cancel the result of such fluctuations in exchange, and thus insure their respective customers in both countries from losses of this character.

[See reports of Indian Currency Committee, 1893, C. 7060 ; C. 7098 ; C. 7060-I ; minutes of evidence and appendices (the most complete source of information), C. 7060-II ; Index, C. 70-86. This report has been reprinted by the U.S. Gov. under the title of "The Herschell Report on Coinage of Silver in India," Sen. Mis. Doc. 23, 58rd Cong. 1st Sess., price \$1.20.—Held, *The Joint Standard*, London, 1894.—Muhleman, *Monetary Systems of the World*, 2nd ed. 1897, New York.—Del Mar, *Hist. of Money*, London, 1885.—U.S. Special Consular Reports, "Money and Prices in Foreign Countries," vol. xiii. pt. i., Washington, 1896, pt. ii., Washington, 1897.—"Silver in China," Talcott Williams, *Annals of Amer. Acad.*, vol. ix., 1897.—The "Currency of China," Willard Fisher, *Fale Review*, March 1897.—"Silver Prices in India," Fred. J. Atkinson, *Journ. of Royal Statistical Society*, Mar. 1897.] (See BIMETALLISM ; GOLD AS STANDARD ; MONEY ; PRECIOUS METALS.)

And App., GOLD, INCREASE IN THE PRODUCTION OF ; SILVER, PRODUCTION AND COINAGE OF, 1896-1905. S. M'C. L.

SILVER, DISCOVERIES OF. There are no authentic accounts of the discovery of any silver mine in antiquity, although there were silver mines in almost every known state except Italy. New sources of supply of the precious metals were opened up by conquest, and not by adventure. Adventure and discovery play a large part in the history of mediæval and modern mining ; and the stories retailed by Jacob (*Inquiry into the Precious Metals*, i. 241, etc.) of the discovery of Chemnitz in Hungary (745 A.D.), Freiburg in Saxony (10th century), and the Hartz (972 A.D.), are paralleled by the stories of the sleeping shepherd at Pasco in Peru (1630, Tschudi's *Peru*, p. 328), the sleeping hunter at Chaharcillo, Chili (1832, Browne's *Mineral Resources of the United States*, 1868, p. 650), the falling hunter at Potosi (about 1640, Acosta's *Peru*, iv. 6), a lady at a picnic at Utah (1863), or by some of those "moving accidents" which make Lord's "Monograph on the Comstock Lode, Nevada" (discovered 1859, *U.S. Geological Survey*, 1883) read like a romance. Another illustration of the different attitude of mind in antiquity and in comparatively modern times is that while the modern business man keeps accounts which are a fairly accurate foundation for statistical generalisations, and while travellers' guesses, such as those embodied in Acosta's or Robertson's *History*, bear no relation to the truth, we find neither business accounts nor wild guesses about ancient mines ; but Herodotus's allusion to the Laurian mines in Attica (vii. 144 ; Boeckh's *Public Economy of Athens*, app. ix. ; Büchschütz, *Besitz und Erwerb*, etc., p. 102 ; but see Grote's *History*, vol. i. 154 n.), and Strabo's allusion to the Turdetanian mines in Spain (iii. 2, 9), probably present sober statements of truth. It is fair to contrast ancient with modern history in these respects because they were separated by a great gulf ; mining, it appears, was discontinued under the Roman empire until it was tentatively resumed by the Moors after the Moorish conquest of Spain in the 8th century.

Amongst the many interesting productive problems raised in connection with silver discoveries, it is a universal rule that new supplies, instead of superseding, stimulate existing sources of supply. Thus the cession of part of Mexico in 1848 and 1853 to the United States enabled the latter to commence mining, and its success reacted upon Mexico in a manner which recalls the effect produced by silver-mining in the new world upon silver-mining in the old world three or four centuries ago. The reason of this apparent paradox is that new supplies beget new inventions which directly affect the production of silver but not of gold—for instance, first, by adding to the

brief life and, therefore, usefulness of the product; secondly, by facilitating its production; thus Medina's cold amalgam (1557) and the numerous processes (Pattinson, Karsten, Parkes, Cordurié, Lauthertal, etc.) invented

between 1842 and 1869 for extracting silver from lead ore "have been equivalent to the discovery of new mines" (Jevons, *Currency*, p. 76; Prof. Roberts Austen, "Memorandum on Cost of Production of Silver," app. vi.,

*Distribution of Production of Silver among the different States of the U.S. Compiled from U.S. Mint Reports. Compare Annual Reports of the U.S. Geological Survey, entitled Mineral Resources of the United States, and compare note (K) p. 399.*

N.B.—\$ U.S. coining value, i.e. 1000 dollars = 773 ounces (fine) approximately.

*Report of Gold and Silver Commission, 1887.* Again, between the time of Job and 1848 (*Papers Relating to the Californian Gold Discoveries*, 1856, p. 47) silver lay in, gold on the earth. What bad mining means may be judged by "A Miner's Notes on the Silver Mines of Honduras" (*Harper*, 1856, vol. xii. p. 721), or Jacob's history of the mine of Guadalcanal in Spain (*Precious Metals*, vol. i. p. 274).

Passing to exchange questions, the effect of the earlier American discoveries was gradually ripening in England between 1570 and 1648, at which date wheat had risen 250 per cent, and grain generally 220 per cent, according to Thorold Rogers, who agrees in the main with A. Smith (see, too, Cunningham's *Growth of English Industry*, § 168). The effect on the ratio between gold and silver is illustrated

by the table printed in the article *PRECIOUS METALS*. The *Reports of the Committee of the H. of C. on the Depreciation of Silver*, 1876, and on *Gold and Silver*, 1887 and 1888, point out that the U.S., where the main discoveries were being made, actually decreased its exports of silver during one critical period, 1873-79, when the ratio was falling; and, further, under the Bland Act 1878-90 and Sherman Act 1890-93, 459,946,700 fine ounces of silver were bought for coinage by the federal mint, which had been comparatively idle up to 1871. It is, or was in 1888, in spite of this new demand for silver in the U.S.—a demand far exceeding any similar demand in any civilised country in the whole history of coinage—that silver fell. Perhaps the still greater amount of the new demand relatively to the new supply of gold—due to the increase of banking reserves (£187,500,000, 1873-85, *Quarterly Journ. of Econ.*, i. 350, J. L. Laughlin), and institution of new gold coinage by France from 1850 (Cairnes, *Essays*, p. 142, —£100,000,000), and Germany from 1870 (£100,000,000, *Rep.*, 1888, § 38)—has made silver fall relatively to gold—if so, the history of the Roman empire affords a close parallel; there, while silver was becoming dearer because it was diminishing four times as fast as gold, this natural tendency was reversed by a social and political tendency—the tendency, namely, to hoard gold and exchange a silver for a gold coinage, so that the ratio fell from 11·91 to 14·4 : 1, at which figure it probably stood between 397 A.D. and Justinian's time (Mommesen's *Verfall des römischen Münzwesens*, p. 277; cp. *History of Rome*, trans. Dickson, ed. 1894, iii. 88; *Geschichte des römischen Münzwesens*, p. 834). But this theory is unnecessary to explain the first, and is inapplicable to the subsequent depreciation; thus U.S. exports of silver did not fall during the second critical period, 1884-89, and in the third critical period, when silver cheapened, 1891-94, they rose from 23 to 51 million dollars. And, further, it is quite possible that state-made ratios which held when the output of silver was 20 million ounces a year (1840) would hardly have done so when it was three (1870) or eight times (1893) as much. Regulation of prices has never succeeded, except on a small scale. This problem will be again discussed after the tables of production and consumption.

As for the distributive questions raised by Chevalier's *De la Baisse d'or*, Cairnes's answer in his essay on Chevalier, that prices rise because wages are raised, and that wages are first raised at the mines, then in those industries which are nearest to the mines, whether locally or industrially, is probably correct.

*Estimates of Production of Silver.*—The following estimates of silver produced during different periods are most often cited in works on political economy:—

Humboldt's *Nouvelle Espagne*, 1811, iv. 212, 218, 220.—Jacob's *Inquiry into the Precious Metals*, 1831, ii. pp. 70, 131, 214, 267.—J. T. Danson's "Gold and Silver sent from America to Europe," 1850, *Journ. of the Statistical Society*, xiv. 11.—Birkmyre's "Letter to the Times," xxi. 5, 1852 (for 1846-50), cited in McCulloch's *Commercial Dictionary*, art. "Precious Metals," and in D. F. Campbell's trans. of Chevalier's *Production of the Precious Metals*, 1853, pp. 93 *et seq.*—Chevalier's article in *Revue des Deux Mondes*, 1846, xiv. 1033, 4; and "De la Monnaie," which is pt. iii. of his *Cours d'Éc. Pol.*, 1842-50, pp. 222, 228, 307, etc. (cited in Tooke's *Prices*, vi. 144).—Faucher's *Production of the Precious Metals*, etc., 1851, Eng. trans., 1852.—J. D. Whitney's *Metallic Wealth of the U.S.*, etc., 1854, pp. 182, 183, 506 (esp. 1800, 1845, 1850, and 1854).—J. A. Phillips's *Mining, etc., of Gold and Silver*, 1800-67 (esp. 1800, 1850, 1865), p. 320.—W. P. Blake's *Production of the Precious Metals*, 1869, p. 361.—Sir Hector Hay's "Tables," 1850-76, printed in app. 66 to the *Report on the Depreciation of Silver*, 1876.—Baron Reinach, 1852-75, trans. in *Banker's Magazine*, N.Y., Oct. 1876, and cited in Walker's *Money*, 1878, p. 237, and others.<sup>1</sup> See also Adam Smith, "Digression concerning the Variations in the Value of Silver," *Wealth of Nations*, bk. i. ch. xi.

In 1879 Dr. Soetbeer published his *Edelmetall-Produktion* as a supplement (vol. xiii. No. 57) to Petermann's *Mittheilungen aus Perthes' geographischer Anstalt*, a work which has superseded every other authority on the subject. Dr. Soetbeer admits in his *Materialien*, 1886 (trans. in app. xvi. to the *Report of 1888*, p. 149), that missing links of evidence may be found which will make it necessary to revise the entire work, meanwhile it is not worth while to seek to mend his calculations after the fashion of Professor Lexis (*Jahrbücher für Nationalökonomie*, xxxiv. 361, etc.). Dr. Soetbeer utilises every shred of evidence hitherto obtained, and fills in *lacunae* as best he may. After 1850 his table of odds and ends is arbitrarily divided between America and Australia, etc., otherwise the figures on p. 399, down to 1880, are, with a few abbreviations, etc., transcribed from Dr. Soetbeer's work of 1879, and an essay of his on the same subject in Conrad's *Jahrbuch*, 1881.

*Estimates of Consumption of Silver.*—In the table on p. 400 estimate enters more or less largely into all figures

<sup>1</sup> R. W. Raymond's summary of the estimates of Phillips (1800, 1850, 1865), Birkmyre (1846, 1850), Whitney (1854), and Blake (1867), shows a general agreement between these estimates as to the relative importance of different nations and periods. Humboldt's estimates for America were derived, in many cases, from the registers of the state tax on the product of each mine; Danson supplements this information with consular reports, e.g. those published in app. iv. No. 7 to the *Report of 1876*; and Soetbeer adds collections of documents relating to Mexico and Bolivia, published 1864 and 1875, Laur's treatise in *Annales des Mines*, 1871, etc.; but Humboldt's estimates are still used where there is no direct authority. Humboldt's estimates for Europe are derived from Héron de Villefosse, co-editor of the official *Journal des Mines*, and author of *De la Richesse Minérale*, 1810-11; and from Georgi's *Geogr. Phys. Beschreibung des Russischen Reichs*, 1797-1800. Jacob added André's *Neueste Zahlenstatistik*, 1823, to his own observations. Chevalier and Danson utilised Dupont's *De la production des métaux précieux au Mexique*, 1843, for modern Mexico.

erlier than 1831, and the same haven still leaves the most recent lump sums for industrial use. But exports to the east have, during this century, and especially since 1835, presented trustworthy statistics, and re-

liance can now be placed upon them (see note *d*, p. 400). These exports amounted (1701-1895) to 2,645,220,000 out of 5,831,940,000 fine ounces, or 45 per cent of the total consumption. This item is but lightly affected by

<sup>a</sup> About three-quarters must be credited to Germany and Austria in almost equal shares, but Austria yielded twice as much as Germany, 1495-1544; Germany twice as much as Austria, 1721-40.

<sup>b</sup> Spaniards arrived in Mexico, 1519; the silver plunder and ransom was about \$35,900 oz. Zacatecas was worked, 1548, but ineffectually till 1558. At this time some mines, chiefly in S. Luis, Potosi, and Central Mexico, were also worked and gradually improved. Guanaxato was worked 1558 to about 1600, but ineffectually.

<sup>c</sup> Spaniards came to Peru, 1533. Potosi, the chief of the three great silver mountains of Peru, was opened, 1545. The silver yield of Potosi attained its maximum, 1581-1600, and 1601-20, when it averaged respectively

8,176,000 oz. and 6,619,000 oz. per annum. Pasco, the second greatest silver mountain of Peru, discovered 1630. Chili first counts, 1721.

<sup>d</sup> The contributions of Central America are trifling.

<sup>e</sup> China, etc., not included.

<sup>f</sup> Tarassenko Otvreshkoff, *De l'or et de l'argent*, says that Nertchinsk, the first Russian mine, was discovered in 1691, Kolyvan in 1728 (pp. 132-34); Kolyvan began to be fruitful, 1744; Nertchinsk, 1775.

<sup>g</sup> This rise was due to discoveries near "Alicante," Spain, 1843-1845, alluded to in E. Levasseur's *Question d'or*, 1858; M'Culloch's *Comm. Dict.*, p. 1124; cp. Phillip's *Mining, etc., of Silver*, p. 326. Spanish mining had been dormant, 1495-1527.

<sup>h</sup> Guanaxato, the richest silver mine of Spanish America, was re-discovered, 1760. In 1785-90 Guanaxato, S. Luis, Potosi, Zacatecas, and Central Mexico yielded two-thirds the silver produced by New Spain. The Mexican mining districts credited with increase, 1861-80, were the same; they yielded then five-sixths the silver produced by Mexico.

<sup>i</sup> This shrinkage was due to the Civil War.

<sup>k</sup> "Silver-mining in the U.S. may be said to have only begun in 1860" (*Geological Survey, Mineral Resources of the U.S.*, 1883 et seq., 1st annual vol., p. 181), and it first exported silver in 1864. In the seventies the Comstock Lode, Nevada, rose steadily from 4,822,500 oz. in 1871 to 15,406,600 oz. in 1876, its record year (Lord's "Monograph," app. ii.), and then rapidly fell. Utah yielded its first silver in 1870. Leadville, the silver capital of Colorado, was only christened 1877 (Emmons' "Monograph" in *U.S. Geol. Survey*). The Eureka district (Nevada) (Curtis' "Monograph") and Arizona (*Banker's Magazine*, N.Y., 1878, p. 811) began to be of importance at the same date.

<sup>l</sup> Gualgayoc, the third silver mountain of Peru, discovered, 1771.

<sup>m</sup> This expansion was due to the discoveries in the "Atacama" Silver Desert, Chili, 1829-31, 1831-48, etc. (see Phillip's *Reise*, 1853-54, p. 112).

<sup>n</sup> Bolivia rose from 2,893,500 oz. p.a. (1866-70), to 7,155,000 oz. p.a. (1870-75), owing to the increased yield of Caracoles.

<sup>o</sup> First reckoned separately in 1882.

<sup>p</sup> Almost exclusively Japan; China is not included.

<sup>q</sup> This does not represent a decline in German production, but an altered mode of calculating it by excluding foreign ores (*U.S. Mint Report*, 1889, p. 166).

<sup>r</sup> *U.S. Mint Report*, 1886, p. 182; 1891, p. 228.

political events; thus though the Indian mints were closed, 26, vi., 1893, net exports to the east from England and the States totalled in 1891, 43; in 1892, 80; in 1893, 92; in 1894, 87; and in 1895, 58 million ounces; and the last figure, which is nearly the same as those for 1896 and 1897 is nearly one-third more than the average figure for 1886-90. The question how much of this vast supply in the eastern reservoir consists of hoards, and therefore does not affect prices, is all-important but

insoluble; and the question how far it exists as coin, or in other active forms, though soluble is irrelevant; for in the east coin, ornament, use and hoarding are hardly distinguishable. As a matter of curiosity, out of 79,000,000, the average for 1891-95, 46,000,000 can be traced into or as coin; but perhaps imperfections in the United States' tables of recoinnages and old material may reduce this figure by a million or so. Whether as coin or hoard, nearly half the silver of the world is damned

*Average Annual Consumption of Fine Silver in 1000 oz. Fine Silver.*

<sup>a</sup> Report of Committee on Depreciation of Silver, 1876, App. 26 c, 28 b, give annual Indian statistics, 1835-75.

<sup>b</sup> Soetbeer, *Edelmetall-Produktion*, 1879, p. 136, etc.; *Jahrbuch für National-Ökonomie und Statistik*, ed. Conrad, N. F., 1881, vol. ii. p. 347; vol. iii. pp. 121, 195, etc., IIIe F., 1891, vol. i. pp. 518, 563, etc.; *Materialien*, 1886, transl. in Report of Gold and Silver Commission, 1888; *Literatur-Nachweis*, 1892.

<sup>c</sup> Actual re-exports to Europe from India, 1881-90, have been deducted; also those from Straits, 1885-87, and Chinese Treaty Ports, 1889-90. They amount (1886-90) to only 2 per cent. Soetbeer under-estimates re-exports from Java (1886-90) by at least 130,000 oz., according to Straits Settlement Reports, 1885-87, or possibly more, 1881-85, according to Van der Berg, *Rep. of G. and S. Commission*, 1888, App. vi. Otherwise he is followed.

<sup>d</sup> Official reports of average annual net imports into India by sea, 1881-90, =27,011,000 oz. into the Straits, 1885-87, =1520,000 oz.; into Chinese Treaty Ports, 1889-90, =4570,000 oz.; into Aden, Ceylon, Mauritius, Java, Mekran, Somniani, Persia, Abyssinia, Abyssinia, Mozambique, Zanzibar, Mayay, Siam, Corea, Japan, Cochinchina, and Java, from India, =2147,000 oz.; from Straits =4055,000 oz.; from Chinese Treaty Ports =5090,000 oz., in those respective years; and French silver coins for French possessions, 1887-90, =1069,000 oz. (Soetbeer); total, 1881-90, 40,452,000 oz. The total in the table is based on exports from Europe and United States, and =40,674,000 oz. Though Chinese statistics are not quite satisfactory, as amongst other things silver and gold have to be separated by estimate, yet this comparison is sufficient to show that the results for these years are accurate.

<sup>e</sup> Van den Berg and Hellerich, respectively, as cited by Soetbeer.

<sup>f</sup> Estimate.

<sup>g</sup> Soetbeer, corrected as to United States statistics by United States Mint Reports (see Table xlv, in Mint Report of 1896, which apparently excludes from new materials "foreign bullion." Totals adopted for United States are, 1881-85, 4008,000 oz.; 1886-90, 4887,000 oz.

<sup>h</sup> United States Annual Mint Reports, deducting trade dollars, etc., meltings of foreign bullion, and recoinnages. Totals in 1000 oz. are, 1876-80, 17,500; 1881-85, 30,832; 1886-90, 24,683; 1891, 17,521; 1892, 3515; 1893-95, 1874 p.a. (average). The purchasing clauses of the Sherman Act were repeated, i. xi. 1890. United Kingdom annual reports give (1) coinage, (2) old silver sent in, and (3) net exports since 1873; (2) and (3) and 10 per cent for old material is deducted. Otherwise Soetbeer is followed until 1890. After 1890, the United States Mint Reports of coinages and (known) recoinnages, etc., of the world, are followed; the east being of course excluded, also Mexico, Central and South America.

<sup>i</sup> English net exports to India, Straits, Japan, China, and Egypt, as given in the *Annual Statement of the Trade of the United Kingdom*, for 1895 and 1896; plus United States ditto; plus French coinage, for Indo-China, etc., and Spanish coinage for Philippines, and German for Zanzibar, etc., and Egypt.

<sup>j</sup> Dutch gross exports of silver plus former estimates for land trade, etc.

<sup>k</sup> United States figures give 6277,000, 1892; 6032,000, 1893; 7206,000, 1894; 3,167,000, 1895. French figures give 4728,000, 1892; 4548,000, 1893; 4988,000, 1894 (De Foville, less 10 per cent for old materials), and 6076, 1895 (United States Mint Report, less as above). Total 11,005, 1892; 10,630, 1893; 12,194, 1894; 14,243, 1895. For other figures see Lexis in Conrad's *Jahrbuch*, 1896, p. 507.

up in the east; and the strength of the dam depends on a state of mind which, though it has existed ever since history began, may some day cease to exist, as it has already begun to cease to exist in Hayti, and Japan (1897). If it ceased to exist, nearly half the existing, and more than half the future silver supplies would be let loose on the civilised world, to which however the east would then belong. It is to be remembered that this possible revolution in the conditions of demand only menaces silver, it does not menace gold.

We have excluded from the category of coinage Mexican, South, and Central American coinages; as, first, no check can be placed on their recoining and use of old material; secondly, most drifts eastward and westward, and finds its way into other columns; thirdly, the trade dollar is usually accepted as an article of merchandise, and it seems irrelevant to distinguish it from bullion. The figures for the United States exclude some 168,000,000 ounces of bullion purchased under the Sherman Act 1890-93, except in so far as it has been coined; the reason for this is that we have no guarantee that the residue which (30 vi. 1897) amounted to 115,488,461 ounces, will be ever coined.

*Production and Consumption Compared.*—From 1701 to 1850 production probably exceeded consumption by 40,000,000 oz., i.e. by  $1\frac{1}{2}$  per cent. The average ratio of silver to gold fell from 15·27 (1701-10), to 15·83 (1841-50), or  $3\frac{1}{2}$  per cent.

Next, between 1850 and 1870 the ratio rose 1 per cent to 15·55 (average for 1866-70); meanwhile supply fell short of demand by 40,000,000 oz., or 4 per cent of the supply during that period. In 1870 there was an apparent balance, but it was only apparent. Between 1850 and 1870, what Soetbeer calls "latent reserves," consisting of hoards, etc., must have returned into circulation to some extent, and that perhaps was why the ratio rose as little as it did.

Between 1871 and 1875 production exceeded consumption by 96,000,000 oz., and the first great fall in the ratio occurred from 15·63 in 1872 to 15·40 in 1879; this process was then arrested, and the 96,000,000 was reduced successively to 55,000,000 in 1880, and 81,000,000 in 1885. During the next four years the second great fall in the ratio occurred, from 18·57 in 1884 to 22·10 in 1889; and the hanging balance of 81,000,000 of idle ounces was simultaneously increased to 121,000,000. The third fall of the silver ratio from 23·72 in 1892 to 32·96 in 1894, synchronised with a final excess of production over consumption which raised the 121,000,000 to 227,000,000. Out of these 227,000,000 the stores of bullion accumulated under the Sherman Act account for 125,000,000 oz.; and the residue, probably in the form of redundant trade dollars, makes Mexico, Peru, Bolivia, and until lately Chili, pay double what they used to pay for every imported commodity. The same result has been produced in the east, by such of the eastern exports as are not hoarded. In addition to the 227 surplus millions of ounces, we must reckon Soetbeer's "latent reserves," which however cut both ways; inconvertible paper currencies in Brazil, Buenos Ayres, and until lately in Chili, driving silver out of sight, while commerce elsewhere lures hidden silver back to the light of day. We will therefore leave this unknown quantity alone.

There have been then three successive doses of 96, 40, and 106 millions each spread over 5 years. Against the idea that an increased coinage of 19, 8, and 21 millions per annum during those respective periods of five years would have counteracted the fall of the ratio, must be set the fact that consumption has increased nearly sixfold in 25 years, 1870-95; and that this sixfold increase is inconceivable without a corresponding decrease of price. Thus had coinage taken off the surplus silver without altering its price, it is possible that exports to the east might still register only 20,000,000 a year, industrial use only 10,000,000, and that the residuary 129,000,000 a year would deluge the mints of civilised states; but this could not take place without lowering the gold value of silver coin. Silver would have certainly fallen, and the ratio to gold would have to have been revised more than once; and what civilised states would have lost by the immense purchases which they would have made, and by recoining, it is impossible to estimate. The influence of mints may be easily overrated. Large quantities of silver have never been bought by civilised states for coinage before 1870; although large quantities of coined silver were sold for gold between 1851 and 1870, sales which could not have been effected but for the eastern demand. Experience takes us but a

little way; but it proves that what saved Europe from the silver flood, and helped France to exchange a silver for a gold coinage, was the silver thirst of the east. This alone has kept pace with the unprecedented increase of the supply; and it is idle to speculate whether a combination of civilised silver-coinage states might have effected at a far greater cost and without any accruing benefit to themselves, and with but little better results to the silver owner, the task which the east silently effected. See App. GOLD, INCREASE IN THE PRODUCTION OF; SILVER, PRODUCTION AND COINAGE OF, 1890-1905.

**SILVER LEGISLATION IN THE UNITED STATES.** The coinage of silver as well as of gold was authorised by the general coinage act of 1792, and full legal-tender quality was given to the silver dollar. By the act of February 12, 1873, the dollar coin was omitted from the list of silver coins, and consequently authority for its coinage ceased; and in 1874 the legal-tender power of silver was limited to an amount not exceeding \$5 in one payment. With regard to the motives and methods which led to this legislation, there has been much prolonged and bitter dispute; the advocates of silver coinage asserting that the omission of 1873 was brought about without fair notice or discussion. By the act of 28th February 1878 (BLAND ACT, *q.v.*), provision was made for the purchase of a limited amount of silver at the market price by the government, of not less than \$2,000,000 or more than \$4,000,000 monthly, which should be coined into dollars, as provided in act of 1837. The seigniorage was paid into the treasury. The amount within these limits was left to the discretion of the secretary of the treasury, and during the twelve years in which this law was in operation the minimum purchase was adhered to. As silver depreciated in value this provided for the purchase of about thirty million silver dollars a year. Authority was also given for the issue of silver certificates of larger denominations upon the deposit of silver dollars. This legislation was brought about by the prevailing conviction in congress that a larger supply of money than gold could furnish was needed, and by opposition to the contraction of the currency; and was a compromise for the original bill of the house of representatives which provided for the free coinage of silver without limit. The existence of a struggle is indicated by the fact that the measure was passed over the veto of the president. As Prof. Taussig remarks (*The Silver Situation in the United States*, p. 7), "This characteristic of the measure, it need hardly be said, was the result not of any deliberate intention to try a new experiment, but of the spirit of compromise which explains so many anomalies in the legislation of democratic communities." An attempt was made by the banks belonging to the New York clearing-house to prevent the use of silver in their mutual settlements. On the other hand, to encourage the use of silver, congress appropriated funds for the use of the treasury

department to ship silver free of expense to all applicants in any part of the country. Again, in 1886, congress authorised the issue of silver certificates in denominations of one, two, and five dollars (30th June). By the act of 14th July 1890, as the result of further popular agitation for a still more extended use of silver, another compromise measure, popularly known as the Sherman Act, was enacted, providing, in place of the legislation of 1878, for the purchase of silver bullion to the amount of 4,500,000 ounces monthly, or so much thereof as may be offered at the market price not exceeding \$1.00 for 371½ grains of pure silver (equivalent to \$1.2929 per ounce), and for the issue in payment thereof of treasury notes. Of this purchased silver, so much should be coined, after 1891, as was necessary to provide for the redemption of such special treasury notes as might be presented in exchange for silver. As, however, it was the policy of the treasury department to redeem these notes in gold if demanded, there was little call for the full coinage of silver on this account. The treasury notes thus issued are a complete legal tender. This act was repealed in 1894, and at the present time (1898) there is no general authority for the purchase of silver for coinage purposes. The operations of the Sherman Act are well presented in the annual reports of the director of the American mint.

The following table exhibits the operations under the law which went into effect 13th August 1890 to 30th June 1897:—

Silver bullion purchased, 168,674,682 fine oz., cost	\$153,931,002
Bullion coined into dollars, 53,236,220 fine oz., cost	51,594,689
Balance (after allowance for wastage), 115,438,461 fine oz., cost	104,336,312
The bullion produced about	\$68,750,000
After deducting seigniorage (over \$17,000,000), there remain for redemption of treasury notes	51,594,689
Treasury note issue	\$153,931,002
Redeemed in silver and cancelled	41,063,722
Outstanding 30th June 1896	\$114,867,280

SIMON, JAMES (ob. 1757).

A native of La Rochelle, settled in Dublin, where he was a merchant, joined the Physico-Historical Society, became F.R.S. (1748), and published his *Essay towards an Historical Account of Irish Coins* (1749), with eight plates, appendices containing acts, etc. This work was based on Sir J. Ware's and Bishop Nicholson's work, but was, according to Ruding (*Annals*, pt. ix.), who is echoed by J. R. M'CULLOCH (*Literature of Pol. Econ.*, p. 163) and M. Chevalier (*Dictionnaire de l'Ec. Pol.*) "the most valuable of all the publications upon the coinage of any part of the united dominions"; and J. Lindsay has added but little to what he calls its "extreme accuracy and deep research"; *View of the Coinage of Ireland* (1839). There are good criticisms on portions of his work in the *Numismatic Chronicle*, 3rd ser. i. 310; ii. 308. The edition of 1810 embodies Snelling's *Supplement* (1770) with three additional plates, and also a fourth plate.

SIMONY. See PATRONAGE.

**SIMPLE CONTRACT.** A term used to describe contracts not couched in the form of a deed under seal. All such contracts, even though they be in writing, which is in some cases required by law, are simple contracts. Consideration is necessary to the validity of every simple contract. The right of action arising under a simple contract is available for six years after the date fixed for performance. Creditors under simple contract can prove in bankruptcy equally with creditors under a contract by deed (see CONTRACT, LAW OF; SPECIALITY DEED). F. C. M.

SINCLAIR, SIR JOHN, Bart. (1754-1835), was brought up to the law, but never practised. He sat in parliament for Caithness in 1790 and 1807, and afterwards for several English constituencies. His public activity was manifold and untiring, both in practical work and in literature, but it was to agriculture and finance that he devoted most attention. A society for the improvement of British wool was established by him at Edinburgh, and he was the main mover in the institution of the BOARD OF AGRICULTURE. Of this board he became president. In the same year he suggested and promoted the restoration of public credit, after several bank failures, by the issue of exchequer bills; but in 1797, standing aloof from government, he distrusted their bank restriction act, though he afterwards gave it his approval.

His chief contributions to agricultural literature are the *Statistical Account of Scotland*, a valuable

compilation, the making of which he directed, and the *General Report of Scotland*, drawn up by the board of agriculture, and of internal improvement, which he superintended, writing himself the introduction and the conclusion. In this work he advocated a "judicious system of encouraging regulations," for instance, experimental farms at the public cost, protective duties on imports and bounties on exports, and the improvement, by government help, of the means of communication, such as roads and bridges.—*Report on the subject of Shetland Wool* in 1790, and an *Address to the Landed Interest on the Corn Bill* in 1791. In the department of finance, besides several pamphlets or books on joint-stock enterprises and banking, he wrote *Hints on the state of our Finances*, 1783, and *History of the Public Revenue of the British Empire* in 1785 (3rd edit. 1805). This is full of detail without neglect of general principles, plentifully illustrated with tables, and ample in its treatment of later periods, though rather insufficient, in the light of modern knowledge, for the earliest periods. Particular attention is given to the national debt and to Pitt's financial administration. His views of the future of the revenue were sanguine.

**SINECURE.** A sinecure (*sine cura*) may be defined as an office to which only nominal duties are attached. Such offices have abounded at certain periods both in church and state. In France, before the revolution, they were very numerous. The *abbés*, so frequently mentioned in French history and literature, were ecclesiastical sinecurists. By the concordat of 1516, the French crown acquired the right to nominate *abbés commendataires* of certain monasteries. These persons received a large proportion of the revenues, but had no share in the government of their respective houses. They were not required to reside, and they did not always take orders. Similar abuses prevailed in the neighbouring countries. The celebrated General Prince Eugene was known as "Monseigneur l'Abbé de Savoie," because he was titular abbot of San Michele in Chiusa. The civil administration of France also swarmed with sinecurists. The governorships of the different provinces had hardly any duties attached, the real administration being in the hands of the "intendants." Just before the revolution the governorship of Guienne was valued at 120,000 livres, and the governorship of Languedoc at 160,000 livres. In the court, too, sinecures abounded. The royal kitchen alone comprised 295 officers, most of whom had little or nothing to do with the preparation of the royal repasts. The household of the infant daughter of Louis XVI. numbered 80 persons, chiefly serving for show. Though the evil was gravest in France, it was not trifling in England. Down to 1783 the royal household contained

many well-paid offices which served chiefly as means of parliamentary corruption. Thus the king's turnspit, as Burke tells us, was a member of parliament. But the most lucrative sinecures were those connected with the treasury, the places of the tellers, the auditors, and the clerk of the pells. As these officers were paid by fees and percentages on the monies which passed through their hands, the work being done by deputies, their profits were always growing. In 1783 a fixed salary of £2700 a year was assigned to the tellers. In 1812 Lord Camden, the last of the tellers appointed under the old system, surrendered to the state all the profits in excess of this salary to which he would have been entitled. By this liberality on his part the treasury saved £244,400 in twenty-two years.

Various causes have tended to multiply sinecures. Offices which had once been important, but had been rendered useless by changes in administration, have been retained either through sheer neglect or as a means of influencing an aristocracy or a parliament. At other times, offices which were useless from the beginning have been created to swell the pomp of a court. In France, under the old monarchy, the creation and sale of sinecure offices was a familiar means of raising money when the treasury was exhausted. The general suppression of sinecures in the 19th century has been brought about partly by the better control of governments by the tax-payers, and partly by the pressure of needful expenses which makes frugality imperative. The growth of bureaucracy tends, however, to produce a number of petty sinecures. In some states, notably in Italy and Greece, the officials are far more numerous than their work requires.

The existence of sinecures has sometimes been of advantage to men of real merit in science or letters. Many eminent Englishmen in the 18th century held sinecure offices. Sinecures such as the presidency of the council or the chancellorship of the Duchy of Lancaster serve as a provision for statesmen who are useful in the cabinet, though unable to undertake a department. A few ornamental sinecures in a court are harmless if the stipend is nominal. But speaking generally, sinecures must be considered pernicious abuses. They exhaust the revenue, they encourage idleness, they assist corruption, and are obstacles to administrative reform. Their multiplication is a sign of political decay; their suppression a symptom of political vitality.

[For examples of sinecures, see the literature and general histories of France and England in the 18th century; Taine, *Ancien Régime*.—Burke, *Speech on Economical Reform*.] F. C. M.

**SINECURES, COLONIAL.** One of the most discreditable political abuses on record was that of conferring posts of responsibility in the colonies on men in England who took no personal part whatever in the duties, and never went out even to see the colonies where their office lay. They were simply devices for extracting fees in order to furnish incomes for

court favourites at first, for parliamentary partisans later on. The abuse ran on for nearly two centuries. The offices were conferred by letters patent, and the patentees at once appointed deputies *en permanence*. In fact they put the office up to auction; the lessee to pay over a certain amount, do the work, and get what he could. The proportion of revenue allotted to the work is illustrated in the letting of an office estimated at £1050 for £840 a year. Of course the holders of the leases had to squeeze out fees to the utmost from the unfortunate colonists. The perniciousness of the system needs no demonstration, but it is strikingly shown in the fact that, owing to the comptrollership of customs at Kingston, Jamaica, being a patent office, fees on shipping in that port were five times higher than those in the Atlantic ports after the independence of those colonies.

These abuses prevailed over all our colonies and plantations where crown offices were concerned. In 1814 it appears that the "colonial secretaryship," *i.e.* the chief administrative office under the governor, was in the hands of absentees in every one of our colonies. The climax of abuse was, however, inflicted on the great colony of Virginia which had to pay an absentee governor, the Earl of Orkney, for forty years.

In vain did the colonial legislatures protest; in 1699, 1711, 1715, they passed acts against non-residence; but the absentees lived near Westminster, and these acts were "disallowed." At last, in 1782, Lord Lansdowne, secretary of state, forbade the issue of more non-resident licenses; but the colonial fees were too convenient for government purposes to be parted with hastily, and it was sixty years before reform was effected. In 1814 there were still 94 such offices, held by 55 absentees—several had more than one—and of these 90 had been issued since Lord Lansdowne's order. But the atmosphere of the approaching reform bill proved effective, and by 1834 they had been reduced to 6, and soon they disappeared.

A. C.

SINGLE TAX, *THE*, is the ordinary name for the proposal "to obtain all public revenue, national and local, by taking as nearly as may be all the rental value of natural opportunities, without regard to improvements." This, however, is only the fiscal side of the proposition. The real problem, as stated in George's *Progress and Poverty*, is to discover the law which associates increasing want with advancing wealth, the cause of "recurring industrial depressions, and of the tendency of wages to a minimum which will give but a bare living." Advocates of the single tax find this cause in the institution of private property in land. The proposed method of collecting public revenue, by appropriating economic rent to public services,

and leaving to producers of wealth the exclusive enjoyment of their entire product, will, it is believed, reverse the present tendency of wages and interest to a minimum and cure the evils arising from the unjust and unequal distribution of wealth. The proposition is to abolish all taxation save that upon land values. The argument for the proposition rests upon a distinction between the wealth produced as the result of individual effort (wages and interest) and that which results from the aid given by the community as a whole to individuals (economic rent); or as otherwise expressed, between the product of industry on land at the margin of cultivation and the greater product of any industry more favourably situated. "Economic rent" is identified with unearned increment (see INCREMENT, *THE* UNEARNED). The effects which are expected to follow from the adoption of the single tax are:

1. That it would "lift the whole enormous weight of taxation from productive industry," opening new opportunities for the investment of labour and capital.

2. That it would "counteract the tendency to inequality."

3. That "all classes whose interests as land owners do not largely exceed their interests as labourers or capitalists, or both, would directly gain."

4. That "greater simplicity would be possible in government."

Physiocratic writers had favoured a LAND TAX upon grounds not unlike those now put forward by advocates of the single tax, and John Stuart Mill was president of a society for the promulgation of the idea that future unearned increment should be appropriated by the state. But the modern single taxer proposes not merely the appropriation of the future increment, but also the confiscation of all existing land values to the amount "that will leave the least selling value by which the action of the market will serve to measure assessments and make sufficient return to induce private individuals to act as real estate agents without direction of government." It is argued that to leave land owners in possession of their present incomes would be to continue a wrong against society.

Herbert Spencer, in *Social Statics*, deduced the right of each man to the use of the earth from the law of equal freedom, and held that the maintenance of this right necessarily forbids private property in land. (This has since been retracted by him). The recent tendency among advocates of the single tax is to place the weight of their argument upon the principle that the rental value of land justly belongs to the community, rather than upon the economic and social blessings to be obtained from the measure. It thus becomes a question of ethics rather than of economics. Economic prosperity could not survive the carrying out of the pro-

posals, as the mainspring of individual energy would be broken.

### SINKING FUND.

History of the Sinking Funds, p. 405; Walpole's Sinking Fund, 1716, p. 405; Sinking Fund, 1717-1758, p. 405; Sinking Fund, 1786, p. 405; W. Pitt's Sinking Fund, p. 405; Vansittart's Sinking Fund, 1813, p. 406; Principle of a Sinking Fund, p. 407.

A sinking fund is a fund formed by the investment of annual savings or other contributions with a view to the ultimate application of the moneys so accumulated in payment of a previously incurred public debt.

The mismanagement of certain attempts to form a sinking fund for Great Britain during the 18th century discredited the term, which has been held up to ridicule by many writers on finance as representing an illusory and unscientific expedient. This, however, is to mistake the abuse of a thing for its use.

It is a sound policy in finance to begin making gradual provision for the repayment of a loan from an early period in the currency of the loan. It is practically impossible in national finance to arrange for the payment of large masses of debt at one time. It is of little use as a matter of experience to devote the surpluses of good years to reduction of debt. The payment of interest on a debt has become so much part of a nation's life that it seems easier to let it run than to make a sacrifice and repay it. But if a regular annual provision over and above the interest be put by every year for the purpose of forming a capital fund and for ultimate use in repaying the debt, it becomes a sort of sacred obligation, which it is discreditable to shirk.

The authors, therefore, of the earlier sinking funds were on a sound basis as far as principles went.

*History of the Sinking Funds.*—Although there seem to have been certain earlier germs of a special fund for repayment of certain debts (see 8 & 9 Will. III. c. 20 in 1697 and other later acts), the first plan for the discharge of the national debt formed on a regular system was Sir Robert Walpole's sinking fund, which was finally established in 1716 (3 Geo. I. c. 17); the terms of the act establishing it enacted that the surplus of certain specified duties and funds "shall be appropriated, reserved, and employed to and for discharging the principal and interest of such national debts and incumbrances as were

incurred before the 25th December 1716, and are declared to be national debts and are provided for by act of parliament, in such manner and form as shall be directed or appointed by any future act or acts of parliament to be discharged therewith or out of the same, and to or for none other use, intent, or purpose whatsoever." Various acts were passed from time to time for carrying further sums to the credit of the fund. This first sinking fund broke down obviously because, at an early period of its existence, acts were passed to charge expenditure of different kinds upon the fund. In fact parliament deliberately diverted the fund from its legitimate objects, first by small encroachments, afterwards by charging upon it more than half the interest of the national debt together with the greater part of the other annual expenditure. In the reports of the public accounts commissioners of 1780-83, the fund as such scarcely figures, and the early formation of a plan for the reduction of the debt was urged, with the recommendation that the obvious means to this end was the creation of a fund to be invariably employed under proper direction to the gradual diminution of the public debt.

The thorough rottenness of this piece of financing will be seen at once from the following figures:—

Total legitimate receipts of the sinking fund from 1717-88	£200,613,693
Amount of fund applied to pay interest on debt 1717-88	£98,768,623
Amount applied to ordinary expenditure	93,251,704
	<u>£192,020,327</u>
Amount applied to reduction of debt	£23,934,344
Excess of expenditure over income in the whole period 1717-88	£184,615,814
Amount of loans raised	£189,417,658

in other words the fund was almost entirely absorbed by expenditure other than the repayment of debt; notwithstanding this, there was an excess of expenditure over income in the whole period which approached the whole amount of the sinking fund; and while on the one hand a sinking fund was being diverted from its purpose of repaying debt, on the other a new debt almost equal in amount to the sinking fund was being incurred.

In 1786 the consolidated fund was formed with the view of taking over the charges which had exhausted Walpole's sinking fund, and a new sinking fund was instituted by W. PITT under 26 Geo. III. c. 31. The real author of the scheme was said to be Dr. PRICE; and he showed that he rightly grasped the principle which should guide such legislation—consignment to a permanent commission, penalties for

dereliction of duty, determination to keep up a settled rate of contribution. The proposal was to set aside £250,000 quarterly, or £1,000,000 a year, out of the old surplus duties which formed the previous fund, according to an act of the following year out of the consolidated fund; all moneys were to be paid into the Bank of England, to the credit of certain commissioners who were to apply them to the reduction of the national debt, and in no other manner whatsoever. Certain other sources for income were also assigned to the commissioners. With the total received they were to purchase portions of the public debt, and if possible below par; stock so purchased was to be transferred to the account of the commissioners at the Bank of England, which received future dividends thereon for credit of the commissioners till the dividends so received reached £4,000,000 a year.

It appears to have been intended that thus £5,000,000 a year would be devoted to the purchase of stock, on which the dividends would lapse, the nominal capital being transferred to the credit of the commissioners till it amounted to the same sum as the debt.

In 1792, besides a further incidental provision for discharge of debt sometimes called a sinking fund but not properly one, there was introduced the principle of the true sinking fund as it is now understood, viz. that in raising further loans, besides interest an annual provision of 1 per cent should be made for gradual redemption. This plan, however, was modified in 1798.

The two sinking funds above described were combined in 1802, the main features of each being, however, maintained.

Of Lord Henry Petty's proposal for a new sinking fund on more complex principles it is unnecessary to say anything, as it came to nothing.

In 1813 the sinking fund was modified by Mr. VANSITTART when chancellor of the exchequer; the details of the change are not important; its main points were the final discharge of the old debt of 1786 and a general and continuous application of the fund to all loans thereafter raised. The act (53 Geo. III. c. 35) legalising the change recited that the amount of £238,350,143:18:1 had been actually purchased by means of the sinking fund.

In 1817 the sinking fund of Ireland was consolidated with that of Great Britain, and in 1819 the whole question of those funds was considered by a committee of the House of Commons which passed a resolution in favour of setting aside £5,000,000 a year surplus income for the purpose of discharging debt. In practice this led to a series of illusive operations with a view to showing a surplus of £5,000,000 yearly—a chief feature in which was borrowing from the sinking fund itself.

In 1823 (4 Geo. IV. c. 19) one more effort

was made to reconstitute the sinking fund on the simple basis of a provision of £5,000,000 a year from the consolidated fund. But in the ensuing years this provision was misapplied in aid of the conversion of the debt.

Thus far it would appear that the general principle described was tolerably sound and based upon a laudable intention. The method in which the principle was applied or rather infringed provoked the criticism of every sound financier. The fund may be considered to have received its death-blow from Lord Grenville's essay in 1827 followed by the recommendations of the parliamentary finance committee in 1828.

The facts of the operations up to that date were as follows:—

#### Receipts of Sinking Fund—

Issues from the exchequer . . . . .	£78,294,278
Percentage on new loans, etc. . . . .	166,473,919
Other receipts . . . . .	97,126,693
	<u>£336,894,890</u>

#### Application of Fund—

To pay off debt. . . . .	£330,050,455
To pay life annuities, etc. . . . .	6,844,435
	<u>£336,894,890</u>

Nominal amount of debt re-deemed . . . . .	£472,942,703
Fresh loans raised . . . . .	£1,052,536,700

from which it appears that just about half the actual receipts of the fund were raised by loans; and that while the fund was accumulating further debt was being incurred, so that in any case the reduction of debt was imaginary rather than real.

There was, however, an actual loss to the nation upon the continuance of the fund, for it has been calculated that the loans raised during the great war at the beginning of the century carried interest at an average rate of £5:0:6 per cent, whereas the previous loans to the extinction of which the sinking fund was devoted carried only £4:10s. per cent interest. In fact, debt was incurred at a higher rate of interest to pay off debt at a lower rate,—a piece of unsound finance which the straits of the nation did not justify, which cost us over  $\frac{1}{2}$  per cent on at least £330,050,455, or more than a million and a half a year for many years.

It is little wonder that the sinking fund was assailed by the economists of the second quarter of this century. "This worthless compound of delusion and absurdity"—M'Culloch calls it. "We doubt," he says, "if the history of the world can furnish another instance of so extraordinary an infatuation."

The House of Commons committee of 1828 restored the idea of the sinking fund to its

original and proper basis, although at the time the recommendation had an air of novelty; it decided that a sinking fund can only depend on a surplus of revenue; and suggested that the aim of the chancellor of the exchequer should be to obtain an annual surplus of £3,000,000 a year to be devoted to the extinction of debt. A modification of this recommendation was proposed by Goulburn in his budget speech of 11th July 1828, and in 1829 a definite arrangement was carried into effect whereby one-fourth of the surplus of revenue in each year was to be issued to the national debt commissioners who were empowered to buy up exchequer bills or other portions of funded or unfunded debt as seemed to them most advantageous.

For about forty years this arrangement was in force, but the annual amount devoted to the extinction of debt never reached anything like £3,000,000; on the average of years it was not more than £1,300,000.

In 1866 the special acts relating to sinking funds were repealed and the remnants of the old sinking fund of 1786 swept away, but a provision was retained under which certain surplus revenues were applied to the extinction of debt. The results of this provision still survive under the name of the "Old Sinking Fund"; in 1875 (38 & 39 Vict. c. 45), the present "New Sinking Fund" was instituted by the enactment that a certain annual sum should be devoted to the service of the debt, and that such balance of this amount as was not required for interest should be applied as a sinking fund.

But these arrangements, which have on occasion been suspended for a time, are not true sinking funds; and the most recent attempt at such a fund in this country, the provision of a true sinking fund to pay off the local loans annuities (44-45 Vict. c. 55), has been shortlived.

It may be stated broadly that in recent years the idea of devoting any definite proportion of the surplus revenue to the extinction of debt, has been abandoned in favour of the plan of terminable annuities, or special schemes of conversion. But considerable reductions were made in the years 1906 and 1907. [See NATIONAL DEBT.]

Sir Robert Giffen in 1867 (*Essays in Finance*, 1st series, 4th ed. (1886), p. 259) made a stand against the prevailing sentiment, and formulated an able plea for a national effort to reduce the debt, though this at present presses very lightly on the British nation as compared with the time when it was contracted. A good sketch of the change of opinion in this direction is given in a parliamentary return of 1869, 366, I., pp. 724-25.

*Principle of a Sinking Fund.*—As indicated in the opening words of this article, a sinking fund

is in its essence a good thing. It is used with great effect in modern public loans of a limited currency. In spite of the discredit which fell upon the old sinking fund the essence of the system has been preserved and applied by financiers during the last fifty years. The United States, for instance, after the war of 1862, set aside 1 per cent of their entire debt every year as a sinking fund (*Foreign Office Reports*, 289, United States, 1888, p. 18).

The successful application of a sinking fund depends on two things: (1) the regular investment of a given annual sum, the produce of taxation or savings, to be applied to the reduction of debt; (2) the accumulation of all the interest upon such sums for the same purpose.

The claim made by Dr. PRICE for the old sinking fund, that it was accumulating at compound interest and paying off debt by its own unaided force, was theoretically accurate; if the fund had been invested outside the country and the interest received had been also so invested each year—each annual sum would have been bearing compound interest. The claim, however, was in the particular instance based on a fallacy, because the annual contributions were invested in the purchase of the debt which they were intended to pay off; therefore the dividends received on the contributions were in effect payments on a dead debt and in themselves unnecessary,—in other words increased contributions from the tax-payer under the guise of dividends. Under such a scheme, especially when the principal was often raised from loan funds, it was absurd to attribute any merit to the sinking fund beyond the bare facts.

In the case of loans to communities such as some of the crown colonies of the British empire, whose resources are not unlimited, and whose credit is easily shaken by over-borrowing, the sinking fund is a guarantee which greatly increases the confidence of the lending public. Such loans are usually repayable within a limited period. To provide for that repayment without undue pressure at any one time the borrowing body—colonial government, or municipality, or whatever it may be—provides usually 1 per cent per annum on the capital of the loan over and above the interest, payable to trustees who invest the sums so received in the securities of other bodies, and accumulate both capital and interest in such a way as to form a fund amounting by annual accretions and at compound interest to the total debt to be repaid. Almost all the smaller British colonial loans at the present day, whether issued in bonds or as inscribed stock, carry a sinking fund of this kind, calculated to pay off the capital at the expiration of the currency of the loan. The success of such funds is undeniable, because they can obtain the two conditions essential to success, viz. official trustees of unimpeachable integrity and an area of absolutely sound in-

vestment much larger than the debt which they are intended to pay off.

The latter of these conditions is not readily available in the case of the debt of a great nation, which cannot find a large field for foreign investment without unduly driving up the price of the stock in which it elects to invest, and in any case must take a risk of loss if it quarrels with the nation whose stock it holds. For such a nation simple paying off and wiping out of its own debt is the safest plan.

[The literature of the old sinking fund is considerable, vide M'Culloch's *Literature of Political Economy*, 1845, pp. 320 *et seq.* See especially *Parl. Return*, 366, I., of 1868-69, pp. 710 *et seq.* Price, *Appeal to the Nation on the Subject of the National Debt*, 1774.—Hamilton, *An Inquiry into the National Debt*, 1813.—Grenville, *An Essay on the Sinking Fund*, 1827.—M'Culloch, *Taxation and Finance*, pp. 446 *et seq.*, London, 1849; *Parliamentary Returns*, c. 8520-1847.—Ricardo, *Works*, pp. *seq.* and *Letters*.] C. SISMONDI, JEAN CHARLES LEONARD SIMONDE DE (1773-1842), born and died at Geneva. Celebrated principally as an historian, he deserves to be studied for the independence of his intellect, the integrity of his character, and his lofty humanitarian sentiments—notwithstanding the errors in his economic views, particularly with regard to labour questions.

He began life as an employé in a house of business at Lyons, which was broken up by political events and the commencement of the revolution. After returning to Geneva, his family were obliged, for the sake of safety, to take refuge in England. They soon returned to make a short stay in Geneva, where young Charles narrowly escaped death in defending his fellow-countrymen.

His father then bought land in the country near Florence, and Charles Sismondi gave himself up entirely to agriculture. This was the beginning of his study of political economy, and it was a happy beginning. The economic conditions of this branch of industry were to him the object of deep study,—interesting traces of which are to be found in all his later works.

Among other things, the advantages of MÉTAYAGE have often been ably illustrated by him.

His first work, *Tableau de l'agriculture toscane*, 8vo, 1801, dates from this period. Two years after he published *La richesse ou principes d'économie politique appliqués à la législation du com-*

*merce*, 2 vols. 8vo, 1803, his masterpiece, in which he boldly avows himself on the side of Adam SMITH, seeking, however, to correct him in some points. He was not then acquainted with J. B. SAY, whose great work *Traité d'économie politique* appeared in 1803. However, they agreed on several subjects, not the least important of these being FREE TRADE. The weak side of Sismondi after this date was the question of the division of the value of a product between the different factors by which it had been created. His mistake on this question, which was only half formulated in 1803, may be described as the theory of the essential wage—what the Roman Catholic Church at the present day calls the *juste salaire*; this took definite form as time went on. His views are questionable also on the question of the basis of the right of property which he regarded “as a fortunate usurpation, a gift of society, and not a natural right anterior to it.” Between 1807-18 he published his celebrated *Histoire des républiques italiennes du moyen-âge* (16 vols. 8vo), a work of the first rank in which economic subjects are often approached with a masterly hand.

A journey which he made, at the commencement of the restoration, to England, where he had not been since 1793, had an unfavourable influence on his economic views. The influence exercised by the increase of machinery on the condition of the work-people on the other side of the Channel touched him deeply. The sufferings he witnessed moved him to such an extent as to influence his public opinions. From that time his reason was the slave of the sentimental impulses of his heart, and *Les nouveaux principes d'économie politique ou de la richesse dans ses rapports avec la population* (2 vols. 8vo, 1st ed. 1819; 2nd ed. 1827) display serious incongruities when compared with his work of 1803. In the latter he declares that economic science is “in many respects the domain of sensibility and the imagination,” and attacks with vigour the doctrine of *laissez-faire, laissez-passer*. This work is a mine whence the socialists have extracted those erroneous but moving arguments with which they attack the natural order of economic society. In conclusion, Sismondi proposes two remedies, the one—prohibition by law of the marriage of all who cannot prove they have sufficient means to bring up a family. He proposed this specific in 1819; he gave it up in 1827. The other—the charging the employer with whatever is required to make up what he terms the *necessary wage* of the workmen.

In other words, the supposed needs of the labourer—things which are extremely variable, varying according to country, period, individuals, profession, age, customs, etc.—are to fix his salary.

This discussion on the position of the workman's wage is characteristic of the time when Sismondi wrote his principal works, a period influenced by the distress caused by the great war on the continent and the economic troubles which followed when peace returned to Europe.

The development of the erroneous doctrine of the necessary wage is set forth theoretically in *Richesse commerciale*, 1803. A letter to Channing written in 1831 shows that Sismondi at last had doubts as to the efficacy of the second remedy, and

renounced it while proposing others. A collection in three volumes appeared 1836-38 under the title of *Études sur les sciences sociales*—the first was devoted to *Études sur les constitutions des peuples libres*, and the two others to *Études sur l'économie politique* which reproduced the views in the former work almost literally, or at least views inspired by the same doctrine.

Sismondi devoted twenty-three years of his life (from 1818 to 1842) to his *Histoire des Français* consisting of thirty-one volumes of which one volume contains the tables. He was prevented by death from doing more than twenty-nine volumes, and the thirtieth as well as the general index is written by M. Amédée Renée. It is an excellent work, but it would have gained, especially as regards style, by another revision.

Sismondi, in conjunction with Fix, assisted in the establishment of the *Revue nouvelle d'économie politique*, which, in spite of its excellent editors, existed only for a short time (1833-1835).

Sismondi took part throughout his life in the political movements of his country—he was a member of the *Assemblée constituante helvétique*, and was appointed an active member a few days before his death, when he delivered a speech, though with great difficulty.

Besides those just mentioned, Sismondi produced many works, the most important of which are *De la littérature du midi de l'Europe* (4 vols. 8vo, 1813), republished in 1819 and 1829; *Julia Sévère ou l'an 420* (a description of the manners and customs of the Gauls of the time of Clovis) (3 vols. 12mo, 1822).—*Histoire de la renaissance de la liberté en Italie, de ses progrès, de sa décadence et de sa chute* (2 vols. 8vo, 1832).—*Histoire de la chute de l'empire romain et du déclin de la civilisation de l'an 250 à l'an-1000* (2 vols. 8vo, 1835).

M. Mignet, in May 1835, and M. Alph. Courtois in October 1892, read notices of Sismondi and his works before the *Institut de France, Académie des sciences morales et politiques*, the former regarding him as an historian and a man of letters, the latter as an economist. A. C. f.

**SIXPENCE.** English silver coin, first struck in the reign of Edward VI.

The following is a list of the coins of this denomination issued since that time:—

Reign.	Year.	Weight.	Fineness.	Value in silver 925 fine at 5s. 6d. per oz.

**SLAVERY.**

Slavery, p. 409; Slave Trade, p. 409; Slave Labour, p. 410.

From the earliest times in all nations the system by which the stronger enslaved the

weaker has for a time prevailed. In early times it was customary to reduce to the status of slave all captives taken in war, however noble their birth might be. Alike in the East, in ancient Greece, and in ancient Rome, the system flourished. Of the conditions of slave life in Greece and Rome full accounts have come down to us, but to enter into the details of the status and its ameliorations is hardly within the scope of this article (for further information see **ABOLITIONIST**; **EMANCIPATION**; **SERF**; **VILLAINAGE**). The general recognition of slavery as a lawful status was made more and more impossible by the spread of the Christian religion.

*Slave Trade.*

Nevertheless, in the course of the 16th century, a new and systematic traffic in slaves was inaugurated by Christian nations, and a régime of cultivation based on slavery was continued almost to our own day. The use of negro slaves by the Moors in North Africa, which had existed from time immemorial, probably suggested the idea of negro slaves to the Portuguese and Spaniards. The importation of the African negro into America and the West Indies became a recognised and profitable traffic which quickly fell into the hands of the Dutch, and later, under the **ASIENTO TREATY** of 1713, was almost monopolised by the English. The facility of obtaining such labour built up the sugar industry of the West Indies, but placed it on a wasteful and extravagant basis; the same facility opened the mines of Mexico and Peru. To some extent the Spaniards and Dutch also enslaved the American aborigines; but these were inferior labourers, and the Dutch in their greatest American settlements—those in Guiana—found it the best policy to treat the natives as friends and allies. The king of Denmark, in 1792, took the lead in abolishing the traffic in negro slaves, England followed in 1807, and in the same year the United States completed their legislation against the trade. France was not long behind. The Spanish government, which had always secretly encouraged the traffic, though interdicted from its actual exercise by the power of the Dutch, were last to give way. It followed naturally from the abolition of the slave trade that slavery itself should be abolished. It is hardly necessary to do more than refer to the emancipation of all slaves in the British colonies in 1833, and to the abolition of slavery in the United States in 1862 which led to civil war the same year. Through the action of Cuba (1886) and Brazil (1887) slavery in nations of European origin has entirely disappeared. Yet even at the present day, amongst highly civilised nations, forms of slave traffic are liable to revive from time to time, and are only checked by a lively public morality.

*Slave Labour.*

It is generally admitted by economists that slave labour is dear labour, extravagant in method as well as brutalising in effect both on the master and slave. This may be fairly adopted as the broad principle based on experience and history; but it is not always of the essence of slave labour; many instances have occurred, both in the West Indies and the southern states of America, where a sort of feudal attachment had sprung up between slaves and the employer. It is possible that this could only take place where a creature of low organisation could not look beyond mere bodily comfort. There are certainly many who know the West Indian negro well who would argue that a negro slave, really well cared for, will do better and more cheerful work than many a free man. This side of the picture has been too often overlooked by writers on slavery; they have naturally revolted from the whole conception of slavery, and detested the thoughtlessness and barbarities which were too often the most conspicuous accompaniments of slave life in the West Indies and the southern states.

So far as the condition of slaves was regulated with harshness, their labour was marked by the following defects:—

(1) A low degree of productiveness, because there was no personal inducement to do good work.

(2) Great wastefulness and expense (*a*) because of the necessity of a disproportionate amount of supervision; (*b*) because of waste of life and the importation of fresh slaves at a high cost.

It is so generally admitted that "slave labour is of all kinds the most inefficient, and that punishment and authority are inferior to reward and free contract as stimulants to exertion" (Nicholson, *Principles*, p. 359), that it is hardly necessary to discuss the question fully. It is desirable, however, to point to the particularly fair and impartial summing up by MILL as to the extent to which slave labour in the West Indies may have enabled the organisation of the sugar industry, and been a source of wealth to the employers.

[The literature of slavery is endless, especially the English works during the first half of this century. For an account of it in Greece and Rome see Smith, *Dictionary of Antiquities*; *s.v.* "Servus," and Wallon, *Histoire de l'Esclavage dans l'antiquité*, Paris, 1879, 3 vols. 8vo. For Rome see also Ramsay, *Manual of Roman Antiquities*, pp. 94-100. For a summary of negro slavery, see Payne, *European Colonies*, p. 73-5.—Caldecott, *English Colonisation and Empire*.—Lucas, *Historical Geography—West Indies*, pp. 65 *et seq.* For economic effects consult Adam Smith, *Wealth of Nations*, bk. iii. ch. ii.—Mill's *Principles of Political Economy*, bk. ii. ch. v.—Nicholson, *Principles*, pp. 358-359.—Cairnes, *Slave Power*, 2nd ed. 1863.] C. A. H.

## SLIDING SCALE (WAGES).

Sliding Scale, p. 410: the Standard Wage in the Sliding Scale, p. 411.

SLIDING SCALE (WAGES). In trades where it is recognised that the wages of labour may appropriately vary with the price of the particular product into which the labour enters, as in coal-mining, and where there are organisations of capital and labour strong enough to obtain trustworthy statistics and enforce decisions, the sliding scale seems to commend itself as an admirable way of regulating wages. The initial difficulty lies in determining the "standards"; that is, the price which may be considered normal and the wage which may be considered normal when this price rules (see STANDARD RATE (OF WAGES)). The second difficulty lies in fixing the percentage of rise or fall of wage which shall accompany rise or fall of price, in such a way that there shall be an approximately satisfactory division of the added price between labour and the other factors. Usually a certain period of time, from one to six months, is taken as normal, and the average prices and wages ruling during this period are taken as the "standards." The relative percentages of rise or fall are likewise empirically determined. A revision-period of two or three months being decided on, at the end of each revision-period chosen accountants, who have access to the books of the employers, decide whether price has risen or fallen, and, on this finding, intimate an advance or reduction of wages.

For example, when the South Wales sliding scale was established in 1875, the standards were taken by reference to the prices and wages ruling during the year 1869: the revision-period was fixed at six months; and the percentages were  $7\frac{1}{2}$  rise in wage for every shilling per ton advance in the price of coal. Since then various changes have been made from time to time; at present the standard price is between 7s. 10 $\frac{1}{2}$ d. and 8s. Wages alter  $8\frac{3}{4}$  per cent for every shilling in the rise or fall of coal; the revision-period is two months.

The advantages of a sliding scale as, to a certain extent, reconciling the interests of labour and capital, need not be dwelt on. It is, of course, only in a few cases that labour enters so largely and directly into the making of a particular commodity that wages can be regulated by its price. But in coal and iron-stone mining, and in the manufactured iron and steel trades, the application of the sliding scale is easy, and the fact that, for over twenty years, the richest and largest coal-fields in Great Britain, those of South Wales, have held by the system without a break is sufficient proof of its practicability.

The practical difficulties encountered may for the most part be traced to an economic weakness in principle. Granted that labour and capital, as instruments of production, get their value from that realised by their products,

and that the total remuneration of labour may be expected to follow the value of the total product of industry (national dividend), it is questionable if this principle is realised by a system which establishes a direct connection between price of any one kind of labour, and price of any one product. It is evident that the price of coal may be advanced or reduced without much reference to general prosperity, and a particular class of wages may, under a sliding scale, be raised or depressed at the same time that wages generally are taking an opposite direction, in which case the miner obtains a disproportionate share of the national produce. In the long run this would probably work out fairly enough, but it is a common experience that workmen are slow to recognise that, if they get an advance of wages when, irrespective of general prices, the prices of their particular product rise, they must submit to a reduction when the prices of their particular product fall. Where it is customary for employers to take contracts for delivery over long periods at a fixed price, as in shipping orders, in supply for gas works, etc., another form of the same difficulty emerges. In such cases the rise of wages which might be expected from the current newspaper quotations for coal does not come at the end of the revision-period, and may never come at all if prices should fall again before the contracts expire. The men are apt to think that they would have been better off without a sliding-scale system. It is difficult, too, to persuade them that their employers, in making the contracts, have not trusted to the sliding scale to keep wages down, particularly if miners in other parts of the country, not under the sliding scale, are enjoying an advance.

The experience of South Wales, however, has proved that when men and masters meet round a table to discuss points of conflict, the difficulties mentioned are found not insuperable.

THE STANDARD WAGE IN THE SLIDING SCALE. The determination of the "standard wage" on a sliding scale is usually empirical, being either the current wage at the time when the scale is established, or the average wage over a period of time taken as normal. Theoretically, the standard wage should be the wage which will keep the remuneration of the particular labour in equilibrium with that of all other kinds of labour of similar skill and conditions in the country; rises or falls therefrom being regarded either as accidental or as tending to balance each other. According as the empirical determination coincides with the theoretical standard, may the sliding scale be expected to work satisfactorily or not (see SLIDING SCALE).

[J. E. C. Munro, *Sliding Scales in the Coal Industry*.—*Sliding Scales in the Iron Industry*.—L. L. Price, *Industrial Peace*.—Smart, *Studies in Economics*, No. III.] w. s.

SLIP. When an insurance broker is requested to effect a marine insurance he prepares a brief memorandum (called the slip) of the particulars of the proposed risk, which is presented to the underwriters, who each initial it for the sum he underwrites. The slip forms the agreement between the parties, but by the 30 Vict. c. 23, § 7 and 9, a marine insurance must be embodied in a policy. The slip, therefore, is not enforceable, though it may be given in evidence, if material (see INSURANCE, MARINE).

[Arnould on *Marine Insurance*, London, 1887.] J. E. C. M.

SMALL HOLDINGS ACT 1892 (55 & 56 Vict. c. 31). Ever since J. S. Mill's *Principles of Political Economy* dwelt so earnestly on the usefulness of PEASANT PROPRIETORS, there has been a growing opinion in favour of an increase in the number of small landowners in England. But such a result is more easily desired than attained. Agricultural estates in England are usually of considerable extent, and their owners are commonly anxious to keep them undiminished. When the owner is disposed to sell, he generally finds it more convenient to sell in considerable quantities. Even when the owner is disposed to sell the land farm by farm, a single farm is usually more than the most thrifty labourer can purchase. He finds it cheaper and altogether more advantageous to hire than to buy. Partly through these obstacles, and partly through the opportunities of a different kind offered by the towns, the ambitious and energetic labourer seldom even thinks of becoming a landed proprietor. Occasionally he becomes a tenant farmer, but though this may be a more comfortable condition, it is not what agrarian reformers have desired for the country. In recent years the decline of agriculture has made many landowners anxious to sell at a low price to any one who would buy land, and the legislature has passed the Small Holdings Act to assist the labouring class to take advantage of this opportunity. Any county council may, and every county council not of a borough must, appoint a committee to consider whether there is cause for putting the act into operation. Any county elector may petition the council to do so, and if his application is in good faith, it must be acceded to. The county council may buy or lease land for small holdings, but has no power of compulsory purchase. It may also execute such works of road-making, draining, and fencing, as can best be carried out before the land has been divided. It may then sell the land in small holdings, that is to say, holdings of more than one acre but not of more than fifty acres, or exceeding an annual value of £50. One-fifth of the purchase-money is to be paid on completion of the contract, and the balance by half-yearly instalments of principal and

interest spread over fifty years. Moreover, a fourth of the purchase-money may be secured by a perpetual rent-charge. Where the land has only been leased to the county council, or where the person desiring to occupy it cannot afford the purchase-money, it may be let in small holdings of not more than fifteen acres, or £15 annual value. Small holdings are only to be provided for those who mean to cultivate them personally, and must not be used for any but agricultural purposes, or be divided, assigned, or let without the sanction of the county council. The county council may also advance to tenants of small holdings on private estates the money necessary to purchase such holdings. Where small holdings have been provided, the county council may delegate its powers to a committee containing representatives of the parish council in whose jurisdiction the small holdings are situated. The intention of the act is that the county council should not incur any permanent loss in carrying out its provisions. The temporary burthen imposed on the county must not be more than can be met by a rate of 1d. in the pound.

No appreciable effect has been produced at present by this act. A parliamentary return, printed August 1895, showed that up to that time petitions under the act had been presented in rather less than half the counties of England and Scotland, that small holdings had been provided only in some eight or nine counties, and that their total extent was but a few hundred acres. It is impossible to predict whether the act will be more operative in the future.

#### SMALL NOTES. See BANK NOTES.

SMITH, ADAM (1723-90), was born at Kirkcaldy, Fifeshire, N.B., a few months after the death of his father, who was comptroller of the customs of Kirkcaldy. He attended the grammar school there, was barely three years student at Glasgow University (1737-40), and went with a Snell Exhibition in 1740 to Balliol College, Oxford. There he remained till 1746, returned to Kirkcaldy, delivered lectures on literature as well as on economics at Edinburgh 1748-49, and edited the poems of Hamilton of Bangour, published 1749. In 1751 he became professor of logic at Glasgow, and was transferred to the chair of moral philosophy in 1752. He contributed to the short-lived *Edinburgh Review* 1755, and gained fame outside of Scotland by his *Moral Sentiments* 1759. Charles Townshend persuaded him to resign his chair in 1763 and become travelling tutor to the young Duke of Buccleuch. Under these auspices he visited Paris, Toulouse, Bordeaux,

Montpellier, and Geneva, but stayed longest (a year and a half) at Toulouse, and nearly a year at Paris. The *Wealth of Nations* was begun at Toulouse; and the author owed to this French visit the knowledge of French industries, finance, and administration so abundantly manifested throughout that work. His pupil's rank, his own rising fame, and, not least, his friendship with David HUME, secured him access to the philosophical, political, and literary celebrities whom he would most have desired to know, including VOLTAIRE, TURGOT, and QUESNAY. Returning to England October 1766, he was back at Kirkcaldy in May 1767, and was little out of it, except to visit Edinburgh and London, till the end of 1773, when he seems to have lived in London till his book was out at the beginning of 1776, the year of Hume's death. Two years afterwards Adam Smith was made commissioner of customs at Edinburgh 1778, and remained there till his death in 1790.

What Adam Smith proposed to achieve was not merely a treatise on moral philosophy and a treatise on economics, but a complete moral and political philosophy, in which the two elements of history and theory were to be closely conjoined. This was his programme as early as 1759, for it stands recorded in the concluding sentences of the *Moral Sentiments*. It was carried out for ethics in the *Moral Sentiments*; but Adam Smith found the rest of the programme too large for one book. "I shall in another discourse endeavour to give an account of the general principles of law and government and of the different revolutions they have undergone in the different ages and periods of society, not only in what concerns justice, but in what concerns police, revenue, and arms, and whatever else is the object of law" (*Moral Sentiments*, 1st ed., p. 551). In the *Wealth of Nations*, however, he dealt only with "police, revenue, and arms," in fact, with regulations founded on expediency, while those founded on justice remain almost entirely untouched as well as the general theory of jurisprudence itself. Some light is thrown on his probable lines of treatment by the Glasgow student's *Notes of Lectures*, edited by Mr. Cannan.

Adam Smith's theory of moral sentiments is, in brief, that they are founded, not, as Hume said, on self-interest, but on fellow-feeling—the power one man has of putting himself in the place of another, and judging others by himself, himself by others. On this foundation are built two distinct kinds of moral judgments, judgments of propriety and judgments of merit. To have propriety, an action done by another must show an effect proportioned to the cause, it must not imply a passion greater than I should feel in the circumstances; outbursts of passion must be so toned down that the spectator can enter into them. On the other hand, to have merit, an action must show a tendency to

produce a beneficent effect. In both cases, the judgment depends on a regard for others which is a reflected regard for ourselves. Thus the treatise is, as described in the later title-pages, "an analysis of the principles by which men naturally judge concerning the conduct and character first of their neighbours, and afterwards of themselves." One of the moral virtues, however, stands by itself, namely justice. It begins with fellow-feeling, but its main support is utility. Without justice, society could not remain in existence. We have seen that the *Wealth of Nations* itself may be said to have grown out of a projected treatise on justice. It is true that there is no reference in the *Wealth of Nations* to the earlier book, but there is no conflict between them, and we must believe the express statements of the author that they form part of one whole. A belief in the "invisible hand" is common to both, and there is the same belief that, on the whole, "nature" works for human happiness and progress. There is no confusion of happiness with wealth; we are told in the earlier book that happiness is fairly well distributed over all ranks of life rich and poor.

The *Wealth of Nations* (1776) is the book that has probably secured its author as near an approach to immortality as can fall to any economic writer. The following are the main outlines.

"Political Economy" is to Adam Smith "an inquiry into the nature and causes of the wealth of nations." (Title, compared with IV. ix. 307, 1, ed. McCulloch, 1863) "The annual produce of the land and labour" of a country makes "the real wealth and revenue of all its inhabitants" (II. iii. 149, 1). "The annual labour of every nation is the fund which supplies it with all the necessities and conveniences of life which it annually consumes" (I. Intro.). The labour is the "cause" and the commodities, the necessities and conveniences are the "nature" of the wealth of nations.

The subject is treated in five books. The first is devoted to labour, the second to stock, including capital, the third to the history of the growth of wealth in different nations, the fourth to systems of political economy, and the fifth to the state and its revenue.

Why are savage societies less wealthy than civilised? Mainly because of the division of labour that prevails in the civilised, to the immense increase of the productive powers of the labourers. It improves dexterity, saves time, and leads to inventions. It is due to a "natural propensity" of men to barter and exchange with one another, but it is not itself devised by men, it has grown up of itself. It is not due to difference of talents; on the contrary it creates these. It is limited by the extent of the market, being the more applicable the more the market is widened (I. iii.). It leads, through the growing difficulties of barter, to the invention of money (I. iv.). It is at once the cause and the condition of the formation of stock (I. i. cp. II. i. Intro.).

The mention of money leads to an inquiry into value, and a distinction of value in use from value in exchange. Money is for short periods a good common measure of value in exchange, and corn is a better for long periods; but labour, which was the first price for all things, is the best measure of their value. By "labour" here Adam Smith means the labour purchased by an article, not the labour involved in the making of the article; but he finds it hard to hold by this distinction, and to keep the senses of the words clear. (See I. iv. v.)

What are the "component parts of the prices of commodities" as they are? They are mainly three—wages, profits, and rent (I. vi.). These are "the three original sources of all revenue as well as of all exchangeable value. All other revenue is ultimately derived from some one or other of these" (I. v. 24, 1).

Now there is in every given society or neighbourhood

an ordinary, average, or customary rate of wages, profits, and rent, determined by the circumstances. This rate may be called the "natural" rate, and when goods are sold at such a price as to yield just this rate, then they are sold at their "natural" price. The market price is determined by the demand and supply of the moment, and may be above or below the natural price, but it "gravitates" towards the natural price (27, 2); if the producers are to carry on their business, the price "over any considerable time" must be equal to the natural price, the price it has really cost to bring the goods to market (I. vii. 25, 26).

In detail, the "natural rate" of wages was at first the whole produce (I. viii. 29, 1), but, after the appropriation of land and the accumulation of stock, it is part of a contract between employer and employed. The lowest wages would yield only physical necessities, but the actual customary rate is beyond that point in most countries, especially in England, where the customary rate has happily been rising. How high it is depends on the state of industry in a country, whether progressive, stationary, or declining (I. viii.).

The condition of the labouring poor, that is of the great body of the people, is happiest in the progressive state when society is advancing to the further acquisition of wealth (37, 1, cp. 35, 2). We seem to be in that state at present. On the contrary the rate of profit, reflected in the legal rate of interest, has been falling; "the increase of stock which raises wages tends to lower profit" through the competition of merchants (I. ix. 40). The two can be high together only in the exceptional circumstances of a new colony (42, 1).

If there is a "natural rate" for wages and profits, why is it that different trades are very differently rewarded? The answer is that in the long-established trades, under ordinary conditions, in the same neighbourhood, and apart from interference of government, "the whole of the advantages and disadvantages of the different employments of labour and stock must be either perfectly equal or continually tending towards equality" (I. x. 45, 2, cp. 52, 2); but this means that the disagreeable, difficult, responsible, precarious, and inconstant employments must have a money reward in proportion to their drawbacks. In the case of profits, the disadvantages that secure compensation are mainly disagreeableness and risk. Profits tend much more surely to a level than wages (50, 2).

Even where liberty exists, there would be causes at work to disturb the balance. But there is not perfect liberty. Corporations, apprenticeships, laws of settlement, restrict competition and hinder the circulation of labour in one department, while endowments increase competition in another. The result is a disturbance of the natural progress of the country, to say nothing of the wrong often done to the labourer by the infringement of his most sacred rights of property, "the property which every man has in his own labour" (I. x. pt. ii., Inequalities occasioned by the policy of Europe).

"Rent, considered as the price paid for the use of land," stands on a different footing from wages and profits. The landlord's interest is to leave the tenant "no greater share of the produce than what is sufficient to keep up the stock from which he furnishes the seed, pays the labour, and purchases and maintains the cattle and other instruments of husbandry, together with the ordinary profits of farming stock in the neighbourhood"; what remains is the "natural rent of land." It is a monopoly price, and is "not at all proportioned to what the landlord may have laid out upon the improvement of the land, or to what he can afford to take, but to what the farmer can afford to give" (xi. 60, 67). If the price of the produce is less than enough to repay the farmer his outgoings with ordinary profits, there will be no surplus for rent. Hence rent enters into price in a different way from wages and profits. "High or low wages and profits are the causes of high or low price; high or low rent is the effect of it" (67, 1). Land on which food is raised always affords a rent, for men multiply in proportion to the means of their subsistence, and so food is always in demand. Such land almost always produces a surplus for rent, though the amount of the surplus will vary (1) with the fertility, (2) with the situation (67, 2). The surplus too is greater for corn lands, and the value of these and their produce is greater also, till the time when with the extension of cultivation the supply of meat from the native pastures becomes insufficient,

and it becomes worth the landlord's while to turn corn lands into pasture (68, 2). In Europe for the most part corn lands regulate the rent of all other cultivated land (73, 1). If the common food were potatoes or rice, cheaper food than corn, the landlord's surplus would be larger, and the potato or rice fields would regulate the rent of the rest (73, 74).

The lands, which furnish not food but clothing or building materials, sometimes do and sometimes do not afford rent. "Countries are populous not in proportion to the number of people whom their produce can clothe and lodge, but in proportion to that of those whom it can feed." Among savages, perhaps one-hundredth part of the year's labour will be spent on clothing and lodging; the other ninety-nine will be no more than enough to provide food" (75, 2), and in the less civilised countries there will be no rent on any lands except those yielding food. But in civilised countries one half the population can provide food for the other half, the latter then producing luxuries, the desire for which, unlike the desire for food, is quite unlimited (75, 2).

In order to obtain food, the poor will vie with each other to provide luxuries of all kinds for the rich, and the land producing the materials for these luxuries will yield a rent, for example coal mines and timber forests (76-78). It is in this connection that Adam Smith investigates the causes that have made gold and silver the chosen metals for the money of almost all nations (78-80).

This first book of the *Wealth of Nations* concludes with a long "digression" concerning the value of silver, introduced by the question whether or not the effects of "the progress of improvement" are uniform. It might have been expected that the value of the materials for luxury should uniformly increase in comparison with that of the materials for food. The case is not so simple. We have three sets of circumstances: (1) Where the demand for silver increases faster than the supply the value of silver rises and the price of corn falls. (2) Where the supply of silver increases faster than the demand, the price of corn will rise higher and higher. (3) Where the supply of silver simply keeps pace with the demand, the price of corn will remain nearly the same (80, 81). The first was the case in Europe from 1350 to 1570; the second from 1570 to 1640, when silver fell after the American discoveries; the third from 1640 to 1770, when silver was steady, with a slight tendency to rise, though "the best opinion which I can form upon this subject scarce perhaps deserves the name of belief" (89, 2, but cp. 224, 2). There had been an increased production from the mines, but trade and the need for silver had increased perhaps still more. A high value of silver is no proof of general poverty or riches any more than a low one (110, 2). Low prices of particular articles, such as cattle and poultry, in comparison with corn, are a decisive proof of poverty (III. 1), and judged by this standard, for the converse is true, England is rich. In the present century (18th) corn has been low and other sorts of provisions have been high (111, 112). Hence the value of land has been high; and "the land constitutes by far the greatest, the most important and the most durable part of the wealth of every extensive country" (112, 1). The real interest of the landlords (not that they are always aware of it) is always at one with the general interest of the society; every improvement tends to raise their rents (115). The interest of the labourers is so too, but not so necessarily the employers', for they seek monopoly wherever they can get it (116).

In the second book Adam Smith treats of "the nature, accumulation, and employments of stock"—"stock" meaning, be it observed, accumulated wealth whether used as capital or not. Under division of labour, production takes time, and even for exchange we must wait. "A stock of goods" must be "stored up," sufficient to support the weaver, for example, till he has completed and sold his web. "The quantity of industry therefore not only increases in every country with the increase of the stock which employs it, but in consequence of that increase the same quantity of industry produces a much greater quantity of work" (119, 2).

A man's stock may be either (a) spent on his own consumption, or (b) intended to afford him a revenue. In the second case it is his capital, and it may be either circulating—going from him in one shape, returning to him in another; or fixed—not leaving his possession, but yielding him a profit *in situ*, as a machine or instrument. In different trades the proportion of these two is very

different (120). Adam Smith includes, under the fixed capital of a country or society, permanent improvement of land, through draining for example (cp. II. i. 121, 2), and "the acquired and useful abilities of all the inhabitants and members of the society," such abilities having cost wealth to acquire (122). The circulating capital includes the money, provisions, materials, and finished but unsold work (122). Fixed capital is derived from circulating, and needs to be continually supported by it; fixed capital cannot yield a revenue but by circulating capital. Both of them have as their sole end the increase and maintenance of the stock reserved for immediate consumption. In all civilised countries "every man of common understanding will undoubtedly employ whatever stock he can command in procuring either present enjoyment or future profit" (123, 1).

The author passes in his second chapter to "Money considered as a particular branch of the General Stock of the Society," but first repeats his analysis of price into its three elements, and adds to it the distinction of gross revenue and neat revenue. Real wealth is in proportion to neat revenue, whether for an individual or a country. For a country, all the expense of maintaining the fixed capital must be deducted, but not that of maintaining the circulating. The circulating capital of a shopkeeper, for example, consists in what is part of the neat revenue of other people (124, 125), and they replace it to him from their revenue. "Money, therefore, is the only part of the circulating capital of a society of which the maintenance can occasion any diminution of their neat revenue" (125, 1). Money in fact is, to the society, not circulating but fixed capital; it is an instrument of commerce which has to be maintained. It is machinery, "a great wheel of circulation," and makes no part either of "the gross or the neat revenue" (125, 126, 2). The goods and not the money are the revenue. Paper money is like an improved machine; it diminishes the cost of circulation, that is all (126, 2). Banking enables this invention to have its perfect work (129-145). Adam Smith is not against all interference with freedom of issue. "Such regulations may, no doubt, be considered as in some respects a violation of natural liberty; but those exertions of the natural liberty of a few individuals, which might endanger the security of the whole society, are and ought to be restrained by the laws of all governments, of the most free as well as of the most despotic. The obligation of building party walls, in order to prevent the communication of fire, is a violation of natural liberty exactly of the same kind with the regulations of the banking trade which are here proposed" (143, 1), namely (a) the restriction of notes to sums that would confine the use of the notes to dealers and exclude ordinary folk, and (b) the obligation to pay notes in gold or silver. There would be then no fear that notes would raise prices, for whatever was added to the currency in notes would be taken from it in the gold or silver (143, 1). The multiplication of banks can then do nothing but good, and the competition of bankers should be as free as possible (145, 2).

Adam Smith proceeds (in II. iii.) to introduce a distinction between productive and unproductive labour, in doubtful consistency with his general view of division of labour in Book I., and with his view of acquired abilities at the beginning of this second book. Productive labour, he says, adds to the value of the subject on which it is bestowed, while unproductive does not. The one is maintained by capital, the other by revenue. The one "fixes and realises itself in some particular subject or vendible commodity," which is, as it were, "a certain quantity of labour stored up" (146, 1); the other consists in services which perish in the rendering. Hence, all manufacture is productive, all menial service and all professional and official service must be reckoned unproductive. The more of the former there are in a country, the richer the country becomes; the more of the latter, the poorer.

Where revenue predominates over capital, as in a residential town, idleness tends to prevail over industry, and the working classes themselves become degenerate (148, 149). Every prodigal is a public enemy, every frugal person a public benefactor (150, 151). The desire to better our condition is, on the whole, stronger than the passion for present enjoyment; and, as the former is the great motive to accumulation, there is hope of continued progress in the right direction (151). Even the mischievous interference of government is not strong enough to prevent progress (152, 153), and the prodigality

of governments, though worse than any private prodigality, is counteracted by the industry of their subjects (154). Even among borrowers (II, iv.) the number of the frugal and industrious surpasses that of the prodigal and idle, and the usury laws have wisely (158) put difficulties in the way both of prodigals and projectors. As to the reward of those who save and lend, we must not suppose it to depend on the value of money. What is wanted is not money but money's worth; the same pieces of money can serve for two or three different loans. The rate of interest will decrease if the stock offered increases, partly because of the general principle that market price will be lowered by quantity, partly because new "profitable methods of employing capital in a country" become harder and harder to find. Competition of employers by raising wages reduces profits, and therewith interest (156-58). The end of all capital is the maintenance of productive labour; yet some employments of capital employ much more than others, and some add much more than others to the annual produce of the country. There are four chief employments: (1) the getting of raw materials; (2) the manufacture of them; (3) the transport of both; (4) the retail distribution of them (159, 160). The profits of the two last are all drawn from the goods of the two first, and the two first are therefore to be reckoned more productive. Of the two first, the getting of raw materials, whether agricultural or mineral, is more productive than manufacture (III, v. 161). In manufacture "nature does nothing, man does all"; in agriculture the "fertility of nature" needs simply direction (161, 2). Our American colonies have prospered so remarkably because almost their whole capitals have been employed in agriculture (168). Of the two last, transport and retail trade, transport together with wholesale trade has three branches. The first of these, home trade, is the most productive, the foreign less so, the carrying trade least of all (164-66). Still all are advantageous if allowed to come as and when "the course of things" introduces them. The carrying trade is at least a symptom of wealth, as in the case of Holland and England.

Book III. shows that the natural course of things has not been followed (166, 167). The improvement of the country would in order of nature precede and occasion that of the towns, but human institutions have frequently reversed the order (168). The development of manufactures would naturally precede and occasion foreign trade, but human institutions have often reversed the order (169, 170). The land was often considered "not as the means of subsistence merely, but the means of power and protection"; and so primogeniture and entails were contrived to keep up large estates and prevent the multiplication of those large proprietors who are naturally the best improvers of land (171). Slaves are perhaps the worst cultivators, and the disappearance of slavery is largely due to the recognition of the fact (172). In Europe the cities obtained political liberty sooner than the country districts; hence came a great impulse to commercial prosperity, with benefit not only to the cities themselves, but to the country districts (176-81). The vanity and improvidence of the great proprietors led gradually to the breaking up of their estates, and the establishment, in the country, of industrial conditions similar to those of the town. The folly of the proprietors and the industry of the merchants, neither of them disinterested, thus brought about "a revolution of the greatest importance to the public happiness" (185, 1). But the natural progress would have secured the same result more surely if more slowly (186, 187).

If the *Wealth of Nations* is to be viewed, as it once was, mainly as an attack on protection, the foregoing three books are a mere preface to the fourth, in which the attack is delivered in full force. The view is too narrow, but undoubtedly the fourth book, for better or worse, stands out from the rest. It has greater pungency of style. In spite of its length, it has more rapid movement. There is much fierce indignation, and there is little of the composure exhibited, for example, in the opening chapters of the first book, where the author at his leisure "artificum manus inter se operumque laborem miratur." In the fourth he is nothing if not critical. He is to deal with systems of political economy, in the current sense of the term, a branch of statesmanship proposing to provide a revenue both for the people and for the sovereign (187). There were in his time two prevailing systems, the Commercial and the Agricultural, the latter existing on paper chiefly, the former reduced

to practice, and hardly expressed in the with any fulness. It is the commercial system that invites his attack. It leans, he says, on the popular notion that wealth consists in money, and the notion is due, to the double function of money, as the tool of exchange and as the measure of value. This notion has led European states to hinder the exportation and encourage the importation of gold and silver; it has led them to prefer the foreign trade to the more productive home trade (187-90). Even writers like Murr, who oppose restrictions, do so on the ground that the result of the unrestricted trade may be the eventual importation of more gold and silver. If bullion goes out to buy foreign goods, and if we sell these goods again, we have the bullion again and more of it (188). It was believed that a proper attention to the "balance of trade" will secure a constant flow of money into the country (188, 189). It was not seen that "freedom of trade" will always secure us as great a supply of money as we want, and the "high price of exchange" following from an "unfavourable" balance, will of itself lead to the correction of the balance (189). The demand for gold and silver in a country is limited by the use there is for these metals, and the main use is to circulate commodities. Money runs after goods, goods not necessarily after money; and money not wanted for circulation of goods is as superfluous as a stock of pots and pans beyond the needs of households. It is as much a "utensil" as the pots and pans (192). Even to maintain fleets and armies, it is not money but consumable goods that are wanted, and the goods are to be purchased with the surplus of the annual produce of domestic industry (192, 193). Remittances themselves can be made more conveniently in goods, as is shown by the great exportation, without corresponding imports, during a war (193-94). Bullion acts as an international money—"the money of the great mercantile republic" of nations—and its circulation and amount are determined by just the same causes as at home (194). The benefit of foreign trade is not any resulting importation of gold and silver, but the importation of goods of all kinds. The discovery of America benefited Europe by opening new markets for goods, at the cost, it must be said, of "savage injustice" to the natives. The benefit would have been much greater had there been no restraints (196, 197).

In discussing the "restraints upon the importation from foreign countries of such goods as could be produced at home" (198-208, ch. II.), Adam Smith takes occasion to lay down a few general principles. The sum total of industry in any society must be in proportion to the sum total of the capital in that society. Therefore any regulation of commerce which encourages one particular trade may certainly cause more labour and stock to go into it than before, but only at the expense of diverting them from others (198). The distribution of labour and stock is better where there is no such diversion. Leave each individual trader to himself, and "the study of his own advantage naturally, or rather necessarily, leads him to prefer that employment [of his capital] which is most advantageous to the society" (198, 2). "He is, as in many other cases, led by an invisible hand to promote an end which was no part of his intention;" and it is the better served when he does not intend it: "I have never known much good done by those who affect to trade for the public good" (199, 2). Statesmen should leave private interest to work its way alone, and they may rest content that "what is prudence in the conduct of every private family can scarce be folly in that of a great kingdom." Nobody will make at home what it will cost him more to make than to buy; and the country will only buy goods from abroad if the goods can be supplied more cheaply there than at home. Allow the individuals of the nation to buy thus freely, and you increase their revenue, and therewith the capital and the revenue of the whole country (200). The change from interference to liberty might cause injury to some existing manufactures; it could hardly injure agriculture (201, 202). There are two cases where a special burden may rightly be put on the foreigner: (1) the case of the NAVIGATION LAWS, where for the sake of "defence" we sacrifice the less important "opulence" (204, 1); and (2) the case of articles taxed at home by the excise, where a corresponding customs duty may be imposed (204, 2).

Taxes, extending as they do now to the very necessities of life, increase the cost of labour, produce the same effects as a poor soil and bad climate, and pull down

rich countries to the level of poor ones (204, 1). If other countries tax our goods, it is not clear that we gain by retaliation. It is a question for that "insidious and crafty animal" the politician to decide, whether the retaliation is likely to secure its end; if it does not, we have simply injured our whole people in order to revenge an injury done to one particular section of the people; we have benefited nobody, not even the sufferers (206, 1). It is true that for humanity's sake repeal of restrictions should be gradual; yet the disbanding of a particular class of manufacturers causes much less distress than the disbanding of an army. "It is easier to change the direction of industry from one sort of labour to another than to turn idleness and dissipation to any." Unhappily it would be utopian to expect the adoption of free trade: the monopolists are too strong (206, 207). The legislature should be careful to create no more of them, and should guide itself in future "not by the clamorous importunity of partial interests but by an extensive view of the general good" (208).

Besides restraints due to self-interest and the spirit of monopoly, there are those due to national prejudice and animosity, such as on the trade with France. These are unreasonable both on the principles of the commercial system itself and on general principles. On the former, because, when articles are imported more cheaply from France, for example, than from other quarters, then the sum total of our importations must in value be less than if they must be got elsewhere, and the "balance" must be the more in our favour (208, 209). Adam Smith himself thinks slightly of the "balance," and doubts if we can ever depend on custom house returns for knowledge of it. He refers to the complication of European trade; thinks we probably pay for Hamburg goods by bills on Holland; and takes occasion to make a long digression on the bank of Amsterdam and other banks of deposit (211-15). Returning to the restraints on such trades as the French, he gives his second proof of their "unreasonableness," namely the proof from general principles. The whole idea of the balance of trade is full of error. It implies that, when two people trade with each other and the balance of advantage is even, then neither gains and neither loses, but, when it inclines to one side then one gains and the other loses in exact proportion to the decline from equilibrium. But it is not so. "That trade which without force or constraint is naturally and regularly carried on between any two places is always advantageous, though not always equally so, to both" (216, 1). The advantage is to be measured not by the precious metals but by increase of revenue. Where two places both exchange home goods, they will usually gain equally, since each is replacing a capital used in preparing a surplus for a foreign market. Where the trade is in home goods for foreign goods, as when England buys French wines for Virginian tobacco, then both gain but not equally. The revenue derived from the trade goes entirely to French industry on the one side but not entirely to English industry on the other. If the foreign goods had been gold, England would have been neither more nor less impoverished than if they had been tobacco. There is always some gain. The people are the richer for having more goods to enjoy in place of a surplus they do not want. As the "trade with the ale-house" is not necessarily a losing one, neither is the trade in wine or tobacco (217). We kept up our duties on French wine in order to benefit the Portuguese who dealt at our shop, thus erecting "the sneaking arts of underling tradesmen into political maxims for the conduct of a great empire" (218, 2). Nations have been taught that it is their interest to beggar their neighbours, and commerce, which is naturally a bond of union, has been made a source of discord. We cannot hope to extinguish the injustice of rulers, but we can surely prevent "the mean rapacity, the monopolising spirit of merchants and manufacturers who neither are nor ought to be the rulers of mankind, from disturbing the tranquillity of anybody but themselves" (218, 2). "The interest of the great body of the people" is to buy whatever they want of those who sell it cheapest; and it is their interest that neighbouring nations should be rich, not poor (219, 1). The important balance is not that of trade, or Holland for example, as well as our American colonies, would long ago have been ruined, but of the annual production and consumption; the value of the produce must exceed that of the consumption. This favourable balance may exist in a country without any foreign trade at all, just as "in the whole globe of the earth, of which the wealth, population, and improvement

may be either gradually increasing or gradually decaying" (221, 1).

Adam Smith proceeds to examine the various expedients "merchants and manufacturers" have devised for the encouragement of exportation. The first is DRAWBACKS, for which he has little but praise, as a drawback tends to restore the natural distribution of labour and capital disturbed by duties (IV. iv. 221, 222, 223). BOUNTIES, on the contrary, find little favour with him (IV. v.). They are of two kinds: (a) on exportation, (b) on production. The former are his special abhorrence. As we cannot force foreigners to buy from us, we pay them for buying. Bounties are only given to trades too weak to stand by themselves, their expense being greater than the return. If all trades were like them, there would soon be no capital left in the country (224). Bounties force trade into channels where it would not run of its own accord. Since the establishment of the corn bounty under William III., the value of the exported corn has exceeded that of the imported by much more than the bounty; but the price of the exported corn has to replace the farmer's capital with ordinary profits or else "the national stock is so much diminished"; and the bounty is given because the price is supposed to be insufficient to do this. The cost to the society is therefore not only the bounty but a whole capital and profits devoted to an unprofitable employment (224). The bounty tends to raise the price in the home market, both in years of plenty and years of scarcity. It is true that, as a matter of fact, since the bounty, prices have been low, but that is in spite of the bounty, and, he added in 1784, because of the rise in silver. Adam Smith in his Glasgow lectures (see *Lectures*, pp. 181-82) had at first allowed that the bounty might have occasioned a lowering of price; but the contrary is his ripper view, and it is significant that in the 3rd ed. of the *Wealth of Nations* he adds to his arguments. The extension of the market, he says, is at the expense of the home market, and imposes two taxes on the people, first the tax to pay the bounty, second the increased price of the home corn, the second being the heavier of the two. The higher price to the farmer is an illusory benefit, for he must raise the wages of his labourers in proportion. The effect is not a rise in the real value of corn but a fall in the real value of silver (226). Now such a fall, if due to the fertility of the mines, would be equal for all parts of the commercial world; but, if due to a particular circumstance in one country, it is a discouragement to that country. Spain hinders the exportation of gold and silver; but the effect is as when water is dammed up; soon, as much will pour over the top of the dam as would have come if there had been no dam at all; prices will increase in Spain to the injury of Spain, till they are high enough to flow over. The injured party is Spain itself. Now the bounty alters the level in the same way, making silver cheaper, and only injuring our own people (227, 228).

The injury extends to the country gentlemen who were so misguided as to procure the bounty, for, by lowering the real value of silver, they tended to discourage the general industry of the country, and especially the improvement of their own lands (229). If bounties on exportation lowered prices, as some allege, it is curious that "I have known" "undertakers of some particular works" to give a bounty among themselves on the exportation of goods which they feared would overstock the market (230, 1). He does not dwell long over bounties to production, the chief instance of which was the herring bounty. He would allow them only for warlike supplies and naval stores. But premiums for manufactures he considers not only pardonable but praiseworthy. He quickly launches us on a long "Digression concerning the Corn Trade and Corn Laws," a characteristic passage (232-42). He shows (1) that the interest of the inland dealer coincides with that of the public; prices should be such that the supply will just outlast the season, as a ship's ratons the voyage (233). Engrossing and combination are mere phantoms (234). Yet in the fear of them the legislature has tried to force the farmer to be his own dealer. "The law which prohibited the manufacturer from exercising the trade of shopkeeper, endeavoured to force this division in the employment of stock to go on faster than it might have done; the law which obliged the farmer to exercise the trade of a corn merchant, endeavoured to hinder it from going on so fast; both laws were evident violations of natural liberty and therefore unjust; and they were both too as impolitic as they were unjust" (236). But

the latter was the worse, for it prevented the farmer from devoting all his capital to the cultivation of his land (237).

Adam Smith then shows (2) that the interest of the merchant importer is also that of the public. He lowers prices, but this means a higher real value of silver, and is otherwise a public benefit (239). The frequent suspension of the duties on importation is a symptom of their impropriety (239).

(3) The trade of the merchant exporter indirectly contributes to a plentiful supply at home, for, unless the growers know that any surplus will find a market, they will pinch the supply intended for home consumption. When encouraged by a bounty, he may, it is true, find it his interest to carry out corn from his own country during a scarcity, if there were actual famine, and therefore still higher prices elsewhere. Hence the suspensions of the bounty on such occasions. "Were all nations to follow the liberal system of free exportation and free importation, the different states into which a great continent was divided would so far resemble the different provinces of a great empire. Among the different provinces of a great empire, the freedom of the inland trade appears both from reason and experience not only the best palliative of a dearth but the most effectual preventive of a famine; so would the freedom of the exportation and importation trade be among the different states into which a great continent was divided" (240, 2). But at present the bad policy of one country hinders the adoption of the best policy by another. "The laws concerning corn may everywhere be compared to the laws concerning religion"; the people are so deeply interested in their present food and their future happiness that government must yield to their prejudices for the sake of peace in both cases (241, 1). Finally (4) the trade of the merchant carrier, or importer of foreign corn for re-exportation, is for the public interest, for when his corn is here and prices rise he will find it his interest to sell here, and thus contribute to plenty (241).

It thus appears that our legislation on corn deserves little praise. British prosperity did not spring from that source, but from political security, and "the natural effort of every individual to better his own condition." The prosperity has been posterior to the bounty, but "it has been posterior likewise to the national debt," and "the national debt has mortuarily not been the cause of it" (241, 2). It is fair to add that throughout this chapter (v.) Adam Smith recognises that later laws have often been wiser than earlier, and have given hope of better times.

In the following chapter (vi.) on "Treaties of Commerce," the MEXICO TREATY between England and Portugal is roughly handled. The relations between the mint and the bullion market are incidentally discussed. Then comes the long and important chapter on "Colonies." Ancient colonies were founded because of "irresistible necessity," or "evident utility," the modern from neither of these, but from love of gold (250, 251), or desire to escape oppression (254, 2). Yet the prosperity of many of the modern has been rapid. The colonists bring with them arts and agriculture, laws and government; they find abundance of good land, no rent or taxes, and a scarcity only of labour. The result of this last is high wages and the encouragement of population (253, 254). English colonies have thriven better than Spanish because their home government paid less attention to them. The Danish, Dutch, and French colonies prospered much more rapidly when their exclusive companies fell (254-6). The English colonies, though better treated than the others, have not escaped interference. The Act of Navigation, it is true, leaves their best raw materials "non-enumerated," but hinders many important manufactures, in "manifest violation of the most sacred rights of mankind" (261, 2). "The policy of Europe" has little to boast of as regards the colonies; Europe bred the men who made the colonies, and the colonies owe it gratitude for nothing else whatever (264, 265). Europe itself, "considered as one great country," may thank the discovery of America for increasing its enjoyments and increasing its industry. "New values, new equivalents" were introduced into European trade (265). By restricting the American trade Europe is diminishing both the enjoyments and the industry, and putting "a dead weight upon the action of one of the great springs which put into motion a great part of the business of mankind." It gains no military strength. The whole benefit to the mother

country is supposed to be the exclusive trade. "To promote the little interest of one little order of men in one country, it hurts the interest of all other orders of men in that country, and of all men in all countries" (276, 1). The benefit to the merchants soon ceases when their high profits attract competitors at home who reduce their profits again; but there is mischief done in the diversion of capital (267, 268). Adam Smith allows that the Act of Navigation has kept the rate of profit up to a greater height than would have been the case under free trade in the branches concerned. But he considers high profits to be at least as great a disadvantage as high wages (269, cp. 275 *et seq.*). Moreover, the colonial trade is of slow return, and therefore increases the annual produce of land and labour much less than a home trade (270). The monopoly has, besides, forced capital from a trade with a near country to a trade with a distant, and has turned a direct trade into a roundabout one (270, 271). British commerce, instead of running in a number of small channels, has been forced into one great channel, at the cost of security and healthiness, as if in the human body one great blood-vessel had been swelled unnaturally at the expense of the rest (272). Some relaxation in the direction of free trade is the only safeguard; but the remedy might be for the moment worse than the disease. Let the legislators find out the best way of restoring "the natural system of perfect liberty and justice" (273, 1). As long as the monopoly is regarded as the chief benefit of the colonies, they will continue to be a source of expense to the mother country, especially for defence, for they do not strengthen it. "Great Britain is, perhaps, since the world began, the only state which, as it has extended its empire, has only increased its expense without once augmenting its resources" (277, 280, 1). The colonies might, perhaps, be taxed by a representation of them in the British parliament, which would have many indirect effects (280, 281), including perhaps the removal of the capital to America, such to be the richest part of our empire (282).

In the East Indies we have seen a somewhat different example of the effects of monopoly. In America all nations have claimed to engross the whole market of their colonies; in the Indian seas the ports have been open to all nations, but each nation has had an exclusive company. The result is to divert from a rich country, like Holland, its full share, and give to a poor one, like Denmark, more than its full share of the trade (285, 1). The result is also, as regards the sovereign, to waste his revenue and lessen the powers of the subject peoples to produce revenue for him (287, 2). THE EAST INDIA COMPANY has tried to combine the two functions of trading and governing, which are quite incompatible. "It is a very singular government in which every member of the administration wishes to get out of the country, and, consequently, to have done with the government as soon as he can, and to whose interest, the day after he has left it and carried his fortune with him, it is perfectly indifferent though the whole country was swallowed up by an earthquake." It is less the fault of the men than of their situation. The fact is that "such exclusive companies are nuisances in every respect" (289, 2).

To these seven chapters on the mercantile system Adam Smith added in his 3rd edition an eighth chapter, "Conclusion of the Mercantile System," which is mainly an account of some particular cases where importation was encouraged or exportation discouraged, still on mercantile principles (289, 2). He takes occasion to remark that "it is the industry which is carried on for the benefit of the rich and powerful that is principally encouraged by our mercantile system; that which is carried on for the benefit of the poor and the indigent is too often either neglected or oppressed," as in the case of linen yarn (290, 2). The wool trade provides examples of protective laws which, "like the laws of Draco, may be said to be all written in blood," but were too cruel to be put in operation (292). In all these cases a great principle is violated. Not only could tools not be exported, but "the living instrument, the artificer," was to be kept from moving so far as possible (297, 298). "Consumption is the sole end and purpose of all production; and the interest of the producer ought to be attended to only so far as it may be necessary for promoting that of the consumer. The maxim is so perfectly self-evident that it would be absurd to attempt to prove it" (298).

The agricultural systems (ch. ix.) "represent the

produce of land as either the sole or the principal source of the revenue and wealth of every country" (299, 1). The most important of such systems is that of the French economists (see *PHYSIOCRATS*). It was a reaction from the excessive attention of COLBERT to manufactures. "If the rod be bent too much one way, in order to straighten it you must bend it the other" (300, 1). Quesnay, "himself a physician, and a very speculative physician," seems to have thought that the political body would thrive only under a particular regimen, namely, of perfect liberty and perfect justice. He did not see "that in the political body the natural effort which every man is continually making to better his own condition is a principle of preservation capable of preventing and correcting in many respects the bad effects of a political economy in some degree both partial and oppressive"; otherwise no nation anywhere would have prospered (304, 305). In detail, the capital error of the theorists consists in representing the labour of artificers, manufacturers, and merchants as unproductive. (1) If this class annually reproduces, as they grant, the value of its consumption, it is not barren, any more than a marriage which produced a son and a daughter. It is true that agriculture is more productive. (2) The labour of menial servants is not worthy to be classed with that of manufacturers; the latter is fixed or realised in a vendible community; the former alone is barren. (3) It is not true that the manufacturing class does not increase the real revenue of the society. The value of what they produce is added to what they consume, and is all revenue (305, 306). (4) It is true that they can only increase the real revenue by parsimony, but this is equally true of the agricultural class. (5) Even if revenue always meant subsistence, it is greater with than without manufactures. Manufactures draw subsistence, from abroad for instance; and a small part of manufactured produce purchases a great deal of raw produce (306).

Nevertheless the theory never did any harm in the world, and it does good by representing wealth as consumable goods, and perfect liberty as the only effectual expedient for raising the annual produce to a maximum (307).

If agricultural systems go farther than this [as in China, Egypt, and India], they may err as much on the one side as the mercantile system on the other (308, 310).

Here is the conclusion of the whole matter: "All systems, either of preference or of restraint, therefore, being thus completely taken away, the obvious and simple system of natural liberty establishes itself of its own accord. Every man, as long as he does not violate the laws of justice, is left perfectly free to pursue his own interest his own way, and to bring both his industry and capital into competition with those of any other man or order of men. The sovereign is completely discharged from a duty, in the attempting to perform which he must always be exposed to innumerable delusions, and for the proper performance of which no human wisdom or knowledge could ever be sufficient—the duty of superintending the industry of private people, and of directing it towards the employments most suitable to the interest of the society" (311, 1).

By this "system of natural liberty" the sovereign has only three duties—the protection of the society against other societies, the securing of justice between man and man, and the undertaking of such public works as are too great for individuals and yet necessary to the community (311, 1). In the fifth book, accordingly, Adam Smith considers the revenue of the sovereign or commonwealth, and its threefold employment, explaining, (a) which expenses are to be defrayed by a general contribution of the whole society, and which by contribution from particular members only; (b) what are the different methods of raising the general contribution; and (c) what has caused the mortgage of these revenues or the contraction of debt, and with what effects (311, 2).

Among barbarous nations defence costs little to the sovereign. The progress of manufactures and the improvements in the art of war have increased the expense of armies for the protection of the country (313). To be a good soldier, too, a man must devote his whole time to the business, and we cannot depend on militias (314). The latter can learn the use of arms, but not that habit of ready obedience which is more important

(316, 1). But standing armies and modern weapons mean great expense, and give advantage to the richer nations, and therefore to civilisation (319).

The administration of justice, too, is of very different costliness in different times. Men who have no property can only injure each other in their persons or reputations, and nobody is the gainer; but, where property is concerned, there may be a gain equal to the loss. The injury to reputation is prompted by the transient passions of "envy, malice, resentment," often restrained by prudence; and where there is little or no property, there need be no civil magistrate. "But avarice and ambition in the rich, in the poor the hatred of labour and the love of present ease and enjoyment, are the passions which prompt to invade property, passions much more steady in their operation and much more universal in their influence. Wherever there is great property there is great inequality. For one very rich man there must be at least 500 poor, and the affluence of the few supposes the indigence of the many. The affluence of the rich excites the indignation of the poor, who are often both driven by want and prompted by envy to invade his possessions." Without the aid of the civil magistrate there could be no security for the rich man (319, 2). Civil government is founded on an antecedent subordination, which may be due (a) to the respect for bodily, and especially mental, superiority; (b) to the respect for age; (c) to the respect for fortune. "The authority of riches, though great in every age of society, is perhaps greatest in the rudest age of society, which admits of any considerable inequality of fortune" (320); (d) to respect for birth, which supposes ancient fortune or the greatness which brings fortune with it. "There never was, I believe, a great family in the world whose illustration was entirely derived from the inheritance of wisdom and virtue" (321, 1). Thus birth and fortune are the two chief circumstances that set one man above another antecedently to civil government; and regard for them establishes order and authority apart from any perception of the usefulness thereof. Once government is introduced, the utility of it as a defence of the rich against the poor becomes evident enough (321, 2).

Adam Smith's short historical sketch here of the judicial system in England corresponds to a much longer one in the *Lectures* (pt. 1. div. 1.). The subject belonged to the projected and never-executed treatise on jurisprudence. He is not quite content with things as they are. He is satisfied, indeed, with the separation of judicial and executive powers, being always suspicious of the interference of politicians; and he would maintain the irremovability of judges. But he thinks the whole expense of law proceedings might be met by fees of court, on the ground that "public services are never better performed than when their reward comes only in consequence of their being performed" (323, 2). The only risk would be the temptation to encourage litigation (324, 2).

The subject of public works is treated at much greater length. There are, 1st, the public works and institutions for facilitating the commerce of the society, either as a whole or (as was added in 1784) in particular branches. Roads, bridges, and canals are for the general benefit of commerce. Canals may be left to private persons to manage; not so the roads, which should be left neither to private persons nor to government, but to local road-commissioners. Government might raise the tolls too high, oppress the poor more than the rich, and neglect repairs with impunity (326-327).

The coinage yields the state a profit (*SEIGNORAGE*), and the post-office is one of the few commercial enterprises all governments have successfully managed (325, cp. 368). As to the assistance of commerce in particular branches, we have instances in the forts for protection of African and East Indian traders, and ambassadors to watch trading interests in foreign courts (329); and we have worse instances in the powers given to *REGULATED COMPANIES*, such as the *TURKEY COMPANY* and the *AFRICAN* (331, 332), and still more to the *JOINT-STOCK COMPANIES*, like the *SOUTH SEA COMPANY* (333, 335, 336), and (greatest of all) the *EAST INDIA COMPANY*. The story of the last is given at some length (336-9), and the comments are very unfavourable. A temporary monopoly, he says, is perhaps the best recompense the state can give for "a dangerous and expensive experiment of which the public is afterwards to reap the benefit," just as with a new machine or a new book;

but the term ought to be fixed and thereafter the trade laid open. Without a monopoly, a joint-stock company cannot long carry on any branch of foreign trade; it would fall before private adventurers (389, 2). The only trades where this would not happen are those capable of being reduced to routine, such as (a), banking; (b), insurance; (c), canal-making and canal-management; (d), water supply (340, 1). To authorise the "establishment" [in the Scotch sense of an Established Church] of a joint-stock company it should appear that the utility of its object would be more general than in common trades, and that more capital is needed than can be got by private partnership. This was so with the Bank of England (340, 341).

There are, 2nd, the public works for the education of youth (V. i. art. 2, 341-353). Our author gives his views on education freely. The teacher is best paid by his fees, which are his "natural revenue." Through all Europe, however, he has been largely supported by endowments, and consequently he has had the less motive to do his utmost. "In every profession the exertion of the greater part of those who exercise it is always in proportion to the necessity they are under of making that exertion" (341, 2). "It is the interest of every man to live as much at his ease as he can," and endowments set his interest at variance with his duty. We see the effects in the state of the universities, especially Oxford, where the professors do not teach at all (342), and the tutors teach in the manner easiest for themselves. "Where the masters really perform their duty there are no examples, I believe, that the greater part of the students ever neglect theirs." After twelve or thirteen years of age force or restraint is quite unnecessary in education. "Such is the generosity of the greater part of young men," that if the master shows a serious desire to serve them they pardon a great many shortcomings (343).

Where there are no public institutions, as with fencing and riding, the teaching is best, and the private schools teach children to "read, write, and account" better than public schools (344, 1). There are no public institutions for women's education, and it has much more usefulness and less absurdity than men's (350, 1). If it be said that, though the universities teach badly, but for them their subjects would not be taught at all, Adam Smith answers, at some length, that their subjects were originally intended for the medieval clergy and are quite unsuitable now (344-6). The poor Scotch universities have adapted themselves to the changed times much better than the richly-endowed English universities and the "learned societies" which are the sanctuaries for "exploded systems and obsolete prejudices" (347). Nothing but the discrediting of the universities could have led to the practice adopted by our gentlemen, of sending their sons at seventeen or eighteen for three or four years of foreign travel. They return home with an imperfect knowledge of some foreign languages, and a greatly-increased conceit and incapacity of application (347). From Adam Smith's biography it is clear that the foreign tour he made with two young pupils was a benefit to both parties, and it is surprising to find so unqualified a condemnation of such tours in the *Wealth of Nations*.

The history of Greek and Roman education lends no support to the modern English system (347-9). Endowments came late. The ancient philosophers, who acquired great power over their hearers, depended entirely on their own exertions; not as now, when the private teacher, as opposed to the privileged, is like the merchant without a bounty competing with a rival who has a considerable one. "The endowment of schools and colleges have [sic] in this manner not only corrupted the diligence of public teachers, but have rendered it almost impossible to have any good private ones" (349, 2).

Ought there, therefore, to be no public institutions for education? Adam Smith answers: Yes, they are needed for the education of the common people. In these days of division of labour all variety, elasticity, and spirit are taken out of a workman's life. "His dexterity at his own particular trade seems to be acquired at the expense of his intellectual, social, and martial virtues"; and in every civilised society this will be the state of the labouring poor, the great body of the people, "unless government takes some pains to prevent it" (350, 2). In a rude people there is much variety in the occupations of the individual, little in those of the whole society; in a civilised, the exact opposite is true; but

the result must be mischievous, even for defence, if not prevented. To secure every man the opportunity of acquiring the essential parts of education would be well worth the expense. In Scotland it is fairly done in the parish schools; in England, though less well, in the charity schools. Compulsion might take the form of a provision that a certain amount of education should be the condition of apprenticeship in trades. It would be well to supplant Latin in the parish schools by geometry and mechanics that would be useful to every working man (351-2). A well-instructed people are always more decent and orderly than a stupid one, and in a free government we should neglect no means of making the people wise (353, 2). Adam Smith is said to have expressed strong approval of Robert Raikes and his Sunday Schools as a step in the right direction (Rae, p. 407).

There remain, 3rd, the public works and institutions for the instruction of the people of all ages. Adam Smith's reasonings about religion are of a piece with those on education. He inclines (355) to a purely voluntary system, the resulting competition of sects making the churches singly harmless against the state, and the effects of austere enthusiasm being corrected by philosophy on the one hand, and public amusements, especially the drama, on the other (357). The mischievous power of the Romish Church was weakened most effectually when the great barons and the Episcopal clergy discovered that modern improvements enabled them to spend their wealth on themselves (361). Where there is an established church, it is better that it should be, as in Scotland, of only moderate wealth (366, 1).

Finally, there is to be considered the expense of supporting the dignity of the sovereign, which must naturally be something greater than that of a lord-mayor (366, 2).

From the expenses, we pass to the sources of revenue from which they are to be met (367, ch. ii.). The sovereign in some cases has a fund or source of revenue of his own, as in Holland and Venice a bank, in Hamburg a wine cellar and apothecary's shop (367, 2). The government of England would be ill-advised if it undertook banking (368, 1). The Post Office is within its powers (see above). It manages the crown lands ill, and is quite incompetent to undertake the management of all the lands of the kingdom (369, 370).

Whence, then, is its revenue to come? Plainly, from taxation, for which we may lay down four maxims "recommended by evident justice and utility" (372).

(1) *Equality*.—The subjects should pay "in proportion to their respective abilities"; in other words, to the revenue they enjoy under the protection of the state. "The expense of government to the individuals of a great nation is like the expense of management to the joint-tenants of a great estate, who are all obliged to contribute in proportion to their respective interests in the estate." It is neglect of this maxim which causes inequality. It is true that "every tax which falls finally upon one only of the three sorts of revenue is necessarily unequal in so far as it does not affect the other two"; but this is over and above the other inequalities which will be considered in detail, those that are caused in the course of the taxation of one and the same kind of revenue (371, 2).

(2) *Certainty*.—A very considerable degree of inequality is a less evil than a small degree of uncertainty and arbitrariness.

(3) *Convenience*.—The tax ought to be levied at the time and in the manner in which it is most likely to be convenient for the contributor to pay it (371, 372).

(4) *Economy*.—The tax should take from the people as little as possible that is not to reach the public treasury. The maxim is violated (a) when the salaries of tax-collectors eat up the proceeds, or their perquisites form a second tax; (b) when the tax obstructs and discourages industry; (c) when it ruins individuals through penalties, and through temptations to evasion and smuggling. "The law contrary to all the ordinary principles of justice first creates the temptation and then punishes those who yield to it"; (d) when it inflicts odious visits of the tax-gatherer, not strictly an expense, but a discomfort from which a man would be glad to redeem himself by expense. In all these four ways a tax may be "more burdensome to the people than beneficial to the sovereign" (372, 1).

By the four maxims Adam Smith proceeds to judge the various taxes, existing or proposed, especially in

England, but with abundance of illustrations from other nations.

The land tax, owing to the stationary valuations and varying improvement of different counties in cultivation, has become unequal. It agrees with the other three maxims (372, 2). The tithe, being a tax not on rent but on produce, is unequal, "a certain portion of the produce being in different situations equivalent to a very different proportion of the rent." On rich lands the tenant might afford more, on poor he may be unable to afford as much. The tithe is a great obstacle to improvement (377, 1).

The section dealing with taxes upon the rent of houses (378-381) is abreast of most modern discussions of the subject. The author presents a clear view of the speculative builder and his relations to the ground landlord. He thinks, however, "A tax upon house rent, payable by the tenant and proportioned to the whole rent of each house, could not for any considerable time at least affect the building rent. If the builder did not get his reasonable profit he would be obliged to quit the trade, which, by raising the demand for building, would in a short time bring back its profit to its proper level with that of other trades. Neither would such a tax, say of 5s. in the pound, fall altogether upon the ground rent; but it would divide itself in such a manner as to fall partly upon the inhabitant of the house and partly on the owner of the ground" (379, 1). For the tenants of houses at £60, for example, would now content themselves with houses at £50, and so down the scale till the lowest class is crowded. All except the lowest would fall in value, and the ground landlord would suffer. The tenant would suffer the inconvenience, and the landlord the loss of revenue (379). There would be inequality because of the different proportion of house rent to income in the case of men of different fortune. "It is perhaps highest in the highest degree [of fortune], and diminishes gradually through the inferior degrees, so as in general to be lowest in the lowest degree."<sup>1</sup> It is food that is most necessary to the poor (see WORKMEN'S BUDGETS), and most of their revenue is spent on food. A tax on house-rent would therefore fall most heavily on the rich. "It is not very unreasonable that the rich should contribute to the public expense not only in proportion to their revenue, but something more than in that proportion." (ib.)

Rent of land is for a productive object, of houses for an unproductive. The rent of the houses is, therefore, drawn from some other revenue, either wages, profits, or rent of land, like taxes on consumable goods. There is no better way of judging of the "liberality or narrowness of a man's whole expense" than by seeing what his house-rent is (380, 1). Apparently it was thought better to tax the hearth or the windows, because of some fancied difficulty in ascertaining the rent of the house and taxing that directly. The first way, HEARTH TAX, was odious and soon dropped. The second, window tax (see TAXATION), involves inequality of the worst kind (381).

Prof. Bastable (*Public Finance*, 1892, p. 396, compare Rae's *Life of Adam Smith*, p. 294) points out that in 1778 Lord North adopted our author's suggestion of an INHABITED HOUSE DUTY. No government has yet adopted his further suggestion of a tax on ground rents, though he says these are "a still more proper subject of taxation" than house rents. In both cases he considers there is a revenue derived by the owner without any particular care of his own, and the real wealth and revenue of the people might be the same after such a tax as before (380). He is not in favour of the taxing of profits or interest. A man's rent can be known, but less easily his capital and profits, and they are subject to continual variations; moreover, "the proprietor of stock is a citizen of the world," and if you tax him heavily he will remove his stock elsewhere, to the injury of the national industry (383). The land tax was intended to include capital, but it has rarely or never done so effectually (383). Elsewhere the plan has been tried in reality, as in Hamburg, Zürich, and Holland (384). As to taxes on the profits of particular employments, they will always in the end fall on the consumers, though, if not proportioned to the amount of trade, they may, as in hawkers' licences, oppress the small dealer (384). The personal TAILLE in France is the most important tax in Europe on the profits of the cultivator. It is both arbitrary and unequal; and it discourages cultivation (385-86). The poll taxes in the

southern states of North America are really on the profits of "a certain species of stock employed in agriculture," namely, negro slaves. There was once in Europe a similar tax on bondmen, and hence taxes were represented as badges of slavery. But taxes to the payer of them are a badge not of slavery but of freedom (387). Lord North introduced a tax on manservants in 1777, but hardly on our author's suggestion, as the reference (387, 1) to the tax on manservants is to a tax already imposed, and occurs first in the second edition of the *Wealth of Nations*, 1778, where the comments on it are not entirely favourable.

Death duties are treated under the head of "Taxes upon the capital value of Land, Houses, and Stock" (V. ii., app. to art. i. and ii. 387-90). They are usually stamp-duties or duties on registration. They fall on the inheritor. Taxes on the sale of land fall on the seller, who usually is more necessitous than the buyer; whereas taxes on the sale of houses, if they are old, fall on the seller, and, if new, on the buyer (389). Duties on law proceedings fall on the litigants, and reduce the capital value of the property in dispute (389). All taxes on the transference of property, so far as they diminish its capital value, "tend to diminish the funds destined for the maintenance of productive labour. They are all more or less unthrifty taxes, that increase the revenue of the sovereign, which seldom maintains any but unproductive labour, at the expense of the capital of the people which maintains none but productive." Though not arbitrary, and not levied inconveniently, they are unequal (390, 1).

Direct taxes on wages (art. iii.) are open to special objections. As shown in bk. i., wages depend on the demand for labour and on the average price of provisions. A tax on wages, when provisions have not fallen, will simply raise wages, and somewhat higher than the amount of the tax (390, 2). It will not raise the price of corn, for the farmers recover the additional wages out of the rent of the landlord (391). But the salaries of officials may be taxed without hardship to any one (392, 1).

The next group considered is that of "taxes intended to fall on every different species of revenue indifferently" (art. iv.). The chief are (a) capitation taxes, which are liable to be both unequal and arbitrary (393, 1), and (b) taxes on consumable commodities. The latter are a means of taxing the revenue of the subject "indirectly" by the taxing of their expenditure, which is thought to be in proportion to that revenue. The effects differ according as the commodities taxed are (a) necessities; (b) luxuries. Necessaries include not only what is indispensable for support of life, but what custom renders it indecent for respectable people, however poor, to be without. All other things are luxuries. If necessities are taxed, wages will tend to rise in proportion (393). "The labourer, though he may pay it [the tax] out of his hand, cannot, for any considerable time at least, be properly said even to advance it. It must always, in the long run, be advanced to him by his immediate employer in the advanced rate of his wages." If the employer is a farmer, he recovers from his landlord; if not a farmer, he recovers from the public in higher prices (394). It is otherwise with luxuries. A tax on tobacco, spirits, or tea, will not raise wages, but will act as a sumptuary tax, and may even have the effect of increasing the power of the industrious poor to bring up a family by causing retrenchment. As for the disorderly and idle, their children survive, if at all, only to be public nuisances (394).

In Adam Smith's time there were many taxes on necessities. Salt, soap, and coals, to say nothing of corn, were taxed. Instead of a tax on coal carried coastwise, a bounty might even be allowable, says our author (395). Consideration of the ways of levying taxes on consumable goods leads us back, of course, to the ways and means of the mercantile system. High duties have increased smuggling, so that, "in the arithmetic of the customs," two and two make often only one. Bounties have even created a new kind of smuggling; goods after being once shipped are fraudulently relanded that the cargo may get the bounty again. The result of this smuggling and of drawbacks together, is that the customs produce much less to government than is extorted from the public (398). "Heavy duties being imposed on almost all goods imported, our merchant importers smuggle as much and make entry of as little as they can. Our merchant exporters, on the contrary, make entry of more than they export, sometimes out of vanity and to pass for great dealers in goods which pay

<sup>1</sup> This could not be said now.

no duty and sometimes to gain a bounty or a drawback. Our exports, in consequence of these different frauds, appear upon the custom-house books greatly to over-balance our imports, to the unspeakable comfort of those politicians who measure the national prosperity by what they call the balance of trade" (399, 1). In any case the system of our customs is inferior in clearness and precision to that of our excise, and should be remodelled accordingly (399, 1). We should have more moderate taxes on fewer and better chosen objects if we want a larger revenue (399, 2). We should adopt the bonding system, and at the same time relieve all necessities and materials of manufacture from taxation (399, 400). "The value of money is in proportion to the quantity of the necessities of life which it will purchase; that of the necessities of life is altogether independent of the quantity of money that can be had for them" (400, 2). We should, therefore, cheapen them. The whole consumption of the poor is in every country much greater not only in quantity but in value than that of the rich and the middle classes. Taxes on expenditure, therefore, falling chiefly on the higher ranks, will produce less than taxes falling on all ranks. So the excise on liquors is of all such taxes the most productive. The private brewer, however, escapes it, and the tax becomes unequal. It would be better, therefore, as has often been proposed (401), to put a single tax and a lighter one on malt, which will bring in much more because collected more surely (402, 403). This was one of the taxes which North is said to have borrowed from Adam Smith (*Rae's Life of Adam Smith*, p. 294), though our author was hardly the inventor of the idea.

It should be noted that though he considers beer and ale "wholesome and invigorating liquors," he speaks less confidently of spirits, and would retain the heavy taxation of distilleries as a sumptuary tax (403). He would also retain taxation of sugar on the ground that the planters themselves say the price is at a maximum, and therefore it would seem a monopoly price; now "the gains of monopolists, whenever they can be come at, are certainly of all subjects [for taxation] the most proper" (404, 1).

But on the whole he is not favourable to the taxation of commodities even when they are luxuries. Not only are they unequal, for the Irish ABSENTEE, for example, may draw a rich revenue and pay no taxes (405, 1), but they offend against the fourth maxim [of Economy] in every possible way (405-7). In France the defects of such taxes appear still more clearly, for the French system is worse than the English. In this respect the Dutch also are not in advance of us (409-10), though we must allow for their special difficulties (411).

Going on now to his last subject, public debts (V. iii.), he begins with a genial contrast between the present times and the good old times, when there was hospitality without luxury, and liberality without ostentation (411, 2). Nowadays our manufacturing industry prepares luxuries which minister to the frivolity and pageantry of rulers; and the parsimony that leads to accumulation prevails as little in republican governments as in others. "The want of parsimony in time of peace imposes the necessity of contracting debt in time of war" (412). But the very causes which make it necessary for the government to borrow, produce in the subjects the ability and inclination to lend, namely, the abundance of manufactures, the presence of merchants and manufacturers trading not only with their own capitals but with borrowed, and the existence of that confidence which comes from a settled state of society and just government (412, 413). "The progress of the enormous debts, which at present oppress, and will in the long run probably ruin all the great nations of Europe, has been pretty uniform." Governments first borrowed on personal credit, hence the unfunded debt; then on mortgage of particular taxes, hence the FUNDED DEBT (413, 414). If they had been content with anticipation of taxes, they would soon have freed themselves from debt; but no governments have been able to confine themselves to this, thence they are driven to reduce debt by such expedients as (1) a SINKING FUND, which, though raised to pay old debts, facilitate the contraction of new (414, 415); (2) an ANNUITY, especially favoured in France, where there is greater demand for incomes perishing with the first owner than in England, where the funds are wanted as a readily marketable commodity by business folk (417, 1). The reduction of debt in Great Britain since the "ruinous expedient of perpetual funding" has never equalled its increase in time of war.

Adam Smith gives a sketch, drawn largely from other authors, of the growth and vicissitudes of the English debt and its interest (418, 419). His economic judgment on the whole policy is his own. The public funds are not a great capital for the extension of trade; they are a capital converted into revenue, and employed to maintain unproductive instead of productive labourers (419). When public expense is defrayed by funding, it is defrayed by the annual destruction of some capital which had before existed in the country. The waste may be repaired by private energy, and this may be less heavily burdened by funding than if heavy taxes had paid off the debt within the year. But when the war is over the interest remains a constant burden. Moreover, it is good for the citizens to have the meaning of a war brought home to them in heavy taxes, that they may not lightly undertake wars at all. It is no defence of funding to say (420, 421) that it is the right hand paying the left, for (1) foreigners may be the lenders; (2) in any case the lenders are usually not producers, and have no concern in the good condition of land or good employment of capital (422, 1). The liberation of Great Britain from debt is very improbable (424, 2). A great increase of revenue would result, it is true, from an extension of the British system of domestic taxation to all the different provinces of the British empire; but these provinces would first need to be represented in a parliament or states-general of the empire. Private interests would probably prevent this. It will be curious, Adam Smith continues, to consider how this idea might be carried out; it may be "a new utopia"; but, if less amusing than the old, it is at least "no more useless and chimerical" (425). So he goes over the taxes *seriatim*, and decides which might and which might not be adopted for the whole empire. If taxed like Great Britain, which has 8 millions of people, with a revenue of 10 millions of pounds, the whole empire, including Ireland with its 2, and the American colonies with their 3 millions, should yield a revenue of 10½ millions of pounds for their 13 millions of people (426). We might deduct one million sterling for the expenses of civil government in Ireland and the colonies. There would be still enough to allow about £ sterling for reduction of debt. This is on the assumption that all taxes on necessities and on materials are removed, to the benefit of all trade and manufacture both here and throughout the empire (427, 1). It is also on the assumption that our author's proposals, for bonding, for a malt duty, and for assimilation of customs to excise, are adopted (428, cp. 426). "The British empire would thus afford within itself an immense internal market for every part of the produce of all its different provinces" (428, 2).

It is just that both Ireland and America should contribute to the discharge of our debt, which was incurred in their cause as well as our own. By a union with Great Britain, Ireland would gain not only freedom of trade, vexatiously obstructed hitherto, but a complete deliverance from an oppressive aristocracy founded on the most odious of all distinctions, that of religious and political prejudice, to which we owe the present mutual hatred of the two countries (430, 1; cp. 425, 2).

A union with Great Britain would deliver the colonies from the factions inseparable from small democracies. "In the case of a total separation from Great Britain, which, unless prevented by a union of this kind, seems very likely to take place, those factions would be ten times more virulent than ever." They would soon break into open violence and bloodshed [witness the events of 1861-65]. At the extremities of a great empire such factions tend to be less formidable than at the centre. In Scotland they are less so than in England, and they would be so in Ireland and the colonies (430, 2).

If this "utopian" scheme still does not yield sufficient revenue, there is nothing for it but a diminution of expense. It is the wars that are expensive, especially those in defence of the colonies. The colonies are "a sort of splendid and showy equipage of the empire." "The rulers of Great Britain have for more than a century past amused the people with the imagination that they possessed a great empire on the west side of the Atlantic. This empire, however, has hitherto existed in imagination only. It has hitherto been not an empire, but the project of an empire; not a gold mine, but the project of a gold mine—a project which has cost, which continues to cost, and which, if pursued in the same way as it has been hitherto, is likely to cost immense expense, without being likely to bring any profit, for the effects of the monopoly of the

colony trade, it has been shown, are to the great body of the people more loss instead of profit. It is surely now time that our rulers should either realise this golden dream in which they have been indulging themselves perhaps, as well as the people, or that they should awake from it themselves and endeavour to awaken the people. If the project cannot be completed, it ought to be given up. If any of the provinces of the British empire cannot be made to contribute towards the support of the whole empire, it is surely time that Great Britain should free herself from the expense of defending those provinces in time of war, and of supporting any part of their civil or military establishments in time of peace, and endeavour to accommodate her future views and designs to the real mediocrity of her circumstances" (481, 2, end).

The foregoing account of the *Wealth of Nations*, being largely in Adam Smith's own words, will perhaps enable the reader to understand the influence of the book, which was without parallel in economic literature, and yet was not at first, and is not now, a popular influence. Its first-fruits were the treaty of commerce with France in 1786; Huskisson's reforms followed, a generation later; and by Cobden, Bright, and Peel was realised that free trade which our author himself calls utopian. But Adam Smith's arguments have, as a rule, reached the masses through an interpreter. The reasonings, though clear, are usually close and without sentiment; they are models of what economic reasoning ought to be (cp. ENGLISH SCHOOL, pp. 728, 734).

Adam Smith was not the first to write on political economy, and like other good authors he acquainted himself as far as possible with what had been written and was being written on the subject by others. If we select those to whom he was most indebted, the list would include CANTILLON, DECKER, DUVERNEY, HUME, HUTCHESON, LOCKE, MAGENS, MONTESQUIEU, PETTY, and (though not named in the *Wealth of Nations*) MANDEVILLE, MOREAU DE BEAUMONT, POSTLETHWAYT. He does not mention STEUART; and on the whole he went to contemporaries chiefly for facts, quoting their arguments only to controvert them. The *Lectures* refer to many more (see especially pt. ii. § 9). It seems very probable that he owed to the PHYSIOCRATS the greater prominence given to distribution in the *Wealth of Nations* as compared with the *Lectures* (see *Lectures*, Mr. Cannan's pref., xxx, xxxi). He owed to them also the distinction between value in use and value in exchange. DUGALD STEUART (*Pol. Econ.*, ii. 6) tells that the analysis of prices into wages, profits, and rent was suggested by James Oswald of Dunikier, a Kirkcaldy friend, whose *Memorials* (Edin., 1825) show him to have taken an active part in economic discussion as well as political life in the middle of the century. Adam Smith must have picked up many hints in Glasgow among the merchants and manufacturers (see *Rae's Life of Adam Smith*, ch. vii., "Among Glasgow Folk"). He had a hereditary interest in the custom-house. His knowledge of France and Switzerland was gained by personal travel as well as from books, and his knowledge of Holland from friendships there.

There are defects and gaps in the best scientific masterpiece when surveyed critically a century after publication. It has been suggested that Adam Smith gave voice to an industrial revolution of which he was ignorant. There were many inventions that he did not foresee, and a few of which he did not see the importance; but it is evident from such passages as the description of feudal society in contrast with modern (bk. III.), and the lamentation over the bad effects of division of labour (bk. V. I.), that he recognised the decay and disappearance of the idyllic and medieval stage of English industry. He was conscious not indeed of being on the eve of a revolution, but of being in the full progress of a revolution that had dawned some time before him.

Another general objection is that humanity is represented throughout as governed by selfish motives. The quotations given above are enough to show that the allegation is too sweeping. A passage from the *Lectures* (p. 232) throws some light here: "Those principles of the human mind which are most beneficial to society are by no means marked by nature as the most honourable. Hunger, thirst, and the passion for sex are the great supports of the human species, yet almost every expression of these excites contempt. In the same manner, that principle in the mind which prompts

to truck, barter, and exchange, though it is the great foundation of arts, commerce, and the division of labour, yet it is not marked with anything amiable. . . . The plain reason for this is that these principles are so strongly implanted by nature that they have no occasion for that additional force which the weaker principles [e.g. generosity] need." This passage occurs in that part of the *Lectures* which is of greatest interest to students of the *Wealth of Nations*, namely, pt. ii., "Of Police." It is precisely here, however, and in pt. iii., "Of Revenue," that we are obliged to accept all statements with reserve, unless they are repeated in the later book. There can be little doubt that the *Lectures* are a genuine copy; but it is also certain that as early as 1778 Adam Smith expressed an anxious desire to destroy the original, thus estimating that it no longer represented his mind on these matters (see *Life* by Dugald Stewart prefixed to *Essays*, p. lxxxix, cp. lxxxvii). It was destroyed with other MSS. at his own request just before his death in 1790 (l.c.).

The following is a list of Adam Smith's writings:—

(1) Preface, dated Glasgow, 21st December 1748, to the *Poems on Several Occasions* (of William Hamilton of Bangour), Glasgow, Foulis, 1749. The poet's name is given in the 2nd ed. 1758, where there is a dedication to Wm. Crauford, probably by Ad. Smith (see *Rae*, pp. 38-41; see also the new edition by Jas. Patterson, Edinburgh, 1850, p. 10).

(2) Two contributions to the *Edinburgh Review*, of which publication the title ran: "The Edinburgh Review Numb. I. To be published every six months. Containing an Account of all the Books and Pamphlets that have been published in Scotland from the first of January to the first of July 1755. To each number will be added an appendix, giving an account of the books published in England and other countries that are most worthy of notice" (Edinburgh, Hamilton and Balfour, 1755, price 1s.). Adam Smith's contribution is in the appendix, art. 3, *Johnson's Dictionary* (a specimen is given in Craik's *English Prose Selections*, vol. iv. pp. 320, 321). Adam Smith re-writes Dr. Johnson's articles on "But" and on "Humour" in his own way.

The *Edinburgh Review*, from July 1755 to January 1756 (no title page), p. 63. *A Letter to the Authors of the Edinburgh Review* (urging that they have been too indiscriminating, and should pick out of European literature only the publications likely to last for, say, thirty or forty years, going on to compare the state of literature and science in Britain with its state on the continent, more especially France, singling out the French *Encyclopédie* for high praise, comparing French and English philosophical works, and ending with an elaborate parallel and contrast between Mandeville and Rousseau). For Adam Smith's authorship of the review and the letter see *Life*, by Dugald Stewart, p. 19; *Rae*, p. 120-124. There was a reprint, Longman and Constable, Edinburgh, 1818, with authors' names, and preface by Sir Jas. Mackintosh (see Mackintosh, *Miscellaneous Works*, 1854, vol. ii. pp. 460-475).

(3) About this time (1755) Adam Smith wrote a paper vindicating himself from a charge of plagiarism, and showing that he had been teaching the doctrines of natural liberty in matters of trade, not only in his first Glasgow lectures, but in his courses at Edinburgh in 1749. See Dug. Stewart, *Life*, pp. lxxx, lxxxi; Dr. Carlyle's *Autobiography*, p. 285; *Rae*, 62-65.

(4) *Essays on Philosophical Subjects*, by the late Adam Smith, LL.D., Fellow of the Royal Societies of London and Edinburgh, etc., to which is prefixed an Account of the Life and Writings of the Author by Dugald Stewart, F.R.S.E. (London, Cadell and Davies; Edinburgh, Creech), 4to, 1795. "The greater number of them appeared to be parts of a plan he once had formed for giving a connected history of the liberal sciences and elegant arts. It is long since he found it necessary to abandon that plan as far too extensive; and these parts of it lay beside him neglected until his death" (Advertisement by the Editors, Joseph Black and James Hutton, his executors). The account of the life had been read by Stewart to the Royal Society of Edinburgh, 21st January and 18th March 1798 (*Transactions*, iii. 1794). It was republished in the *Scots Magazine*, January and February 1798; and in the *Biographical Memoirs of Adam Smith*, William Robertson, and Thomas Reid, by Dugald Stewart, Edinburgh, 4to, 1811, with an indifferent portrait. The "Notes," pp. 121-152, are new, and valuable both to the biographer and the economist.

The essays are as follows:—

(a) *The Principles which lead and direct Philosophical Enquiries, illustrated by the History of Astronomy*, pp. 1-93 (written before 1758, see p. 90 and note).

(b) *The Principles which lead and direct Philosophical Enquiries, illustrated by the History of the Ancient Physics*, pp. 95-111.

(c) *The Principles which lead and direct Philosophical Enquiries, illustrated by the History of the Ancient Logics and Metaphysics*, pp. 115-129.

(d) *Of the Nature of that Imagination which takes place in what are called the Imitative Arts*, pp. 134-184 (probably from the lectures at Edinburgh, 1748-49).

(e) *Of the Affinity between certain English and Italian Verses*, pp. 187-194.

(f) *Of the External Senses*, pp. 197-244 end (the only psychological essay).

(g) *The Theory of Moral Sentiments*, by Adam Smith, Professor of Moral Philosophy in the University of Glasgow (Millar, London; Kinnaird and Bell, Edinburgh), small 8vo, 1759; 2nd ed. 1761. *The Theory of Moral Sentiments, to which is added A Dissertation on the Origin of Languages*. This addition, pp. 437-478, is described on p. 437 as "Considerations concerning the First Formation of Languages and the Different Genius of Original and Compounded Languages"; 3rd ed. (unchanged) 1767; 4th, 1774; 5th, 1781. In the sixth edition not only was the title expanded, but there were many alterations in the text. It was published in two volumes in the year of the author's death. The title runs now: *The Theory of Moral Sentiments, or an Essay towards an Analysis of the Principles by which Men naturally judge concerning the Conduct and Character first of their Neighbours and afterwards of themselves. To which is added A Dissertation on the Origin of Languages*, by Adam Smith, LL.D., Fellow of the Royal Societies of London and Edinburgh, one of the Commissioners of His Majesty's Customs in Scotland, and formerly Professor of Moral Philosophy in the University of Glasgow. The sixth edition, with considerable additions and corrections, in two volumes (Strahan and Cadell, London; Creech and Bell, Edinburgh, 1790).

(h) *An Inquiry into the Nature and Causes of the Wealth of Nations*, by Adam Smith, LL.D. and F.R.S., formerly Professor of Moral Philosophy in the University of Glasgow, Strahan and Cadell, London, 1776, 2 vols., 4to. (It was really printed at the end of 1775 and beginning of 1776. See preface to third edition.) The second edition, also in two 4to volumes, was published in 1778. There are very few changes. One is noted above. The third edition (1784) is in three volumes 8vo, and has considerable additions, especially in bk. IV., to the chapters on "Drawbacks" and "Bounties." There is a new chapter inserted in bk. IV., entitled "The Conclusion of the Mercantile System," and a new article (art. 2, "For Facilitating Particular Branches of Commerce") in bk. V. The additions and corrections were also published separately, 4to. The fourth, in three vols. 8vo, 1789, contains no alterations, but acknowledges the debt of the author to Mr. Henry Hope of Amsterdam for the information about the bank there. The fifth (and last in the author's lifetime), 1789, 8 vols. 8vo, Strahan and Cadell, contains no alterations. Besides the above there are Dublin editions, 1785 and 1793, in 2 vols. "pirated" from the 4th and 5th editions.

(i) *The Life of David Hume, Esq., written by himself* (Strahan and Cadell, London, 1777). Adam Smith contributed to this book a "Letter to William Strahan, Esq.," dated 9th November 1776. It gives an account of Hume's last illness and a warm appreciation of his character.

(j) Letters of Adam Smith to various correspondents have been printed by Dugald Stewart, Sir John Sinclair, Hill Burton, McCulloch, Dr. Birkbeck Hill, also in the *Life of Kames*, the *Life of Oswald*, and in the *Catalogue of his library*. All may be traced in Mr. Rae's biography.

(k) *Lectures on Justice, Police, Revenue, and Arms, delivered in the University of Glasgow*, reported by a student in 1763, and edited with an introduction and notes by Edwin Cannan (Clar. Press), 1896. Allusion has already been made to this volume. The contents are: Introduction. Part I., "Of Justice, including Public Jurisprudence, Domestic Law, and Private Law," pp. 1-158. Part II., "Of Police, including Cleanliness and Security, Cheapness or Plenty, Commerce and Manners," pp. 154-236, 253-259. Part III., "Of Revenue, including Taxation and (Government) Stocks," pp. 237-252. Part IV., "Of Arms, including Militias, Discipline, and Standing Armies," pp. 260-264. Part V., "Of the

Laws of Nations, including War, Rights of Neutrals, Rights of Ambassadors," pp. 265-280.

Biographies begin with Dugald Stewart's (see above), which is the foundation of all the best others. The biographers include W. Smellie (1800), Playfair (1805), James Patterson (in his notes to Kay's *Edinburgh Portraits*), Brougham, McCulloch, Bagehot, Leser (1881), J. A. Farrer (1881), Delacour (1886), Haldane (1887), Courcelle SENEUIL (1888). Professor Leser's was perhaps the most thorough in details and knowledge of sources, till Mr. John Rae's *Life of Adam Smith* (Macmillan, 1895) superseded all others. Mr. Rae's publication has no portrait. Two fresh items have been added since its appearance. The correspondence of 20th, 21st, and 22nd March 1895 in the *Scotsman* newspaper showed that Adam Smith's father married twice, and our author had a half-brother, Hugh, who was born in 1709 and died in 1750. A letter of Adam Smith to the then Duc de Rochefoucauld, dated 1st Nov. 1785, was published by Mr. Rae in the *Athenaeum* of 28th Dec. 1895, and will be found in the *Economic Journal*, March 1896, pp. 165, 166.

The *Catalogue of the Library of Adam Smith*, published for the London Economic Club (Macmillan, 1894), is a *catalogue raisonné* of about 1000 books then known to be his, and about a score have been added to the list since then, the most important being Mercier de la Rivière's *L'Ordre Naturel et Essentiel*, 1767. There is a chapter on the Portraits of Adam Smith, by the late John M. Gray. The will is given, also the plan of the house at Kirkcaldy, also the facsimile of a letter. A similar facsimile was appended by J. R. McCulloch to his *Life of Adam Smith* in its separate form (Edinburgh, 1855). McCulloch's edition of the *Wealth of Nations* in its later issues contains the Tassie medallion and the full-length portrait by Kay, very fairly executed.

As to editions of Adam Smith's works, the only edition of the collected works is that of Dugald Stewart, in five volumes, published in London, 8vo, 1811-1812. It is headed, *The Works of Adam Smith, LL.D.*, and includes the *Moral Sentiments*, vol. I., 1812; the *Wealth of Nations*, vols. II., 1812; III., 1811; IV., 1811, with index; *Formation of Languages, Essays, Life*, as above, with the notes, appendix containing the two contributions to the *Edinburgh Review*, vol. v., 1811.

*Wealth of Nations*, 11th ed., edited with introduction and Life by William Playfair, 3 vols. 8vo, and footnotes, Cadell and Davies, 1805. (Obtrusively anti-Gallican).—*Wealth of Nations*, with Life, comparison with French economists and Garnier's method (see below), 3 vols. 8vo, Maynard and Zinke, London, 1811. Similar editions founded on Garnier had been printed at Edinburgh, 1806, and Glasgow, 1805.—*Wealth of Nations*, edited, with notes and additions, by D. Buchanan, 4 vols. 8vo, Edin., 1814 (see BUCHANAN).—*Wealth of Nations*, edited, with Life, introduction, notes, and supplement, by J. R. McCulloch, 4 vols., 8vo, Edinburgh, 1828. This passed through many editions, and the edition of 1863 in one thick volume 8vo is the one cited throughout this article. *Wealth of Nations*, with Life, comparison with French economists, etc., from the French of G. GARNIER, edited by Edward Gibbon Wakefield, 4 vols. 12mo, London, 1835-39.—*Wealth of Nations*, edited by J. E. Thorold Rogers, 2 vols. 8vo, Clar. Press, 1869.—*Wealth of Nations*, with introductory essay, and notes, by Prof. J. S. Nicholson, 1 vol. 8vo, Nelson, Lond. and Edin., 1884. The text was set up from the types of the edition of Thos. Nelson and Peter Brown, Edin. Univ. Press, 1829. The special value of the book is in its new introduction and notes. Joyce (Jeremiah) published *A Complete Analysis or Abridgement*, Cambridge, 1797, small 8vo, which passed through several editions. The 3rd (London, 1821) supplements Joyce's own analysis by Garnier's. Mr. W. P. Emerton's *Analysis of the First Two Books* (Oxford, Thornton, 1877) is founded on Joyce and Garnier, with notes based on Rogers, Fawcett, and other later authorities. Selected chapters from the *Wealth of Nations* are given in Professor Ashley's *Adam Smith*, "Economic Classics," Macmillan, New York, 1895.

*An Analysis of the Moral Sentiments* is given by J. A. Farrer (English Philosophers Series, Sampson Low, 1881). The first translation of the *Moral Sentiments* into French appeared in 1764 in 2 vols. 12mo, under the curious alternative title, *Métaphysique de l'Âme*, by E. Dous; a better by Abbé Biavet in 2 vols. 12mo, 1774, and still better by la Marquise Condorcet, 1798, 2 vols. 8vo. It was translated into German, 1 vol. 8vo, Brunswick, 1770, and by Kosegarten, Leipzig, 1791.

The *Wealth of Nations* was translated by Blavet piecemeal for the *Journal de l'Agriculture* of Ameilhon, 1779 and 1780, and then published in 6 vols. 12mo at Yverdon, and 3 vols. in Paris, 1781. Another translation, by the poet Roucher, not, as he had hoped, assisted by Condorcet, 3 vols. 8vo, 1790. But the translation of Count Germain GARNIER superseded its rivals. It was published in 5 vols. 8vo, Paris, 1802. It has a Life and a portrait from the Fassie medallion, reversed. The 1st volume contains a long preface, including Garnier's famous *Method for facilitating the Study of the Wealth of Nations*. He regards the main doctrine of Adam Smith as all contained in the first two books; the rest can be read separately for illustration. He then divides the subject of the two books into three parts: (1) Value, including price, wages, profit, and rent; (2) stock, including fixed and circulating capital; (3) production and distribution of wealth, including division of labour, employments of capital, exchange. Garnier's last volume (v.) consists entirely of notes and index. In 1843-44 Garnier's translation was republished in 2 vols. 8vo with *variorum* notes from Blanqui (the editor), Buchanan, McCulloch, Malthus, Ricardo, Mill, Sismondi, and Say. There was a new portrait. For more details see the French *Diet. de l'Ec. Pol.*

The first German translation appeared anonymously in 1776-78—vol. i. 1776, vol. ii. 1778 (Leipzig, Weidmann). It is ascribed to J. F. Schiller, who is not to be identified with the poet. (Prof. Cohn calls him a German living in London, *Nat. Oek. Grundlegung*, 1885, p. 110.) The first German review seems to have been in the *Göttingische gelehrte Anzeigen*, 10th March and 5th April 1777 (Roscher, *Nat. Oek. in D.*, p. 599). There was a translation by the philosopher GARYZ and the official Dörrien in 3 volumes, 1794, which reached a 3rd edition in 1810, Roscher, *ib.* 603; by Max Stirner in 1846-47; and, finally, by C. W. Asher, under the title *Ueber die Quellen des Volkswohlstandes*, Stuttgart, in 1861.

The *Essays* were translated into French by P. Prévost of Geneva, 2 vols., Paris, 1797. Mr. Rae tells us, ch. xxiv., that a Danish translation of the *Wealth of Nations* by Drebye appeared in 1779-80, an Italian in 1780, and a Spanish by J. A. Ortiz in 1794, after the book had been suppressed by the Inquisition for "the lowness of its style and the looseness of its morals."

Germany has made amends for a late recognition of Adam Smith by publishing more monographs on him than any other nation. In England he has had a place in almost every treatise on political economy in the century, but monographs have been fewer, even if we include articles in reviews (as BAGEHOT's and CLIFFE LESTER's). The Dutch monograph by J. F. B. Baert, *Adam Smith and his Inquiry into the Wealth of Nations*, Leyden, 1888, must be mentioned. Professor Rösler's *Grundlehren der von Ad. Smith begründeten Volkswirtschaftstheorie*, Erlangen, 1868, contains the paradox that what Adam Smith calls in one place division of labour he calls in another capital. Professor Leser has treated of the *Notion of Wealth in Adam Smith* (1874), and Professor Oncken of *Adam Smith in der Culturgeschichte*, Wien, 1874; and in "Das Adam Smith-Problem," *Zeitschrift für Sozialwissenschaft*, I. Band, 4 Heft, Berlin, 1898: Professor Inama Sternegg, of his *Bedeutung für die mod. Natöik.*, 1876. Professor Oncken, in his *Adam Smith und Immanuel Kant* (1877), tries to make us believe in a close kinship between the two philosophers. Perhaps the best of recent books of the kind are those of Dr. R. Zeys, *Ad. Smith und der Eigennutz*, Tübingen, 1889, and Prof. W. Hasbach, *Die allgemeinen philosophischen Grundlagen*; of Quesnay's and Adam Smith's political economy (1890); and *Untersuchungen über Adam Smith* (1891). Both writers embrace the philosophy as well as the economics, as is done on a smaller scale in Bonar's *Philosophy and Pol. Ec.* (1893). Dr. Zeys disposes *inter alia* of the notion of Skarzynski, *Ad. Smith als Moral Philosoph*, 1878, that Adam Smith's philosophical views were completely changed by his French journey. Adam Smith's relations to Quesnay are fully discussed by Hasbach, and to Turgot by Dr. S. Feilbogen, *Smith und Turgot* (Wien, 1892).

For general estimates of Adam Smith's economics, see Mr. L. L. Price's *Political Economy in England*, London, Methuen, 1891, chapter i., and his *Economic Science and Practice*, Essay XII, on "Adam Smith and his relations to recent Economics," London, Methuen, 1896.

For an estimate of his views on taxation, see Prof. Bastable's *Public Finance* (1892) throughout, where amongst other things there is noted the remarkable omis-

sion of the poor rate in connection with taxation (p. 81), perhaps due to the absence of a Poor Law in Scotland. Mr. Edwin Cannan, *History of Theories of Production and Distribution, 1776-1848* (1893), gives a full discussion of Adam Smith.—Buckle, *Civilis.*, i. 105 n., has chronicled the occasions on which Adam Smith was mentioned in parliament during the first seventeen years after publication of the *Wealth of Nations*. The first was in 1783.—Toynbee, *Industrial Revolution*, ch. vii., 1884, considers Adam Smith's relation to the mercantilists. For estimates of the *Moral Sentiments*, it will be sufficient to refer to Mackintosh's *Dissertation on Ethical Philosophy*, and Mr. Leslie Stephen's *English Thought in the Eighteenth Century*, vol. ii.

J. B.  
SMITH, CHARLES (1713-77), a wealthy owner of corn-mills chiefly in Essex, wrote—

*A Short Essay on the Corn Trade and the Corn Laws* (1758), and *Considerations on the laws relating to the Importation and Exportation of Grain, and A Collection of Papers relative to the Price, Exportation, and Importation of Corn*, both published 1766 and called "second edition." The whole was republished in 1804, *plus* notes by Catherwood and extracts from Chalmers's *Estimate*, etc. C. Smith's list of corn prices (1595-1765) (ed. 1804, p. 123) was taken from the Eton audit books either directly or through Bishop FLEETWOOD (*Chronicon Preciosum* (1707), pp. 125-130), and was utilised by A. YOUNG (*Farmer's Letters* (1767), pp. 40, 48), Combrune (*Inquiry* (1768), pp. 36, 37), and others, until Thorold ROGERS did the same work on a far larger scale in his *History of Agriculture and Prices* (1887), vol. v. pp. 170 *et seq.*; official figures began only in 1771. A. SMITH who speaks highly of C. Smith's work refers also to the obvious fallacy of his and A. Young's approval of the export bounties levied since 1688 on corn because they cheapened corn (*Wealth of Nations*, ed. McCulloch, p. 224). Although he wrote, "Quantity alone can frustrate all attempts to ingross or forestall," so that if crops are good "no art can enhance the price of grain," if bad, "no art or regulation of government will keep the prices low" (p. 92), C. Smith praised the "discreet" use of assizes of bread, corn duties, and corn bounties. J. D. R.

SMITH, EDOUARD (1789-1852), director of statistics in the Belgian ministry of the interior, wrote:—

*Statistique Nationale, Développement des trente et un tableaux publiés par la Commission de Statistique et relatifs aux mouvements de la population dans les Pays Bas depuis la création du royaume jusqu'en 1824* (Brussels, 1827).—*Statistique des Pays Bas publiée au nom de la Commission Royale* (Brussels, 1827-1829).—*Recherches sur la reproduction et la mortalité de l'homme aux différents âges et sur la population de la Belgique* (1832).—*Statistique criminelle de la Belgique* (1832), and *Recherches statistiques sur la Belgique faites au nom du Ministère de l'Intérieur* (1836). E. ca.

SMITH, ERASMUS PESCHINE (1814-1882), studied in Columbia College, New York, and in Harvard Law School, was an editor in Rochester, N.Y., and for two years professor of mathematics in the university of Rochester. He resigned this position to be superintendent of public instruction for the state of New York (1852), and was subsequently reporter of the court of appeals

of the same state. He served the national government as commissioner of immigration and as examiner of claims. In 1871 he went to Japan as special adviser to the Mikado in international law, serving for five years as a sort of foreign secretary, during which time treaties were negotiated and better relations established with several European countries. While in this position he was instrumental in breaking up the Chinese coolie trade.

His *Manual of Political Economy* (New York, 1853) was translated into French by Camille Baquet in the year after its publication. He is a close disciple of Henry C. CAREY (*q.v.*), expressly waiving in his preface any claims of originality as against him. The book deserves attention, however, for its emphasis of the physical conditions of production and its analysis of the methods by which soils are produced. His definition of the object of political economy is quite in the spirit of Carey: To investigate the laws which explain man's attainment, through association, of enlarged power over matter in all its forms, and the development of his intellectual and moral faculties, in virtue of that power. E. T. D.

SMITH, HENRY (1550–*d.* about 1592), lecturer at St. Clement Dane's.

Was the author of the *Examination of Usurie* (two sermons appended to the *Preparative to Marriage*), 1591. In these the condemnation of usury, elaborately founded on scripture, is extended not only to loans to the poor and needy, but to money lent at interest in business, on the ground that lenders expect to share in gains but not in losses. The inference that to a lender who consented to take his part in losses interest might reasonably be paid, is prevented by a later passage where the preacher forbids the borrowing of capital, first because people should not wish to be richer than their own means can make them—an empty maxim—and secondly because prices must rise if interest as well as profit is to come out of them. The relation between profit and interest is not clearly seen; through Jewish practices the word "usury" had gained an ill reputation, and the innocent thing was prejudiced by its name (see CANON LAW; INTEREST AND USURY).

[Wood, *Athenæ Oxonienses*, vol. i. with discussion on date of death.—Fuller, *Church Hist.*—Chalmers, *Biographical Dictionary*.—Cunningham, *Industry and Commerce*, *Modern Times*, pp. 79–82.]

E. G. P.

SMITH, JOHN. A London merchant:

Was the author of the *Trade and Fishing of Great Britain displayed*, 1661, and of *England's Improvement Reviv'd*, 1673 (written and intended to be published a few years earlier). The former describes a journey round the north and west of Scotland, with the object of investigating native and Dutch methods of fishing, and includes an account of the Orkney and Shetland Islands, and proposals for so conducting the fishing as to oust the Dutch; a slight historical sketch is added of the successive control of trade by the "Venetians, Genoese, Portugals, EASTERLINGS, or HANSE Towns, Hollanders, and English." When he wrote this, Smith was apprenticed to "Mr.

Matthew Cradoch of London, merchant, one of the society for the fishing trade of Great Britain."

His other work was written to encourage timber-growing. After pointing out the damage done by careless and wasteful felling of trees, without replanting, especially on royal lands for the navy, the writer gives full directions for the planting and cultivation of different trees, with accounts of their special uses, and calculations of cost according to the spaces to be left between them. The tract on fishing was incorporated as the sixth book of this work.

[Preface to *England's Improvement Reviv'd.*]

E. G. P.

SMITH, JOHN (18th century)—

Was the compiler of a highly valuable work on the wool-trade, entitled *Chronicon Rusticum-Commerciale, or Memoirs of Wool, etc.; being a collection of History and Argument concerning the woollen manufacture and woollen trade in general, particularly the rise, progress, improvements, declensions, revolutions, and the respective causes thereof in England; as also an account of the several laws from time to time made and of many schemes offered for preventing the exportation of raw wool, with occasional notes, dissertations, and reflections upon the whole*, London, 1747, 2 vols. 8vo; 2nd ed., 1756–57, 2 vols. 4to—a most careful and detailed account of the incidents and references relating to the woollen and cloth trade from the earliest mention of wool until the middle of the 18th century. He quotes from the parliamentary petitions, statutes, patent and other rolls, of each reign, and inserts all the available contemporary literature of each period bearing upon the subject. In this way he prints "W.S.'s" *Compendium or brief examination of certain ordinary Complaints of divers of our Countrymen in these our Days* (ch. xxiii.); *A Treatise of Commerce*, or a brief history of the merchant adventurers, by John Wheeler, secretary to that society (ch. xxv.); John May's *Declaration of the state of clothing now used with in this realm of England*; also the writings of MISSELDEN, MALYNES, and (ch. xlvii.) Sir Josi CHILD's *New Discourse of Trade*. He continues to embody in his work the writings of many small economic writers of each period, and with whose works it is not otherwise easy to become acquainted. He strongly urges a duty on wool as the principal means of restraining its being exported raw, on the grounds that "an absolute prohibition hath never yet had the effect that was genuinely intended by it." The writer of these "Memoirs" was immediately attacked by a Mr. Temple, who, as Smith himself summed up, charged him upon the four following points:—(1) that Mr. Smith had made that the price of the best English wool which was very far from being so; (2) that he had treated the wools of Cotswold as the *finest* clothing wools of England, which they are not; (3) that the best Spanish wools were not at Amsterdam in 1719 of the price mentioned (Mem. ch. 172); (4) that most of the Spanish wools are of a lower price than the lowest there mentioned; (5) that the author has shown great ignorance in making any comparison between the

<sup>1</sup> See also WILLIAM STAFFORD.

price of English wool, as sold from the farmers in England, and Spanish, as well as obtained for wools at the market of Amsterdam.

All these objections Smith replied to in a volume entitled *The Case of the English Farmer and his Landlord in answer to Mr. Temple's pretended Refutation of one of the Principal Arguments in Memoirs of Wool*, London, 1750 (?), 8vo.—Smith also published *A Review of the Manufacturers' Complaints against the Wool Grower*, pt. i. *Wherein of Pitch and Tar Marks, the Excess, the Injury, and their respective Remedies, are considered minutely*, London, 1753, 8vo.

The dearth of wool, said the Manufacturers' Petition, tended to cause the farmers to increase the weight of their wool by excessive pitching and tarring. Also they complained of false and deceitful winding. Smith defended the growers by disputing the charge of over-marking; and proposes as a remedy to reduce the necessary brandings and to limit their size, and to prohibit the use of tar or pitch in other markings made by the owner.

SMITH, JOSHUA TOULMIN (1816-1869), was an ardent writer on local self-government and its history.

The best known of his many works is *The Parish: its Obligations and Powers* (1854, 2nd ed. 1857). Besides this, he made the collection of returns from *English Guilds*, afterwards published under that title by the Early English Text Society (1870). These furnished for some years the only, as they do still the chief printed material for the history of the "social-religious" fraternities of England during the middle ages. *Local Self-government and Centralisation, the characteristics of each, and its Practical Tendencies as affecting Social, Moral, and Political Welfare and Progress*. London, 1851, 8vo, pp. 408. This treatise states the broad permanent principles of the English constitution, and their historic application to great questions of law and economics, with some contrasted infringements.

W. J. A.

SMITH, PRINCE. See PRINCE-SMITH.

SMITH, SIR THOMAS (1514 or 1515-1577), was born at Saffron Walden and educated at Cambridge, where he became regius professor of civil law; he was employed under Edward VI. and Elizabeth as ambassador and secretary of state. He was one of the most active movers in the Elizabethan attempt to colonise Ulster.

His chief literary work was *The Commonwealth of England*, an imitation in the first part of Aristotle's *Politics*, and a description, historically interesting, of English ranks and classes, and of the English constitution and law courts, with a view to the comparison of our common law with the civil law used by continental nations. The book, though it is not remarkable as a literary or philosophical work, is valuable as comprising a considerable number of important details concerning legal procedure and social distinctions—the clear line which could be drawn then between the classes of esquires, yeomen, and farmers, etc., in contrast to our present looseness of class, is particularly to be noticed (Strype's *Life*, ed. 1820, p. 85, note).

Sir Thomas Smith also wrote elaborate tables of money, especially as a guide to the calculation of Roman money in English denominations; they are printed at the end of the *Life*.

[Strype, *Life of Sir Thomas Smith*.—Wright, *Queen Elizabeth and her Times*, contains much of Smith's correspondence with Lord Burleigh.]

E. G. P.

SNELLING, THOMAS (1712-1773), a Fleet Street bookseller and coin-dealer, wrote:—

(1) *A View of the (a) Silver* (1762), (b) *Gold* (1763), and (c) *Copper* (1766) *Coin and Coinage of England* from (a) William I., (b) Henry III., and (c) Elizabeth respectively, down to George II., with copper-plate engravings and historical and critical notes. The plan had been devised by the Society of Antiquaries, whose members—S. M. LEAKE and Martin FOLKES—had carried it out, but far less accurately and completely than Snelling. His (2) *View of the Origin, Nature, and Use of Jettons* (1769); (3) *Miscellaneous Views of the Coins struck by English Princes in France, etc., by the East India Company West India Colonies, etc.* (1769), and (4) *Supplement to Mr. Simon's Essay on Irish Coins* (after 1769) throw light (amongst other things) on the connection of coinage, traders' tokens (which perhaps an ancestor of his coined; Boyne, *Trade Tokens of the Seventeenth Century*, ed. Williamson (1889), p. 704) or promissory notes, and municipal charities, and are still authoritative (*Antiquary* (1873), pp. 8, 165, 309); (5) *His View of the Silver Coin and Coinage of Scotland* (1774) shows that he had begun to do for Scotland what he did for England, and displays critical sagacity of a very high order (E. Burns, *Coinage of Scotland* (1887), i. 98, 99; ii. 113). His (6) *View of the Coins at this time current throughout Europe* (1766), and (7) *Doctrine of Gold and Silver Computations* (1766) are less important. He also published engravings of (8) *Seventy-Two Plates* (1757) (prepared in 1652—*Numismatic Chronicle*, 2nd ser., xiv. 159; Ducarel, *Anglo-Gallic Coins* (1757) p. 3); (9) *Five Plates of Gold Coins, etc., of Scotland*—an appendix to (5) and (10); *Thirty-Three Plates of English Medals* (1776). Some of his plates for (1) had strayed into Ducarel's book, and into *Twelve Plates of English Silver Coin printed for Withy and Ryall* (1756); and most of his plates were prepared by F. Perry, J. Lodge, C. Hall, and others; but whatever was "printed for Snelling," though coarse when judged by modern standards, is still invaluable.

[Ruding, *Annals*, 3rd ed. (1841), p. x.; R. W. Cochran-Patrick, *Records of the Coinage of Scotland* (1876), pp. 6, 7; E. Hawkins, *Silver Coins of England*, ed. Kenyon (1887), pp. 3, 4.]

J. D. R.

SOCAGE. The chief free tenures in mediæval England were tenure by KNIGHT'S SERVICE, tenure in SERJEANTY, FRANKALMOIGN, and socage. Socage has been defined as the great residual term, which includes all free tenures not included under the other heads. Thus there is great variety as to the conditions of socage tenants—some hold on condition of almost nominal service, some on payment of a

money rent, and some on condition of agricultural services not very different in kind from those of the *VILLEIN*. In early times land held in socage was divisible among sons, but the custom of *PRIMOGENITURE* gradually became the rule, except in Kent and other districts where special customs, such as *GAVELKIND*, prevailed. Socage tenants were always exempt from compulsory military service, and though they paid *AID* and *RELIEF*, they were free from the burdensome incidents of wardship and marriage. The guardian in socage was the next of kin who could not inherit. The act of Charles II. (1660) abolishing feudal rights made socage tenure practically universal. [Pollock and Maitland, *Hist. of English Law*.—Digby, *Hist. of the Law of Real Property*.] R. L.

### SOCIAL CONTRACT AND SOCIAL SCIENCE.

Social Contract, p. 427; Social Science, p. 428; Social Science (Sociology), p. 430.

**SOCIAL CONTRACT, THE.** The doctrine of the social contract may be described as the doctrine that every state owes its existence and constitution to the free and deliberate agreement of its original members, and that its present members by continuing within it are presumed to acquiesce voluntarily in its authority by reason of receiving its advantages. It thus involves the assumption of a state of nature and a law of nature antecedent to civil society and to civil law. The date of its origin is difficult to fix, for the theory that society has its origin in convention is as old as the Greek sophists, and has been in vogue at intervals ever since. It is easier to fix the time at which the doctrine of the social contract had most influence. With the decline of mediæval beliefs men felt the necessity of some justification for the authority of the state, apart from theological arguments or ideas of feudal tenure. Science was still so little advanced that hardly any one thought of asking how the state has actually arisen. The notion of an original compact became popular in the 17th and 18th centuries. The three most celebrated exponents of this notion are *HOBBS*, *LOCKE*, and *ROUSSEAU*.

Hobbes's conception of the social contract is set forth in his *Leviathan* (1651). As he had been profoundly impressed with the miseries of civil discord in England, he sought to found on the social contract a system of absolute government. He assumed an original state of nature in which man was subject only to the natural law of self-preservation, and was therefore justified in taking every advantage of his fellow-creatures. Such a state of nature was necessarily a state of universal war, and whilst it lasted the life of man was "solitary, poor, nasty, brutish, and short." The same law of self-preservation constrained men to seek for an escape from this wretched condition. Therefore they came together and entered into a covenant,

every man with every other, whereby each resigned all his natural rights into the hands of a particular person or body of persons, on condition that every one else did the same. Thus they created a sovereign who was not indeed a party to the social contract, but who derived from it an absolute authority which could not be revoked, because the members of society had reserved no rights to themselves. The sovereign was subject neither to legal nor to moral restraint, and political liberty meant merely liberty to do that which the sovereign had not forbidden.

Locke, in his *Treatise on Civil Government* (1690), gave a new complexion to the theory of the social contract. According to Locke the state of nature was one of freedom and equality. Whilst in that state men were subject to the law of nature which restrained their rights over their own or their neighbours' life and property. Thus the state of nature was not necessarily a state of war or of misery. It was, however, a state of insecurity, as there was no impartial and irresistible arbiter to protect each individual in the enjoyment of his rights. Therefore men agreed to form a society and to resign to a ruling authority so much of their natural rights as was necessary for this purpose. They could not invest their governors with unlimited rights over life and property, for they had not possessed such rights themselves. Nor could they be supposed to resign more of their natural rights than they were obliged to do, in order to secure the benefits of civil society. Therefore the sovereign could not claim more than a limited authority, and if he betrayed his trust, he might lawfully be deposed. In this way constitutional government was made to appear the logical corollary of the social contract.

Rousseau published his famous book on the social contract in 1762. In this work he combines some elements derived from Hobbes, with other elements derived from Locke. He seeks to harmonise the absolute authority of the sovereign with the absolute freedom of the citizen. The aim of the social contract, he taught, was "to find a form of association which may defend and protect, with the whole force of the community, the person and property of every associate, and by means of which, each coalescing with all, may nevertheless obey only himself and remain as free as before." Like Hobbes, Rousseau held that, by the social pact, each individual surrendered the whole of his natural rights. But, unlike Hobbes, he held that the community formed by this pact necessarily remained sovereign. Sovereignty being inalienable and indivisible, the "prince," i.e. the government, could only be a subordinate authority. The "prince" wielded the executive power, but the legislative power always remained with the people, and when the people assembled they resumed plenary authority, and

the "prince" was suspended from his functions. With ingenious sophistry, Rousseau tries to prove that this absolute power of the body means the absolute freedom of its members, so that when an individual suffers death in virtue of a law enacted by the people, he is really a consenting party to his own execution, and if he thinks otherwise, is not thinking clearly. It will be clear, from what has been said, that each writer will deduce from the hypothesis of a social contract the legitimacy of that form of government which he thinks most beneficial. The hypothesis rests on a sharp distinction between the state of nature and the social state, between the law of nature and the civil law. But these distinctions have no basis in history. From the first, men lived in rudimentary associations, and these passed by gradual development into what we call political society. How the state has arisen is a purely historical question which must be solved by the collection and interpretation of historical evidence. No genuine instance of a social contract has been found, nor, if found, would it support inferences like those drawn by Hobbes, Locke, or Rousseau. That savages could foresee the political needs of later generations, or bind those generations by their covenant, has been proved absurd by anthropology. Nevertheless, the theory of the social contract contains in mythical form a serious truth. Government cannot be justified simply on grounds of force, of tradition or even of instinct. It can be justified only on the ground that it conduces to the good of the governed. It is most powerful when it has their conscious approval. In this sense it is true that the consent of the governed is the basis of government. The theory of the social contract had the merit of contradicting the theories which based government on divine right, on patriarchal right, or on proprietary right. It was an instrument of intellectual and social revolution, not a scientific summary of historical fact.

[Hobbes, *Leviathan* and *De Cive*.—Locke, *Civil Government*.—Rousseau, *Contrat Social*.—Hume, *Essays*.—Green, *Theory of Political Obligation*.—Ritchie, *Natural Rights*.—Pollock, *History of the Science of Politics*.—Bluntschli, *Theory of the State*.]  
F. C. M.

**SOCIAL SCIENCE.** Social science is a new word for the old Greek science of politics—which included every kind of human association. But the old point of view had been shifted and enriched by mediæval writers, who looked more at the spirit which created than at the thing created, and whenever the social sense wove some spiritual texture, or struck some unintended harmony, their first impulse was to contrast it with the state; and they believed in universal history: "The entire succession of men," wrote Pascal, "must be regarded as one man always living and incessantly learning."

That is why TURGOT and HEGEL took for their theme "l'esprit humain," or "Volksgeist," and rang on it subtler and more various changes than ARISTOTLE dreamt of. And the results of Greek thought had been so clean forgotten that VICO (1725) called his science—founded on the axiom that man is social—"a new science," "the philosophy of humanity," etc.; and DUPONT (1768) attributed the "discovery" that "natural" meant "social" law, to GOURNAY and QUESNAY (1755), and this too was called "a new science"—"la science sociale et économique," etc. (*Éphémérides d'un citoyen*, 1767). After J. B. SAY (1803)—much to Dupont's regret (1815)—sacrificed social to economic science, FOURIER (1808) invented "a new science"—"la science sociale," and disciples of Cabanis, like DESTUTT de Tracy (1824), and of St. SIMON counterclaimed for the title. Then A. COMTE (1830-42), the last European inventor of "a new science," took the name sociology—partly in order to distinguish the constructive views of the 19th from the individualism of the 18th century. But this was also St. Simon's aim; nor has the aim been reached; thus to-day Ferri's nationalised industries, Schäffle and Siciliani's autonomous industrial groups, S. P. Andrew's and H. Spencer's *laissez-faire*, Fouillée's compromise, and Lilienfeld's (iv. 386) reconciliation of these opposing schools, are all claimed as offshoots of this same stock. Comte also rebelled against the watery, non-national, levelling doctrines of men like CONDORCET, and looked towards a federation of the leading races of the world; but St. Simon, Kant (1784), whom Comte had read, and Vico, had already found salvation in this idea. As Comte put forth three stages of progress as the first-fruits of his new science, so had BODIN (1580) and Vico; and Vico's first stage was theological, and his third scientific; Turgot characterised the second stage as one where men substituted abstract essences for causes (Say et Chaillet, *Dict. de l'Économie Politique*, s.v. "Sociologie"); and St. Simon named the second the critical or metaphysical, and, following a hint of Burdin (1797), the third the positive or reconstructive stage (*Œuvres Choiesies*, i. 198; ii. 20). The truth is that there was no new science, but only the old Greek science draped by the middle ages, and the discovery by modern writers of the nude beneath the drapery upset their minds. Vico stood between the mediæval and modern world; after him the way parted in three directions.

(1) The first was towards a philosophy of history. Hegel's *Philosophy of History* (1825) is a sequel to his *Philosophy of Right* (1821). The latter criticises associations from the successive points of view of a Roman lawyer, a French economist, and a Greek philosopher. In the former he looks at history metaphysically as the externalisation of

spirit, and also historically, but through a telescope. Every historian feels himself in contact with "secret living impulses" (v. Ranke), which are half empiric laws, half aspirations grounded on self-knowledge; and Hegel's generalisation that consciousness of freedom (De TOCQUEVILLE'S (1835) "Democracy") passes down the ages in ever-widening circles is an effort to see what the philosophic historian feels; and so far only, Hegel tells us, history accords with what other scientific processes might lead us to expect. The philosopher, therefore, does not follow history any farther than this. True, this is only a vague rough outline, which historians must fill in with the aid of their microscopes; and even they desist from details the moment that their sympathies wane. But it has the merit of being a bridge which leads straight on from science to history, and so to real life. As Schläger's *Vorstellung einer Universal Historie* (1772) was the prelude to his *Welt-Geschichte* (1785) so (as Bernheim tells us) v. Ranke's *Welt-Geschichte* (1881) took up the thread where Hegel dropped it. And history itself only reaches up to real life a little farther than scientific knowledge; so that philosophies of history mark the dividing line where science gradually fades away and loses itself like a dream in the waking world.

(2) The extreme sociologists start from the opposite point of the compass. As the physiocrats made natural science, so, since Cabanis (1795), biologists have made biology reach down to human life, as though there were some law of the outer which would unlock every secret of the inner world. Thus St. Simon and Comte wished to explain the social sense as a force like gravitation; yet Fourier and Fonillée were surely wiser in writing of gravitation as a sort of social sense, for "we come nearer to a real knowledge of the causes" in the case of "the working of an intelligent will," than in the case of "an unexplained force" (E. A. Freeman, *Methods of Historical Study*, p. 154), and St. Simon and Comte therefore explained "ignotum per ignotius." Again, H. Spencer's law of progress as progress towards definite and orderly variety is admirable but for his genitive cases—the "integration of matter," and "dissipation of motion," which may suit the stars but do not suit human life. Even he holds that human beings are under the yoke of physical laws. Again, Spencer, Liliensfeld, Schäffle, De Greef, and Worms, define society as "a discrete organism," or "superorganism," and Giddings as "an organism with duplicate functions," i.e. potential and actual institutions. Yet organism applied to humanity is only a metaphor which they, like Plato, have a perfect right to work out each in his own way, but which, if pressed, misleads. Much of what goes to make society, some fraction even of its language, folk lore, and common law, is deliberate invention, and might more justly be compared to mechanism than to organism; and the residue—"wisdom without reflection," as Burke called it—grew partly by the influence of mind on mind (Bagehot, Durkheim, Tarde), partly by other motives which may act like, but are not an organ. And if they were an organ—no one understands why organs work together, every one partly under-

stands why he and his class contribute to the well-being of a society; for in the first case he attacks the problem from outside and sees it through a glass darkly; in the second case he attacks it from within, and what he knows he knows at first hand. The metaphor of organism leads us into a blind alley, somewhat farther from the truth than the point from which we started. Again, efforts to make "survival of the fittest" a central social principle have failed, for nations struggle in a way that single men do not, and even with nations "consciousness of kind" tempers the wind to the shorn lamb (Gumplovicz, Novicov, Huxley, Vaccaro, Giddings, among others); indeed Brentano in that passage in which he declared his method identical with COMTE'S method traced competition and union—with a view to extinguish competition—to one and the same cause, namely, industrial changes in a free state (*Arbeitergilden* (1871), ii. 310); moreover, the whispers of individual consciousness produce social effects of great moment, thus a good poor law softens natural with what Ritchie calls moral selection, and MALTHUS knew the moral and immortal checks to births. Again Comte, and perhaps H. Spencer (ch. xxvii.), made sociology into history, while BUCKLE made history into sociology. Now science has only to do with types and typical relations; it selects them from the real world, and discovers laws which are immutable only because conflicting units or relations are left out. But Comte and Buckle, ignoring what they omitted, transferred laws and prophecies about sociological man—a type to which no one ever quite conformed—to real men. The method of regarding one's units as "quantities" and therefore "*négligeables*"—which, by the way, science has not yet justified in the case of organisms—is the only possible method with external nature, of whose units we can know nothing; but in human sciences it must only be followed provisionally and for a purpose, for there the scientist is, and therefore must know the unit. Or the matter may be put thus: these writers forget that life consists of an action and reaction between individuals and society; but for society individuals are phantoms; but for individuals society is a shadow, therefore social laws apply literally to shadowland alone; they can only be applied to the inexplicable sea of human life—every wave of which is unlike its fellow—with modifications suited to each case.

(3) Social science is also regarded as a science which selects its material, and therefore its results only hold good of one aspect of life. If so it is just like political economy and the other special social sciences; and the only wonder is that they have done so much and it so little; so that it seems, as A. Clément and Letourneau virtually admit, but a mosaic composed of them. True, Mill claimed Malthus as a sociologist; but that was not Malthus's view, and the best writers in English on those questions which natural selection has suggested—Bagehot and Ritchie—call their subject-matter politics. Again, Maine was perhaps encroaching on sociology when he wrote that society goes from status to contract; and De Greef supports and Durkheim combats this "sociological" view. Again, social philosophy figures

along with political economy on the title page of the book always cited as Mill's political economy, Pulszky brackets the theory of law and civil society (1887), G. Mayr statistics and social theory (1897), and so on. Why then, if social science has a legitimate sphere of its own, have the special social sciences invariably encroached upon this sphere? The reason must be sought in the peculiar character of those sciences which deal with human nature. A common-sense summary of every human problem is dimly present to every one's consciousness; hence, if an inquirer who has with the artificial aids of science investigated some part of human nature—wealth, language, etc.—ends off with his scientific results, there is a conflict between these results and his instinctive common sense; it is as though he ended with a discord. The nature of his task urges him to look across the gap between what his science supplies and his common sense demands. And the same reason causes not only the special social sciences but social science itself to overflow its banks; thus, for instance, a healthy mind cannot long keep its ideals out of its ideas about society. Mill and Maine ought really to have trespassed further afield in order to probe the soil in which their sciences were rooted. Not only the social and political sciences—as Schmoller and the New York Society of that name call them—but all branches of “moral and political science”—to use Hume's name, and the name of the modern French Académie—hang in a cluster; their subject-matter, if divided for a moment, must be reunited. Division and reunion is the only means by which we advance our knowledge of human nature. L. v. Ranke wrote of social scientists, “they embrace not Juno but a cloud, and turn vendors not of truth but of formulæ and empty wind”; but formulæ are often valuable half truths, and the wind (though not solid) is not empty. Science cannot be a substitute for, but it may be the utmost help to history, and to a keen perception of the concrete facts of life.

**SOCIAL SCIENCE (SOCIOLOGY)** A hybrid word first employed by Auguste COMTE to denote the vast department of knowledge which was earlier in this century termed the science of society or SOCIAL SCIENCE, and is dealt with in the dictionary under the latter name. Mr. Herbert Spencer in the preface to vol. i. of the *Principles of Sociology*, defends the word in spite of its origin on grounds which have been generally accepted as sufficient. Purists have suggested the word “politics,” the title of ARISTOTLE'S great work on social

science as conceived by the Greek mind of the fourth century B.C.; but this word has long since acquired in European languages a much narrower signification, and is therefore inadmissible.

Strictly speaking sociology, in the sense in which it is generally used, would seem to require the qualifying epithet "human," for the class of phenomena under consideration, which Mr. Spencer, and others who have followed him, term "super-organic," are seen to some extent among communities of various kinds of birds and other animals, and of bees and ants. Such qualification is, however, needless in most cases.

The science of society is still in an extremely imperfect condition, and probably will remain so for a considerable time. It is only during the present century that exact quantitative observation of social facts has received systematic attention, and even now the difficulties in the way of obtaining such facts are very great. Much more has been obtained regarding some classes of phenomena than others. Many facts of an economic character, and what are called vital statistics, are collected with considerable regularity and accuracy, but regarding vast fields of investigation the information is scanty. Nevertheless several eminent philosophers have expressed a confident hope that eventually a science of sociology will be constituted, and Mr. Herbert Spencer, in the concluding volumes of his *Synthetic Philosophy*, has sketched in a masterly manner the lines on which, so far as can be seen at present, it must be constituted. In the *Principles of Sociology*, pt. i. ch. ii., and *ib.* pt. ii. chs. i. and xii., will be found a summary of the views of Mr. Spencer on the subject; but the whole volume, and those which precede and follow it, should be read in order to acquire a clear conception of the position he takes up. Mr. Spencer conceives of society as an organic whole constantly tending to differentiation of parts and functions, between which, however, a great degree of interdependence subsists. This complexity and interdependence of parts tends to increase with the growth of the social body. Many writers have conceived of a science of society, from PLATO and Aristotle to Comte, Spencer, and Schäffle. The latter philosopher's voluminous work, *Bau und Leben des sozialen Körpers*, is well worth the attention of the inquirer. His philosophical standpoint differs in some important particulars from that of Spencer, as well as of Comte.

It is hardly necessary to say that history, anthropology, ethnology, and economics, are the basis of sociology, and that the statistical method is one of the most valuable aids in sociological inquiries. For many branches of sociology it is the only method available, and this fact has led some thinkers to claim for

statistics the position of an independent science (Maurice Block, Sir R. W. Rawson, Gabaglio), but this claim is not conceded by the majority of authorities. The claim of economics to the position of a distinct sub-science appears to be more tenable, but would not now be admitted as readily as a quarter of a century ago.

## SOCIALISM.

Definitions and Character of Socialism, p. 431; Socialism merges into Social Democracy, p. 431; Reaction against Laissez-Faire, and Individualism established by French Revolution, 1794, p. 432; Influence of St. Simon, p. 432; A. Comte, p. 432; Fourier, p. 432; Socialism in connection with French Revolution of 1848, p. 432; Spread from France to other countries of Europe, p. 432; Scientific Socialism and K. Marx, p. 432; German Social Democracy and Lassalle, p. 433; Statistics of Socialistic Vote in different countries, p. 433; Socialism in Germany, p. 432; Socialism in Austria, p. 433; Socialism in Switzerland, p. 434; Socialism in France, p. 434; Socialism in Belgium, p. 434; Socialism in the United Kingdom and the Colonies, p. 435; Socialism in the United States, p. 435; Political Influence of Socialists, p. 435; Internationalism and Anarchy, p. 435; Socialism, State, p. 436; Socialists of the Chair, p. 437.

**SOCIALISM AND SOCIAL DEMOCRACY.** The term socialism, as opposed to INDIVIDUALISM, was coined by Pierre Leroux in 1838. It was then adopted by L. Reybaud in his *Études sur les Réformateurs ou Socialistes modernes* (1840); in its widest signification it is a protest against the doctrine of LAISSEZ-FAIRE, and a general attack on capitalistic enterprise. Socialism requires that the process of production and distribution should be regulated, not by competition, with self-interest for its moving principle, but by society as a whole, for the good of society. The term COLLECTIVISM more accurately connotes its aims and methods. This implies that the individuals who make up society should, in their collective capacity, possess all the instruments of production, and thus prevent the evils arising from the present industrial system. It implies the subordination of the individual to the community, and puts public utility above private interest. Under the new socialistic régime, it is assumed that all will receive their due, according to the measure of their capacity and willingness to perform the social duties assigned to each by public authority.

**ANARCHISM**, the exact opposite of socialism, would do away with state authority and destroy the present social system. There are several varieties of socialism: State Socialism (see SOCIALISM, STATE), regulation by government. Voluntary Co-operation (see article CHRISTIAN SOCIALISM) is the application of the principle of association, instead of egotistical conflict of interest. But whatever its varieties, the essential character of socialism is some economic

theory which shall prove a corrective of the existing order of things, and prevent the recurrence of those social inequalities and inequitable arrangements which have produced social dissatisfaction and the problems now calling for solution. It proposes to remove the existing conflicts between capital and labour and the dependence of the worker on his employer. Thus socialism merges into social democracy, which seeks to solve the problem how to reconcile the increase of political power among the masses with the increase of wealth among the classes, and to equalise not only political rights, but also economic possessions, to enable all to share the results of human effort in more equal proportions. The earlier history of socialism is described in UTOPIAS. Here we may refer to the schemes of the fathers of the movement, St. SIMON, FOURIER, and OWEN, which contain the first protests against the theory of *laissez-faire*, or the practical working of the individualism established by the French revolution of 1794, which, as A. HELD points out in his *Socialismus, Sozialdemokratie und Sozialpolitik* (1878), was itself a reaction against the state socialism of the *ancien régime*—against those effects of unlimited competition which were established by the political and aggravated by the industrial revolution in France and elsewhere, with the introduction of steam and machinery. The early socialists raised their protest, and in their works we see reflected the contemporary reaction of romanticism as opposed to the rationalism of the revolution. The socialism of St. Simon was eminently religious—he calls it *le nouveau Christianisme*—and it was mainly ethical; he desired to apply the principle of Christian brotherhood to industry, and that of association under the authority of a “hierarchy of capacities,” in fact a “centralised industrialism under royal patronage,” and all this with a view to prevent the “exploitation de l’homme par l’homme.” St. Simon, and his friend and disciple A. COMTE, first introduced the idea of social evolution, with the growth of the altruistic sentiment, into economic literature. FOURIER’s leading principle, that if men were permitted to follow their own bent they would select that kind of work for which each is best fitted, and do it cheerfully and well, as opposed to the prevailing economic doctrine that all labour is repugnant to human nature, was the basis of his elaborate theory of the association of labour. Fourier suggested the grouping of the workers into “phalanges,” according to their predilections and passions, in his *Nouveau monde industriel*. OWEN also desired a new organisation of labour on a moral basis, and emphasised the importance of education, as, in the “new moral world,” co-operation is to replace competition. Labour tickets, representing the value of so much work done, are to be the medium of ex-

change in the place of money. Each of these proposals, it will be seen, militates against some of the evils of society which arise out of the free play of economic forces, and searches for some new method for reuniting the scattered units of the industrial world, so that all the weak as well as the strong may be protected and encouraged in the industrial warfare. Their final object was *l’association pacifique universelle* (see *Les précurseurs du socialisme moderne*, by B. Malon in *La Revue Socialiste*, tome xi., No. 61). The next stage of socialism was reached in 1848, in connection with the revolution of that year in France. An attempt was made to organise labour by the state. As the first revolution claimed the “rights of man,” the revolution of 1848 (see *ATELIERS NATIONAUX*), through Louis BLANC, demanded the “rights of labour.” The opening of national workshops, and the foundation of co-operative association supported by government, form the beginnings of state socialism. In his book on the organisation of labour, L. Blanc shows that the state, as the greatest capitalist, can alone compete satisfactorily with the power of capital; let it, then, become the chief competitor as an employer of labour, and by degrees the uneven conflict between capital and labour will disappear. Thus the state becomes the “sovereign of industry,” but only for a time. By degrees the direction may be left to those concerned—the producers themselves—by acting committees elected out of their own class. From France, social democratic ideas found their way, through the instrumentality of secret societies, to other parts of Europe—Belgium, Switzerland, and Germany.

*Germany.*—In this country it led, under the influence of MARX and Engels, to the formation of the *Kommunistenbund*, from which emanated the celebrated “Communist Manifesto,” which contains the leading ideas of “scientific socialism” in embryo, and constitutes the “literary arsenal of the social democratic party.” It concludes with the words, “Working men of all countries, unite,” and points to a new departure of socialism, which ceases to be now a political, and becomes a purely economic movement in theory, though still using the state for party purposes. (See an article on “Socialism” (historical), in No. 2 of *Subjects of the Day*; also on further development of German socialism up to 1884, *Fortnightly Review*, for December of that year, pp. 30-34, by M. Kaufmann.)

Scientific socialism is a deduction from the doctrine of value “that labour is the only measure of value,” as held by the old economists, after A. SMITH. Lassalle, following the same track, adopts Ricardo’s theory of the “iron law” of wages. From the doctrine of Surplus Value, the “mother idea” of K. MARX’s negative criticism is deduced the doctrine that the capitalist is enriched by appropriating the surplus

value of commodities created by the workmen over and above that which is necessary to keep them alive. Thus "the productive power of labour in society becomes the productive power in the interest of the capitalist" (see Scheel in *Handbuch der politischen Oekonomie*, 3rd ed., p. 124 seq.; also HELD, on the principles and tendencies of contemporary socialism, *loc. cit.*, pp. 14-16). These ideas are ably and succinctly summarised under the following five heads by B. MALON. They are: (1) class antagonism; (2) the technical organisation of production with modifications which determine the organisation and transformation of economy and politics; (3) the capitalistic modes of production are distinguished from those which preceded them by (a) the separation of the producer from the instruments of production; (b) the intensification of work under conditions rendered more severe through those who direct and those who are engaged in the work being not brought into personal relations with each other; (c) reduction of wages, together with the employment of women and children, owing to the use of machinery and uncertainty of employment; (d) incessant increase of capital at the expense of underpaid labour, which becomes in turn the cause of further exploitation; (e) "the absorption" of small into large capital enterprise; and the rise of an industrial governing force, gradually diminishing in numbers and increasing in wealth and power; (4) from this results an acute antagonism between capitalists and producers whose massing in factories favours combined effort; the victory of the latter is to be attained by "la conquête des pouvoirs publics," i.e. by securing parliamentary majorities. (5) The victorious proletariat can only fulfil its historical mission either by gradual or by revolutionary means, according to circumstances (*Revue Socialiste*, tome xi., No. 62, pp. 137-138). As to methods of action socialists differ to some extent. There have been always the moderate and the more advanced sections, inclining towards reformatory or revolutionary methods respectively, the former willing to take their share in politics and party organisation; the latter despising and discarding such expedients in order to obtain concessions piecemeal from reluctant legislatures, and determined to work for the entire *bouleversement* of the present social order. Thus LASSALLE, the original organiser of German social democracy (1862-64), demanded universal suffrage and state subvention of productive associations. ROBERTUS-JAGETZOW proposed a gradual modification of the laws of property and such governmental interference for the protection of labour (e.g. fixing a normal day of labour and regulation of the rate of wages) as would gradually bring about a complete transformation of social conditions. K. MARX, the founder of the INTER-

NATIONAL, though opposed to ineffectual revolts against society, regarded the social revolution as inevitable, and identified it with evolution and its natural results. A union, by way of compromise, was effected between these two wings of social democracy at the Gotha congress (1874), expressed in the programme of the party (see the text in appendix to Zacher's *Die rote Internationale*, p. 173; and the *Statutes of the International Labour Association*, *ib.*, p. 171). This programme has since been superseded by that adopted at the Erfurt congress (1891), which omits the preamble that labour is the source of all wealth and culture, and the reference to the "iron law of wages," so as to bring the programme into greater conformity with contemporary economic science. It also drops the Lassallean demand for productive associations, and emphasises the importance of class struggles. The confident tone of the early triumph of social democracy is its special characteristic (see full text of the programme in the *Protokoll über die Verhandlungen des Parteitag*, now printed in every subsequent yearly report under that title, and cp. H. Herkner, *Die Arbeiterfrage* (1894), pp. 126-128, 173 seq.; also the *Handwörterbuch der Staatswissenschaften*, Band v. p. 725, for the latest developments of German socialism). The following statistics show the growth of the party. In 1874 the socialist vote in the German empire amounted to 351,670; in 1884 to 549,990; in 1893 it had reached 1,800,000. The contributions from members in 1883 amounted to 95,000 marks (£4750); in 1893 to 258,326 marks (£12,916). As to the socialist press there existed in 1893, 75 political party organs in addition to 58 trades-union papers—which in Germany are mainly under socialist influence—the number of subscribers to the central organ *Vorwärts* was 42,500, and its annual profit 40,655.10 marks (£2033). Its predecessor of the same name, confiscated in 1878, had only 12,000 subscribers, whilst the whole of the party organs in that most flourishing year of social democracy did not exceed 44. The social democratic deputies in the German parliament numbered 56 in 1898, compared with 46 in 1894, and 24 in 1884. These figures explain the confident tone adopted of late by the party leaders and programmes.

Austrian Socialism, originally imported from Germany by Oberwinder and A. Becker, both followers of Lassalle, has also considerably advanced with industrial progress, greater freedom of association, and liberty of speech and meeting. The official programme of the party, adopted at the Hainfeld congress (1888-89), was framed on German models. Dr. V. Adler, son of a Jewish millionaire, is at the head of the party. Here, as in Germany, a minority of young zealots threaten from time to time to divide the party, but as yet without serious

effect on its organisation and strength. Here, too, the growth of trades unionism under socialist leaders is highly important in estimating the strength of the movement, though in both countries the practical and conservative tendencies of trades unionists provoke the fear and jealousy of the socialist protectors. Austrian socialism is also remarkable for the success of the yearly celebrations on 1st May, decreed at the Paris international congress in 1889. At the congress held March 1894, a resolution demanding universal suffrage, and recommending a general strike in the event of its refusal, was passed by 66 against 42 votes. The official organ of the party, the *Arbeiterzeitung*, has 150,000 subscribers; in all, there are 14 party prints apart from trades-union papers, with a collective impression of 78,400, which may give a clue to the numerical strength of the party. The annual receipts for the purpose of agitation, etc., according to recent reports, amounted in Austria to fl. 10,000 (£833), in Hungary to fl. 60,000 (£5000). Considering the hampering effect of still existing press laws and official opposition, overt and concealed, to party propaganda, these numbers indicate some vigour in the movement. The number of delegates from the different lands composing the Austro-Hungarian monarchy, at the Vienna congress, which increased from 67 in 1889 to 133 in 1893, speaks for itself; 74 attended the Hungarian congress at Buda-Pest. Here the land question and land nationalisation form the chief subject of discussion, industrial enterprise being still in its infancy.

*Switzerland.*—In Switzerland, which has been, though at different times, the centre and rallying-point of socialism, especially when persecuted elsewhere, the prevailing political institutions and conditions of local industry have thus far impeded the progress of socialism.

*France.*—In France, the original home of socialism, the revolutionary tendencies of the people, their impatience of party discipline and control, arising from the individualistic bent in the national character, have been the cause of division and splitting up into factions which seriously weakens the movement. Moreover, the presence of a property-loving rural proletariat and the existence of a considerable body of petty tradesmen in the towns, prove an impediment to socialistic progress. The first attempt to re-organise the party after the suppression of the commune in 1871 was made in 1876, when Jules Guesde and G. Deville, both Marxists, framed a collectivist manifesto. But the definite programme of the party was adopted at the Havre congress, 1880, following that of Gotha. At the St. Etienne congress, 1882, a split occurred between the Marxists and the Possibilists, who owe this nickname to Guesde. It expresses their opportunism, *i.e.* willingness to accept any possible social reforms by way

of instalment. Their name is *Fédération française des travailleurs socialistes révolutionnaires*, Brousse and the late B. Malon being the original leaders, whilst the former call themselves *Parti ouvrier*. These contain the abler minds, the others the larger following. A further division into "Broussistes" (from Brousse) and "Allemanistes" took place in 1890 at the Châtelherault congress. But these differences spring from personal jealousies rather than from differences of principle. All aim at "l'expropriation de la bourgeoisie capitaliste" and "la socialisation des moyens de production" (on the state of socialism in France up to 1887 see an article by M. Kaufmann in the *National Review* for November 1887). Measured by electoral successes in France, the party does not appear to great advantage. In 1889 the Possibilists received 53,816 votes in Paris, their stronghold; in 1893 the socialist vote throughout France was 600,000. The anarchists do not enter into the political arena. The other socialists, including Blanquists and independents, uniting for this purpose as *L'Union révolutionnaire socialiste*, secured 123,003 votes in 20 departments. Estimated by number of party organs, and specially by the high-class tone and literary excellence of the monthly *La Revue Socialiste*, founded by Malon (d. 13th September 1893), French socialism would appear to be much more widely diffused than the votes obtained indicate, and many of its supporters are to be found among the cultured and well-to-do. There are indeed secret sympathisers, "crypto-socialists" as M. Leroi-Beaulieu calls them, from whom the movement receives material support, apart from the moral support of the "groupe des députés républicains socialistes" in parliament. It is also strongly represented in the municipal council of Paris, which has been called "le grand conseil de collectivisme," one-fifteenth of the councillors being socialists. The increase of trades unions, more or less under socialist influences—there were 402,125 members in 1893 against 288,770 in 1892 (see *Revue Socialiste*, March 1894, p. 359),—and the concentration of socialistic forces of late, corresponding to the republican concentration, indicate a movement towards more united action.

*Belgian Socialism.*—In Belgium with its highly-developed industry and opportunities for combination, and the support given to socialism and its press by co-operative associations under its control, considerable advances have been made, especially since the fusion of the two main sections, the Flemish and Walloon, under Anseele, Velders, and Bertram, in 1879. It is calculated that no less than 50,000 to 60,000 persons entertain socialist theories, whilst no country can boast of so many philosophical socialists, such as Collins, the late Dr. Papepe, Agathon de Potter, Defuisseaux, and Professor

Denis of the Brussels university. The political influence of the socialists has also considerably increased since the late extension of the suffrage voters. The socialist vote in 1896 amounted to 461,000. Passing over Holland, the Scandinavian and the two Latin peninsulas, where by reason of retarded industrial development socialism has not as yet attained to anything like formidable strength, we may now turn to Great and Greater Britain and the United States.

*The United Kingdom and the Colonies.*—The number of actual and active adherents in England is comparatively small, but the indirect influence of socialistic propaganda on the new trades unionism is considerable. The new Independent Labour Party, together with the "Social Democratic Federation," the "Socialist League," and the Fabian Society are comparatively few in number. But their publications, meetings, and efforts have familiarised the minds of many with the doctrines of K. Marx and his school. In the colonies, owing to the powerful organisation of trades unions, and the pressure which the labour party can bring to bear on the legislature and government, state socialism has made considerable progress, whilst the philanthropic movement and the growing tendency of the ruling class to protect the weak, and to promote the welfare of those less favoured by fortune, through private and public action, has done much at home and in the British dependencies to break the force of class antagonism and to lessen the chances of socialistic agitation (see S. Webb's *Socialism in England*).

*The United States.*—In America, where the gulf between wealth and poverty is greater than in Europe, and the industrial warfare at times much fiercer in consequence, the theories of socialism are beginning to take root. In 1878, there were about 10,000 professed socialists in the United States. They appear to have risen to 30,000 or 40,000 since, though out of 78 sections 14 only are English-speaking. America is the home of European malcontents, and it is those who have introduced internationalism (first organised by Sorge in 1867) and anarchy. Both are busily at work, at times conjointly, at other times separately, in spreading their views among the labour associations, such as the knights of labour and the federation of organised trades unions. These they join for the purpose of becoming the "sappers and miners of the coming revolution." Some headway has been made among native Americans, who, however, whilst accepting socialistic criticisms on the existing order of things, are by no means willing as yet to entertain proposals for the establishment of a collective commonwealth. It has to be noted, however, that H. George's book on *Progress*

and *Poverty* and Bellamy's *Looking Backward* have had a marvellously large sale in the United States. It is significant that the populist vote in 1892 amounted to one million, whilst Bryanism commanded six millions in 1896. The Controller of New York State, in his official report, regarded this as so great a danger to society that he recommended an "inheritance tax" to stay the concentration of wealth in a few hands, to which fact he ascribed it.

Thus, both in the old and new world, socialism has made considerable progress of late years; whilst the unanimity of view entertained, minor varieties notwithstanding, the methods adopted by socialists all over the civilised world, and the readiness to act in concert and to merge differences in a common assault on society, renders the movement as a whole more formidable than similar but more isolated movements in the past. With the growth of democratic representation and the increased intelligence of the labouring population in making use of their political power, the "revolutionary vote" is fast becoming a great factor in politics. Militant socialism, moreover, as a revolutionary force, may be said in membership to be equal to, or approaching in numbers the effective force of the military establishments in modern Europe—the socialist vote in Europe and America is about five millions. As the latter are recruited from the body of the people and to it return after serving their time, well trained for action in the field, and since attempts are constantly made to disseminate socialist views among soldiers, the safety of society, as far as it depends on material force, is by no means on the footing it used to be, though it has to be remembered that "the battalions of labour" are not armed. And this is rendered still more serious by the fact that the efforts of social democracy are now chiefly directed to systematic agitation among the agrarian proletariat, having for their object the capture of this strongest force of resistance to its pretensions. This being so, a critical study of the movement as a whole is all the more important, so as to discover its real danger, and, if possible, to provide the proper remedy.

Here we are only concerned with it as an economic theory, and in its influence on the development of economic doctrine. As has been said already, it is founded on the theory of surplus value as established by K. Marx, which itself rests on the fallacy that underpaid manual labour is the sole cause of accumulation of capital, which in its turn is used for the further enslavement of labour; that, in the words of the Erfurt programme, the means of production thus become the monopoly of the few, and that private property is used for the expropriation of the masses; that for this reason capitalistic industry must be

replaced by a socialistic direction of the process of production and distribution to insure social harmony in the place of competitive warfare, and concord in the place of class conflicts. It is enough to point out here in answer to this the importance of capitalist enterprise and of the direction of labour by men of high mental ability. These points are overlooked by socialism, as is also the danger of committing to public functionaries the entire control of the economic process, there being no guarantee whatever that the administration of the "Co-operative Commonwealth," if called into existence by and dependent on the will of "the people," would prove more efficacious and reliable than that of "government by class," as now carried on. On the contrary, the stimulus of individual rivalry, self-interest, and ambition being removed, social efficiency could only be secured either through a highly centralised organisation of labour by the authority of the collectivist state, which would sacrifice liberty, or by means of a moral regeneration throughout the whole community, which would cause altruistic duty to become the ruling principle of economic action. But such a moral change cannot be expected from the proposed alterations in the economic mechanism. While socialism has supplied economic science with a closer view of the darker aspects of modern industrial life, the deductions, however erroneous, of K. Marx and others, have given a clearer conception of the consequences to which an abstract view of the science may lead, unless the utmost care is taken in formulating the conclusions arrived at. Meanwhile the speculations of socialists and of utopian dreamers have been useful in reminding society of its own shortcomings by building up a high social ideal (see CONJUNCTURE).

Stammhammer, 1893, and the three volumes of the *Jahrbuch für Sozialwissenschaft und Sozialpolitik*, edited by Dr. L. Richter, 1879-81. Only original writers are given above, not popularisers, with E. de Laveleye at their head, who more or less quote them; an exception, however, may be made in favour of l'Abbé Winterer, whose compilations under the name *Le Socialisme contemporain* 1878, 1882, 1885, and 1890, may serve as helps in following the movement. The original works of the principal socialist writers, like K. Marx, etc., all are given under their names *supra*. The *Handbuch des Sozialismus* by C. Stegeman and C. Hugo (1897) may also be consulted.] M. K.

SOCIALISM, CHRISTIAN. See CHRISTIAN SOCIALISM.

SOCIALISM, STATE, both in name and in fact, originated and has always found its chief home in Germany. Other nations have adopted the name, and their legislation has been modified, often very profoundly, by the ideas expressed by the name, but hardly outside Germany has there arisen any professed school of state socialists, and in no other country has the theory of state socialism been so energetically and consistently carried out.

As the name itself seems to imply, state socialism is essentially of the nature of a compromise. It may be described as an attempt to engraft certain socialistic conceptions on to the existing trunk of the historical state, and by doing so, to secure all that is good in socialism without the loss of anything that is healthful and strong in the existing order of society. While retaining the two fundamental laws of the existing historic state—the right of private property and the institution of the family—it would yet leaven the existing state with a new spirit of socialism; not subverting the state, but using it as an instrument for carrying out in certain particulars the socialistic ideal. The object which it keeps steadily in view is to aid the weak in their struggle against the strong, and by doing so to restore that equality of opportunity in which it sees at once the surest guarantee for the permanence of society and

the best means of removing the acknowledged evils which at present exist. Thus while socialism proper treats all the citizens of the state as incapables, inadequate to look after their own interests, and undertakes for them a task which it considers them incompetent to discharge for themselves, state socialism would protect, not all, but some only of the existing citizens, those, namely, whom their failure to obtain a satisfactory maintenance shows to stand in need of the assistance which the state is able to give. The theory sounds excellent and excites great enthusiasm, and there are cases, as all must admit, when the aid of the state may be legitimately invoked to redress evils which are obvious and pressing; but it may be doubted whether in practice it is a wise course for the state to interfere to save people from the foreseen consequences of their own acts; and the attempts which have been made to redress evils by the direct intervention of the state have already been productive of other evils scarcely less formidable than those which state socialism has been invoked to cure.

The theory and practice of state socialism have been, both of them, as already stated, most highly developed in Germany. The so-called SOCIALISTS OF THE CHAIR (*q.v.*) *Kathedersocialisten*, have not only formulated a considerable body of doctrine, but have also profoundly affected the legislation of Germany during the last five-and-twenty years. It is necessary only in this connection to cite the names of Gustav Schmoller, Adolph Wagner, Lujo Brentano, and above all of ROESLER, whose writings furnish the most adequate text books of the theory. In practice the famous protective legislation of Prince Bismarck and his still more famous measures for compulsory insurance (see INSURANCE, STATE), and the establishment of old age pensions, furnish the most noteworthy examples of the application of the theory to actual legislation. The same tendency which was at work most actively in Germany did not fail to manifest itself also in other European countries. Amongst ourselves, while the term state socialism has never become fully naturalised, the ideas denoted by it have been by no means without influence. Not only was the factory legislation of Lord Shaftesbury and Mr. Disraeli a considerable practical step in the direction indicated, but J. S. Mill, in *Principles of Political Economy*, pleaded, though rather hesitatingly, for a larger measure of government interference than most of his predecessors would have been willing to sanction. Most of his successors, notably Professor CLIFFE LESLIE and Professor Ingram, have been willing to advance much farther along the same path. Nor has their teaching been without influence on much of our recent legislation—Mr. Gladstone's two Irish Land Acts are an advanced

embodiment of the theory, and a large amount of recent legislation, including "the Workmen's Compensation for Injuries Act," etc., bear the same stamp.

In another direction the proposals which have been made, and to some extent carried out, to "municipalize" many undertakings, particularly those which are to some extent of the nature of monopolies, *e.g.* the supply of gas and other forms of lighting and of water to towns, are an additional proof of the practical hold which the ideas denoted by the term "state socialism" have gained amongst us. So far as the experiments have gone at present, the evidence furnished by them has been of an extremely mixed character. That such undertakings can be carried on, and even profitably carried on, by the state or municipality has been amply demonstrated. On the other hand, there are evils which experience both at home and abroad warns us will have to be carefully guarded against. They are such as these—the tendency to throw an undue share of the cost of such undertakings on a particular class; to create a body of specially-favoured workmen with peculiar privileges and special advantages; to make things pleasant all round to those in the service of the community, to the obvious detriment of the interests of the tax-payers or rate-payers generally. The proposal lately made to subsidise the opera or theatre out of public funds furnishes another instance of the spread of the ideas in question, and of the difficulty of setting limits to the principle when once admitted.

In Austria the most noteworthy adherent of the theory of state socialism is to be found in Schäffle, originally professor at Tübingen, subsequently Austrian minister of commerce. His work *Bau und Leben des sozialen Körpers* attacks the theories of orthodox political economy on grounds which are biological as well as economic.

[Besides the works already referred to, the subject may be studied in Mill, *Principles*, bk. v. ch. 11; J. E. Cairnes, *Logical Method of Political Economy*, 1875; and in the excellent work of Maurice Block, *Les Progrès de la Science Economique depuis Adam Smith*, Paris, 1890.—Ingram, *History of Political Economy*, ch. vi., Black, Edinburgh, 1888.—A. Wagner's *Lehr und Handbuch der politischen Oekonomie*, Leipzig, 1892.

See also HELD; GERMAN SCHOOL.] W. A. ST.

SOCIALISTS OF THE CHAIR, *i.e.* the professorial chair, (*Kathedersocialisten*), was the nickname given by the liberal journalist, H. B. Oppenheim, in 1872, to a number of the younger German professors of political economy, and quoted by one of the most influential of them, Professor Gustav Schmoller, of Strasburg, in his opening speech at the Eisenach congress of economists held in the same year. The

group of teachers thus characterised agreed in believing that there were grave social questions to which it was their duty to call attention, and that these could not be solved, as the MANCHESTER SCHOOL, then dominant in the German press, and organised in the *Volkswirtschaftliche Kongress*, believed, by a mere resort to *laissez-faire*. On the other hand they differed from the social democrats in that they disbelieved in the possibility or desirability of violent revolutionary changes; and they rejected as inaccurate the "scientific" formulæ both of Lassalle and Marx,—the "iron law" and the doctrine of "surplus value." Among themselves, opinions ranged all the way from a disposition to think well of trades unions to an eagerness for state intervention in industry in all directions. But most of them were moderate in their expectations and cautious in their proposals. From Hegel and the philosophers on the one side, and from the bureaucratic traditions of the Prussian monarchy on the other, they had learned a high doctrine of the state; but they were guided in their application of it by their firm hold on the principle of relativity which had been inculcated by Roscher and the creators of the historical school. The whole group may be described as the historical school become militant,—under the stress of new industrial conditions, the stimulus of the social democratic movement, and with the confidence engendered by the establishment of the German empire. They did much to promote factory legislation, and to prepare the way for the system of compulsory insurance which may be regarded as the most notable outcome of their activity (see SOCIALISM, STATE). The term "socialists of the chair," after playing a considerable part in the controversies of a decade, chiefly in the mouths of their critics, seemed to have passed out of current use. Marked divergences had made themselves apparent among those who once bore that name,—as in practical politics between Professors Brentano and Schmoller, and with regard to scientific method, between Professors Schmoller and Wagner; while the Liberal and *Fortschritt* parties had begun to manifest a greater interest in social reform. Thus the apparent unity and distinctness of the group of 1872—then chiefly the unity of protest—had largely disappeared; though most German economists were still dominated by the leading principles of the Eisenach congress. But in 1896-97 in the attack in the German Reichstag, led by the Freiherr von Stumm, upon Professors Schmoller and Wagner, and most of the other teachers of political economy in the country, the use of the term "Kathedersozialisten" was once more resorted to as indicating the dangerous character of their teaching, and many explanations were again given of its origin and significance.

[The best general accounts of the movement are given in the chapters under that head in Emile de Laveleye, *Le Socialisme Contemporain* (2nd ed. 1883), and John Rae, *Contemporary Socialism*, (2nd ed. 1891).

The most characteristic writings of the period are perhaps Adolf Wagner, *Rede über die soziale Frage* (1871); Gustav Schmoller, *Ueber einige Grundfragen des Rechts und der Volkswirtschaft* (1875), in reply to the attack of the historian Von Treitschke in a pamphlet, *Der Sozialismus und seine Gönner*; and Lujo Brentano, *Das Arbeiterverhältniss gemäss dem heutigen Recht* (1877). See also GERMAN SCHOOL; A. HELD.

Among the fugitive writings concerning the more recent discussions, may be singled out the article by Professor Hasbach in *Die Zukunft* for 14th August 1897.] W. J. A.

SOCIETAS is a contract of Roman law whereby two or more persons undertake the mutual performance of certain acts in order to effect a common purpose. It is a contract of a less limited kind than the corresponding English contract of partnership.

*Societas omnium bonorum* is an entire union of property by agreement of two or more persons. *Societas* may be restricted to a particular undertaking, as making a journey in common. The acquisition of gain or profit, though it is generally the object of this contract, is not necessarily so.

*Societas leonina* is an agreement that a socius or partner is to be subject to loss, but not to share in the profit of the common undertaking; such a contract is void.

Unless it is agreed to the contrary, the shares of the *socii* are equal. In the administration of the common property, each *socius* is only bound to be as careful as he is in the management of his own individual property, not to take the care of a careful *pater familias*. (See PARTNERSHIP, HISTORY OF). E. A. W.

SOCIÉTÉS COMMERCIALES (Fr.). French law recognises three kinds of commercial associations—(1) ordinary partnerships, called *sociétés en nom collectif*, the title of the firm comprising the name of one or more of the partners, and the liability of each being unlimited; (2) *sociétés anonymes*, so called because they are designated by the object for which they are formed: these are the ordinary limited-liability companies in shares; (3) *Sociétés en commandite*, which share the characteristics of the two others, being composed of two classes of persons, the acting partners or *commandités*, with unlimited liability, and the passive or *commanditaires*, who are only liable for the amount of the capital put into the firm, but cannot take any part in the management even by proxy, without incurring the same liability as the acting partners, as specified in art. 28 (*Code de Commerce*). *Commanditaires* are distinguished from lenders at interest, as they are only remunerated from

the profits, and have a right to examine the books and accounts, be present at inventories, and exercise other prerogatives of a partner. Public companies could formerly only be constituted by a direct authorisation of the government. A first step was made towards liberty of association for commercial affairs by a law of 1863 which permitted their formation without authorisation, provided that their capital did not exceed 20,000,000 francs. That law was followed by one of the 24th July 1867, in sixty-seven articles, which forms the substance of the present legislation on public companies, with some modifications introduced by a law of 1893. As in the English law, a minimum number of seven founders is necessary for the formation of a company. The statutes must be deposited at the tribunal of commerce, or, where none exists, at the *mairie* of the locality, and be published with the documents annexed in one of the journals appointed for the insertion of legal notices. Under the law of 1867 shares could not be of a less nominal value than 100 francs (£4) when the capital did not exceed 200,000 francs (£8000); nor less than 500 francs (£20) if above 200,000 francs. The whole of the capital had to be subscribed and one-fourth be paid up before the company was constituted. By the law of 1893 shares may be of as small a value as 25 francs (£1) if the capital is not above 200,000 francs, but in that case the whole must be paid. With a capital exceeding 200,000 francs shares must not be of a lesser nominal value than 100 francs, but payment of one-fourth on allotment is sufficient. The law of 1893 modified that of 1867 on some other important points. Previously, shares might be converted by a vote of a general meeting from registered shares to shares to bearer, and the original holders only remained liable for the uncalled part of the capital for two years from the date of the meeting. By the law of 1893 shares must remain nominative until fully paid up. Ordinary shares given in part or whole payment for a business converted into a company cannot be negotiated for two years from the date of the constitution of the company. That provision was not contained in the law of 1867, and by an omission, probably not intended, the prohibition in the law of 1893 does not apply to founders' shares. The statutes of a company fix the number of shares to be held, rarely less than twenty-five, to give the holder a right to attend and vote in meetings of proprietors. Holders of a lesser number were not represented, but a clause in the new law permits them to put their shares together to make up the required number and appoint one of themselves to act as their delegate. Foreign companies whose shares are dealt in on the French market, or which have an agency in France, must appoint an approved representative, a French-

man of substance, liable for the taxes to which the company is subject in France.

[*Code de Commerce*, arts. 18-64.—Laws of 24th July 1867, and 1st August 1893.—Duvergier, *Recueil des lois et décrets. — Commentaire de la loi du 24 Juillet 1867 sur les sociétés par Rivière— Régime fiscal des Valeurs mobilières étrangères en France*, par Maurice Jobit, 1893.] T. L.

SOCIOLOGY. See SOCIAL SCIENCE.

SOCMEN. Manorial tenants who were free in status, though their land was not held by charter like that of a freeholder, but was secured to them by custom. They paid a fixed rent for the virgate, or part of a virgate, which they generally held, and, taking the Peterborough socmen as samples, they were bound to render farm produce, such as fowls and eggs, at stated seasons; to lend their plough teams thrice in winter and spring; to mow and carry hay; to thresh, harrow, and do other farm work for one day; and to help at harvest for one or two days. These services, contrasted with the WEEK-WORK of a villein, were little more than nominal, and are comparable to those of the RADMANNI (*q.v.*). The Peterborough socmen reappear under the *Descriptio Militum* of the abbey, where it is said that they served *cum militibus*; but this appears to be exceptional. Socmen were, like *libere tenentes*, frequently liable to merchet, heriot, and tallage.

Their tenure was the origin of the free socage, common in the 13th century, and now the prevailing tenure of land in England; for socmen held by a fixed money payment and by a fixed, though trivial, amount of base services which would ultimately disappear by commutation.

All socmen, as customary tenants, required the intervention of the steward of the manor in transfers or sales of their rights.

About 23,000 socmen appear in Domesday, of whom one-half were in Lincolnshire and the remainder mainly in the other Danish counties; but later records show them all over England living under the soke or jurisdiction of lords, paying rent and taking a nominal share in the cultivation of their manors. Some tenants *in capite* held of the king by free socage, but were scarcely socmen, while a few true socmen appear to have held considerable estates with villeins upon them. A few socmen, on the other hand, could not leave the manors in which they were settled, that is, could not sell their holdings.

An inquisition of the time of Edward I., now in the public record office, distinguishes the three classes of manorial tenants above the villeins as freeholders *per cartam*; freeholders who are called freesokemen; and socmen who are called MOLMEN (*q.v.*).

Two other varieties of socmen are found. Bond socmen, who appear to have differed from freesokemen only in the fact that they gave labour in lieu of rent; and villein socmen

or privileged villeins, on lands in ancient demesne, who were men free in blood holding land in villenage.

[Vinogradoff, *Villainage in England*;—*Chronicon Petroburgense*, Camden Soc., app. p. 159.] R. H.

SODEN, FRIEDRICH JULIUS HEINRICH REICHSGRAF VON (1754-1831) was born at Ansbach. He studied law at Erlangen and afterwards at Jena and Altdorf. He was employed in the department of justice in his native state until it, with Bayreuth, was given over to Prussia in 1792. Before this, in 1790, in consideration of his services, he had been made a count of the empire. He was a Prussian official till 1796, when from a divergence between his views and those of the government on German politics, he retired to his estates, and devoted himself for the rest of his life chiefly to dramatic authorship, to the patronage of the theatre and the creation or support of other public institutions, and to the study of political economy, which he took up by desire of Karl Friedrich of Baden. In 1825-27 he represented the circle of the Upper Main in the second chamber of the Bavarian diet.

Soden was a very prolific, as well as versatile, writer; his works fill eighty vols., dealing with a great variety of subjects. His principal work is his *National-Oekonomie*, 9 vols. 1805-24, which arose out of a review of Garve's translation of the *Wealth of Nations* which he had been requested to undertake. He is one of those who, when the principles of Adam Smith had been made known in Germany, adopting them in the main, sought either to present them in a more systematic form or by a critical revision to fix more exactly the fundamental conceptions of the science. Soden stands essentially on the basis of Smith's doctrine, which, however, he does not always represent correctly; he rejects the mercantilist views, and condemns prohibitions and high duties on imports or exports, but is not an unconditional advocate of the free-trade principle. He depreciates unduly the *Wealth of Nations* in regard to its form and style, speaking of it as utterly wanting in orderly arrangement, so as to be only a series of "precious fragments," and as marred by obscurity and ambiguity. He also censures Smith as not possessing a grasp of the whole subject, and as too narrowly English in his ideas. Cossa avenges Smith by describing Soden himself as "obscure, prolix, and inclined to merely verbal disputes."

[Gross in *Allg. Deutsche Biogr.*—Schmidt in *Handw. der Staatswissenschaften.*—Roscher in *Gesch. der N. O.*, p. 674.—Cossa, *Introd. allo studio dell' E. P.*, p. 322.] J. K. I.

SOETBEER, ADOLPH (1814-1892). Few German economists, or to be more exact, few German specialists, have enjoyed a greater reputation in foreign countries than Adolph Soetbeer. He was one of the first authorities on monetary questions and especially on the

statistics of the precious metals to which subject exclusively he devoted the best years of his life.

Born in Hamburg, 23rd November 1814, the son of a prosperous merchant of that city, he studied at the universities of Berlin and Göttingen, taking his doctor's (Ph.D.) degree at Göttingen in 1837, having given special attention to philosophy and history. After his return to his native city he began studying the Hamburg customs' regulations, Hamburg being at that time a free Hanseatic city. It was the published results of this work that started Soetbeer in his career as an economist and brought him successively the offices of librarian (1840) and secretary (1843) of the Hamburg chamber of commerce. In these important positions he rendered great and well-recognised service to the cause of good statistics by his methods in the editorship of the statistical publications on Hamburg commerce. After the Frankfurt parliament in 1848, in which he took part, he was for a time connected with the Magdeburg chamber of commerce as "Kammerkonsulant" and later again in Hamburg. In 1872 he returned to Göttingen, where he lived quietly as honorary professor of the university, restricting his work and lectures to his special studies on monetary topics.

Undoubtedly Prof. Soetbeer was well versed in general economic literature, as may be inferred from the fact that he made a very satisfactory translation of John Stuart Mill's *Political Economy* with critical notes; but since 1846, when he published his *Denkschrift über Hamburgs Münzverhältnisse* (published in Hamburg 1846, but reprinted in numbers 13, 14, and 15 of the weekly supplements to the stock exchange list, Hamburg, 1850), he showed a decided and ever increasing interest for monetary studies, and it is in this line that he rendered the greatest service to the economic literature of his time.

He was always a gold monometallist. Where he lived and worked he saw most plainly the evils caused by the current silver coins, which lacked uniformity, throughout the various German states before their unification, and he knew well Germany's loss in the commercial world, due to her unfavourable position in foreign exchanges. He believed that Germany could compete with England in foreign commerce if she had as stable and sure a monetary system, and because England's coinage was on a gold basis Germany's must be also. To accomplish this was Soetbeer's dream long before the German coinage acts of 1871-73 became a possibility. Almost alone in the early battles, he fought for gold coinage when he had nearly all the powerful commercial and political forces against him, and he well deserved the name that was later given him,

"father of the German gold coinage." The success of his project once assured, after so many long and hard battles to obtain it, and later to maintain it, it is not to be expected that he would agree to any proposal to destroy the work he had done, even if changed conditions made its expediency doubtful. He therefore was among the first to call in question the results of the researches of the celebrated Vienna geologist, Eduard Suess, whose *Zukunft des Goldes* in 1877, with its gloomy predictions for the future of the production of gold, spread general alarm in economic circles. Yet Soetbeer knew better than many of his less liberal followers the evil effects of the continued fall in the value of silver. He gave every plan for attaining to a qualified restitution of its former purchasing power careful consideration, always, however, with the determination that no change should receive his approval which would disturb the single gold standard as a monetary basis. Shortly before his death he made suggestions to various conferences proposing plans by which silver should be given as large a place in the world's coinage as would be, according to his opinion, consistent with the maintenance of the single gold basis. He and Prof. Suess discussed, on the most friendly terms, all possible proposals to prevent the continued fall in the gold price of silver, though Soetbeer would never have agreed to Suess's suggestion of a single silver standard, nor did he have any faith in the soundness or possibility of the bimetallic solution.

Soetbeer's literary activity was really astonishing. His independent and noteworthy publications number over one hundred. Besides these he published much in newspapers and periodicals. A fairly complete list of his works is to be found with some biographical references in Schmidt's article on Soetbeer in Conrad's *Handwörterbuch der Staatswissenschaften* (bd. 5, p. 692, Jena, 1893). The most important are as follows:

1. *Materialien zur Erläuterung und Beurteilung der wirtschaftlichen Edelmetallverhältnisse und der Währungsfrage*, Berlin, 1885. Second and enlarged edition, Berlin, 1886. The second edition is translated into English and published in the appendix to the final report of the gold and silver commission, London, 1888, price 2s. 6d. Another English translation, made by Prof. Taussig of Harvard University, is to be found in the United States consular reports, special report, entitled *Bimetallism in Europe*, Washington, Dec. 1887. There is a French translation by Ringelsen, Nancy, 1889. 2. "Edelmetallgewinnung und Verwendung in den Jahren 1881-90." Conrad's *Jahrbücher*, folio 3, band 1, Jena, 1891. 3. *Edelmetallproduktion und Wertverhältnisse zwischen Gold und Silber seit der Entdeckung Amerikas bis zur Gegenwart*. Gotha, 1879. 4. *Beiträge zur Geschichte des Geld- und Münzwesens in Deutschland*, 1-3 Abschnitt (*Forschungen zur deutschen Geschichte*, 1 und 2 bd.), Göttingen, 1861 and 1862, 4 Absch. same collection, vols.

3 and 4, Göttingen, 1864. 5. *Denkschrift betreffend die Einführung der Goldwährung in Deutschland mit besonderer Rücksicht auf die Hamburger Bankvaluta*, Hamburg, 1856. 6. *Andeutung in Bezug auf die vermehrte Goldproduktion und ihren Einfluss*, Hamburg, 1852. 7. *Zur Frage der deutschen Münzeinheit, mit besonderer Rücksicht auf die abweichenden Währungen in Hamburg und Bremen*. Printed as manuscript for the Heidelberg Handelstag, 1861. 8. "Bericht über die bevorstehende Münzreform; gegen die vorgeschlagene Doppelwährung. Der Uebergang zur Goldwährung" (Aufsätze in *Bremer Handelsblatt*, No. 899, 924-927), Bremen, 1869. See also a paper with similar title in proceedings of the twelfth congress of German economists held at Lübeck in 1871. Proceedings published, Berlin 1872. 9. "Die Wirkung der Silberentwerthung," Conrad's *Jahrbücher*, 1884, Jena. 10. *Deutsche Münzverfassung. Mit Erläuterungen versehen von Soetbeer*. This important collection of German monetary laws with Soetbeer's interesting notes and explanations, and an introduction of thirty-four pages, bears no date nor mark of place of publication (Erlangen, 1874-76) 11. *Litteraturnachweis über Geld- und Münzwesen*, Berlin, 1892. The most complete bibliography of monetary literature extant but less complete on the side of the English literature than on that of the German.

[See articles on INDEX NUMBERS; PRICES, HISTORY OF, 1850-1896; SILVER, DISCOVERIES OF; SOETBEER'S TABLE OF PRICES; TABULAR STANDARD.] S. M'C. L.

SOETBEER'S TABLE OF PRICES. In the seventh part of Dr. Adolph SOETBEER's remarkable work entitled *Materials toward the Elucidation of the Economic Conditions affecting the Precious Metals and the Question of Standards*,<sup>1</sup> he has devoted a quarter of his book to a discussion of variations in general prices and in the purchasing power of gold. The work was prepared at the request of the Society for Preserving the Economic Interests of Trade and Manufactures, and is an impartial collection of statistical data rather than an argument for any particular view of the money question. Dr. Soetbeer's previous publications on the precious metals, dealing more particularly with the disputed statistics of the production of gold and silver, were characterised by such painstaking methods that his price statistics were accepted at once as authoritative guides in all subsequent discussions.

<sup>1</sup> *Materialien zur Erläuterung und Beurteilung der wirtschaftlichen Edelmetallverhältnisse und der Währungsfrage*. Herausgeg. vom Vorstande des Vereins zur Wahrung der wirtschaftlichen Interessen v. Handel und Gewerbe. Berlin, 1885, 4mo. "Zweite vervollständigte Ausgabe," Berlin, 1886. *Graphische Darstellungen in Bezug auf die Silberfrage*. Ausgearbeitet von H. Soetbeer, Berlin, 1886. An English translation of the second edition, together with the charts prepared by the son of Dr. Adolph Soetbeer, was made by Prof. F. W. Taussig, and published in the United States Consular Report, No. 87, for December 1887. Another translation into English has been published in the appendix to the final report of the royal commission appointed to inquire into the recent changes in the relative values of the precious metals, London, 1888. This translation does not include the charts.

The method by which the quotations were obtained gave these tables additional value. From 1847 to 1888 a statement giving the weight and quality of all goods brought into Hamburg by waggon, rail, or water, including sea and river traffic, was sent to the Hamburg bureau of commercial statistics. Opposite each entry was placed by the officials of the bureau the value of the article calculated from the market rate for that day as quoted on the commercial exchange. For articles for which no quotation was given on the day of entry the probable price was estimated in the absence of other data from the purchase price plus the cost of importation. Where more than one quotation was given for the same quality the average was taken. This method eliminated the usual objection to prices based on import values as given by the importer, as is customary at United States ports of entry, because in such cases the importer is often interested in making false returns. Over three hundred articles were quoted in the Hamburg tables for the several years, and the average price of each was given, based on the average for the year of the value per unit of measurement of all the importations, inland and foreign, calculated for the most part from the actual quotations of sales on the bourse on the day of each importation. Hamburg was, moreover, during this period an important market for all raw materials. It was also a free port without duties or differential taxes.

Dr. Soetbeer selected one hundred representative articles from the Hamburg statistics, choosing those whose prices could be best followed for the whole period 1847 to 1885-86. A percentage statement of the changes in five and ten year periods of the average prices of the hundred articles for the years 1851-1880, compared with the average price of the same articles for the four years 1847-50 was published by Soetbeer at first in Conrad's *Jahrbücher für Nationalökonomie und Statistik* in 1881, new series, vol. iii. In the *Materialien* these figures were changed slightly in order to meet certain criticisms and to make them generally available as a test of the movement in the purchasing power of the standard of value. Some articles of small importance were thrown out; other articles of great importance, but whose price data were not accessible from this source, for the whole period were added and their wholesale prices taken from the yearly accounts of large institutions at Hamburg. This was the case with meat, butter, eggs, and milk. Fourteen articles of British export and manufacture whose quotations were derived from British trade statistics were added, making in all 114 articles. In the first edition of the *Materialien*, the average prices were given only for five and ten year periods: in the second

edition, however, the average price of each article for each year (1851-1885 inclusive) is quoted. The articles are grouped as follows:—

I. *Products of Agriculture*.—Wheat, wheat-flour, rye, rye-flour, oats, barley, malt, buckwheat, peas, beans, potatoes, hops, clover-seed, rape-seed, rape-seed oil, linseed oil, oil-cake, raw sugar, refined sugar, spirits from grain or potatoes. Total 20.

II. *Animal and Fish Products*.—Beef, veal, mutton, pork, milk, butter, cheese, tallow, lard, hides, calf-skins, leather, horse-hair, bristles, feathers, bone, ox-horns, mucilage, eggs, herring, cured-fish, fish oil. Total 22.

III. *Southern Products*.—Raisins, currants, almonds, prunes, olive oil, French wine (exclusive of champagne), champagne. Total 7.

IV. *Tropical Products*.—(Exclusive of cotton). Coffee, cocoa, tea, pepper, pimento, cassia, rice, sago, arrack, rum, tobacco, indigo, cochineal, log-wood, red-wood, mahogany, cane, palm oil, ivory. Total 19.

V. *Minerals and Metals*.—Coal, pig-iron, bar-iron, steel, lead, zinc, tin, copper, quicksilver, sulphur (raw), saltpetre (raw, Chile), salt, lime, cement. Total 14.

VI. *Textile Materials*.—Cotton, wool, flax, hemp, silk, cordage, rags. Total 7.

VII. *Miscellaneous Articles*.—Guano, india-rubber, gutta-percha, rosin, potash (prussiate and chromate of), pitch, potash (carbonate of), soda, tallow candles, tar, wax. Total 11.

VIII. *Cotton Manufactures*.—(British manufactured articles of export). Cotton yarn, piece goods (plain), piece goods (printed), stockings and socks, thread for sewing, glass (common bottles), linen yarn, linen (plain), linen sail cloth and sails, woollen and worsted yarn, clothes, etc., flannels, etc., worsted stuffs, carpets, etc. Total 14.

In addition to the price quotations (in marks) for each article for each year, Dr. Soetbeer gave an index number (see INDEX NUMBERS) for the average yearly price of each article, and also for each group of articles. We reproduce here the group index numbers for five-year periods from 1851-1885, which show the percentage of variation for each group compared with the average prices for the group during the four year period 1847-50, which is taken as 100.

1847-50 =100	Group I.	Group II.	Group III.	Group IV.	Group V.	Group VI.	Group VII.	Group VIII.	Groups I-VIII.
1851-55	129.08	114.79	119.43	110.97	107.08	105.20	106.65	98.47	112.22
1856-60	131.84	122.31	124.72	122.61	118.59	107.12	108.21	102.41	130.91
1861-65	124.46	128.24	114.13	118.64	102.11	131.83	144.33	127.66	123.59
1866-70	137.74	136.35	121.54	118.32	95.47	129.17	105.90	130.55	123.57
1871-75	144.90	154.57	131.50	130.72	116.90	117.17	114.98	126.44	123.29
1876-80	138.12	146.76	133.91	126.38	94.55	102.33	96.79	111.70	123.07
1881-85	136.77	150.65	134.41	119.91	81.55	96.65	91.11	103.28	117.65

In the last column of the above table will be found the index number for all eight groups combined, covering 114 articles. Dr. Soetbeer has always laid much stress on the necessity of having a large number of articles in order to secure a safe method for measuring changes in the monetary standard. He regarded the twenty-two articles of the "Economist" as too limited a list. Many writers, on the other hand, object to a

large number of articles on the ground that it involves the assigning of too great importance to articles of which only small quantities, if any at all, enter into average consumption.

Dr. Soetbeer's figures can be continued from the same sources down to 1888, but in that year Hamburg joined the German customs union, and entry was made henceforth only of articles coming into Hamburg by sea. Therefore the figures for years since 1888 are not strictly comparable with those in the Soetbeer tables. Dr. Heinz, director of the Hamburg chamber of commerce, has estimated the corrections necessary to be made in order to use this material up to the year 1891; (see *U. S. Senate Report on Wholesale Prices*, 1893, vol. i. p. 258 ff.); but such estimates are necessarily unsatisfactory. Dr. Heinz has also revised the data for the years 1851-1888, so as to give the prices of about 180 articles based on the sea importations. This constitutes, however, a new series of prices for those years, because several of the articles included in the Soetbeer tables are not given in Dr. Heinz's list. His list is continued down to 1895 in the last report of Hamburg's *Handel und Schifffahrt* (1895), and will doubtless be given in subsequent reports (Dr. Heinz's tables are also given in Exhibit A, vol. i. of *U. S. Senate Report*, 1893).

In an article entitled "Veränderung im Niveau der allgemeinen Waarenpreise in den Jahren 1881-1889" (Conrad's *Jahrbücher*, neue folge, bd. 21, 1890), Dr. Soetbeer spoke less confidently of index numbers, and maintained that the number of articles is always too small. As the basis of this discussion he took the latest statistics of the German empire, giving the export and import value of goods for the whole German customs union since 1881 (published by Kaiserliches Statistisches Amt). The values are not those given in the invoices, nor those estimated at the time of entry as at Hamburg, but are calculated by a commission of experts in the leading lines of trade which is called together periodically to make reports to the bureau. Values were assigned to 933 articles by 39 experts (*Sachverständiger*) (see Band LX. der *Statistik der deutschen Reiches*). Soetbeer took the total value of the imports and exports for the year 1881, and deducted all duties paid on imports and bounties on exports, and compared the result with the total value of imports and exports similarly calculated for 1882 by placing the 1881 prices for the 1882 quantities. He found that the value of imports fell off 6.5 million marks or about 2 per cent, and that exports increased 23.2 million marks or about 7 per cent.

	Imports.	Exports.	Imports and Exports.
1881	100.0	100.0	100.0
1882	99.8	100.7	100.3
1883	98.2	98.5	98.4
1884	93.3	92.8	93.1
1885	85.8	85.8	85.8
1886	85.4	83.8	84.6
1887	85.5	83.5	84.5
1888	85.4	84.7	85.0
1889	88.6	87.2	87.9

Combining exports and imports, there was a net increase of 0.3 per cent, which amount, according to Soetbeer, is a fair measure of the change in the purchasing power of the standard of value. Adhering to the same method for the several years up to 1889, he got the results given above. Dr. Soetbeer in all his statistical work was extremely painstaking and eminently fair. Many students in all countries looked to him for reliable data concerning the production and consumption of the precious metals and the course of general prices, and still regret that no one has continued his work along the same lines, in the same comprehensive and thorough manner. S. M'C.L.

The place of Soetbeer's tables in England is practically taken by those of the *Economist* and of Mr. Sauerbeck, who by communicating his calculations to the public press every month has done a great service to statistical enquiry.

**SOFT MONEY.** A term occasionally given to notes (paper money), whether issued by government or otherwise, especially applied to the "green-back" circulation of the United States. This was "first issued in 1862, in the amount of \$150,000,000 (£30,000,000), as a measure of resource, the recognised alternative being the selling of government bonds below par in gold" (Prof. F. A. Walker, *Money*, 1878, p. 369). One issue followed another with great rapidity owing to the pressure of the civil war. In July 1864 the green-back currency was worth but 35 cents to the dollar, "but at least it maintained its currency as the general medium of exchange unimpaired from the moment when it was first issued, whether wisely or mistakenly, under the stress of war down to the moment when it was made equal in value to gold by the patience of the American people, and the courage and constancy of the present secretary of the treasury" (John Sherman, 1878).

[Prof. F. A. Walker, *Money, Trade, and Industry*, 1880, p. 201.]

**SOKE.** In the customary of the manor and soke of Rothley (*Archæologia*, xlvii. 128), a soke is defined as *secta ad homagium in curia . . . secundum consuetudines regni*; and it is seen that free socmen, whose holdings were scattered all over the county, owed suit to the manorial court of Rothley. The same is apparent from the lists of suitors at the courts of the abbey of Ramsey given in full in the cartulary (i. 41-43). A soke was thus a jurisdiction over free tenants without as well as within a manor. It was derived in many cases from a royal grant, as for instance that of the *soka Fraunchewyl* mentioned in the Rot. Hundred., ii. 180; but in others it was a growth of which the origin cannot be traced (see SOKEMANEMOT). R. H.

**SOKEMANEMOT.** A manorial court attended by free sokemen mentioned in the *Rotuli*

*Hundredorum*, ii. 143. Possibly like the occurrence of *curia militum* and *curia villanorum*, it is a sign of a division of the two classes of tenants in the *halimot* into the so-called court baron and the customary court; but the matter is beset with difficulties.

[F. W. Maitland, *Select Pleas in Manorial Courts*, p. xx.—Vinogradoff, *Villainage in England*, p. 365.] R. H.

SOL. The standard of value in Peru.

A silver coin weighing 25 grammes of silver 900 fine, the equivalent of the peso or dollar of Chile, and also of the five franc piece. F. E. A.

SOLDO. A copper coin of Venice and Milan. Prior to the formation of the modern kingdom of Italy, the currency system of Venetian Lombardy was as follows:

5 centesimi . . . . . 1 soldo austriaca  
20 soldi or 100 centesimi 1 lira austriaca

Besides the copper soldi, the following gold and silver coins were at that time current:—

Gold—

Sovrano (or 40 lire piece)  
Half-sovrano (or 20 lire piece)

Silver—

Scudo (or 6 lire piece)  
Half scudo (or 3 lire piece)  
Lira austriaca  
Half lira (or 50 centesimi piece)  
Quarter lira (or 25 centesimi piece)

F. E. A.

SOLIDARITY. The word solidarity expresses the relations of mutual dependence existing between the individual members of one and the same whole. Thus, in biology we speak of the solidarity between the organs of the same body,—between the functions of the brain, for instance, and those of the heart. Thus also in jurisprudence there is said to be solidarity between persons responsible for the same debt. Solidarity may exist not only in the order of co-existence, but in the order of succession; thus, in history there is solidarity between the present and the past generation.

This theory of solidarity has for some years held an important place in sociology, economics, and philosophy—it has even become the motto of a new school which has gathered its adherents, by a rare coincidence, both among Christian socialists and positivist and evolutionist socialists (see bibliography). Auguste COMTE exemplified the subject as “the connection of each to all others under many different aspects, so as to render the feeling of social solidarity extending to all time and in all places instinctively familiar” (*Discours sur l'esprit positif*). But long before him St. Paul, addressing not only the church but the whole human race, had uttered the noble sentence, “We all are members of one body”—a speech in itself the noblest illustration of the solidarity of the race of man.

The discovery by science of order, under very different aspects, has given examples how far these declarations are founded on fact, for

instance, in political economy in the question of the division of labour. It is obvious, also, that the larger part of the great recent inventions—railways, telegraphs, telephones, and, above all, of modern journalism, tend to increase continually “these relations of mutual dependence” which exist between men, and make them vibrate throughout the universe in the community of the same emotions, causing economic and political crises to be as contagious as epidemics.

The “school of solidarity” believes that this growing interdependence of individuals and peoples is a harmonic law, and that the solution of the social question must be sought in the continual development of this solidarity, especially in co-operation in all its forms, since co-operation, with its motto “Each for all, and all for each,” is only the practical application of solidarity. Some objections, however, may be made to this doctrine. At first it seems that solidarity appears as a simple *fact*, devoid of all moral value and often even opposed to our ideas of justice. For instance, nothing can appear more unjust than that solidarity which makes the innocent suffer for the guilty, and visits the sins of the fathers on the children, or that which binds the destiny of the bee to that of the drone, of the industrious to that of the parasite; and almost justifies the severe remark, “the only solidarity discoverable in the world is that of mutual exploitation.” The reply to this is that, even as a simple fact, solidarity testifies to the unity of the human species, its common origin and its common destiny, and compels our attention to all that happens to our fellow-creatures, whether fortunate or not, since all that concerns them concerns us. Thus, the certainty of contagious disease obliges the rich to interest themselves in the question of dwellings for the poor, to construct workmen’s houses, to impose laws with regard to unhealthy dwellings, etc. Again, the feeling of the solidarity of nations, from the point of view of their economic interests, is the principal check on war.

But solidarity will gain a high moral value when it is understood, accepted, and desired by men, when it becomes the basis of *duty*, and when men, instead of resigning themselves to it as to a fatality, endeavour to realise freely that “Moral good will then be the desire to be and to behave as members of a common humanity. Moral evil will then be the desire to isolate ourselves and to keep separate from the body of which we all are members” (C. Secrétan, *Civilisation et Croyance*). Now this is exactly the course of evolution; history shows us solidarity becoming free and voluntary, gradually separating itself from the “drift of circumstance.” In primitive society solidarity reigns,—a solidarity imposed by the accidents of nature or of birth. For example, all the

members of the Roman *Gens*, or of the clan, were responsible for all offences committed or all debts contracted by one of them, and the inheritance of this was obligatory on the heir (see art. NECESSARI HEREDES). The necessity of contending with the Nile floods compels all the inhabitants of Egypt to solidarity in labour and cultivation. The struggle against natural forces obliges weak individuals to combine—"Nature commands either solidarity or death" (Metchnikoff, *Les Grands Fleuves Historiques*). But little by little, and in proportion as men become more powerful, the individuals incline to separate from the primitive collectivism:—in fact, as regards offences, each one now answers only for himself. Men would proceed rapidly to absolute individualism if the feeling of human solidarity did not fortunately stop this dispersion by bringing them back by means of the thousand forms of association and insurance under a bond of a voluntary solidarity similar in a degree to primitive solidarity, but as superior to it as liberty is superior to fatalism.

At this point this theory closely approaches that of Herbert Spencer, which consists in the progressive substitution of an industrial system resting on free contract for a military system depending on coercion, in other words, the substitution of spontaneous co-operation for obligatory co-operation. This school, however, differs from that of Herbert Spencer in the sense that it does not reject all state interference, but, on the contrary, regards the state as the highest form of social solidarity. It is true it has the defect of being coercive, but it can and ought to serve to develop in the people the feeling of solidarity, which remedies the defect and prepares the means for its realisation—for instance, the system of obligatory assurance in Germany. Also, it is almost needless to add that the school of solidarity, in opposition to the individualism of Spencer, or of the Manchester school, does not favour competition, but raises the device, "union for existence," against the phrase, "struggle for existence"; and "each for all"—against "everyone for himself."

SOLIDUS (or *nummus aureus solidus*), gold coin struck by Constantine, c. 312 A.D., 72 to the lb. or 70·2 grains fine, the same weight as the first denarii, milliarense, and half folles, superseded the "aureus" of Julius ( $\frac{1}{4}$  lb. or 126 grains), Nero (111 grains), Caracalla (101 grains), Diocletian (84 grains), etc.

As the aureus was modelled on the Persian DARIC, so modern gold coins are modelled on the solidus, and its divisions "semis" ( $\frac{1}{2}$ ) and "triens" ( $\frac{3}{4}$ ). Obverse, portrait of Caesar, later with saint; reverse, allegorical or later religious; exergue often stated weight thus lxxii. or thus OB.

In the east the weight was kept uniform, and it was the standard (c. 312-1453 A.D.); 1 solidus = in silver 12 milliarense, or 24 siliquæ, in copper (c. 312-500) 288 folles or 5760 denarii, or (c. 870-1453), 288 obols ( $\frac{1}{2}$  folles). As the bezant it circulated among traders from India to Portugal.

In the west (after c. 550) its weight was  $\frac{1}{4}$ th less and its value 21 siliquæ; or under the salic law 40 silver deniers. Under Pepin (755 A.D.), and for nearly 5 centuries afterwards, gold coins ceased and silver sous or solidi became the standard. Pepin fixed the values thus; 1 lb. silver (= 5055 grains) = 22 sous (compare siliquæ) = 264 deniers (compare folles); Charlemagne (801 A.D.) restored the Babylonian numbers, and enacted that 1 lb. silver = 5710 grains = 20 sous = 240 deniers. In England in the 9th century 1 lb. silver (= 5400 grains) = 20 "scillings" (i.e. sous) = 240 pence (the only coin); and these weights and methods of reckoning were retained until gold coinage was effectively introduced in the 14th century; Henry VII. first coined the pound into a (gold) coin, and the shilling into a silver coin of that name, but these coins were coined as though money pound (£) meant about  $\frac{1}{4}$  lb. silver. In France the money pound, as such, was never coined; in 1080 A.D. it = 1 marc (3777·3 grains) (4608 Paris grains) and soon afterwards was a mere figure of speech. "Sou" was also a figure of speech in the 13th century; and in 1258 and 1305 A.D., 1 marc = 53 gros tournois, and 1 g.t. = 1 nominal sou (1258), but 3 nominal sous  $3\frac{1}{2}$  deniers (1305). Yet Frenchmen reckoned by livres, sous, and deniers after the Carolingian proportions down to 1789, when deniers had long ceased to be coined; and peasants still call the 19th century representative of the 18th century livre 20 sous. For similar reasons an Italian "lira" is still said to = 20 "soldi." Germany has repeated French history with considerable variations; thus e.g. (1) mark and lb. are never confused, and mark = 8 oz.; (2) the Rhenish system, 1 gulden = 60

kreuzer=240 pfennige largely displaced the Carolingian system; (3) the English system prevailed in Cologne, where a mark=3600 grains=160 pfennige; (4) the money of account often comes very near to actual coins; thus the (coin) gulden in the 16th century=75, 72, or 68, but never 60 kreuzer; (5) the threefold depreciation of the nominal schilling (or sou) occurred between the first half of the 14th instead of in the second half of the 13th century.

SOLUTIO in Roman law is the discharge of an obligation by performance of that which is due under it. The performance may be made to the creditor either by the debtor himself or by any third person. E. A. W.

SONNENFELS, JOSEPH REICHSFREIHERR VON (1733-1817), was born at Nikolsburg in Moravia. His grandfather had been a Jewish Rabbi at Berlin; his father, a learned Semitic scholar, emigrated to Austria, became a Roman Catholic, and was ennobled by the name of Sonnenfels. The young man, in consequence of family difficulties, entered the army as a private soldier; but, when his father's circumstances improved, he commenced the study of jurisprudence at the university of Vienna in 1754. In 1763 he was appointed to the newly-created professorship of police and cameral science in that university. He held several high offices under Maria Theresa and Joseph II., and threw himself with ardour into the movement of intellectual *Aufklärung* and practical philanthropy which marked those reigns. In particular, he laboured earnestly for the improvement of the penal system, and the abolition of torture in Austria was largely due to his exertions. He was made a baron of the empire in 1804, and appears to have retained the confidence and favour of the court to the end of his life. He died at Vienna.

The principal work of Sonnenfels was *Grundsätze der Polizei, Handlung und Finanzwissenschaft*, 1763-67. His importance in the history of economics arises from the fact that this work became the official text-book of political science in the universities and lyceums of Austria (and of Hungary through the Latin translation of Beke), and continued to be in use during several decades of the present century. He was not an original thinker, nor much interested in the scientific

analysis of phenomena; he was more occupied with practical precepts—with what, according to his conceptions, ought to be, than with what is. His doctrines represent an improved version of the mercantilist theory. He follows JUSTI's views in the main, giving them a more systematic basis, and carrying them out to all their consequences. He was also largely influenced by the "inimitable" FORBONNAIS, as he calls him. He emphasises still more strongly than the earlier members of his school the importance of a dense population regarding it as one of the highest objects of statesmanship to bring about by various devices. The lengths to which he and others went on this subject help to explain the counter-exaggerations of the Malthusians at a later period. It should, however, be observed that he also insists on the useful employment of the population, and casts this burden in the last resort on the state, which accordingly he regards as authorised, and indeed bound, to interfere in industrial life, directing the activity of the citizens into such lines as will be most conducive to the good of the whole community.

Sonnenfels published his collected works in ten vols. 1783-87; the first vol. of the series contains an autobiography.

SORCHIN was one of the items in the ancient revenues of the petty princes of Ireland. It was an exaction of [the equivalent of] meat and drink for one soldier for one day in each fortnight. C. A. H.

SOU, the name in colloquial French of the brass coin of 5 centimes, almost equivalent to and resembling an English halfpenny. Colloquially the expressions *pièce de dix sous*, *de vingt sous*, *de quarante sous*, and *de cent sous* are also often used for half a franc, 1 FRANC, 2 franc and the FIVE FRANC PIECE.

In former times gold and silver *sous* existed, for instance the *solidi aurei* of 70½ grains coined under the Merovingian kings. The *solidus aureus* was divided into 40 *denarii*, and the *solidus argenteus* into 12; for further information see Guérard, *Prolegomènes du Polyptique d'Irminon*, Paris, 1844, pp. 114 *et seq.*, according to whom the *sou d'or* was relatively worth 90 francs (say £3:12s.). Pepin ceased coining gold, and introduced the silver "solidus." From the 12th century the French monetary system may be considered to have been based on the LIVRE, the lineal ancestor of the present franc, being either the *livre tournois* (coined in Tours) or the *livre parisais*, the latter one-fourth more valuable, but always a nominal money only used for accounts, both of them subdivided into 20 *sous* or *sols* of 12 *deniers*. One *sou parisais* was thus equal to 15 *deniers tournois*. For several centuries the *sous* have been simply copper coins; there was a general recoinage of *sous* in 1738, and severe penalties were enacted during the last century against the introduction of foreign copper coins—d'Avenel, *Histoire des Prix*, vol. i. p. 57,

note 1. Quite recently, 1st December 1896, a statute was again passed against the introduction and circulation of foreign *sous*; large quantities had been imported from such countries as Spain, Italy, Greece, the republic of Plata, etc., when the rate of exchange secured a considerable margin of profit to this operation, the type of coinage being the same as the type adopted in France since 1852. The amount of these foreign *sous* in circulation at the time when the law was passed was officially estimated at 13,000,000 of francs, say half a million sterling.

[See art. SOLIDUS].

SOUTH SEA COMPANY (SOUTH SEA BUBBLE). The war of the Spanish succession (1701-1713) involved the expenditure of large sums, and a number of navy, victualling, transport, and other debentures were afloat at a considerable discount and without any regular fund for their discharge, when, in 1711, Harley attempted to quiet the monied men and to restore public credit. It was determined by 9 Anne, c. 21, to incorporate the proprietors of those debts into a "Company of merchants of Great Britain trading to the South Seas and other parts of America, and for encouraging the Fishery." With the exception of the Portuguese and Dutch possessions, the company was granted the right of exclusive trade with the east side of America from the Orinoco to Tierra del Fuego, and also along the west, to a distance of not more than 300 leagues from the shore. Territory discovered within these limits was to be owned by the company under the crown, while power was given to the queen to direct that a stock of 20s. on every £100 of stock should be kept apart for the improvement of the fishery. To encourage the company to make settlements within the limits of their charter (8th September 1711), commercial powers and privileges, apart from any redemption of the fund, were granted in perpetuity by 10 Anne, c. 30. The stock soon rose, and preparations were made for the dispatch of a cargo in 1712, but the continuance of the war rendered this impossible.

By the Treaty of Utrecht (1713) between Great Britain and Spain, a grant was made to the queen and "to the company of her subjects appointed for the purpose," of the contract "el pacto de el assiento" (see ASSIENTO TREATY), for introducing negroes into Spanish America at the rate of 4800 annually for thirty years, and under the conditions previously enjoyed by the French Guinea Company (Koch and Schoell, ii. 125). Former assientists had been losers; and to guard against this, the company to whom the queen presented the

contract was to be allowed to send to Spanish America annually for thirty years a ship of 500 tons; the king of Spain, however, reserved to himself one quarter of the profits on this ship and 5 per cent on the remainder. According to Macpherson (*Annals of Commerce*, iii. 33), "this sugarplumb of an annual trading ship . . . was too much clogged with difficulties to prove of any certain advantage," for the license for such ships was frequently suspended and the company's goods were constantly liable to seizure. A license for two additional ships to accompany the annual vessel was obtained and finally presented for the use of the company without a demand for a percentage. The ports open to the company were Panama, Portobello, Carthagena, Vera Cruz, Buenos Ayres, and Havana; inland sub-factories were also permitted, and their agents were to be found in Jamaica, at Cadiz, and Madrid. The first annual ship sailed in 1717, its tonnage having been fixed by an explanatory treaty at 650 tons, Spanish measure. The policy of paying off part of the national debt by incorporating it with the stock of successful companies was still popular, and the capital stock and yearly fund, augmented in 1714 to £10,000,000 (1 Geo. I. § 2, c. 21) was further increased in 1717 when the proprietors of certain short annuities, amounting to about £135,000 and having twenty-three years to run, were permitted to subscribe the residue into stock at the rate of eleven years purchase at 5 per cent (5 Geo. I. c. 19). A further development took place when, in 1719, the directors proposed to absorb the national debt by purchase or subscription. That portion which consisted of irredeemable, they desired to convert into redeemable funds: the various funds were then to be united in a single stock, and after seven years the interest on the debt was to be reduced from 5 per cent to 4 per cent. With the profits they hoped to start a sinking fund for the gradual extinction of the debt, while they offered the large sum of £7,567,000 for the debt. A bill to promote this scheme passed in 1720 (7 Geo. I. st. 1, c. 5). The support of the government, erroneous calculations as to the value of the South Sea trade, rumours of extraordinary profit, and the high price offered by the company, led the public to speculate wildly until the stock rose to £1000 for every £100 subscribed. The "bubble" then burst, bringing ruin not only to holders of South Sea stock, but to many others who had taken shares in the impossible speculations of the day. Walpole, who had always opposed the scheme, now came forward, and by his great financial ability gradually restored public credit. The directors were leniently dealt with, and their estates handed over towards the discharge of the company's liabilities; the payment

guaranteed to the public was remitted, and upon a division of stock among the proprietors a dividend of 33 $\frac{1}{3}$  per cent was declared (Lecky, i. 326). In 1723 the capital was divided into (a) annuity and (b) trading stock, while in 1727 all debtors who had not repaid the sums borrowed in 1720 were discharged upon payment of 10 per cent of the loan. The company now turned its attention to the encouragement of the fishery. Twelve ships were built for the prosecution of the whale fishery, which had been entirely abandoned by the English, and the government, to further the scheme, repealed the duty on whale fins. But the eight voyages undertaken (1725-1732) were singularly unsuccessful, and in 1732 they sold off their ships and stores. Although their negro traffic with Spanish America, for which about thirty ships were employed, was encouraged by a license (from the E. I. Co.) to ship negroes from Madagascar to Buenos Ayres, their trade in general was precarious and unsuccessful, owing to the mismanagement of agents and the seizure of property upon slight provocation. Spain, in 1733, proposed as an equivalent for the annual ship, a return of 2 per cent on the flota and galleons during the remainder of the company's term (see GALEON). The question was discussed for several years, and though no steps were taken, no ship seems to have been dispatched after 1733 (*Macpherson*, iii. 199). The proprietors would probably have gained by the equivalent, but the profits of the illicit trade carried on by their servants was considered by many to be more valuable.

The high-handed measures taken by Spain to check this illicit trade, especially the enforcement of a right of search, led to war in 1739, and the trade was consequently interrupted for some years. By the Treaty of Aix-la-Chapelle, art. 16 (1748) the *asiento* was indeed renewed for the four years during which it had still to run, but it was soon seen that the execution of the clause was not to be permitted. War seemed imminent, but by the Treaty of Madrid (1750) England agreed, upon grant of compensation, to renounce the *asiento* and the annual ship (Koch and Schoell, ii. 438). Their trade with the Spanish West Indies being at an end, the company converted their trading stock into annuity stock, and practically ceased to be a trading company (A. Smith, bk. v. c. 1). It was not, however, until 1807 that their exclusive trading rights were formally lost (47 Geo. III. sess. 1, c. 23), when a guarantee fund for their indemnification was raised by the imposition of a 2 per cent *ad valorem* duty on certain commodities imported from within the limits formerly occupied by them until such time as the guarantee fund should be completed (55 Geo. III. c. 57).

SOVEREIGN. English gold coin, first struck in the reign of Henry VII.

The following is a list of the several varieties of coins of this denomination issued since that time:—

Reign.	Year.	Rating.	Weight.	Fineness.	Value in gold 916·6 fine at £3: 17 10½d. per oz.
Henry VII. . .	1485	20/	grs. 356	994·8	£ s. d. 2 5 1
" VIII. . .	1527	22/6	240	994·8	2 3 3
" VIII. . .	1543	20/	200	916·6	1 12 6
" VIII. . .	1545	20/	192	916·6	1 11 2
Edward VI. . .	1549	20/	169·25	916·6	1 7 5
" VI. . .	1550	24/	240	994·8	2 2 3
" VI. . .	1551	30/	240	994·8	2 2 3
" VI. . .	1551	20/	174·5	916·6	1 8 4
Mary . . .	1553	30/	240	994·8	2 2 3
Elizabeth . . .	1558	20/	174·5	916·6	1 8 4
" . . .	1601	20/	172	916·6	1 7 11
George III. and subsequently }	1817	20/	123·27	916·6	1 0 0

From the reign of James I. to the beginning of that of Charles II. the principal gold coin was the UNITE; while from 1663 to 1816 the chief English gold coin was the guinea (see GUINEA). The sovereign, therefore, did not assume its present important position in the currency system of England until the passing of the coinage act of 1816, when this coin was adopted as the standard of the new gold currency, and became the "pound sterling" of gold in place of the former "pound sterling" of silver (see POUND STERLING).

F. E. A.

SOVEREIGNTY. A *sovereign state* is a state whose government, while receiving the habitual obedience of the bulk of its subjects, does not itself render habitual obedience to any human superior.

The *Sovereign* in an independent state is that person or body of persons which exercises supreme control, and is not legally bound to submit to the control of any other authority, internal or external. *Sovereignty* is the power of supreme control, possessed by the sovereign one or number. It has been divided into internal and external sovereignty. The former refers to the final and absolute determination of domestic affairs, the latter to a similar authority over dealings with foreign powers. The distinction is useful when we discuss those anomalous political communities which are said to possess "autonomy" under the suzerainty of some external ruler, by which is meant that the home government controls internal matters, but cannot settle the relations between the community and other states without the consent of the suzerain power. Sometimes only certain classes of foreign affairs are thus reserved; and such

cases are described by saying that the local rulers are deprived of a portion of the powers of external sovereignty. Another important distinction is drawn between legal and political sovereignty. Legal sovereignty is defined by Professor Dicey as "the power of law-making unrestricted by any legal limit"; while of political sovereignty he says, "that body is politically sovereign or supreme in a state the will of which is ultimately obeyed by the citizens of the state" (*Law of the Constitution*, Lect. II.). He illustrates his meaning by a reference to the British constitution, where we have in parliament a supreme legislative assembly, which can make or unmake any law, and has no legal authority above it to set its laws which it is bound to obey. But nevertheless this parliament, or rather the most important part of it, the House of Commons, must in the last resort conform to the will of the majority of the electorate, which has no power of itself to make laws, but can, at a general election, call into being a law-making body pledged to carry out its wishes. The definition of legal sovereignty just quoted might with advantage be enlarged so as to include administration as well as legislation. With this alteration in the statement of terms, the distinction we are considering is most valuable; but it does not apply to states which are living under autocratic rule. It would be absurd to speak of the Russian people as possessed of political sovereignty. Moreover in countries which live under a federal system of government, for instance the United States of America, it is very difficult to discover where the legal sovereignty is placed.

[See Austin, *Jurisprudence*, Lect. VI., London, 1869; Maine, *Early History of Institutions*, Lect. XII., London, 1875; Bluntschli, *Allgemeine Staatslehre*, bk. vii., Stuttgart, 1875; Dicey, *Law of the Constitution*, Lects. I-IV., London, 1886].

T. J. L.

**SPANISH SCHOOL OF POLITICAL ECONOMY.** During the 16th, 17th, and 18th centuries, Spain produced a considerable number of writers on economic subjects, many of whom are quite worthy of attention, though in that fragmentary and empirical age, as it has been aptly called by Professor Cossa, they only dealt with the possible remedies against the frightful existing evils and abuses.

Ferdinand of Aragon and Isabella of Castile (1474-1516) had left Spain a united kingdom, with prosperous trades, arts, and agriculture, and with a currency restored on a sound and dependable basis. Their grandson, the emperor Charles V. who was king of Spain from 1516 to 1556, and after him Philip II. (1556-1598), strained the resources of the country by employing it as the instrument of their schemes of universal dominion. Under their successors, the four last kings of the Austrian dynasty, Spain became more and more an utterly exhausted and ruined kingdom ruled by a squandering, dishonest, and pompous court, encumbered with unpaid debts and painfully raising a bare hand-to-mouth subsistence

by the most oppressive and often absurd fiscal exactions. The opening of the New World gave at first a wonderful impetus to the export of Spanish manufactures, but the enormous rise of prices caused by the abundance of American silver, which was experienced in Spain earlier than in the rest of Europe, and was intensified by the prohibition of the export of bullion, prevented the possibility of exchanges on the normal basis with the neighbouring nations. Simultaneously the final expulsion of the Moors and the legal disqualifications imposed on the descendants of converted Jews (*Marranos* and *Cristianos nuevos*), annihilated the only classes conversant with the successful cultivation of land and the working of the money-market. Besides the systematic debasement of the currency dating from the first years of the 17th century, the neglect of all public works; the stringent official and fiscal trammels (*Platos y Tonelada*) imposed on intercourse with the colonies; a fitful economic policy, at one time striving to suppress foreign imports, at other times anxious to secure cheapness by favouring them and restricting exports; the taxation of corn; the privileges of the powerful association of owners of wandering sheep flocks (see *MESTA*; *TRANSHUMANCE*) preventing the extension of agriculture; the stringency of taxation, as the *ALCAVALA* and the *MILLONES*, levied on the daily sale and consumption of the necessities of life; the terrible mismanagement of state *MONOPOLIES*—all concurred to turn the soil of Spain into wide and uninhabited wastes (*despoblados*), where, according to the Venetian ambassador Soranzo, "every thing was wanting and at inexpressibly high prices." The middle classes almost ceased to exist as an economic force. Foolish pride assisted in this; after 1505, every Castilian burgher and almost every mechanic was allowed to entail his property both real and personal, and became eager thus to raise his family to the rank of *hidalguia* (gentility), which conferred exemption from direct taxation, but debarred the possessor from all professions connected with trade and manufactures. In short, the whole drift of the legislation, especially for Castile, cannot be better summed up than in the words about Sicily used by Coleridge in his *Table Talk*: "You may learn the fundamental principles of political economy in a very compendious way by taking a short tour through Sicily and simply reversing in your mind every law, custom, and ordinance." Owing to their political and fiscal autonomy and privileges, as well as to their favourable situation on the sea-shore, Valencia, Catalonia and the Biscayan provinces alone more or less succeeded in keeping alive something of their former prosperity.

This short sketch enables us to realise what an ample field was opened for proposals of reform.

One class of writers may be dismissed summarily, namely the so-called *arbitristas* and *projectistas*, or inventors and defenders of interested or foolish financial nostrums intended to fill the empty coffers of the royal treasury; Colmeiro devotes to them the last chapter of his economic history of Spain. But the more serious writers or *políticos*, as they are called in Spain, deserve to be noticed; almost all of them belonged to the secular or regular clergy, except during the 18th century, under the domination of the reforming kings of the Bourbon family, when they were recruited among the higher ranks of the civil service.

Although theoretically distinguishing between the intrinsic and the extrinsic value of money on the lines of AQUINAS, —MARIANA stands forward prominently as a firm upholder of monetary honesty; besides him, father Marquez, preacher to King Philip III. and professor of theology in the university of Salamanca, maintains the same principles in his *Gobernador cristiano* (1612), as well as Gonzalez de Ayala (*Discurso sobre la reduccion de la Moneda*, 1626), Cellorigo (*Memoriales sobre la política necesaria á la república de España*, 1600), Carranza (*El Ajustamiento de la Moneda*, 1629), DÁVILA Y LUGO, FAJARDO, and DORMER. Many of these express opinions akin to those of GRESHAM as to good money being driven out by bad, and also inveigh against the unwisdom of the nation which owned the silver and gold mines of Peru and Mexico in opposing the export of the precious metals. In the absence of satisfactory official returns, several contemporary writers endeavoured to ascertain the quantities of these metals imported into Spain; among these were Father Mercado (*Tratos de mercaderes*, 1569), Valle de la Cerda (*Desempeñó el patronio de S. M.*, 1618); MONCADA, NAVARRETE; Peñalosa (*Libro de las cinco Excelencias del Español*, 1629); Perez de Rocha (*Epítome político*, 1644), Mendo, (*Príncipe perfecto*, 1662), and Solorzano (*De Indiarum Jure*, 1672). In the 18th century, UZTÁRIZ adopted the calculations of Moncada and Navarrete, and continued them up to his own time (1724). During the second half of the same century, Salazar (*Restauracion política de España*) and at the beginning of ours, Canga Argüelles in his *Diccionario de Hacienda* (article "Caudales") have also attempted to solve this statistical problem.

The conquest and colonisation of the New World attracted thousands of Spanish adventurers, and everywhere complaints arose about the *despoblacion* resulting from this emigration towards the *bella retirada*, as America was called in the popular language of the day. These complaints are often echoed in the writings of the *políticos* such as MONCADA, NAVARRETE, and Peñalosa; generally, however,

they point out the injurious influence of the European wars then being carried on, and of the progressive and continuous decay of trade and manufactures. In the 18th century, UZTÁRIZ and LARRUGA (vol. vii. of his *Memorias políticas y económicas*) steadily maintained that the depopulation of the country, which has perhaps been exaggerated, had for its principal and almost only cause the loss of its productive industries. On the closely related question of the expulsion of the remaining descendants of the Moors, it is worth mentioning that two *políticos*, themselves members of the clergy, NAVARRETE, royal chaplain and canon in Santiago in his *Conservacion de Monarquías* (*discurso vii*) and father Alonso Fernandez (*Historia de Plasencia*, bk. iii. ch. xxv.) boldly remonstrated against the sweeping though popular measures taken against these, perhaps disaffected, but industrious and useful subjects of the Spanish crown.

If population decreased, crowds were still left who, through necessity or disinclination to work, became professional beggars, and the question of the poor was permanently debated from the beginning of the 16th century. The humanist VIVES, whose treatise *De Solventione Pauperum* (1526), dedicated to the magistracy of Bruges in Flanders, inspired most of the legislation of Northern Europe, was a Spaniard by birth; in Spain itself a copious and special literature was constantly pouring forth from the days of GIGINTA, MEDINA, and HERRERA to those of UZTÁRIZ and even WARD. With differences as to the method of proceeding, there exists among them a general agreement that the law ought to coerce vagrants and idlers, whilst providing for those actually destitute. Moved by his theological zeal, the Dominican Soto, in his *Deliberatio in causa Pauperum* (1545), stood isolated in his protest that moving from one place to another and begging was a natural right, and that the state is not entitled to set up a distinction between *bona fide* and pretended poor, whatever may be their nationality.

As to foreign trade, STRUZZI and DORMER were the sole and unheeded champions of its liberty; to the very end of the 18th century all the leading writers belong to the mercantilist school, with, during the latter period, a loudly professed admiration for COLBERT. During the 16th century the national policy had fluctuated between the mediæval anxiety to secure plenty and the desire to favour native industry, but from the beginning of the 17th, MONCADA, Damián de OLIVARES, and Gracian Sarrano, showed themselves unflinching partisans of the most inflexible mercantilism; during the 18th, its principles were in the same uncompromising way defended by UZTÁRIZ and ULLOA and with more moderation by WARD, with this difference, however, that instead of repelling industrious and skilled foreign artisans, they proposed to attract

them by liberal and favourable treatment. Having travelled abroad, they had learned to prize the superiority of foreign countries. Notwithstanding this universal faith in mercantilism, a persistent and almost unanimous opposition was manifested against state interference with internal trade, and especially against the regulation of the price of corn. From the very commencement of the 17th century, Cellorigo, NAVARRETE, and MARTINEZ DE LA MATA strenuously attacked this last-named system, and showed its injurious influence. Still the internal corn trade only became free in the second half of the 18th century, thanks to the enlightened statesmen, FLORIDA BLANCA, CAMPOMANES, and JOVELLANOS, although the suppression of the old system had again been powerfully advocated some years before by Zabala in his *Representacion á Don Felipe V.* (1732).

From early times direct taxation had been comparatively light, but indirect taxation had continually become more oppressive and vexatious, and the idea naturally arose and spread that a great improvement would be effected if all these many and iniquitous taxes could be merged in one single and direct tax derived from the very fountain of wealth, namely land: under the pressure of circumstances, this favourite tenet of the French PHYSIOCRATS (see IMPÔT UNIQUE) was put forward in Spain almost a century before it was supported by the physiocrats themselves. Putting on one side some rather indefinite proposals as old as the reign of Philip II., Centani proclaimed in his *Tierras* (1671) that land being the only real and solid wealth, one single land-tax ought to supersede all existing taxes. Under the ministry of ENSENADA, about eighty years later, steps were taken to introduce this *Unica Contribucion*, and the necessary preliminary operations of survey and valuation of land were even effected, but this plan was afterwards abandoned. Urged by the same motives, but proceeding on other lines, Father Bántista DÁVILA (*q.v.*) had in 1651 extolled the advantages of a single and progressive poll-tax. The liberal Spanish statesmen and writers of the end of the 18th century, such as CAMPOMANES, JOVELLANOS, and others, placed more confidence in cautious and gradual reforms than in the promulgation of extreme theories or the introduction of radical innovations; their books and reports prepared the reform of the laws concerning the privileges of the *gremios* (crafts) and of the *Mesta*, and insisted on measures for the promotion of agriculture.

All the writers reviewed up to this point wrote under the spur of the existing circumstances, and excepting the mercantilists of the 18th century, without having undergone any foreign influence whatever. From the date of the translation of Adam SMITH into Spanish

(by J. A. ORTIZ in 1794), opinions were entirely reversed, and Spanish economists as a rule strictly followed the guidance of Adam SMITH and of J. B. SAY, and later still of BASTIAT. Towards the end of the first quarter of the present century FLOREZ ESTRADA may be said to have acquired a distinct pre-eminence by his first-hand knowledge of James MILL and RICARDO. But he is the servile follower of no one, and never gives up his right of independent criticism, so that his *Curso de Economia Política* (1828-31—1841-48), despite the title of its French translation (*Cours Éclectique*), is not by any means the production of a shallow eclecticism. Half a century later the leading Spanish economists, such as Madrazo (*Lecciones de Ec. Pol.*, 1874-75) and Olozaga y Bustamante (*Tratado de Ec. Pol.*, 1885-86), may still be considered as a wing of the French liberal school, advocating free trade and the extension of the principle of *laissez-faire*. The celebrated economic historian, Colmeiro, whose *Tratado elemental de Ec. Pol. eclectica* (1845) displayed a strong bias in favour of protection, reconsidered his views and took the opposite standpoint in his *Principios* (1859 and 1873), and in his valuable *Historia de la Ec. Pol. en España* (1863). The same strongly marked tendency prevails in Coll y Masadas (*Principios de Ec. Pol.*, 1872), and quite recently in Vidaurre y Orieta (*Economía Política*, 1892); this last work, developed on purely deductive and abstract lines, without the smallest tinge of induction, is remarkable from the amazingly long string of *natural laws* evolved by the author.

Notwithstanding this almost undeviating adherence to the doctrines of the French school, another tendency, already noticeable as a sort of undercurrent in Florez Estrada, comes out openly in the systems of some of the recent Spanish writers, namely the predominance given to the ethical aspects of economic problems. Although his distrust of state interference and his confidence in the unrestricted display of individual activities clearly separates him from the German *Kathedersozialisten* (see SOCIALISTS OF THE CHAIR), Carreras y Gonzalez, in his *Filosofía del Interés Personal* (1874), steadily insists on the difference between self-interest (*interés personal*) and selfishness, and Professor Piernas y Hurtado, in his *Estudios Económicos* (1889), proceeding further in this direction, maintains that pure *laissez-faire* is "mere physiocracy, nothing but physiocracy." Both keep their homage undivided between ethics and economics; and in Piernas there is also a distinct opinion expressed that economics have been led astray by abandoning the direction given and the method used by Adam Smith. Besides, for him there exist no such things as specific economic laws: laws described as such are simply universal laws considered in their

application to economic activities. A plea in favour of the relativity of economic phenomena will also be found in Rivas (*La Ec. Pol. de España*—meaning political economy for Spain,—1889) and in Conde (*Cuestiones agrarias en España*, 1889) who maintain that an economic policy ought to be primordially national. Nevertheless Spanish economics have not received any direct impulse from the contemporary German schools, and the influence of the latter, if felt at all, has reached Spain in completely indirect ways. Recent theories concerning marginal utility (see FINAL DEGREE OF UTILITY, and MARGIN) and VALUE also seem to be left, up to the present date, unnoticed beyond the Pyrenees.

If in the sphere of pure economics Spain does not stand high, it has not ceased to produce excellent works on financial, fiscal, and economic history. The first rank undoubtedly belongs to Colmeiro's *Historia de la Ec. Pol. en España*, 1863, which, carried to the close of the last century, is both a history of facts, institutions, and theories, presented in their historical connection. But before him, Canga Argüelles' *Diccionario de la Hacienda con aplicación a España* (Spanish finance, 1826 and 1833), is also mainly historical; Capmany's *Memorias históricas sobre la marina y el comercio de Barcelona* (1779), and *Código de las costumbres marítimas de Barcelona* (1791), and *Ordenanzas Navales* (1787), have afforded copious and interesting materials to foreign scholars; the same is also true of the works of Sempere and of the *Ilustraciones* (appendix) to Clemencin's *Elogio de la Reina Católica Isabel* (1807), which extend to the 15th and 16th centuries. On specialised subjects are to be noticed Pastor's *Historia de la Deuda Pública Española* (History of the public debt) (1863); Santillan's *Historia de los Bancos* (1865); Cardenas' *Historia de la Propiedad Territorial en España* (1873), and Iglesias, *Historia de la Beneficencia Pública en España* (1876). Besides its qualities of clearness and fulness, Piernas y Hurtado's *Tratado de Hacienda Pública*, 4th ed., 1891, must be mentioned for the historical résumé it gives of the development of Spanish taxation and finance from the Roman period up to 1875, vol. ii. (pp. 1-145).

[Excepting Sempere's *Biblioteca Económico-Política* (1801-1821), and Colmeiro's *Biblioteca de los Economistas Españoles* (1880), Spanish authorities are mentioned above. Out of Spain the economic history of the peninsula has been investigated by Forbonnais, *Mémoire sur le commerce et les finances de l'Espagne* (1753); de Bourgoing, *Tableau de l'Espagne* (1789, 1797, and 1807—the two first edit. anonymous); Ch. Weiss, *Des causes de la décadence du Commerce et de l'Industrie en Espagne* (Strasbourg, 1839); Maurice Ansiaux, "Histoire économique de l'Espagne au

XVI<sup>e</sup> et au XVII<sup>e</sup> Siècles" (in the *Revue d'économie politique* of 1893); Konrad Haebler, *Die wirtschaftliche Blüte Spaniens im 16ten Jahrhundert*, 1888 (a vindication against Spanish historians of the economic policy of Charles V.); and Bonn's *Spaniens Niedergang während der Preisrevolution des 16. Jahrhunderts* (Stuttgart, 1896). Goury du Roslan's *Essai sur l'histoire économique de l'Espagne* (1889) stops with the middle ages; a clear picture of Spanish administration will be found in Gounon-Loubens, *Essais sur l'Administration de la Castille au XVI<sup>e</sup> Siècle*, 1860. See also Villars, *Mémoires de la Cour d'Espagne*, pp. 123, 167, and 185 (edition, Morel Fatio, Paris, 1893).

For modern Spain, books and articles in periodicals generally give very scanty information about the economic movement. Professor Max von Heckel has, however, traced its evolution in an article entitled *Zur Entwicklung und Lage der neuern staatswissenschaftlichen Literatur in Spanien*, inserted in the *Jahrbücher für Nationalökonomie* (vol. 21, new series), which, with the notices to be found in Cossa, *Introduction to the Study of Political Economy*, Eng. trans. by Dyer (Macmillan, 1893), is by far the most reliable and available source of information. See also Villeneuve Bargemont "De l'état actuel de l'économie politique en Espagne" (*Journal des économistes*, vol. vii. pp. 358 et seq., 1844) and the transactions of the *Sociedad Económica de Madrid*.] E. ca.

**SPECIALITY DEBT.** A debt arising under a contract made by deed under seal (see CONTRACT, LAW OF) is called a "speciality debt." Whilst an ordinary contract debt is barred by the statute of limitations (see LIMITATION, STATUTES OF) after six years, a speciality debt becomes barred after the lapse of twenty years only. A speciality debt was formerly also entitled to certain privileges in the administration of the estate of a deceased debtor, but these privileges no longer exist.

**SPECIE.** See MINT.

**SPECIE POINT.** See GOLD POINTS.

**SPECIFIC PERFORMANCE.** According to English law, the only remedy to which a party injured by a breach of contract is entitled is, as a general rule, an action for pecuniary damages. The courts of equity have, however, in certain exceptional cases in which damages were not considered a sufficient compensation, ordered the defaulting party to perform the act promised by him, which they were able to do owing to their peculiar power to enforce their orders by imprisonment. Specific performance can now, in a suitable case, be ordered by any court, but most actions for specific performance are still brought in the chancery division.

The most common instances of orders for specific performance occur in the case of contracts for the sale of land; contracts for the sale of chattels are not, as a general rule, specifically enforced, but exceptions have been made when the object sold was "unique" and

had a "pretium affectionis" over and above the market value. The case of the celebrated Pusey Horn (*Pusey v. Pusey*, 1 Vern. 273, cp. White and Tudor, Leading Cases, 454), is generally referred to as the leading authority on this point, though it did not arise in connection with the non-performance of a contract. Contracts for the sale of shares in companies are specifically enforced, as they relate to a subject matter which exists in limited numbers only, and cannot always be readily procured, but in the case of sales of public stock, damages are the only remedy. Contracts for personal services are not specifically enforced, but a promise not to give one's services to a third person during a certain time is specifically enforced by injunction (*Lumley v. Wagner*, 1 D., M. and G. 607).

The exercise of the jurisdiction relating to specific performance is subject to a number of conditions and restrictions which cannot be understood without being described in detail. It is sometimes stated by writers on the subject that the remedy of "specific performance" does not exist, or exists in an incomplete form only in systems of jurisprudence not influenced by English law, but this statement is based on misapprehension. As a matter of fact, the scope of specific performance is more restricted in English law than in the continental system of law.

[Fry on *Specific Performance*, 3rd ed. 1892; and see *Law Quarterly Review*, vol. viii. p. 250.]

E. S.

SPENCE, THOMAS (1750-1814), an English radical agitator and agrarian communist, was born at Newcastle-on-Tyne a short time before the American revolutionary war. The son of a shoemaker, he was educated for a school teacher. In a lawsuit respecting an enclosed common, it was decided that the rent of this land should be divided amongst all the freemen of Newcastle (see *GILDS OF NEWCASTLE-UPON-TYNE*). This led Spence to read, in 1775, before the philosophical society of his native town, a paper in which he argued that the rent of all land should be similarly dealt with. For printing this paper the society expelled him, and he removed to London and settled there as a bookseller. He edited from 1793 to 1795 a periodical entitled *Pigs' Meat, or Lessons for the Swinish Multitude*, which was made up of selected extracts from the writings of Priestley, Godwin, Swift, D'Alembert, etc. He was several times prosecuted. He had a small body of followers, who, as appears from the reports of the committee of secrecy, were regarded as wild revolutionists, and excited an alarm quite out of proportion to their importance. On the appearance of OWEN, their principles seem to have passed for the time out of sight.

The doctrine of Spence consisted of a single thesis, which he preached with monotonous itera-

tion in prose and verse. All his pamphlets are only variations on the first paper of which we have spoken, which was re-issued in 1796 with the title *The Meridian Sun of Liberty, or the whole rights of man displayed and most accurately defined, etc.*, republished 1882 by Mr. Hyndman. Every man, he holds, has a right to live, of which his social predecessors could not justly deprive him, and the individual occupation of the soil is a usurpation which later generations ought not to recognise. The soil belongs inalienably to the commune, which should let it and the buildings on it by public auction in small parcels every seventh year. The existing owners should be dispossessed, by force if necessary, and should receive no compensation, for the first occupiers were robbers and those who purchased from them are concealers who are as bad as the thieves. They have no claim on the score of capital invested in the land, for it is really the working classes who ought to be thanked for the improvements which have been made. Out of the rent payable to the commune, first its share of the general taxes, and next the entire local expenditure, should be defrayed, and then the residue divided in equal shares between all the men, women, and children in the commune, rich and poor, without distinction.

Spence was a man of very limited culture and a narrow range of ideas. Though he regards labour alone as the source of value, he confines his attack altogether to the proprietors of land, and ignores the conflict between the working man and the capitalist. The one practical measure which he all along had in view was the same as that which Mr. George has advocated; but in Spence's mind it rested, not on economic ideas, but on the sentiment of equality and the supposed rights of man.

His writings, which are now not often met with, were, in addition to the paper above mentioned—*The Rights of Man*, a poem, 1783; *The End of Oppression*, apparently 1795; *The rights of infants, or the imprescriptible right of mothers to such a share of the elements as is sufficient to suckle and bring up their young*, 1797; and *A receipt to make a Millennium or Happy Year*, 1805. [Held's *Zwei Bücher zur sozialen Geschichte Englands*, p. 110.—Anton Menger, *Recht auf den vollen Arbeitsertrag*, 2nd ed. 1891, pp. 143-146.]

J. K. I.

SPENCE, WILLIAM (1783-1860).

Was the author of the *Radical Cause of the Present Distresses of the West India Planters pointed out*, etc. 8vo, London, 1807, and of *Britain Independent of Commerce; or Proofs deduced from an Investigation into the true Causes of the Wealth of Nations, that our Riches, Prosperity, and Power are derived from Sources inherent in ourselves, and would not be affected even though our commerce were annihilated*, 8vo, London, 1807. McCulloch, in his *Literature of Political Economy*, says of the former that it is a "well-reasoned and, indeed, unanswerable pamphlet," but of the latter he remarks that, "owing to the peculiar juncture of circumstances at the time, the nature of the statements put forth by Mr. Spence, and the little attention paid by the bulk of the people to such

subjects, which disposed them to lend a willing ear to the wildest paradoxes, this pamphlet met with a ready sale and went through several editions," and declares that it is an "exaggeration of the exploded errors of the economists." It called forth replies from James MILL (*q.v.* for the notice, in vol. ii., of his criticism of this pamphlet) and Colonel TORRENS.

SPENDINGS was an item in the ancient revenues of the petty princes of Ireland, and denoted an arbitrary imposition levied on extraordinary occasions. It was either the same as, or very similar to, TALLAGE. C. A. H.

SPOLIS SYSTEM. The constitution of the United States vests the appointment of all federal officers in the president, subject to the right of congress to pass laws giving the power of filling up inferior offices to the courts of law or the heads of departments. This power of appointment was held to involve the power of dismissal also; and as a result all office-holders under the central government held their posts at the pleasure of the president for the time being, or of some ministerial chief. Moreover, acts of congress, the first of which was passed in 1820, fixed four years as the duration of about 4000 of the most important offices, and made the terms run out soon after each new president entered upon his duties.

In the early days of the national government there were no wholesale evictions. Washington and his immediate successors held that no one should be dismissed except for inefficiency or misconduct, and from 1789 to 1828 there were but seventy-three removals. But in 1829 President Jackson adopted the doctrine that "to the victors belong the spoils," and displaced large numbers of office-holders in order to fill their places with his own partisans. Other presidents followed in his steps, till the whole vast patronage of the federal government became the prize of the winning side in party warfare. The custom spread to state and municipal offices. The executive departments all over the union were filled with men whose first care was to secure victory for their party at the next elections, and whose salaries were almost invariably charged with a regular percentage for the replenishment of the party coffers. The system was defended on the ground of democratic equality. Rotation in office was elevated to the rank of a great political principle; and the danger to popular liberty from a permanent bureaucracy was constantly insisted upon. The "spoilsmen" had their own reasons for approval, and the rest of the community did not trouble themselves much about the matter. But after a time high-minded men began to revolt against methods which gave the nation inefficient service at a high cost, demoralised politics, and wasted the energy of the president, and those senators and representatives who recommended their supporters to him, upon the petty details of personal services rendered to their party. The writer of this article has himself seen, three months after the inauguration of a president, the room of his secretary of the treasury at

Washington filled with applicants for office, waiting for an audience. At first the opposition to the system made little progress, and the early attempts to modify it were frustrated by interested politicians. But the corruption and inefficiency engendered by it became so glaring that public opinion ceased to tolerate them. In 1883 an act of congress was passed, which gave the president power to nominate civil service commissioners, whose duty it should be to institute competitive examinations of candidates for about 15,000 minor offices. This plan has worked well, and has been extended by subsequent legislation. The president can now by executive order add whole categories of offices to what is called the classified service. This power was largely used by Mr. Cleveland in 1896; and it is calculated that, out of about 130,000 posts in the national civil service, as many as 83,000 are at the present time won by merit and not by favour. Some of the more enlightened municipalities are beginning to apply the same method to the appointment and promotion of their officials.

It is quite possible that the United States, having long been behind Great Britain in the efficiency and purity of its civil services, may lead the way for the old country in a much-needed reform of those municipal and local services which are growing more numerous and more important every day with the growth of the functions of local government.

[See Bryce, *American Commonwealth*, ch. lxvi., London, 1895; and also the *Reports of the U.S. Civil Service Commissioners*, and the address of Mr. Carl Schurz at the annual meeting of the National Civil Service Reform League, held at Philadelphia in December 1896]. T. J. L.

SPRINGER, JOHANN (1727-1798), successively professor of political and cameralistic science in Erfurt; later an official in the financial administration of Darmstadt. He was one of the German PHYSIOCRATS, and even maintained that this system was actually applied in China 4000 years since (see Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 489, note 3).

He published *Grundriss der Cameralwissenschaft*, 1766.—*Die Grenzen der Kameral-Oeconomie-Finanz- und Polizeiwissenschaften in ihrer Verbindung*, 1767.—*Oeconomisch-kameralistische Tabellen*, 1771.—*Das physiocratische System*, 1780. E. Ca.

STABILITY OF VALUE. See VALUE.

STAFFORD, WILLIAM. There was published at London in 1581 a treatise entitled "A compendious or briefe examination of certayne ordinary complaints of divers of our countrymen in these our dayes: which although they are in some part unjust and frivolous, yet are they all by way of dialogues thoroughly debated and discussed, By W. S., Gentleman."<sup>1</sup> The work is dedicated to Queen Elizabeth. The idea was entertained by some that "W. S." stood for William Shakespeare, and this supposition was put forward in the edition of 1751. But it was refuted by Farmer in his

<sup>1</sup> See also John Smith.

*Learning of Shakespeare*, who pointed out that Antony à Wood had attributed the work to one William Stafford of whom nothing is certainly known. Until of late he has continued to be regarded as the author.

Miss Elizabeth Lamond examined the extant MSS. of the treatise, and, in an article in the *English Historical Review* for April 1891, shows that it is extremely probable that it was written long before it was published—in fact, in the reign of Edward VI., that the author was John HALES, M.P. for Preston in 1548, and that W. S., whoever he may have been, dishonestly brought it out as his own, introducing changes to adapt it to the time of Elizabeth.

It takes the form of a series of dialogues between a merchant, a knight—representing the landowners, a husbandman, a capper—representative of the artisans, and a doctor of divinity. The last of these expresses the views of the author. He hears the complaints of the others respecting the economic evils of the period—the dearth (*i.e.* high price) of all things in comparison of the former age, “though there be scarceness of nothing”—the desolation of countries, *i.e.* depopulation of rural districts by inclosures and substitution, on a large scale, of sheep-farming for tillage (see articles on DEPOPULATION)—the “desolation of towns for lack of occupations and crafts.” The rise of prices is spoken of as affecting everything except corn, which, in consequence of the late large harvests, was cheap. Various causes are assigned for it—the debasing of the currency, the importation of base coin from abroad, the undue raising of the rent of land, the preference of foreign to home manufactures, and especially the fondness for foreign fripperies and follies. Most of these are shown by the doctor not to account for the facts, and in the end, and as has been truly said, “then almost unconsciously,” he hits upon the true cause of the “dearth” so universally complained of, namely the influx of the precious metals from the American mines. The author, to use the words of Mr. Matthew, is “not a scientific economist; he is only a shrewd empiric,” but his views on currency are sane, his miscellaneous observations are often acute, and he gives us indirectly much information concerning the England of Elizabeth.

The treatise was printed in vol. ix. of the *Harleian Miscellanies* (1808). The New Shakspeare Society published, in 1876, an excellent edition of it, by F. J. Furnivall, with an Introduction by F. D. Matthew. J. K. I.

Dr. Furnivall urges that W. S. cannot stand for the William Stafford who was concerned in a rebellion in 1587. Dr. Leser, in his introduction to the German translation (*Sammlung älterer u. neuerer staatswirtschaftlicher Schriften*, No. 5, 1895), argues that a Stafford, who was surveyor to the bishop of Norwich and is mentioned in the *Calendar of State Papers*, Domestic, 1578, p. 551,

may have been the author, but there is little evidence in support of this suggestion. In the introduction by Dr. Cunningham to Miss Lamond's edition, which was published under the title *A Discourse of the Common Weal* (Camb. Univ. Press, 1893) it is suggested that no great weight need be attached to Anthony à Wood's assertion (*Fasti Oxon.*, pt. 1, col. 378) that the author's name was Stafford, and an attempt is made to set up a claim on behalf of William Smyth, the nephew of Sir Thomas Smyth.

STAIR, JOHN DALRYMPLE, fifth earl of (died 1789), became a member of the faculty of advocates in 1741, succeeded to the earldom in 1762, and from 1771-74 was one of the representative Scottish peers in parliament.

He was the author of several despondent tracts on the financial position of England at the close of the American war and in the following years, attempting to prove by figures that the national resources were unequal to the support of the war, that ruin must follow the secession of the colonies, and that the annual revenue could never average more than £12,000,000, while the ordinary peace expenditure, including interest on the debt, amounted to £15,000,000 or even £16,000,000. He depreciated the taxable capacity of the nation, and its probable progress after the conclusion of peace. According to Horace Walpole he was called the Cassandra of the nation.

His gloomy forecasts were refuted at the time by Sir John SINCLAIR (*q.v.*) in his *Hints on the State of our Finances*.

The pamphlets are entitled: *The State of the National Debt, the National Income, and the National Expenditure*, 1776; *Facts and their Consequences*, 1782; *State of the Public Debts*, 1783 (the last two went through several editions). *An Attempt to balance the Income and Expenditure of the State*, 1783; *An Argument that it is the Indispensable Duty of the Creditors of the Public to insist that Government do forthwith bring forward the State of the Nation*, 1783; *Comparative State of the Public Revenues for 1783 and 1784*, published 1785.

[M'Culloch, *Literature of Pol. Economy*.—*Memoirs of Sir J. Sinclair*, vol. i. p. 102-105.—G. E. C., *Peerage of England, Scotland, Ireland, etc.*]  
E. G. P.

STAMP DUTIES, properly so termed, are duties charged on documents and writings having a legal operation or forming necessary steps in suits in the law courts. These duties are collected by means of stamps impressed on, or affixed to, the instruments. Among stamp duties, however, were formerly included, mainly for administrative purposes, several taxes on articles of consumption (*e.g.* hats, gloves), which taxes, though collected by means of stamps, were in their essence excise duties. The present stamp duties on medicines and playing cards are of this latter description. On the other hand, postage and fee stamps do not represent duties at all, but are used as the simplest method of paying the charges of government

for particular services rendered. For administrative purposes stamps are used to denote the fixed death duties of 30s. and 50s., payable in respect of small estates.

Stamp duties were first imposed in England in 1694. They were introduced from Holland, in which country they had been adopted in 1624 at the suggestion of a private individual in response to a proclamation of the states-general offering, at a time of dire necessity, a reward for the invention of a new tax. The first English duties were *fixed* charges of 40s., 5s., 2s. 6d., 1s., 6d., and 1d. according to the class in which the instruments made liable by the act (5 & 6 W. and M. c. 21), were placed. The duties were charged for every skin, or piece of parchment or paper, upon which the instrument was written, and in order to prevent any curtailment of length with a view to avoid payment, all deeds and writings were required to be engrossed and written in the manner theretofore customary. The duty was consequently, to a certain extent, a tax on the amount of paper used. With exceptions as regards a few instruments, this was the governing principle of the various stamp acts passed subsequently down to the year 1797, when Pitt, acting in conformity with Adam Smith's opinion (*Wealth of Nations*, bk. v. ch. ii. pt. ii., appendix to articles 1 and 2), that stamp duties should be charged by reference to the magnitude of the transaction evidenced by the document rather than to the number of words used, applied the *ad valorem* principle to bonds, and proposed it without success for transfers of property, which continued till 1808 to be charged according to length. By 1815 *ad valorem* duties had become general, but the scales were arbitrary and jumping, with maximum charges for transactions over a certain amount. This defect in principle was not remedied till 1850, when *percentage* duties on bonds, conveyances, mortgages, and settlements, were substituted for the unsatisfactory scales hitherto existing. The last important step was one apparently backward, opposed to the *ad valorem* principle. In 1853, Gladstone, applying the principle of the penny postage system, imposed a fixed duty of 1d. on receipts in place of a scale with charges ranging from 3d. to 10s., and allowed an adhesive stamp to be used. The change being popular and productive, other penny duties were subsequently imposed, the principle being to tax everyday transactions at the lowest possible rate in the manner most convenient to the tax-payer.

The stamp duties now in force in the United Kingdom are those imposed by several acts now consolidated in the Stamp Act 1891. They fall broadly under four heads:—

- (1) *Ad valorem* duties on bills of exchange and promissory notes.
- (2) *Ad valorem* duties on transactions relating

to property, *i.e.* sales, settlements of money, leases, and securities for money.

- (3) Penny duties on receipts, cheques, etc.
- (4) Fixed duties on deeds and instruments not before mentioned.

The liability to duty extends to all instruments of the descriptions specified which are executed in the United Kingdom, or relate, wheresoever executed, to any property situate, or to any matter or thing done or to be done, in the United Kingdom. The stamping of instruments is enforced by the general provision that, unless duly stamped, they shall not, except in criminal proceedings, be given in evidence or be available for any purpose whatever. In certain cases also personal penalties (to be sued for and recovered in the high court) are incurred by the omission to stamp. If an instrument is not stamped within a limited time, thirty days generally, after execution, it can only be stamped subsequently on payment of a penalty, £10 generally, which penalty the commissioners have power to mitigate or remit. But there are certain instruments (*e.g.* inland bills of exchange) which by law cannot be stamped after execution, and which are, therefore, void for all purposes if unstamped. The duties are placed, by the Stamp Duties Management Act 1891, under the care and management of the commissioners of inland revenue, who supply the stamps through stamp offices, post offices, and licensed vendors (Dowell's *History of Taxation*, etc., 2nd ed. vol. iii. pt. ii.—*Alpe's Law of Stamp Duties*, 5th ed., 1896).

The net receipt of stamp duties in the United Kingdom in the year ended 31st March 1906, was as follows:—

Bills of exchange, bankers' notes, and composition for duty on bills and notes . . . . .	£892,565
Companies capital duty and loan capital duty . . . . .	449,440
Deeds, bonds, contract notes, foreign certificates, and share warrants . . . . .	4,345,298
Licenses, certificates, and cards . . . . .	197,876
Life and marine insurances . . . . .	318,986
Patent medicines . . . . .	324,112
Receipts, drafts, and other penny stamps . . . . .	1,624,720
	<hr/>
	£8,152,992

(*Statistical Abstract for the United Kingdom*, 53rd number, p. 13.)

"Stamp duties, if moderate in amount, imposed by clear enactments, and accompanied by reasonable facilities for obtaining the requisite stamps, are an easy method of revenue. To regard them from the tax-payer's point of view: He pays the smaller contributions without effort, while he considers any *ad valorem* payment as, prac-

tically, part and parcel of the transaction to which the instrument liable to duty refers, to the expense of which the duty forms a hardly appreciable addition. To regard them from a revenue point of view—The tax is easy to collect, and the cost of collection is small, consisting principally of the trifling expenses of dies and plates, and payments to agents for distribution of the stamps. . . . The practical advantages which stamp duties possess have induced the adoption of this mode of taxation, in one form or another, in many countries, including France, Russia, Austria, Prussia, Italy, Spain . . . Belgium, Holland . . . some of the cantons of Switzerland, India, and several of our colonies" (Dowell's *History and Explanation of the Stamp Duties* (1873), p. 124). In France a considerable revenue, 177,568,500 francs (£7,102,740), in 1896, is obtained from stamp duties on instruments, the charges being to a small extent proportional, but mainly non-proportional, the latter category including duties payable according to the dimensions of the paper used. (For statistics for the years 1800-1892, see *Bulletin de Statistique*; July to December 1893, pp. 55-85). In Germany there are imperial stamp duties at proportional rates on securities, contracts, and lotteries, the produce in 1895-1896 being 55,036,000 marks (£2,801,800) (*Statistisches Jahrbuch für das Deutsche Reich*, 1897, p. 178). For the new Prussian stamp duties (law of 31st July 1895) see *Bulletin de Statistique*, July to December 1895, pp. 381, 513). In the United States the stamp duties (proportional for bills, conveyances, leases, mortgages, and probates) charged during the civil war on various legal and commercial instruments have been repealed, but since 1868 stamps have been used for the collection of substantially the whole of the internal revenues, the duties on tobacco, malt, liquors, spirits, and licenses being paid in this way. (*Taxation and Taxes in the United States under the Internal Revenue System*, Howe, 1896.—*United States Internal Revenue Tax System*, Eldridge, 1895). F. A.

#### STAMPS. See STAMP DUTIES.

**STANDARD GOLD AND SILVER.** See also ALLOY. The standard of fineness for gold in the United Kingdom is  $\frac{11}{12}$  fine, or 916·6 (quoted also as 22 carats, *i.e.*  $\frac{3}{4}$ ), and has remained unaltered for more than two centuries. When gold coins were first introduced by Henry III. in 1257, they were made of fine gold; and, a few years later (1265) with  $\frac{1}{12}$  part of alloy. In the time of Henry VIII. some gold was coined at 20 carats ( $\frac{1}{12}$  fine), but gold crowns were struck  $\frac{11}{12}$  fine, which was made the sole standard in the reign of Charles II.

Standard silver is  $\frac{11}{12}$  fine, or 925, *i.e.* 11 oz. 2 dwts. fine, and 18 dwts. of alloy; and assays are reported at so many pennyweights, "better" or "worse." This has been the standard since at least the time of Edward I., with the exception of from 1532 to 1552, when the coin was very much debased, even as low as 3 oz. fine to 9 oz. alloy. In 1552 the standard was raised to 11 oz. 1 dwt. fine, and in 1558 was restored to its present proportions.

In most countries the standard is  $\frac{9}{10}$  fine both for gold and silver coins of unlimited tender, with a lower standard for the subsidiary coinage.

The details are as follows:—

	Gold.	Silver.	Subsidiary silver coins.
United Kingdom . . .	916·6	925	925
British India . . .	916·6	916·6	..
Portugal . . .	916·6	916·6	..
Uruguay . . .	917	900	900
Holland . . .	900	945	640
United States . . .	900	900	900

#### STANDARD OF COMFORT. See COMFORT, STANDARD OF.

**STANDARD OF VALUE.** This subject will be more particularly dealt with under the heading of VALUE. In this place reference will mainly be made to the choice of a material which shall be available as a medium of exchange and shall provide a fixed and unchangeable standard for contracts extending over long periods of time. It is by no means a matter of necessity that the medium of exchange should be this standard of value, though it is a matter of convenience that it should be so. As it is impossible to find a commodity in which the two requisite qualities are combined we have to content ourselves with trying to get all possible stability as a measure of value in the recognised and authorised medium of exchange.

In practice no commodity whatever has yet been discovered which completely satisfies this demand. Gold and silver were chosen for the purpose even before the dawn of history, yet, to use the words of Ricardo, "Neither gold . . . nor any other commodity can ever be a perfect measure of value for all things," while but little practical inconvenience has been felt from gold and silver being the general medium in which the value of all other things is estimated. Though undoubtedly these form a variable measure of value, there are probably no commodities subject to fewer variations, and these have been spread over a period of many years, a circumstance which has greatly diminished the inconvenience arising.

At the present time (1898) in all the principal countries and commercial centres of the civilised world, gold is the sole standard of

<sup>1</sup> France, Italy, Belgium, Switzerland, and Greece.

<sup>2</sup> Denmark, Sweden, and Norway.

value. A gold coin, the sovereign or pound sterling, is the recognised embodiment of the standard in the United Kingdom for all business purposes.

This suffices for present wants. For historical purposes in all comparisons of values made over long periods it is usual to take as the "standard of value" something other than the common means of exchange, to seek to allow, in fact, for the variations in the value of money by estimate of the price of corn, the quantity of wheat which the usual day's wages of an ordinary working man will purchase, etc.

It is thus sought to obtain a measure of the variability of the value of money, and for that purpose to set up some "standard of value" as a reference standard which shall itself be invariable.

Such invariability is impossible of achievement, impossible even of conception, if we require the same standard to be invariable for all persons and all times. The impossibility arises out of the human element of value, from the fact that value has reference not to a property inherent in a commodity, but to the estimate by a person of the desirability of the possession of the commodity.

As in the nearly analogous case of INTRINSIC VALUE (*q.v.*), the position of the standard of value depends on circumstances extraneous to itself.

**STANDARD RATE (OF WAGES).** The insistence on payment according to some definite standard, uniform in its application, is the most universal of TRADE UNION regulations.

The most rudimentary forms of combination, such for instance as the "shop bargain" in an unorganised trade, require that all workmen shall receive the rate fixed for the particular job. The organised union, whether local or national, requires that all its members in the town or district shall be remunerated for their effort according to a fixed standard rate of payment. The standard rate is never a maximum but only a minimum. Thus the London Central Master Builders' Association and the Friendly Society of Operative Stonemasons agree that the minimum wage of able-bodied masons shall be tenpence per hour. This, however, does not hinder any individual stonemason from receiving more if his employer thinks his character and skill justify a higher rate. Thus, again, the "log" settled between the Amalgamated Society of Tailors and the local Master-Tailors' Association fixes the payment for making each kind of garment in any particular town, but many master-tailors will be paying their workmen much higher rates. We are aware of no case of members of a trade union being prevented or discouraged by their union from receiving higher rates than those decided on for the whole body as the general standard.

A considerable equality of rates results from

the existence of this standard, notwithstanding that it is a minimum and not a maximum. It is observed, and no doubt correctly, by employers that the being compelled to pay each man at least a certain fixed minimum rate must lead to a more uniform rate than would otherwise prevail, and hinders the system of graduating the rate "according to merit." This result cannot be proved to be inevitable by any deductive argument except that which asserts the existence of a fixed and unalterable "wage fund." The "rent of ability" may always be obtained, in theory, by any workman above the class considered by the employer as the worst, this being merely the equivalent of his superiority, whatever arrangements the employer makes with the workmen below the average. No fair-minded trade unionist however would deny that for all competent workmen the minimum rate tends to become a uniform rate. When the employer gives up his right to take full advantage of the necessities of the individual workman, he expects that other workmen, though they may be in a position to exact better terms, will submit to the standard rate collectively agreed to for them by representatives of the whole body.

This result has been denounced as paying "bad and lazy workmen as highly as those who are skilled and industrious"; setting a premium on idleness and incapacity, "destructive to the legitimate ambition of industry and merit," and as being, that "worst kind of communism," an equal remuneration of all men. Such criticisms confuse the rate of payment with the amount actually earned. A standard "rate" of payment for the work actually performed is a necessary condition of collective bargaining. But this in no way interferes with workmen's receiving pay most widely differing in amount. Thus the standard rate insisted on by most trade unionists is not any definite sum per hour, but a list of piece-work prices.

It is seldom realised how largely these piece-work lists extend over the country. In countless trades, such as basketmakers, boot-makers, brushmakers, compositors, coopers, tailors, etc., there are lists of prices dating from the beginning of the century, revised from time to time and signed by both employers and employed. These are but little known even by those who have heard of the elaborate tonnage rates of the ironworkers, steel-smelters, and miners, and the complicated cotton lists, which together determine the wages of a third of the trade union world. And since, in all the above-mentioned trades, the standard rate is drawn up in the form of a schedule of piece-work prices, there can be no question of equal earnings.

Nor does the standard rate imply any equality of wages in industries in which it is a definite wage per hour, and not per piece.

The weekly pay of the workmen in these trades will be found to be very different even when they have worked the same length of time. For instance, a uniform rate per hour is paid for ordinary bricklaying, masonry, and plumbing, but it is to the advantage of the employer to pay a higher rate to any man engaged in work demanding special capacity—a course warmly supported by the trade union. Thus a rate from ten to fifty per cent over the standard is paid for such jobs as brick-cutting or "gauge work," furnace-building, or sewer construction, with the result that the superior bricklayer seldom works at the standard rate. In other trades the superior workman has the advantage of working under more agreeable conditions. In the case of a large building, the best stonemasons are appointed to do the carving, an occupation admitting some personal liberty and not needing great muscular exertion, whilst the ordinary workmen are setting stones under incessant supervision. Heavy mechanical tasks, such as laying down flooring, are given to the rough carpentering hands, leaving the superior workman to perform in the workshop the fine work combining variety and lightness when they are not earning extra rates for "staircasing" and "handrailing."

In short, the difference in the efforts and sacrifices actually made may be great, and therefore the rate of remuneration may be very different though the actual number of shillings received by the men at the end of the week are the same.

The standard rates which at the present time govern industries in the United Kingdom are of every degree of complexity, and include every form of "time" and "piece-work" wages.

If all the trade unions in the United Kingdom having over 1000 members, those of unskilled labourers and transport workers excepted, are classified according to the method of remuneration they enforce, we find there are 49 societies with 573,000 members which actually insist upon piece-work, 24 societies with 140,000 members which willingly accept in various departments both piece and time-work, and 38 societies with 290,000 members which insist upon time-work.

This divergence of view arises exclusively from the character of the operations performed. In those trades where piece-work is consistent with collective bargaining, that is, where the work is of such a nature that a standard list of prices can be compiled and is adhered to by the employers, the trade unionist willingly accepts or even actually enforces piece-work. Where, on the other hand, the work varies from job to job, and from man to man, a standard list is impossible, and piece-work becomes merely a reversion to the individual bargain, the trade unionists strenuously insist upon time-work rates. What they are aiming at in the one case as in the other is uniformity in the rate of remuneration for the work actually done. In some industries this can be maintained

only by insisting on time wages. In others, covering, as it happens, a far larger number of organised workmen, time wages would produce just the opposite result, and the trade unionists accordingly insist with equal determination on payment by the piece.

**STANDARDS, WARDEN OF THE.** By the Standards of Weights, Measures, and Coinage Act 1866, the custody of the imperial standards of weights and measures was transferred from the office of the exchequer to the board of trade. For the purposes of the act a new department of the board was constituted, the head of which was styled the warden of the standards. It was his duty (1) to conduct comparisons, verifications, and operations with reference to the standards in aid of scientific research or otherwise when authorised or directed by the board, (2) to make an annual report to the board on the proceedings and business of the department to be laid before both Houses of Parliament.

The act was repealed by the Weights and Measures Act 1878, which declared that the board of trade should have all powers and perform all duties relative to the standards vested in or imposed upon the warden of the standards by the act of 1866 or otherwise. G. I. T.

**STANNARIES.** The name "stannaries" (*stannum*, tin) is an ancient legal designation embracing the whole of the tin mines of Devon and Cornwall. The mining industry being of pre-historic antiquity, was from very early times prosecuted in accordance with a code of customs which are described as "ancient" by the Black Book of the Exchequer of 1198. These customs were consolidated and enlarged by a charter of Edward I. (1305), which formed a precedent for other later mining charters. Labour was attracted to the mines by the privilege of enfranchisement granted to escaped serfs. Courts were established for the settlement of questions affecting their interests, with the exceptions customary in these local franchises of life, limb, and land. The connection of the stannaries with the princes of Wales began with a grant of 1337, which entitled the princes to draw royalties from them. It must be remembered that at that time tin mines were held to belong to the crown (MINES). The government of the

stannaries was immediately in the hands of a warden (*Custos*), who had the right of impressing labourers and compelling them to work for wages. Devon and Cornwall were each divided into stannary districts. To each district, called a stannary, belonged a civil court and a court-leet for trial of police offences. The revenues of the princes of Wales arose partly from coinage duty, partly from a right of pre-emption which was farmed. The coinage duty in Devon remained at 15s. 6d. a 1000 weight from the time of Henry III. until 1838, and for centuries at 40s. per 1000 weight in the case of Cornwall. Prices were settled at meetings of the tinners with the farmers convened at Crockentor twice in the year. These meetings were called great courts or parliaments. On these occasions the regulations were drawn up under which tin was to be worked, coined, etc. Representation at these parliaments was not to be confined to working tinners, but extended to capitalists interested in the development of the mines. In 1511 a collision occurred between the parliament of the tinners and the parliament of Westminster. Richard Strode, who sat for Plympton, one of the stannaries, introduced a bill into parliament to prevent the tinners silting up the Devonshire harbours with the detritus from their works. This was construed by the stannaries as an attack on their chartered franchises, for which Strode was presented at a stannary court, fined, and imprisoned in the castle of Lidford, assigned to them as a gaol by the grant of Edward I. This led to the passing of an act which first laid down the important constitutional principle that members of parliament were not liable to actions for proceedings by them in parliament (4 Hen. VIII. c. 8, *Pro Ricardo Strode*). But the nuisance continued until 1532, when parliament was aroused to action by the repeated complaints of the western ports. By the act 23 Hen. VIII. c. 8, stream works near the tributaries of rivers were prohibited, and all others were ordered to be provided with "hatches," to check the choking of water-courses. By this act the initiative in the suppression of the nuisance was left to the inhabitants, who shrank from legal conflicts with the neighbouring landowners, so that the statute remained inoperative. This led to another act (27 Hen. VIII. c. 23), passed in 1536, which increased the penalties and let in the common informer. The introduction of another bill into the House of Lords in 1539 is evidence that the difficulty was not at an end, but no further legislation took place until the time of Charles I. In 1632 a new charter was granted reaffirming the ancient privileges of the stannaries as to exemption from process in other than their own courts, from toll, and the concession of the right to search for tin. In 1640 an act was passed (16 Car. I. c. 15), to restrain the encroachments of the

stannary courts, which were asserting a jurisdiction over the entire counties of Devon and Cornwall "out of the places where the tinners do work." In 1836 an act of parliament (6 & 7 Will. IV. c. 106), regulated anew the jurisdiction, constitution, and powers of the stannaries courts. By 18 Vict. c. 32, the respective parliaments or stannary courts of Cornwall and Devon, the customs of which presented a general similarity, were consolidated in one court. These customs are in short (1) the right of "free tinners" to work upon rendering a proportion called the "toll-tin," usually one-fifteenth of the produce, to the owner or lord of the soil. (2) The right to such tinners to "bound any unappropriated waste lands, or any several or inclosed lands which have been formerly waste land," subject to the custom and the delivery of toll-tin to the lord of the soil. The bound is marked by turf or stone, and is about an acre in extent. Particulars of the bound have to be returned to the stannary court. These bounds are in Cornwall accounted personal, in Devon real property. They must be annually renewed and may be sublet, subject to the payment of "farm-tin" or "tin-dues." The principal acts regulating the stannaries down to the year 1896, are the 6 & 7 Will. IV. c. 106; 11 & 12 Vict. c. 83; 18 & 19 Vict. c. 32; 25 & 26 Vict. c. 89; 32 & 33 Vict. c. 19; 50 & 51 Vict. c. 43; and 53 & 54 Vict. c. 63. These acts chiefly affected procedure. In 1896 an act was passed "for abolishing the Court of the Vice-Warden of the Stannaries" (59 & 60 Vict. c. 45). By this act the jurisdiction and powers of the stannary court were transferred to the county court sitting at Truro, the judicial office entitled the vice-wardenship of the stannaries being abolished. But it must be remembered that the foundation of the law of the stannaries still remains ancient custom and the charters which embodied it.

[Edward Smirke, *The case of Vice against Thomas, determined on appeal before the Lord Warden of the Stannaries of Cornwall*, London, 1848.—W. Bambridge, *Treatise on the Law of Mines and Minerals*, 4th ed. by A. Brown, London, 1878.—Rowe v. Brenton, 3 Manning and Ryland's Reports, Appendix of Documents relating to the Duchy of Cornwall.] I. S. L.

STAPLE, THE STAPLE SYSTEM. The company of merchants of the staple had a monopoly of exporting the staple commodities of England, and certain staple towns were appointed as centres of their trade. The staple exports were wool, woollens, leather, tin, and lead, and of these the chief was wool, the "sovereign treasure" of England, wherewith she was said to keep the whole world warm. Before the reign of Edward I. the export trade of England was principally carried on by foreigners, of whom the most important were the Hanse merchants (see HANSEATIC LEAGUE). The

staplers asserted that their company dated from Henry III.'s reign, but at this time the exports were taken to various marts, chiefly in Flanders because the Flemish excelled in cloth-making (see MERCHANTS, ENGLISH). An association of English merchants was in existence as early as 1313, in which year Edward II. sent Richard Stury, "mayor of the merchants of our kingdom," as ambassador to the Count of Flanders. In order to concentrate the wool trade, Edward I. fixed the centre at Antwerp, which he bought from the duke of Brabant, and in 1313 Edward II., by letters patent, "*pro certa stapula pro mercatoribus Anglie*," ordered the mayor and community of the merchants of England to appoint a staple in the Low Countries; they might change the town at will, and were to fine to the king's use those who took staple wares to any other mart abroad. "The system of the staple was, it would seem, a combination of the principle of the guild and of the royal privilege of establishing fairs and markets" (Stubbs, ii. 447), (see FAIRS and MARKETS; GILDS; MARKET OVERT). It was necessary for mutual protection and for regulation of trade and prices that merchants should form a company, and it was also profitable to the king, as both increasing the customs revenue and facilitating its collection. Since the customs had been fixed, it had become necessary, for the better control of trade, to restrict the export of the staple commodities to certain English ports where collectors of customs were stationed, and Edward II. appointed home staples at Newcastle, York, Lincoln, Norwich, London, Winchester, Exeter, and Bristol in England; at Dublin, Drogheda, and Cork in Ireland; and at Shrewsbury, Carmarthen, and Cardiff in Wales. During the reigns of Edward III. and Richard II. the staple towns were frequently changed, foreign and home staples sometimes existing at the same time. The power of changing the staple town was useful as a political weapon, and also as a means of gaining the goodwill of foreign merchants from whom the king wished to borrow. In 1328, during the minority of Edward III., and again in 1334, all staples were abolished, and trade was free according to the Great Charter; but this free trade did not last, and the staple was fixed at Bruges in 1344. Bruges, Ghent, and Ypres were the three great marts for Flemish cloth, and were loath to let the coveted wool of England pass through their hands; accordingly, the Lombard, Brabant, and Spanish merchants were prevented from buying, that the Flemish towns might have a monopoly; this, together with the unsettled state of Flanders, lowered prices by lessening competition, and in 1353 the staple was withdrawn to England. The decay of feudalism had gradually made the king dependent on the produce of the land, rather than on the land

itself. The toll, which was the king's prerogative of merchandise coming to or leaving his kingdom, had been definitely fixed in the customs, and was becoming increasingly important; with this the king paid his Lombard bankers, and with this, augmented by a yearly subsidy on wool, the French war was chiefly maintained. On the other hand, Edward II. made several attempts to collect the scutage levied by Edward I. for the Scotch war, and Edward III. issued a writ for the same hopeless purpose (see KNIGHT'S SERVICE). Profiting so little as feudal lord, the king turned his attention to the wool trade, from the development of which he and his subjects alike would gain, and in 1353 the Ordinance of the Staple was issued. This measure appointed ten staple towns in England, and to those not on the sea a port was assigned; these towns were Newcastle, York and Hull, Lincoln and Boston, Norwich and Yarmouth, Westminster, and London, Canterbury and Sandwich, Chichester, Winchester and Southampton, Exeter, and Bristol, in England; Dublin, Waterford, Drogheda, and Cork, in Ireland; Carmarthen, in Wales; also for tin, Asperton in Devonshire, Lostwythiel and Truro in Cornwall. The merchants of each staple town, both native and alien, were yearly to appoint a mayor and two constables. The weight of wool for export was to be certified by the mayor, and at the port it was to be again weighed, and an indenture of the weight made between the mayor and the customs officers. Export trade was restricted to aliens under pain of death, and altogether prohibited to Berwick and Scotland. Staple goods were to be taken to the staple towns for forty days, after which they could be sold elsewhere. Merchants were to be under the jurisdiction of the mayor of the staple only, according to LAW MERCHANT; aliens were to be tried by aliens; merchants were to use lodgings and warehouses, the rent of which was fixed by the mayor and constables of the staple and four leading inhabitants. At first, the offices of mayor of the town and mayor of the staple were held by different persons, but later in Bristol, Southampton, London, and probably elsewhere, the mayor of the town acted as mayor of the staple. In some Irish staple towns the mayor and bailiffs of the town became, for the following year, the mayor and constables of the staple. The appointment of home staples only was thought to be advantageous to England because it would break the monopoly of Flanders, and the consequent competition would raise the price of wool, while the foreign merchants would bring "money and plate, gold and silver, and merchandise of other lands"; and the increased revenue from the customs, which were heavier for aliens than denizens, would bring in larger supplies for the "*arduis negociis*," under which the king was continually groaning. But the

high duties, as well as the extensive smuggling which evaded them, prevented home staples from being successful, and in 1363 the staple was established at Calais. The taking of Calais, the nearest continental port and a home of pirates, was of great importance to the English export trade, and with short intervals, when it was removed to Flanders or to England during war with France, the staple remained there until 1558. The staple merchants paid no toll between Dover and Calais, they yearly chose a mayor and two constables, whose jurisdiction alone they were subject to, and the mayor was responsible for their lodgings in Calais. Like the Jews and the Lombards who had been under the king's protection and not answerable to the common law, the staplers lent large sums to the king, and in return he assigned to them a portion of the customs revenue; "riches follow the staple" became a proverb. Statutes were passed from time to time, protecting the staplers and the staple town. The cherished monopoly was in danger, not only from illicit traders, but from those whom, not being staplers, the king licensed to export wool. Petitions were presented against these licenses, until, in 1449, when the revenue from the Calais staple had fallen, since Edward III.'s time, from £68,000 yearly to £12,000, by means of frauds and licenses, it was enacted that all such licenses should be void, five only excepted. The staplers, by their "ordinance of partition," charged so highly on the wool sold at Calais, that there was much smuggling, the mint at Calais fell into decay, and the price of wool went down; therefore, it was ordained, in 1442, that wool should be sold only according to the form and at the price of the staple, and that a third part of the price should be taken in silver, coined at Calais, and brought by the merchants to England. Henry IV. granted a charter to the merchant adventurers (see ADVENTURERS, MERCHANTS) of England who dealt in cloth; and to the number of staplers, and especially to their dealings with this company, Armstrong, writing in the reign of Henry VIII., attributes all the evils of the time. The number of staplers so increased, he says, in Edward IV.'s time, "by meane of apprentishode without any consideration of the welth of the holl reame" that "the merchants begane to giff rewardes to fermours and to their wiffes to have wolles oon before another," and, in consequence, the cloth-makers suffered from want of material. So much wool was taken to Calais, that the buyers "perceyvid they shuld never lakk non, but have it soo plentious which causid theym to forsake to pay redy money and bullion at the staple to bye it for respite," paying partly at the staple, partly at a mart in the Low Countries. This gave rise to a system of exchange with the merchant adventurers who traded largely in

the Netherlands, and the staplers, instead of minting their money at Calais, and sending home the much-needed coin, received bills of exchange in London, payable abroad. So many staplers were there in London, that middlemen were employed, "and then," says Armstrong, "begane the rank myschyff and distruction of the holl reame." To supply enough wool, the farmers began "to putt ther ertle to idulnes," and four hundred or five hundred villages in the Midlands were destroyed in sixty years, the profits of the wool being spent in importing "artificiall thynges," with which England became "stuffed, storid, and pesterid," to the ruin of English handicrafts. Many merchants became exchangers, which is "pleyn usury." The inferior pasture of sheep who fed on sites of villages and off "rank, foggie, wild gresse," affected the quality of the wool, and Spanish wool, mixed with English in cloth-making, threatened the market of the latter. From this time the staplers were continually in disputes with foreign merchants and merchant adventurers, and could only sell their wool to the Flemings, in 1509, by taking all risks until delivery. In 1522, a treaty was made with the Emperor touching the price and weight of the staple wool. Many of the lodgings and warehouses in Calais, formerly used by staplers, stood empty, to the loss of the townfolk, and the staplers complained to Wolsey of bad seasons, Spanish competition, and the evil ways of the foreigner; in consequence of a riot in the Calais garrison, who, during the Wars of the Roses, were not paid for eight years, the customs had been raised from 6s. 8d. to 40s. on a sack of wool, that their wages might be furnished by this branch of the revenue. The conversion of arable land into pasture had thrown many out of employment, and in 1515, to promote manufacture, commoners were forbidden to wear imported cloth, as, in 1337, it had been forbidden to all save the royal family. The decrease in the export of wool, and the loss of Calais in 1558, brought about the downfall of the staplers, though their liberties were preserved in later statutes regulating trade, and the staple was established for a short time at Bruges. From 1660 to 1787, the export of wool was entirely prohibited.

**STATE-AIDED PENSIONS.** When in the last century methods of insurance were first introduced, several proposals were made in England for its adoption by the state, in the hope that by that means the poor might provide for themselves instead of coming on the parish (cp. Eden, *State of the Poor*, 1797). Similar motives have suggested the establishment of state insurance in most European countries during the last twenty years. In Germany and Denmark state-aided pensions have been provided. In Germany (cp. J. G. Brooks, *Compulsory Insurance*, Report of Commissioner of Labour, Washington, 1893), philosophic and economic theory, the philanthropic desire to equalise social conditions, the enfeeblement of voluntary associations by legislative interference, and the policy of neutralising socialism by legislation, combined to create a system of state insurance to provide for accidents, sickness, disability, and old age.

The German system of pensions applies to persons sixteen years of age who are wage-earners, employees with a salary of £100 or less, or small employers in certain trades. It is regulated by the disability (*Invaliddät*) and old age insurance law of 1889. Disability is defined as such inability to work permanently or for a complete year as prevents the insurer from earning a third of his average wage reckoned according to certain definite principles. It does not depend on age, and is payable after five years' contributions. At the age of seventy, after thirty years' contributions, the insurer is entitled to a pension. The contribution-year is taken at forty-seven weeks. The contributions are graded in four classes (under 350 marks or £17·13 a year; 350 or £26·92; 350, or £41·61; and over 350 marks) according to the average annual remuneration of the insurer's calling. They are paid weekly by the purchase of stamps which, pasted on cards, serve also as vouchers. The employers are responsible for their payment. They amount according to the four classes to 14 pf. (1·84d.), 20 (2·35d.), 24 (2·82d.), and 30 (3·55d.). The annual allowances for disability amount respectively to £5·64; £6·08; £6·43; £6·89. The old-age pensions amount to £5·22; £6·60; £7·99; and £9·78 respectively. (For cases worked out see Brooks.) To women on marriage, and to widows and orphans, compensation for past payments is given. The insurance fund consists of (a) contributions (as above) from the employee; (b) equal contributions from the employer, and (c) 50 marks (£2·45) a year from the imperial exchequer for each pension. For the conduct of business there are thirty-one insurance offices with committees on which the government, the employers, and the employees are represented. There is also supervision by local committees (*Vertrauensmänner*). In 1895 the disability allowances amounted to £411,102, the pensions to £764,248; and on 31st December 1895, 110,377 persons were in receipt of the

former, and 195,723 in receipt of the latter or 13 per thousand of the population over 70.

In Denmark, subject to certain restrictions, at the age of sixty persons are entitled to a pension if they cannot provide for themselves or those dependent on them. The communal authorities grant the pension and pay half the cost. The government pays the other half. On 1st January 1894, 46,581 or 210 per thousand of the population over 60, were thus assisted.

In England several schemes have been much discussed (cp. *Report of Royal Commission on the Aged Poor*, pp. lxi., cxv.); Canon Blackley's—compulsory payments between the ages of sixteen and twenty-one, and a pension of 4s. a week at sixty-five or seventy; Mr. Chamberlain's—5s. a week at sixty-five provided by the abolition of bonus on voluntary payments; or under certain conditions by the doubling of working-class insurances by a government grant; Mr. Booth's—a pension of 5s. to all at the age of sixty-five, without contribution required; and Canon Fowle's—a government grant of 5s. a week to each member of a sound friendly society, coupled with the abolition of outdoor relief. These schemes have hitherto been set aside for the following amongst other reasons: (1) compulsion is unacceptable in England; (2) the aged for the next forty years or so would not benefit; (3) the friendly society movement would be hampered or brought eventually under direct government control—a very undesirable result; or (4) the cost is too great—in Mr. Booth's scheme at least £24,500,000 a year.

One or two of the arguments on the general question may be mentioned: (1) after the lapse of a certain time, as experience shows, state aid, and especially state maintenance, weakens individual energy very seriously. In Germany, of the very scanty average pension of 2s. 6d. a week, about two-thirds is paid by the state and the employer. Thus it is rather a special form of relief, than insurance, and unlike well-administered relief, it makes the bulk of the working class state-dependent. In England those in receipt of poor relief over sixty years of age number approximately only 137 per 1000 of the population of that age (cp. Denmark above). (2) There is no sufficient evidence that the large outlay is recouped to any substantial extent by reduction in expenditure on the poor. (3) The bargain considered as insurance is disadvantageous. Of males alive at sixteen only 52 per cent reach their sixtieth, only 34 per cent their seventieth year. A state bonus in these circumstances runs counter to social as well as individual interest. The working man is right to save or invest his money in such a way as to reap benefits earlier and to provide in part for old age indirectly. There are other better forms of insurance. (4) In working-class life, the family is the unit of obligation in this matter. State aid will do more harm in weakening it than good in subsidising individuals. (5) The state-aided pension will tend to relieve the trades unions of the payments now made to old members, and to promote a minimum working life at a maximum wage (cp. on points (4) and (5), *English Economic Journ.*, vol. v. p. 347, 1895.) State Pensions for Old Age were established in New Zealand in 1898.

A Comm. (cp. *Report of the Comm. on Old Age Pensions*, 1898) recently reported on some of the above-mentioned schemes and others, disapproving of them on the ground of injurious interference with wages, with self-reliance, with self-government in Friendly Societies, etc.

### STATE NOTES

[Rates of conversion: £=33 drachmai=85=25 francs=12 guilders=11 gulden=25 lire=24 milreis=13½ pesos (Chile)=9½ roubles=15 rupees.]

STATE NOTES fall into three groups;—

(1) The EXCHEQUER BILL (*q.v.*)<sup>(6)</sup> payable *in futuro*, affecting the loan market but not the currency; (2) coin-receipts,<sup>(9)</sup> which are never loans, and enter into, but, being fully covered, do not inflate the currency. They are usually issued where coin is difficult to transmit, or when, being at a premium, it is likely to be hoarded or exported, and Chile has been censured for neglecting this precaution while trying since 1. vi. 1895, to redeem its notes, then £2,209,425, but now almost extinguished. Instances are: Indian gold and silver currency notes, under acts of 1861 No. xix., 1871 No. iii., 1882 No. xx., 1890 No. xv., 1893 No. viii., and 1896 No. xxi., in so far as £6,666,666½ is exceeded<sup>(9)</sup>; Canadian Dominion gold notes in so far as £4,000,000, is exceeded<sup>(10)</sup>; U.S. gold certificates first issued 3. iii. 1863, now £7,756,434; and Russian gold notes issued<sup>(1)</sup> *e.g.* 1. viii. 1895. Similarly, Austria-Hungary deputed its bank to issue, against equal gold, silver coin or notes first up to £14,545,454, 9. vii. 1894; then up to £7,272,727, April 1898<sup>(11)</sup>; these sums *plus* £6,545,456 silver coin are being used to redeem the state notes of 1866, which in 1894 were £28,363,636. These gold receipts, though only justifiable on local and temporary grounds, often become chronic; otherwise they are innocent. But Indian silver currency notes since 1893,<sup>(9)</sup> when the mint was closed to silver; Italian "buoni di cassa" for one and two lire, issued, 1894-95, against silver in place of similar bank notes, and now £4,400,000; U.S. Bland certificates of 28. ii. 1878 *et seq.*, now over £75,000,000<sup>(9)</sup> and Sherman treasury notes of 14. vii. 1890 to 1. xi. 1893<sup>(4)</sup> now over £22,900,000, being issued against a metal not the standard, present peculiar risks. Thus the Sherman notes are usually cashed in gold and re-issued; except therefore when cashed for silver or for Bland certificates—which happened, 1891-97, at the rate of over £1,000,000 per ann.—they have the same effect as indefinite issues of uncovered convertible paper. And there is the added risk that cover may fail through a fall in the market

price of silver, and silver has fallen one half since the mint value of most silver coins was fixed, so that the earlier U.S. certificates are now only half covered, and all silver coin-receipts have degenerated into class 3 (c). The United States proposed, October 1897, that England should adopt the policy of silver coin-receipts, but England refused.

(3) The state note, in its narrowest sense, is a compromise between (1) and (2), and steals a loan from those who wish to use but not to lend money by adding to the currency. It creates chaos as well as loss, and therefore its initial mischief is incalculable, and finally either—like the *billets d'état* of the regency, the credit notes of the North American colonies, and the ASSIGNAT in the last century, and the notes of Louis Kossuth (1849) in the present century—it leads to repudiation, or it involves the very loan for which it was meant as a substitute. It is always either inconvertible legal tender, or non-interest bearing; sooner or later it always circulates at a discount, but its essence is that it is meant to be taken as money and not like (1) under a contract of loan; this being a question of fact, not of form. There are three chief varieties: (a) *Inconvertible notes*.—Brazil notes have been inconvertible since 1835, and now=£15,485,042. U.S. notes<sup>(3)</sup> (5) for £90,000,000, under acts of 25. ii. 1862, 11. vi. 1862, and 3. iii. 1863, were, until 1. vii. 1863, fundable (but scarcely any were funded), and until 31. v. 1878 slowly redeemed: the gold premium, once 185 per cent, first vanished 1. i. 1879, when the state resumed cash payments, thus transferring these notes, then and now £69,336,203, to group (c). In Greece, state notes guaranteed by the banks and amounting to £606,060,<sup>(8)</sup> (4) and bank-notes issued on account of the state up to £2,242,424,<sup>(3)</sup> (4) will, if the estimates of the International Commission are realised, be redeemed next century at the rate of at least £30,303 per ann. until they belong to class (c). In 1866 Austria-Hungary took over bank notes for one and five gulden, and then replaced them by similar state notes<sup>(3)</sup> (4) (5); their total value was £28,363,636. Until 1879 they were below par, and thereafter at or above par with silver, which was, 1879-92, the "limping standard" of Austria-Hungary; they were always at a discount with gold, and latterly of 16 per cent. The programme of 1892, now nearing completion (*vide supra*), is to make gold the standard and raise enough gold, less 16 per cent, to redeem these notes at face value. Some similar exclusively Austrian notes, now about £500,000, will be redeemed within a year.<sup>(11)</sup> Italian notes<sup>(3)</sup> (4) (5) for 5, 10, and 25 lire, worth £16,000,000, 31. xii. 1895, are meant to undergo a similar transformation, but are still in the chrysalis stage of bank notes taken over by the state, with inadequate metallic cover, and Italy has never taken the necessary preliminary step which Austria-Hungary, Russia, Chile, Japan, and Haiti have taken of saving or borrowing coin equal to their whole value; the loans of 1883 and 1894 were merely partial, and the surpluses on which the budget for 1898 relies are surely visionary. In addition to these notes, fractional notes and currency certificates exchangeable for them, aggravated their evil; all the fractional

notes have been lost, redeemed, or have disappeared, although in the United States they once aggregated £10,000,000. (b) *Interest-bearing notes*.—U.S. one and two year notes <sup>(2)</sup> <sup>(5)</sup> <sup>(7)</sup> of 3. iii. 1863, and three year notes <sup>(2)</sup> <sup>(5)</sup> <sup>(7)</sup> of 30. vi. 1864 for £53,200,000, substituted for the former,—are a cross between loan certificates and cash. Thus these were replaced by notes at interest; but a similar Austrian issue in 1849 was replaced in 1853 by Reichsschatzscheine <sup>(2)</sup> <sup>(6)</sup> <sup>(8)</sup> without interest for £12,181,818, and the latter by bank-notes borrowed at interest. (c) *Convertible demand-notes*.—These notes should be to the state what bank-notes are to a bank; but the state is a bad banker, because it has the law in its own hands, and therefore notes of this class are sure to degenerate into class (a) in times of stress. Thus U.S. demand-notes <sup>(2)</sup> <sup>(6)</sup> <sup>(8)</sup> of 17. vii. 1861, and 12. ii. 1862 for £12,000,000—said to be the first of their kind in the States but foreshadowed in 1843 by an issue for £170,000—became inconvertible after 28. xii. 1861, yet commanded almost as great a premium as gold down to their virtual withdrawal in 1863. Russian credit roubles <sup>(1)</sup> <sup>(2)</sup> <sup>(4)</sup> <sup>(8)</sup> are the successors of the old assignats; they were all but at par when convertible 1843-54 (cover  $\frac{1}{2}$ th), and like the Austrian gulden at par with or above silver and below gold when inconvertible, 1854-96; they are now convertible into gold at  $\frac{2}{3}$ rd the value of the former gold rouble; they equalled £77,447,690, 13. ix. 1897, and the redemption fund handed by the state to the bank was £62,500,000 and the state held over £19,000,000 more for this and other purposes. The U.S. notes of 1862-63 which since 1879 <sup>(2)</sup> <sup>(6)</sup> <sup>(8)</sup> belong to this class and are now £69,336,203 (about  $\frac{1}{3}$ rd cover in gold), the German imperial notes for £6,000,000 (since 1890) <sup>(2)</sup> <sup>(6)</sup> <sup>(8)</sup> which in 1874 replaced various state issues, the Canadian notes up to £4,000,000 <sup>(2)</sup> <sup>(4)</sup> <sup>(8)</sup> <sup>(10)</sup> ( $\frac{1}{2}$ th this cover in gold <sup>1</sup>), and Indian notes up to £6,666,666 <sup>(2)</sup> <sup>(4)</sup> <sup>(8)</sup> <sup>(9)</sup>, and the Dutch notes for £850,000 <sup>(2)</sup> <sup>(4)</sup> <sup>(8)</sup> mentioned by Prof. Lexis—are exposed to a special risk, though they circulate at par. Being always in existence, though cashed again and again, they may at a critical time be used to drain the treasury reserves. Mr. Sec. Carlisle recently referred to the American notes—which must be reissued—as presenting an impossible task, and gold-loan after gold-loan has been raised to convert into gold what is often reconverted into silver. Mr. Sec. Gage proposed in December 1897 to change them into gold receipts.<sup>(2)</sup> These convertible, reconvertible, phoenix-like notes are really a mixed species half way between convertible and inconvertible notes, and cannot be defended on the analogy of bank-notes.

The latest schemes in Japan, Greece, and Haiti for redeeming the residue of their government paper, are too recent (1897) for criticism. Chilian, Brazilian, Italian, Austro-Hungarian, and Russian problems are complicated by bank issues to which we have not referred; nor have we referred to the difficulties of Argentina, Spain, and Portugal, which are exclusively referable to bank issues.

[R. Chalmers, *History of Currency in the British Colonies*, 1893 (a standard work, includes India).—C. F. Dunbar, "Safety of the legal tender note" in *Quarterly Journal of Economics*, April 1897 (a powerful indictment).—The

D. R.

<sup>1</sup> Since 1860 Russian state notes are issued by the bank which stands for this purpose to the government much as the "department of issue" stands to the Indian government.

<sup>2</sup> Convertible. <sup>3</sup> Inconvertible. <sup>4</sup> Legal tender.

<sup>5</sup> Legal tender except for customs.

<sup>6</sup> Not legal tender except for state dues.

<sup>7</sup> At interest.

<sup>8</sup> Without interest.

<sup>9</sup> Indian notes are given for gold and silver, all of which is retained by the treasury except £6,666,666 $\frac{2}{3}$  which is invested. That limit was exceeded, in 1897, by £9,168,872.

<sup>10</sup> Canadian issues up to £4,000,000 are guaranteed by  $\frac{2}{3}$  gold and  $\frac{1}{3}$  securities. Notes, if any, in excess of this limit are guaranteed by gold which the treasury retains, *Statutes of Canada*, 1895, c. 16.

<sup>11</sup> We assume that the proposals of April 1898 will pass into law.

STATE SOCIALISM. See SOCIALISM, STATE.

STATES-GENERAL. See ÉTATS-GÉNÉRAUX.

STATICS, SOCIAL, AND SOCIAL DYNAMICS.

Auguste Comte's mode of conceiving in terms of applied mathematics the essential factors of the social state, and the order of its evolution, have been already alluded to (v. COMTE, A., art. ii.). Under the head of social statics Comte set out a number of "social instincts"—sociability, benevolence, labour (of muscle and mind), family life and co-operative activity—the action and reaction, or equilibrating functioning of which results in what he termed "the spontaneous order of human society." Under social dynamics he treated of "the theory of the natural progress of human society," finding that the disturbances in social equilibrium made on the whole for improvement, and analysing this progressive tendency into the three stages, theological, metaphysical, and positive, now current as perhaps the most popular formula in his philosophy.

To political economy, even if classed as a branch of the inchoate science of sociology, these mechanical concepts have not in the way of method proved useful. Adopted for a time by writers who felt the inspiration of Comte's great co-ordinating vision, and applied with rhetorical laxity, they are already virtually superseded in economics by the more abstract generalisations of pure mathematics on the one hand, and the more concrete and therefore more cognate concepts of organic phenomena on the other. Herbert Spencer, it is true, adapted them to some extent, defining social

statics as treating of the equilibrium of a perfect society, and social dynamics, of the forces by which society is advanced towards perfection. Nevertheless they form in the economy of his thought a less effective scaffolding than the notion "social organism." In considering social philosophy under a statical and dynamical aspect, he claims to be dividing the subject as J. S. MILL, following Comte, divided political economy. Mill, however, though implicitly mindful of the analogy, only applies it, as an illustrative figure, at a late stage of the *Principles* (v. *infra*), and, in the two works where he does take account of that mechanical aspect is more concerned, in the one to criticise Comtism, in the other to formulate the logic of that historical method for social science where Comte's concept of social dynamics has really, if indirectly, proved fruitful in results. He is as little concerned as either Spencer or Comte to give more than (to use the latter's qualification) "an exploratory value" to the mechanical metaphor, or to waste himself in fitting a more abstract view of things to the relatively more concrete world of his hypothetical wealth-craving economic man. In this last-named abstract entity indeed, reacting to the "pressure" of his one desire, in so far as this is not neutralised by the opposing forces of dislike of work and of abstinence, Comte might have found, as BAGEHOT did, room for mechanical analogies. But it was precisely the hypothetical, or so-called "metaphysical" character of political economy, pursued half consciously half unconsciously by earlier economists, that turned Comte from that science.

The really fruitful result in Comte's method of letting the "simpler" concepts of mechanics play around the field of social phenomena lay in his two governing ideas of continuity and solidarity. The statical aspect showed him the elements of the social structure as an interrelated, interacting whole. And the true spirit of social dynamics, he held, "consists in conceiving of each consecutive social state as the necessary result of the preceding, and the indispensable mover of the following, according to the axiom of Leibnitz, etc." Thus far, then, a mathematician of genius inspired Comte. Probably not even the modern standpoint of regarding statics and kinetics as modes of dynamics would have led him farther, viz. to a more critical research into those apparently irreducible factors of that on which he bestowed the somewhat musty designation of "spontaneous order." For this it required advance in that historical method which he so earnestly prescribed, and in those biological inductions which, for him, were less dominated by "the master-thought of . . . the gradual development of humanity" than was his own social dynamics.

[Comte, *Positive Philosophy*, bk. vi. chs. iii. v.

and vi.; cp. bk. i. ch. iv.—Spencer, *Social Statics* (1892), p. 229.—Mill, *Principles of Pol. Econ.*, bk. iv. ch. i.; *Auguste Comte and Positivism*, pp. 88-106; *Logic*, bk. vi. ch. ix. and x.—Bagehot, *Economic Studies*, pp. 73-77.] C. A. F.

**STATIONARY STATE.** Adam Smith mentioned the "stationary state," describing it as the state in which a country had "that full complement of riches which the nature of its laws and institutions permits it to acquire" (*Wealth of Nations*, bk. i. ch. viii.; in bk. i. ch. ix. the "full complement" is said to be determined by "the nature of its soil and climate"). China is several times referred to as being in the stationary state; Holland is really stationary; Bengal is even "decaying." In the stationary state, as described by Adam Smith, wages are low; it is only in countries which progress rapidly that wages are high. Profits also are low. Adam Smith said nothing as to rent in the stationary state, but it was an easy step for his followers to proceed to say that rent was high. James Mill simply followed the hints in the *Wealth of Nations*, when in *Commerce Defended* (1807) he remarked that in a stationary country wages are at "the lowest rate which is consistent with common humanity" (ch. vi. p. 87). Ricardo, while he did not mention the stationary state in so many words, yet made the conception more definite. The stationary state virtually is that in which profits are just high enough to make the "trouble" and "risk" of "accumulation" worth while. Wages in any case are fixed, being the natural or necessary wages which habit and custom fix for the labourers. With the progress of society and thence to poorer soils, profits fall and rents rise until profits are at the minimum which just suffices to maintain accumulation. But when "the very low rate of profits will have arrested all accumulation" (Ricardo's *Works*, p. 67), "almost the whole produce of the country, after paying the labourers," will go to the landowners. This was certainly considered by Ricardo a deplorable situation, and was expressly so described by his contemporaries, and especially by M'Culloch. For writers of the school of M'Culloch wages were "naturally" low, and high profits were "the real barometer, the true and infallible criterion of national prosperity"; hence any approach to a stationary state in which profits were at the minimum was an evil. Some protest against this point of view was raised by Chalmers (*Political Economy*, vol. i. p. 43, vol. ii. p. 133) who pointed out that wages might be kept high "by the moral preventive check" even in "the ultimate stages of the wealth of a country." J. S. Mill finally protested eloquently against the notion that the stationary state was to be looked forward to with aversion (*Political Economy*, bk. iv. ch. vi.). Indeed, he wished the progress of society to relax before the utmost limit

had been approached, pleading in noble language for the enjoyment of solitude and of the beauties of nature, for mental culture, and for moral and social progress. With later writers, the discussion of a stationary state has ceased. The assumptions of an inevitably low, or at least fixed, rate of natural wages, and of a stage when accumulation would cease, which dominated the reasoning of the followers of Ricardo, have been shaken by the experience of a gradual and steady advance in wages, and by an extraordinary and uninterrupted accumulation of capital; while the rapid progress of the arts has lessened the likelihood of any approach to a really stationary state. Hence the topic hardly appears in recent books on political economy. A writer like Roscher, imbued with the historical spirit, refers to "flourishing" and "declining" states of society (thus with reference to wages, to population, to luxury; *Politische Oekonomie*, §§ 171, 225, 244); but a clearly-defined stationary state is not deemed worth mention, even in a historical sketch of population. Professor Marshall, again, uses the conception of a stationary state, not as indicating a stage which society will certainly or even probably reach, but as a means of reasoning hypothetically on permanent tendencies in the distribution of wealth. "The hypothesis of a stationary state is useful to illustrate many points in economics; but it is the nature of such hypotheses to be treacherous guides if pursued far away from their starting-points" (*Principles of Economics*, bk. v. ch. xi. 2nd and 3rd editions). In one sense, France may be said to present the case of a country that has in fact reached the stationary state. The population of France, after having advanced at a fairly steady though gradually slackening rate through the greater part of the 19th century (setting aside changes from gain or loss of territory), has become practically stationary since 1886. The census figures for the population of France were 38,218,903 in 1886; 38,342,948 in 1891; 38,961,945 in 1901. But industrial progress has continued in France; wealth has augmented, capital has increased, wages have tended to rise, cities have gained in numbers, the country districts have lost, so that the stationary state, in the sense in which the older economists understood it, has not been reached (POPULATION, ECONOMIC THEORY).

## STATISTICS

F. W. T.

Statistical method, p. 467; Statistics, p. 469.

STATISTICAL METHOD in its common acceptation consists in the study of social phenomena which can be counted or expressed in figures.<sup>1</sup> The ways in which the observa-

tions are made, and the mode of analysis, so that they may yield facts for social science, have been examined in the article METHOD OF POLITICAL ECONOMY.

The material is either population, the number of people, number of births, deaths, marriages, blind, paupers, criminals, or facts connected with the population—e.g. prices of commodities, wages of labour, distribution of wealth, amount of bank notes, etc.

Observations are of two kinds—either enumeratory at a particular time, like a census, an agricultural *enquête*, a German *Gewerbe-zählung*; or continuously enumeratory, like registration of births, deaths, and marriages.

The way in which the observations are made comprises the technique of statistics. The first step is collecting the statistics. This is a matter not only of administrative skill, but also of scientific judgment. We cannot gather statistics of all social phenomena. Some are incapable of measurement; others would not repay the effort. We must make a choice and gather those that are of most importance. As a matter of fact, statistics are collected mostly through governmental agency, and those are gathered which are of administrative interest, such as the amount of exports and imports, or those which can be easily obtained in connection with administrative activity, such as the statistics of crime. In modern times the statistical activity of governments has been extended to investigations of simply social or scientific interest, such as births, deaths, and marriages, occupations, wages, etc. Thereby extended, the statistical method becomes a most important instrument of investigation in the social sciences.

The statistical method reaches its limits owing to the difficulties of classification. When population is studied statistically, it is divided into groups, all the members of which, while differing in many particulars, have one common characteristic. Classification fails either because the characteristic is not sharply enough defined, or because it depends upon the testimony of individuals whose statements cannot be controlled. Classification by age, sex, and conjugal condition is elementary, and not difficult. Classification by nationality or race is possible on the basis of place of birth, because that is definite and generally known; on the basis of political allegiance it is false; on the basis of blood or physical characteristics or language it is indefinite. For instance, the great mass of Prussians are German on the basis of language, but if we take into consideration physical characteristics, only 35 per cent of the population is pure German, i.e. German in speech and blonde in type; 24 per cent is principally German, i.e. German in speech, but mixed in type—blonde hair and grey eyes; and 23 per cent is German in speech, but partly slavie or romance in type—dark hair and grey

<sup>1</sup> Levasseur, "La statistique est l'étude numérique des faits sociaux." Lexis, "Die Statistik ist die zahlenmässige, Untersuchung des gesellschaftlichen Menschenlebens."

eyes (*Zeitschrift des Preussischen statistischen Bureaus*, 1893, p. 199). In the United States census of 1890, they tried to ascertain the number of persons of pure and mixed African blood by distinguishing blacks, mulattos, quadroons, and octaroons. But no physical distinction is always to be depended upon, and the persons themselves were ignorant of their genealogy, so that the attempt was a failure. In these cases the characteristic was not definite enough to permit trustworthy classification.

Classification of the population according to wealth or income fails because direct inquiries will not be answered truthfully, and outward marks fail. Even such a question as whether one is employer, employee, or working on one's own account was imperfectly answered in the English census of 1891, either because it was misunderstood or through perverseness. It is said that questions in regard to religious denominations excite suspicion in France; and questions in regard to mental or physical infirmity of members of the family excited considerable feeling in the United States in 1890. Difficulties of classification occur also in occupation statistics, in regard to degrees of infirmity (blind or partly blind), degree of illiteracy, wages, etc.

The practical statistician attempts to overcome these difficulties by making his schedule as simple and the questions as direct and unequivocal as possible, and by arranging the questions so that the answer to one will control more or less the answer to another. In some cases it is better to take a portion of the class rather than the whole class, e.g. wages from the pay-rolls of large establishments rather than from individual returns by all workmen. Again, one set of statistics will sometimes control another, as the ages of very young children may be ascertained more accurately from birth and death statistics than from the returns of parents, who often simply give the age to the nearest year. Finally, where it is impossible to reach a classification directly, some symptom or neighbouring circumstance may be used, as the number of persons to a room or a house, or keeping or not keeping a servant, may indicate social class or economic well-being (cp. Ch. Booth, *Life and Labour in London*).

The second step in statistical method is tabulation and analysis of the returns. Summing up the figures in each class gives us of course the absolute numbers. For the purpose of analysis and comparison these numbers may be expressed as proportions, rates, and averages, e.g. the population of the United States consists of 85·33 per cent native-born, and 14·77 per cent foreign-born; or of 87·8 per cent white and 12·2 coloured. A rate is the proportion between a number of events occurring in a year and the total population or some portion of

the population immediately connected with the event. It is generally expressed in decimal form. Thus a birth-rate would be expressed by saying there are 25 births for 1000 of the population. It might be expressed by saying 1 birth for every 40 of the population. The former method is generally preferred. The suicide rate in England is 80 per 1,000,000. Sometimes a fraction of the population is taken, as in France there are 171 legitimate births to 1000 married women under the age of fifty. In England (in 1891) there were 8314 males employed per 10,000 males of and above ten years of age, and 3442 females employed per 10,000 females of and above ten years of age.

A *per capita* proportion is sometimes used in statistics, for instance dividing the total amount of tea consumed in any given country by the number of inhabitants, we get the *per capita* consumption; or dividing the total wealth by the number of inhabitants, we get the *per capita* wealth.

Finally we have the *average* or mean, which represents an intermediate value of a number of quantities, e.g. average wages, average birth-rate, etc. (cp. AVERAGE; MEANS, METHOD OF).

The average is of inestimable use in statistics. It is the short expression for a long series, and hence can be used for purposes of comparison, e.g. the average marriage-rate in France and Germany for twenty years. Some averages or means are more than this—they are the middle value about which the variations tend to concentrate, as the average stature of recruits. In that case, the average is said to be typical.

There are two common misuses of the average in statistical work. The first is averaging quantities which are not similar. Thus we often have an average wages of men, women, and children, which shows us nothing either in respect to wages as income or wages as labour-cost (cp. WAGES IN UNITED STATES OF AMERICA). Such an average is not typical. Again, averages are drawn from too small a number of cases, so that any variation may be purely accidental. The mathematical method of determining whether a variation is accidental or due to cause, is explained under the article ERROR, LAW OF (see further Edgeworth, *Statistical Methods*, in jubilee volume of London Statistical Society).

The third step in statistical method is to compare the statistics of one social phenomenon with those of another, in order to discover if there be any relation between the two. These relations may display themselves either in space or time, e.g. high death-rates in urban communities; hard times and an increase of crimes against property. This is simply the method of concomitant variations (see art. METHOD OF POLITICAL ECONOMY, vol. ii. p. 745). In the complexity of social phenomena many causes are bound together, and there is always danger of attributing to one cause an effect due to

another. Crime, for instance, is more frequent among the foreign-born population of the United States than among the native-born. But if we take account of the larger proportion of adult males among the foreign-born, we shall suspect that the greater criminality is due as much to the sex and age proportion as to the nationality.

If we could really isolate any single cause, the statistical method would enable us to measure its intensity. How much is bad economic condition responsible for the increase of crime? This is a matter of greater refinement of method which is sometimes possible but is more often impossible. Bad economic condition increases crime, but is very seldom of such importance that a variation in it results in a proportionate variation in the amount of crime.

The statistical method, therefore, gives us quantitative measurements of social phenomena. It reveals to us certain relations which are more or less constant. Some of these are merely the expression of a fact whose cause we do not know, *e.g.* the constant excess of male over female births. Others are the expression of a relation which remains constant so long as circumstances remain about the same, as that the rate of suicide in England is 80 per 1,000,000 inhabitants. Others are expressions of variations which are put into the form of cause and effect, *e.g.* that economic condition is a cause of crime. The expression of these relations is sometimes called a statistical or sociological law. In regard to these so-called laws, it is only necessary to remark (1) that they are merely empirical laws of no high degree of validity—simple regularities that may be easily affected in a great variety of ways. Suicide is influenced not only by economic condition, but by social opinion, religious belief, external hindrances, etc., so that the number varies from year to year. (2) That the regularities of the mass have no compelling force over the individual. That the rate of suicide in England remains constant from year to year, does not mean that I am in any more danger of committing suicide than if the rate fluctuated capriciously. (3) This last affirmation means that statistics do not affect the doctrine of the freedom of the human will. They only show that social actions are controlled often and demonstrably by certain great and general influences. These things are sometimes forgotten when we speak of the inevitableness of social laws, of the responsibility of society for the crimes committed in its bosom, of the budget that must be paid, the budget of the galleys, the scaffold, and the prison (see article on STATISTICS).

M. S.

STATISTICS. In view of the fact that it is still unsettled whether statistics is more properly a science of things or a science of method, the term may be held to cover both fields. As a science of method it is treated in the article STATISTICAL METHOD (*q.v.*). Even as a science of things, however, controversy is not slight as to its precise content, whether it be concerned only with the examination of the conditions, past and present, of different states and peoples, and the best modes of securing knowledge in this field; whether the facts with which it is concerned are limited to those which permit of presentation in numerical form; or whether facts presentable in such form, no matter to what branch of knowledge they relate, are to be considered within its scope. It is certain that workers of great eminence have not been contented to limit the scope of statistical investigation to the facts of human societies, while very valuable additions to knowledge have been made by the statement and description of conditions which were not susceptible of any accurate measurement for precise comparison with cognate facts.

In any branch of statistical investigation which deals with human beings, and matters in which they are concerned, the observation of a numerous aggregate of cases, grouped together on account of similarity in some condition of importance in connection with the subject of investigation, is necessary. Individual cases show considerable differences in the intensity of any characteristic possessed by them; but in a numerous aggregate it frequently happens that the degree of irregularity is not so great but that some type can be determined to which all more or less approximate. The determination of the type and of the extent and frequency of variations from it are important problems. The comparison of the measurements corresponding to the type derived from different aggregates is one of the most useful of the applications of statistical knowledge. The aggregates may differ either in the time or in the place at which they are observed, or in both. Country and country, time and time, may be compared by comparison of the tabulated measurements of the characteristic in question, and the progress of different countries over any selected periods may also be compared. The GRAPHIC METHOD (*q.v.*) is one of great utility for the effective carrying out of such comparisons.

The comparison of various phenomena which are symptomatic of the moral condition of the aggregate under examination is of more than merely scientific interest, inasmuch as it may point the way to an advantageous modification of the influences of which the symptom in question serves as a measure. In this connection it should be remarked that the regularity manifested by some phenomena of this class has been incorrectly interpreted as indicating a lack of free-will on the part of individuals. The steadiness of the number of crimes in proportion to population has impressed some observers with the idea that the criminal is a victim of some evil necessity for which he is not personally responsible. A closer and wider investigation of facts is sufficient to demonstrate that criminality is dependent on human character, and is only constant under conditions which imply constancy in the moral tone of the aggregate under examination. In any case the regularity in the aggregate implies no compulsion on any individual. As above pointed out, careful research into related phenomena may reveal the appropriate means for introducing beneficent modifying influences to diminish criminality. A connected subject is that of forecasting the future from observations of the past. The observed regularities in statistical phenomena can only be expected to continue on the hypothesis that the producing causes, of the operation of which the observed phenomena are symptoms, continue to operate in equal intensity in future.

In all statistical enquiries having as their object the determination of a type which may be representative of the aggregate to which the enquiry refers, it is of importance that the characteristics of the aggregate should not be lost by including under the one aggregate two or more groups of essentially different characters. Recently Professor Karl Pearson has shown how, in certain cases, the observations relating to such separate groups may be sufficiently disentangled to permit of studying the results separately, by the application of a suitable principle in dealing with the numerical observations when the separation of the groups themselves, before making the observations, is not open to the investigator (cp. *Phil. Trans.*, 1894 and 1895).

[For the history of the progress of statistical science reference may be made to Meitzen, *Geschichte, Theorie und Technik der Statistik*, and for a statement of the development of official statistics and their present position, to the articles, chiefly by Dr. E. Mischler, "Die amtliche Statistik in den einzelnen Staaten" in Conrad's *Handwörterbuch*; also to the works mentioned in the article on STATISTICAL METHOD, to the address by Sir Rawson Rawson and the papers by Dr. Mouat and Mr. Guy in the Jubilee volume of the Royal Statistical Society and the presidential address to the same society by Mr. J. B. Martin in the

*Journal* for 1896, and to Dr. Jacques Bertillon, *Cours élémentaire de Statistique*. For first use of term, see ACHENWALL, G. There are several very useful compilations of comparative statistics, among which that of Dr. von Juraschek, *Geographisch-statistische Tabellen*, is very compact and includes much of general utility in its annual issues. The elaborate bibliographies of various subjects attached to the chapters of Dr. von Mayr's *Statistik- und Gesellschaftslehre* may be referred to for information as to the extensive literature under special heads. W. F. Sheppard "On the Geometrical Treatment of the 'Normal Curve' of Statistics" in the *Proceedings of the Royal Society*, vol. lxii. number 381, p. 170, 1897.] A. W. F.

STATUTE OF MERCHANTS. This measure, recognised as law in 1285, possesses a two-fold importance, the one in the history of constitutional, the other in that of commercial law. It was really an ordinance put forth by the king and council at Acton Burnell in 1283 in the presence of deputies from the towns, owing to which last circumstance it acquired the authority of a parliamentary statute. Commercially it was of importance as being designed to facilitate the recovery of debts. The machinery for creating a "contract of record," which is the legal definition of the statute merchant, had before the accession of Edward I. been by way of recognisance. This procedure, which took place in the king's court, was afflicted with "the law's delay" (stat. merc. 13 Ed. I. c. 6), to remedy which the new measure was enacted. It was probably borrowed at the instance of foreign merchants, as the preamble of the act discloses, from the debt book (*Schuldbruch*) of Hamburg, Riga, and other continental towns. The expository re-enactment in 1285 of the ordinance of 1283 recites the "malice and false interpretation" of the sheriffs as its justification, an evidence that the law had influential opponents. The original ordinance of 1283 provided that a debtor should appear with his creditor before the mayor of London, Hull, or Bristol, make acknowledgment of his debt and of the day of payment, and witness with his seal the entry of this acknowledgment or recognisance by a clerk upon a bill obligatory (*escrit de obligation*) sealed with the king's seal. This bill was transcribed on to a roll in the custody of the mayor. On the day of payment due the creditor was entitled to present his bill to the mayor, and on its verification by the roll, the mayor was empowered to cause the movables of the debtor to be sold to the amount of the debt or in default of a purchaser to be delivered to the creditor at a reasonable price. The king's seal conveyed a title to the purchaser. In default of movables within the mayor's jurisdiction, the recognisance might be certified into chancery, and any sheriff on receiving a writ from the chancellor was authorised to seize and sell the debtor's

movables within his jurisdiction. In default of goods, the person of the debtor might be seized and imprisoned at the creditor's expense for bread and water, which expense was added to the debt. If the creditor were a merchant stranger the debtor's goods might further be charged with the expenses occasioned by detention in England. Sureties were permitted, subject to the same penalties as the principal debtor. In 1285 this was modified by the provision that the creditor might procure the arrest of the debtor's person immediately upon default, and a compulsory sale of the debtor's chattels was legal only after the interval of two quarters of a year, within which time the imprisoned debtor was at liberty to order the sale himself. This change, while improving the security of the creditor, was also in a measure favourable to the debtor as facilitating a profitable realisation of assets (see *LAW MERCHANT*). The statute was also extended to all fairs (see *FAIRS AND MARKETS*; *MEDIEVAL FAIRS* on the Continent). Another provision shows that the use of the ordinance had been enlarged to secure debts due from English landowners; for the merchant creditor became entitled to an assignment of the debtor's lands, and therewith to the rights incident to a freehold such as the writ of *Novel Disseisin*, to protect his possession, and this even against the debtor's heir. It is evident that these changes gave great offence to the landed gentry, for in 1311 the lords "ordainers" procured, among the ordinances of that year, a prohibition of the extension of the statute of merchants to parties other than merchants, and of seizures under it to other lands than burgages, *i.e.* lands in towns holden at a rent. At the same time the statute was excluded from fairs where it interfered with the seigniorial rights, but extended to the towns of Newcastle, Nottingham, Exeter, Southampton, Lincoln, Northampton, Canterbury, Shrewsbury, and Norwich. The procedure under the statute of merchants which went by the name of a "statute merchant" became, at a later date, practically indistinguishable from that of a "statute staple" (see *STAPLE*). The statute merchant is described by Tomlins's *Law Dictionary*, ed. 1835, as "one of the common assurances of the kingdom." The act of 1285 was repealed by the Statute Law Revision Act 1863.

STATUTE OF MERTON. See *MERTON*, *THE STATUTE OF*.

STATUTUM MERCATORUM. See *STATUTE OF MERCHANTS* and *LAW MERCHANT*.

STEELBOW TENANTS (Scotland) were farmers, receiving from the landowner a certain quantity of stock, corn, straw, and implements with the land. These "steelbow goods" had to be returned in kind at the end of the lease. The system arose at the beginning of the 14th century. Villeinage was falling into decay, and the new class of free tenants had not enough capital of their own to stock their farms without aid from the landowner.

Similar circumstances in England produced the same results in the "stock and land" leases, which appeared after the Black Death. Adam Smith mentions the survival of this tenure in the Highlands, and compares it with the metayer system of France (see *METAYAGE*). He complains that the great share the landowner took of the farm produce—one half—must be a great hindrance to improvement of the land.

No tenant would take the trouble, risk, and expense of improvements, of which he did not reap the whole benefit. Moreover, the landowner's cattle were used too much for carriage and other outside purposes, the profits of which were not shared with the landowner.

L. R. H.

STEELYARD, THE, was the establishment in London of the *EASTERLINGS*, the German merchants belonging to the Teutonic *HANSE*.

It was situated on the north bank of the Thames, a short distance to the west of London Bridge; occupying, in fact, part of the site of the present Cannon Street railway station. It formed a parallelogram, somewhat less than 200 feet wide along the river, with a depth twice as great back to Thames Street; it included, besides wharves, warehouses, and residences, a stately hall adorned by Holbein with allegorical representations of the Triumph of Riches and the Triumph of Poverty; and the whole was enclosed on the three landward sides by strong walls. That such defences were necessary is shown by the events of 1493, when a London mob burst in and pillaged the warehouses and chambers. After the expulsion of the Hanseatic merchants from England in 1598, the land and buildings remained the property of the League, and were let to German and other merchants for business purposes. Even when the old edifices were burnt down in the great fire of 1666, it was thought well to replace them by new warehouses, which continued to belong to the Hanseatic cities, Lübeck, Bremen, and Hamburg, until the property was sold to a railway company in 1852. There were similar though smaller establishments at Boston and Lynn, known by the same name.

[The one great authority is J. M. Lappenberg, *Urkundliche Geschichte des hansischen Stahlhofes zu London*, Hamburg, 1851, where will be found the most minute and intricate details of the history of the several buildings. Based upon this is the popular article on "The Hanseatic Steelyard in

London" in R. Pauli, *Pictures of Old England*, Eng. trans. 1861. The origin of the name and of the German equivalent *Stadthof* is uncertain; with the older explanations in Lappenberg pp. 70, 174, compare the more recent in the *Century Dictionary* (s.v.). Pictures and plans of the Steelyard are given at the end of Lappenberg, and in Herbert, *Livery Companies*, vol. i. ch. ii.—where, however, there are some gross mistakes in the identification. Of the account, probably somewhat idealised, given by Werdenhagen, *De rebuspublicis Hanseaticis*, 1641, of the quasi-monastic or collegiate regulations for the daily life of the residents, an abridgement will also be found in Herbert (*u.s.*). Stow, *Survey of London*, 1598 (in ed. Morley, 1890, p. 233) gives a list of Hanseatic imports, and of the buildings in his time. The most recent account of the last days of the Hanse in England is that of Richard Ehrenberg, *Hamburg und England im Zeitalter der Königin Elizabeth*, Jena, 1896] (see HANSE OF LONDON; HANSE TOWNS; HANSE-ATIC LEAGUE).

W. J. A.

STEIN, HEINRICH FRIEDRICH KARL, FREIHERR VOM (1757-1831), was by birth an imperial knight, sovereign in his own territories, and owing no allegiance to any one but the emperor. In 1773 he went to Göttingen, then the great centre of juristic and political teaching, where he studied law, and, in an extra-academic way, English history, politics, and political economy. He became well acquainted with the work of Adam Smith, and adopted his doctrines, diverging from him only in points on which, as statesman, German, and man of the 19th century, he was led to modify his views. In 1777 he left the university and travelled in Germany for about three years. In 1780 he entered the service of Frederick the Great in the department of mining, and, four years later, was appointed director of the Westphalian mines. Nor was he unfitted for the position; Alexander von HUMBOLDT declared him to be one of the men of his time best acquainted with metallurgy. In 1784 he was employed on a mission to induce the elector of Mainz to join the league of princes which Frederick was forming to oppose the designs of Joseph II. in relation to South Germany; in this mission he was successful. In 1786-87 he made a mineralogical and technical visit to England. Declining diplomatic appointments which were offered to him, he was made a director of the war-and-domains chambers of Cleves and Hamm, and became in 1796 supreme president of all the chambers in Westphalia, where he introduced the system of road-making without *corvées*. He was employed in the transfer to Prussia of the dominions of the Westphalian bishoprics in accordance with the principal resolution of the imperial deputation in 1802, and performed the task with great judgment and forbearance. In 1804 he became Prussian minister of state, with the charge of customs,

excise, trade, and manufactures—an office which he carried on with his accustomed vigour and industry. His most important achievement in this position was the abolition of provincial customs, or, in other words, the establishment of free trade within the Prussian dominions (December 1805). He was by nature a practical economist, and, up to the time of the Prussian catastrophe, he had devoted himself to the conduct of the national industry and finance exclusively. But the circumstances of his country inspired him with a war policy. Objecting to a man so able and patriotic as HARDENBERG being passed over by the king at a critical period, as well as to the maintenance of a personal cabinet distinct from the ministry, he asked for and obtained his dismissal in January 1807. He was recalled in the same year, and remained in office for thirteen months. His immediate task was to bring the French occupation to an end by paying the indemnity; his further task was the civil reorganisation of Prussia, as Scharnhorst was charged with the military. He now carried out in conjunction with Hardenberg the great peaceful revolution—for such it deserves to be called—usually designated the Stein-Hardenberg legislation. In September 1808 Napoleon intercepted a letter of Stein's which revealed his anti-French designs, and at the same time the king refused to adopt the minister's warlike policy, whilst the French party among the *noblesse* caballed against him. Accordingly in the November of that year he resigned office. He drew up in his retirement a political testament, from which, as well as from other manifestos of his, we gather that, besides the economic, administrative, and municipal reforms already effected or at least matured in conception, he contemplated the abolition of hereditary jurisdictions, a reform of the nobility, an ecclesiastical and educational reform, and the introduction of some sort of parliamentary system.

Having taken a leading part in the reconstruction of Prussia, he became, after an interval of forced quietude, the principal author of the liberation of Germany. In December 1808, Napoleon issued a decree of proscription against him, and he retired first to Bohemia and Moravia, afterwards by invitation of the emperor Alexander to Russia, becoming for years his chief adviser, especially on German affairs. He accompanied the Russian army in its march to Prussia, and was usually at the headquarters of the allies till they entered France. When the central administration for the government of the recovered provinces was formed, Stein was made a member of it, and, on its reconstitution after the battle of Leipzig, he was placed at its head. He was a strong advocate of the displacement of Napoleon and the restoration of the Bourbons—which latter

seems, indeed, to have been the only possible policy at the time. He was invited by Metternich to preside in the diet of the new confederation, and by Hardenberg to act as representative of Prussia in that body, but declined these offers. He took, however, some part in local government, presiding over the provincial estates of Westphalia during three of their sessions. The king appointed him a member of the council of state in 1827. He spent much of his later years in organising a society for the publication of the original materials of German history—a project realised in Pertz's *Monumenta*.

Stein had great moral elevation and a massive grandeur of character, and is altogether an impressive and imposing figure. There is much about him that reminds us of TURGOR. He had, no doubt, his defects, amongst which was a somewhat narrow Germanism, which however probably aided him in the discharge of his historic office by giving him the necessary concentration and intensity. He was not without aristocratic prejudices, and was only imperfectly imbued with the modern spirit. But he was a great man and did a great work; and not only Germany but Europe should hold his memory in everlasting honour.

The principal feature of the Stein-Hardenberg legislation was the abolition of serfdom. But it must not be supposed that the two ministers whose names are peculiarly associated with it were alone in advocating or planning the emancipation edict. Frederick William III. had always had such a measure at heart; it was thoroughly prepared in public opinion, and had been elaborated by a special commission (see HARDENBERG and SCHÖN). In this edict, signed by the king October 9, 1807, it was decreed that the serfdom (*Unterthänigkeit*) of those who possessed their peasant holdings by hereditary tenure should at once cease to exist throughout the monarchy, and that serfdom should come to an end altogether from Martinmas 1810. The menial services to which peasants had been subject were also abolished; but any obligations to their lords, binding them as free persons—arising, that is to say, out of their possession of property or out of a special contract—were to remain unchanged until redeemed by mutual agreement. Frederick William I. had abolished serfdom on the royal domains in the kingdom of Prussia, properly so called, in the case of peasants holding directly from the crown; and now on 28th October 1807 a cabinet order extended this abolition to all the domains; and in the following July the domain tenants obtained full right of property in their holdings, subject, however, to the continued payment of certain dues and services.

The emancipating edict also established free trade in land, though not in the modern

English sense of the phrase. It was a rule of law that noble estates could only be held by nobles, and that persons of the middle class (*bürgerlicher Herkunft*) could only possess them by special permission of the king; so also that peasant land could only be held by peasants, and lands belonging to civic communities by citizens. All these rules were now abolished, special provisions being introduced at Stein's suggestion to prevent the undue consolidation of peasant holdings or their absorption into the estates of the landlords. The restrictions were also removed which prevented the members of the several social classes from engaging in certain occupations, and in general forbade their passing into classes to which they did not previously belong; and every one was set at liberty to choose or change at will his calling or trade. It cannot be doubted that these reforms greatly contributed to the regeneration of Prussia, and did much to awaken the strong sentiment of patriotism and sense of national unity which brought about in the following years the liberation of the country from the tyranny of Napoleon.

Hardenberg afterwards considerably extended the provisions of the emancipating edict. By the ordinance of 16th March 1811, all dues and services from tenants on the domain lands were abolished in consideration of definite money payments; and on 14th September of the same year a corresponding edict was issued relating to peasants on the estates of landlords. This last made the peasant full owner of the land he cultivated, and relieved him of all payments in kind or in money, and all labour on the property of the landlord, who was compensated by receiving a portion of the tenant's holding—one-third in the case of hereditary tenancies, and one-half in the case of a tenancy for life or for a term of years or at will—and by being at the same time set free from all his legal obligations of contributing towards the maintenance or assistance of the tenant. For the surrender of the fixed proportion of the holding might be substituted, with the consent of the landlord, either a yearly rent or the immediate payment of an equivalent sum of money. These enactments had the effect of establishing the system of peasant proprietorship as it now exists in Prussia.

Further steps were also taken to remove restrictions on trade. In December 1810, it had been enacted that a trade certificate should authorise the holder to practise a trade anywhere in the monarchy, without interference from any corporation or individual. By the edict of 7th September 1811, Hardenberg practically abolished gilds, or at least deprived them of all coercive power, and changed them into voluntary associations. This later legislation of Hardenberg, both as

to land and as to trade, was disapproved by Stein, who was more conservative by temperament, and wished rather to reform than to abolish old German institutions.

[Stein wrote, at the request of the crown prince of Bavaria, an autobiography, in very curt and official style, which originally ended at the Peace of Paris, but to which some passages were subsequently added, describing his occupations after his retirement. E. M. Arndt, author of *Des deutschen Vaterland*, who saw much of Stein from the beginning of the war of liberation to the end of his life, wrote in 1850, by desire of Bunsen, his recollections of the statesman. The standard German life is that by G. H. Pertz (the editor of the *Monumenta Germaniae Historica*) in 6 vols., a most valuable work on the man and his period. The English reader will find a full account of both in Prof. Seeley's *Life and Times of Stein* (3 vols., 1878), a work founded throughout on original documents, and these collected from the most various sources and studied with conscientious care and penetrating judgment]. J. K. I.

STEIN, LORENZ VON (1815-1890), born at Eckernförde in Schleswig, was educated at a military school and at the gymnasium of Flensburg, and studied at the universities of Kiel and Jena. After having been for some time employed at Copenhagen as a government official for Schleswig, he went to the university of Berlin to complete his scientific education. During a subsequent residence at Paris, he studied closely the life of the people, became acquainted with Louis BLANC, Considérant and CAILLÉ, and thoroughly learned the characters and principles of these and other leading socialists. In 1846 he was appointed professor extraordinary of the political sciences at Kiel, but lost this position in 1850, when the supremacy of Denmark in the duchies was restored. In 1855 he was called to Vienna as professor of political science, and worked there as such, with undiminished zeal and spirit, till 1888, when he retired, maintaining, however, his intellectual activity to the end.

His writings cover the entire field of economic science and a part of the theory of politics, properly so called. His *Lehrbuch der National-Oekonomie* appeared in 1858 (3rd ed. 1887); his *Verwaltungslehre* in 1865 *et seq.*, and an abridgment of it, entitled *Handbuch der Verwaltungslehre* in 1870 (3rd ed. 1887-88) and his *Lehrbuch der Finanzwissenschaft*, in which he studied the financial systems of all the countries of Europe, in 1860 (5th ed. 1885-86). He and R. von MOHL are regarded as the creators of the modern science of administration; they substituted, says Cossa, for the empirical *Polizeiwissenschaft* of the cameralists (see CAMERALISTIC SCIENCE) a new science of administration adapted to the wants of our own time, and, of necessity, comprising economic elements. Stein compares, in his work on the subject, the administrative systems of France, Germany, and England. All his writings give evidence of a very high order of ability, though sometimes they were too much influenced by the metaphysics of HEGEL

(*q.v.*), while he sometimes is led, by his love of system and his lively imagination, to erroneous or premature generalisations. A special object which he keeps in view is to exhibit the close relations which exist between economics, law, and philosophy. The work by which his name is best known in England is his *Sozialismus und Kommunismus des heutigen Frankreichs* (1843; 2nd ed. 1848), in which he utilised his early Parisian experiences. It was afterwards re-written and expanded, and published under the name *Geschichte der sozialen Bewegung in Frankreich* (1850-51). Stein was in a high degree awakening and stimulating as a lecturer and teacher, and had many thousands of pupils, including a number of Japanese youths, sent over by their government to study the western sciences. He was editor of the *Centralblatt für Eisenbahnen und Dampfschiffahrt*, 1861-87, and of the *Zeitschrift für Eisenbahnen und D. der österreichischen Monarchie*, 1886-90.

[Inama in *Allg. Deutsche Biogr.*—Stammhammer in *Handb. der Staatsw.*—Cossa, *Introd. allo Studio dell' E. P.*, ed. 1892, p. 534; English ed. 1893, p. 408.] J. K. I.

STEPHEN, JAMES (1759-1832), lawyer and distinguished anti-slavery agitator, was master in chancery Feb. 1811 to March 1831. He may be regarded as one of the ablest legal advocates of the anti-slavery group (see also ABOLITIONIST).

The publication of his most famous work, *The Slavery of the British West India Colonies delineated* (2 vols., London, 1824-30, 8vo) extended over six years. The title exactly describes the work. Vol. i. treats of the legal status of the West India slave, showing how he or she was debarred from giving legal evidence, bereft of the right of self-defence, and shamefully neglected in education. The volume closes with an account of the different kinds of ENFRANCHISEMENT and MANUMISSION. Vol. ii. treats of agricultural labour in the torrid zone, and the pernicious effect of its excess when forcibly exacted, with the consequent decline of population among the predial slaves on sugar estates. Chap. iv. exposes the barbarities practised on these plantations in excess of labour exacted under the lash, both as to time and actual physical exertion. Not only is the feeding, clothing, and housing of the negroes bad to the last degree, but they are even treated harshly when sick. Instances are quoted of ill-treatment, resulting in the slave's death. Chap. viii. concludes the work. Slavery is shewn to be a disgrace to Great Britain. The author quotes Mr. Pitt's view of compensation, and makes an urgent appeal to parliament to "undo the heavy burthen and let the oppressed go free."

This great work was both preceded and accompanied by smaller publications on the subject, *New Reasons for abolishing the Slave Trade*, by the author of *War in Disguise* (J. S.), 1807, 8vo. — *A Defence of the Bill for the Registration of Slaves in Letters to W. Wilberforce*, London, 1816, 8vo. — *Ibid. Letter the Second*, London, 1816, 8vo. — *England enslaved by her own Slave Colonies*, 1st ed. London, 1826, 8vo, 2nd ed. 1826, London, 8vo. Stephen also published *War in Disguise, or the Frauds of Neutral Flags*, 1st ed. London,

1805, 8vo; 3rd ed. London, 1806, a pamphlet on international law, and *The Dangers of the Country, by the author of War in Disguise* (J. S.) London, 1807, 8vo.

A. L.

STERLING. See EASTERLINGS; POUND STERLING.

STEUART, SIR JAMES (1712-1780), was born at Edinburgh, the only son of Sir James Steuart, solicitor-general of Scotland; great magistrates were also among his ancestors on both sides. Educated in the university of his native city, he was admitted as an advocate in 1735. He then, according to the custom of the period, went abroad and travelled for some years in the Netherlands, France, Spain, and Italy. At Rome he was presented to the Young Pretender, and became one of his most devoted and faithful supporters; he drew up the manifesto addressed to the people of England at the commencement of the insurrection of 1745. After Culloden, Steuart retired to France, and took up his residence at Angoulême, where he applied himself to the study of political economy and finance, for which he had always shown a marked predilection. He afterwards removed with his family successively to Paris, Brussels, Frankfurt, Tübingen, Venice, Padua, and Antwerp, thus extending the range of his social observation. At the peace of 1763 he was allowed to return to Scotland on certain conditions; and in 1767 recovered the full rights of citizenship. In 1770 the work on which his reputation rests appeared. The range of subjects with which it deals is indicated in the title—*An Inquiry into the Principles of Political Economy, being an Essay on the Science of Domestic Policy in Free Nations, in which are particularly considered Population, Agriculture, Trade, Industry, Money, Coin, Interest, Circulation, Banks, Exchange, Public Credit and Taxes*. He describes it as "an attempt towards reducing to principles and forming into a regular science the complicated interests of domestic policy," offering it only "as a canvas for better hands than his to work upon." The book was at first well received at home, but after the publication of the *Wealth of Nations*, it fell into neglect, and has never since been much studied in England. Opinion respecting it has varied much among foreign economists. Many of the Germans from HUFELAND (1807) to HASBACH (1891) have estimated it very highly. HERRENSCHWAND declared Steuart to be the most thorough (*Gründlichste*) of all the English economists. Rehberg thought him more important than Smith, and valued so highly his exposition of the theory of money and prices that he said it ought, as a work of instruction, to be placed beside the *Principia* of NEWTON. He thought it very desirable that Steuart should find an interpreter (*Bearbeiter*), as Smith had found one in J. B. SAY. Roscher also holds him to have been "a great economist," who, by the higher

merit of Adam Smith, and especially by the classic form of the latter's exposition, has been thrown unduly into the shade. On the other hand, in the view of GENTZ, "Steuart is to Smith what a very practised calculator is to a profound mathematician"; and the Italian Cossa, whilst admitting that he has good ideas on population, taxes, machinery, the influence of the market, and the distribution of systems of cultivation, adds—"It is mere pedantry to compare with the PHYSIOCRATS and with Adam Smith, a writer who could not distinguish between money and capital, value and price, wages and profits." One characteristic which has doubtless won for him the special esteem of the Germans is the *relativity* of his conceptions (which Roscher regards as among the most marked advances in economics before Smith), his constant reference to the stage of general national culture as influencing industrial life, and his often repeated enforcement of the necessity of adapting public policy to "the spirit, manners, habits, and customs of a people." He agreed, too, with most of the recent Germans in his sense of the danger of excessive abstraction, of too wide generalisation in deductive reasoning, and of neglecting "the influence of concomitant circumstances" on economic facts.

Steuart is to be viewed as one of those eclectics of the 18th century who, like FORBONNAIS in France, JUSTI in Germany, SONNENFELS in Austria, and GENOVESI in Italy, attempted to produce a connected series of dissertations on the several subjects with which political economy deals, before the foundation of the study on a truly scientific basis. He, as well as those foreign writers, adopted a system of moderate mercantilism, from which his acquaintance with the *Essays* of Hume had not converted him. In the spirit of the mercantile school, he considered political economy (he had adopted that name from MONTCHRETIEN) to be not so much a science as an art, having for its object "to provide food, other necessities, and employment for every member of a society." We find in him many survivals of the characteristic prejudices of the mercantilists. Thus, for example, he entertains an altogether exaggerated view of the influence which statesmen can exercise on the national well-being. He dwells too much on the circulation of money as the one thing needful, the doing which tends to obscure all our notions of industrial economy. He over-estimates the importance of foreign as compared with domestic trade. And he seems to countenance the old opinion expressed by MONTAIGNE, that in the commerce of peoples "le profit de l'un est le dommage de l'autre."

The plan and leading features of the *Inquiry* will be understood from the following summary:—Bk. i. is devoted to *Population*. Steuart is one of those named by MALTHUS in the preface to his *Essay* as having preceded him on this subject;

and he is generally admitted to have treated it well. He compares the generative faculty to "a spring loaded with a weight, which always exerts itself in proportion to the diminution of that weight," and explains clearly how increase and decrease of numbers follow the increase and decrease of the available amount of food. Bk. ii. is on *Trade and Industry*. Here he seeks to show how a judicious statesman ought to be constantly endeavouring, by legislative interference adapted to varying circumstances, to encourage some and discourage other branches of industry and commerce. He dissents from, and criticises, the views of Hume with respect to what the latter writer considered unfounded ideas as to the balance of trade. Bk. iii. is on *Money and Coin*, which are treated at great length; British coin, in particular, being historically dealt with, and its defects and the necessary remedies being elaborately discussed. In bk. iv. the author treats of *Credit and Debts*, and goes fully into the theory of banking and the history of some foreign banks, especially the Bank of France, and also into the doctrine of exchange. Bk. v. is on *Taxes*, which he divides under three heads: 1. those upon alienation, which he calls *proportional*; 2. those upon possessions, which he calls *cumulative*; and 3. those exacted in service, which he calls *personal*. A proportional tax is paid by the buyer who intends to consume at the time of the consumption, and is consolidated with the price of the commodity. Examples are excises, customs, stamp duties, postage, and the like. A cumulative tax implies no transition of property from hand to hand; instead of being laid on any determinate piece of labour or article of consumption, it is made to affect past, and not present, gains. Examples of this class are land-taxes, poll-taxes, window-taxes, etc. Of the third class, the *Corvée* in France was an example, as was also the militia service in England before pay was allowed.

The most important general rule respecting taxation, according to Steuart, is that it ought to impair the fruits, and not the fund-income and not capital. The net produce of the land remaining after deduction of the cost of production should alone be taxed, and so also only the produce of artisan work over and above the "physical necessary" of the workman, that is, his maintenance and his expense on tools. He refutes the notion that taxes act as a spur to industry, whilst admitting that a wise expenditure of them by the government may have that effect. He discusses the *Dime Royale* of VAUBAN, and considers the question of the mode of collection of taxes, whether by farming or through government commissioners.

Steuart is not an attractive writer. His failure to achieve popularity must be in part attributed to his defects of style. Cossa complains of his tiresome digressions, and Dugald STEWART, while acknowledging him to be "very ingenious and well informed," remarks on the profusion of words with which he often obscures his meaning. Indeed, Steuart himself apologises for his prolixity and other faults of style, and tells his readers that he has sacrificed everything else to perspicuity. But more adverse still to his acceptance and reputation was the state of opinion in his time,

when the principles of industrial liberty were strongly tending towards the decisive ascendancy, both intellectual and political, which they were destined soon to acquire from the superior genius of Adam Smith. Steuart's book must, however, always retain at least a historical interest and value, as abounding in information respecting facts and institutions, and exhibiting the transitional stage of economic studies immediately before the new era opened by the *Wealth of Nations*.

Other writings of Steuart are:—*A Dissertation upon the Doctrine and Principles of Money applied to the German Coins*, 1761; *The Principles of Money applied to the Present State of the Coin of Bengal*, 1772; *A Dissertation on the Policy of Grain*, 1783; *Plan for Introducing Uniformity of Weights and Measures over the World* (published posthumously). These tracts will be found in the edition of his collected works published by his son General Sir James Steuart (6 vols., 1805). Appended to this edition are *Anecdotes of his Life*, by the editor. There is also a biography by his nephew Lord Buchan, 1780.<sup>1</sup>

J. K. I.

STEWART, DUGALD (1753-1828), was son of Dr. Matthew Stewart, the able successor of Maclaurin as professor of mathematics in the university of Edinburgh. To that university the young Dugald passed from the High School as early as 1765, and was there a pupil of Adam FERGUSON; he was afterwards a student at Glasgow for a session, where Reid was then teaching. In 1785 he succeeded Ferguson in the chair of moral philosophy, which he continued to fill till 1810.

It was the practice of the Scottish professors of moral philosophy to include in their courses lectures on political economy. Stewart did so, and with great effect, exerting by his teaching of this, as of the other subjects he dealt with, a powerful influence on many hearers who afterwards became distinguished, as for example Lords Lauderdale, Palmerston, Lansdowne, Brougham, and Jeffrey, Francis Horner and Sydney Smith. "His disciples," says Sir James Mackintosh, "he lived to see among the lights and ornaments of the council and the senate; and, without derogation from his writings, it may be said that his disciples were among his best works." The course on economics delivered by Stewart was prepared by

<sup>1</sup> The anxious care Steuart devoted to his work, his desire to do his very utmost for the benefit of his country, his earnest anxiety to be impartial, stamp his work with a powerful and vivid individuality. His very motto—

*Ore trahit quodcumque potest atque addit acervo*

is characteristic of his energetic toil and his consciousness that at the time he wrote patient labour was what was most needed to advance the study, the interests of which he had so closely at heart.

him for publication in a corrected and amplified form; but his son, in a fit of disappointment and despondency, destroyed the manuscript, only a small portion accidentally escaping, along with those of other writings of his father and almost all his correspondence. What could be recovered of the economic lectures, whether in this revised form or in their earlier shape, with additions from notes taken by students when they were delivered, has been published in Sir William Hamilton's edition of *Stewart's Collected Works* (1877), vols. viii. and ix.

Whilst in general agreement with the practical conclusions of the *Wealth of Nations*—of which he elsewhere said that it was "the most comprehensive and perfect work that had yet appeared on the principles of any branch of legislation"—he occasionally criticises Smith's statements of theory and technical phrases and distinctions, differing from him, however, with reluctance. In advocating liberty of individual enterprise and unrestricted exchange of the products of personal or national industry, he goes even farther than his master, as with respect to the NAVIGATION LAWS. He also examines with care the doctrines of the PHYSIOCRATS, and to some extent defends them against the strictures of Smith. He seeks to enlarge the comprehension of political economy, so as to make it comprise "all those speculations which have for their object the happiness and improvement of political society." His observations everywhere exhibit good sense, clearness of thought, and a fine enthusiasm for justice, liberty, and progress. But he is sometimes unduly prolix, and degenerates into commonplace; and he is too much given to quotation, even where there is nothing in the passage cited which might not as fitly have proceeded from his own pen.

The subjects successively dealt with by Stewart in his lectures are—population, including the question of the comparative advantages of small and great farms, enclosures, and agrarian policy in general; national wealth, with the distinction of productive and unproductive labour; money, prices, and interest; trade, especially the trade in corn; taxation; and the relief and maintenance of the poor. After the study of those subjects which strictly belong to political economy, follow a brief treatment of the education of the lower orders, and a pretty full discussion of politics proper or the theory of government. The bibliography of the lectures is very valuable.

Besides the lectures, he was author of an "Account of the Life and Writings of Adam Smith," read before the Royal Society of Edinburgh in 1793, and published in vol. iii. of its *Transactions*. There is a biography of Stewart by John Veitch in vol. x. of Hamilton's edition of his works.

J. K. I.

STINT, sometimes called a cattle-gate, was pasture on which the tenants of a MANOR, and even the lord himself, might graze only a limited, "stinted," number of cattle, usually perhaps for a limited season of the year. The right of grazing cattle on stinted pastures

was not a general but a specific right of common; it did not carry with it ownership of the soil, but it was a real estate, tenable and transferable as a freehold or a copyhold tenement, like any other estate in land.

The term is said to be chiefly used in the north. [Elton, *Law of Commons and Waste Lands*, ch. ii. and *Law of Copyholds*, p. 18, note.—Woolrych, *Law of rights of Common*.—Joshua Williams, *Rights of Common*.—Fitzherbert, *Extent Maner.*, 12, 13.—*Gen. Inclosure Act*, 8 & 9 Vict. c. 118.]

E. G. P.

STIPULATIO is the ordinary contract of Roman law entered into between the parties in the presence of each other by the oral form of question and answer, e.g. the stipulator or promisee asks the other party, the promissor or person promising: Do you promise to pay me 10 aurei? The promissor answers: I do promise.

The stipulatio might be either absolute or conditional.

It was a general form, by which any kind of agreement might be made.

*Stipulatio poenae nomine* corresponds in principle to the bond of English law.

The stipulatio did not require witnesses, but it became usual to draw up a written memorandum (*cautio*) of its terms, at the time of its being entered into, and the existence of such a memorandum was under the law of Justinian presumptive evidence of the fact that the form of question and answer had been observed.

E. A. W.

STIRLING, PATRICK JAMES, LL.D. (1809-1891), for fifty years a well-known and much respected lawyer in Dunblane, N.B.

Author of *The Philosophy of Trade, or Outlines of a Theory of Profits and Prices, including an examination of the principles which determine the relative value of Corn, Labour, and Currency*. (Edinburgh, Oliver and Boyd, 1846): also of *The Australian and Californian Gold Discoveries and their Probable Consequences* (Oliver and Boyd, 1853): translator of BASTIAT's *Harmonies* (1860) and *Sophismes* (1863), the former with a notice of Bastiat's life and writings. *The Philosophy of Trade* treats, in a highly abstract way, of value, labour, profits, rent, foreign trade, the chief contention being, in opposition to Ricardo, that value depends solely on the relation of demand and supply. It purports to describe in outline the laws which would regulate the operations of trade in its healthy and unfettered state, assuming freedom from external interference of every kind, even from taxes for revenue. It had the good fortune to be highly praised in the *N.B. Review*, Nov. 1846, by Dr. T. CHALMERS—whose favourite student Stirling had been in St. Andrews—as "something far higher than an exposition: it is a rectification of first principles"; and by George Eliot in the *Westminster Review*, Oct. 1847, for "the extreme clearness of its illustrations and the almost geometrical form of its doctrines and demonstrations."

In the *Gold Discoveries* one sees the misgivings

with which the new flood of precious metal was regarded. Stirling anticipates "a great social and commercial revolution, a disturbance of the relations and distribution of property"; suggests that prices may be trebled or quadrupled; and seriously "counts the cost" of adhering to the gold standard. He has, however, the true banker's belief in the sacredness of the money contract. "The man who has undertaken to pay his creditor £100 sterling has in law and in fact engaged to deliver to him 100 sovereigns, or 253 oz. of standard gold. Providence, in the meantime, has furnished the debtor unexpectedly with cheaper and more abundant means of fulfilling this engagement. Is he to be deprived by arbitrary legislation of the benefit of those means?" In the end he concludes that the question embraces considerations of justice and equity as well as of policy and expediency, and should be handed over to the politician or practical statesman.

W. E.

STIRNER, MAX (1806-1856), born at Bayreuth, is the name by which Caspar SCHMIDT, the philosophic individualist anarchist, is most generally known in Germany. After studying philosophy and theology, he became a master at the Gymnasium in Berlin, and was also a teacher in a girls' school. He published, in 1845, his chief work, *Der Einzige und sein Eigenthum*. This had a brilliant but transitory success. He also wrote a *History of the Reaction after 1848*, and published translations of Adam Smith and other English economists. His life was spent in humble circumstances, and he died in poverty. His position was that of an individualist anarchist of the most extreme and uncompromising kind, preaching the cultus of the ego of the individual almost as a religion. He maintained in his *Einzige und sein Eigenthum* the crudest form of the doctrine "might is right," deriving every right and moral sanction from the individual alone. His views on property are best expressed in his own words, which form a remarkable contrast to Proudhon's view that "property is theft." "What is my property?" asks Stirner, and answers at once, "Nothing but that which is in my power: to what property am I entitled? to any to which I entitle myself. I myself give myself the right to property by taking property." He accepts the principle that in labour-questions each should look out for himself, and will have no organisation and no division of goods among the community. He would let all struggle for existence, and fare as best they can. The only form of community he would admit is that of a "free union of egoists," which should only last as long as any one member of the union pleased. Stirner, in fact, is the philosophic exponent of the extremest form of LAISSEZ FAIRE and INDIVIDUALISM (q.v.) in society and economics, and as such has had considerable influence over the modern school of anarchists in Germany and Russia.

[Stirner's chief work is *Der Einzige und sein Eigenthum*, Leipzig, 1845, republished by Ph. Reclam of Leipzig, with an introduction by Paul Lauterbach.—See also *Max Stirner und Friedrich Nietzsche, Erscheinungen des modernen Geistes*, by R. Schellwien, Leipzig, 1892; and (better) *Der Anarchismus*, by E. V. Zenker, Jena, 1895.—Cf. Nordau, *Entartung*, 1892.] H. de B. G.

STIVER, the full predecimal money of account of Holland, Flanders, Brabant, Liège, Clèves, and Westphalia, may be stated thus:—lb. (£) = 3 rix dollars = 6 florins [£] = 20 schillings (s) = 120 stiver [s] = 240 groat (d) = 960 pfennig (Clèves) = 1440 deniers [d] = 1920 pfennig or (in Clèves) heller; but some only of these items are selected, and those to which we have given the Carolingian titles £ : s : d do not appear twice over in the usual money of account. The stiver, when coined, was in modern times the least silver coin; it has now been superseded by the 5 cent piece, with which it is popularly identified.

[P. Kelly, *Universal Cambist* (1835).—Tate, *Modern Cambist* (1893).] J. D. R.

STOCK. Public loans may be raised in one of two ways: either by the issue of bonds, obligations, or debentures, or by the issue of "stock." Bonds, obligations, or debentures are issued in fixed amounts; stock, on the other hand, may be allotted and transferred in any amounts appearing suitable to the parties concerned, subject, however, in some cases to certain restrictions prohibiting fractions of pounds or of larger or smaller amounts. In the case of securities of the first named description the investor receives a document stating his rights, whilst in the case of stock the document, if any, which the holder receives, merely states that he is the holder of stock for a certain amount constituted by some statute, or trust deed or general bond, by which the rights of the shareholders are defined (see DEBENTURE STOCK).

The expression "stock" is also used in respect of such part of the capital of a company as has ceased to be divided into shares of fixed and equal amount. Shares in companies may be converted into stock as soon as their nominal amount is paid up in full.

[Companies' Act 1862, §§ 12 and 28; Companies' Clauses Consolidation Act, § 61. The conversion of shares into stock is almost universal in the case of English railway and canal companies.] E. S.

STOCK EXCHANGE. See EXCHANGE, STOCK.

STOCK JOBBING. See JOBBER.

STONE. See MEASURES AND WEIGHTS.

STOPPAGE IN TRANSITU. If a buyer of goods becomes insolvent, the unpaid seller who has parted with the possession of the goods has a right of stopping them *in transitu*, that is to say, he may resume possession of the goods so long as they are in course of transit,

and may retain them until payment or tender of the price.

[As to the Roman law, see Moyle, *Contract of Sale in the Civil Law*, Oxford, 1892. As to English law, Sale of Goods Act 1894, §§ 44-46; Chalmers on the *Sale of Goods*, London, 1894; and as to the French law, art. 1664, of the *Code Civil*, and arts. 574-576 of the *Code de Commerce*.]

J. E. C. M.

STORCH, HEINRICH FRIEDRICH VON (1766-1835), is sometimes regarded as having, along with C. von Schölzer, founded a Germano-Russian school of economics; he had at least the principal part in naturalising economic studies in Russia (see RUSSIAN SCHOOL). Born at Riga, he studied philosophy, law, and political science at Jena and Heidelberg. He afterwards travelled in South Germany and France, and published the results of his observations in *Skizzen, Scenen, und Bemerkungen auf einer Reise durch Frankreich gesammelt 1787*. In 1788 he returned to Russia, and was appointed professor of belles lettres to the corps of cadets at St. Petersburg, and secretary to the chancellor of the empire. In 1799 he was employed as teacher of the daughters of the czar Paul I., and obtained, some time after, the title of court councillor, which conferred on him hereditary nobility. He was charged by Alexander I. and the empress mother with the instruction in political economy of the granddukes Nicholas, afterwards emperor, and Michael. The lessons which he gave to his imperial pupils composed the substance of his principal work, *Cours d'économie Politique, ou exposition des principes qui déterminent la prospérité des nations*, 6 vols., Petersburg, 1815.

Storch is, in essentials, a follower of Adam SMITH. He also uses J. B. SAY largely, but judges the opinions of both these writers with independence. On the theory of RENT, he approaches the School of RICARDO. There is not much originality in the portion of the work relating to general theory, but he is strong on several special subjects; thus, he gives a full and luminous account of the organisation of almost all the banks of Europe. As BLANQUI remarks, he was favourably situated for studying peculiar conditions and institutions which existed in Russia, but which had been overlooked or insufficiently considered by the economists of the western nations; hence his work is valuable in relation to SLAVERY and the emancipation of the working classes. He described with praiseworthy honesty the vices of the contemporary administration of justice in Russia, the spendthrift and irregular lives of the nobility, and the economic and moral evils resulting from SERFDOM. The book was too liberal in tone for the Russia of his day, and a Russian translation of it was forbidden by the censorship.

We find in Storch germs of the principles of the HISTORICAL SCHOOL. He points out the impossibility, in many cases, of arriving at theorems of universal validity, and the necessity of studying

economic phenomena in their relation to the stage of development which the wealth and institutions of a nation have attained. He shows a tendency to the expansion of economics into a general theory of civilisation, as is indeed indicated by the title of his principal work. With this tendency are connected his treatment of personal intellectual and moral acquisitions and possessions as economic goods (see GOODS, ECONOMIC), and his discussion of the differences between agricultural, manufacturing, and commercial societies. He freely introduces ethical considerations, led to this, doubtless, as ROSSI has suggested, by a sense of the importance of calling the attention of his princely pupils to higher things than economics. J. B. SAY published in France an unauthorised edition of the *Cours* (1823), with notes, in which he sharply contradicted some of the author's opinions. Storch, justly indignant at this, replied to some of Say's criticisms in a treatise entitled *Considérations sur la nature du revenu national* (1824), which may be regarded as an additional volume of the *Cours*, and is, perhaps, his most mature and scientific work. In it he corrects and completes Say's theory of immaterial products, and refutes his doctrine that for an entire people the gross and net revenue are identical.

The *Cours* was freely translated into German, with additions, by RAU (1819-26), and the *Considérations* into the same language by Storch himself (1825). Other works of Storch are—*Statistische Uebersicht der Statthalterschaften des russischen Reichs*, 1795; and *Historisch-statistisches Gemälde des russ. Reichs am Ende des 18ten Jahrhunderts* (9 vols. 1797-1803). He also edited (1803-1811) a periodical entitled *Russland unter Alexander I.*

STORY, JOSEPH (1779-1845) jurist, son of Elisha Story, was born at Marblehead, Massachusetts, on 18th September 1779, graduated at Harvard in 1798, becoming LL.D. in 1821, and gave himself to the study of the law, commencing practice in Salem in 1801. He rapidly acquired distinction, was elected to the state legislature as a democratic member for Salem in 1805, and to congress in 1808. In 1811 he became speaker of the Massachusetts assembly, and the same year was appointed associate justice of the supreme court of the United States. In 1829 he was elected to be the first professor of law at Harvard. In 1881 he declined the post of chief justice of Massachusetts. He died at Cambridge, Mass.

Story was a profound lawyer, and the number of works he left behind him is extraordinary. The aspect of his work which concerns this dictionary is the value of his contributions to INTERNATIONAL LAW. His judicial career began just before the war of 1812-14, and he had to face the intricate questions of admiralty law, salvage, marine insurance, and prizes. His study of these questions led up to that great work entitled *Commentaries on the Conflict of Laws*, Boston,

1834. A selection from his decisions, entitled *Notes on the Principle and Practice of Prize Courts*, was published in London in 1854.

**STOTINKI.** A Bulgarian copper coin equivalent in currency value to the French centime.

100 stotinkis—1 leu (or franc).

F. E. A.

**STRACCA, BENVENUTO** (1509-1578), born at Ancona, of a business family. An eminent jurist and originator of scientific commercial law; he collected and compiled, on absolutely systematic lines, a body of precepts which, up to that date, had been scattered over innumerable volumes of *Commentaries* and *Opinions*. His works contain information of interest to economists. He shows the usefulness of trade and navigation; discusses the restrictions on certain branches of trade, and expresses comparatively moderate opinions on the theory of usury.

He wrote *De Mercatura seu Mercatore*, Venetiis, 1553.

[See Franchi, *Benvenuto Stracca, giureconsulto anconitano del secolo XVI.*, Rome, Loescher, 1888.

U. R.

**STRIKES.** A strike is a cessation of work resulting from an agreement on the part of a body of workmen either to break or not to renew their existing contracts of service. Since the passing of the Conspiracy and Protection of Property Act 1875, it has ceased to be, in any case, a criminal offence (see CONSPIRACY, COMMON LAW DOCTRINE OF); but, where there is breach of contract, the employers affected can recover damages both from their workmen and probably also from the promoters of the strike (see *Lumley v. Gye*, 2 E. and B. 216; and *Bowen v. Hall*, L.R. 6, Q.B.D., c. 333). A cessation of work resulting from an agreement not to renew existing contracts may be the occasion of many acts civilly or criminally wrongful; but it affords in itself no ground for any legal proceedings whatever, except possibly in so far as its promoters may be proved to be acting "maliciously" (see *Temperton v. Russell* (No. 2), 1893, 1 Q.B., 715).

To conduct a strike successfully, the men must be able to prevent the employers obtaining a sufficient supply of labour from other sources. With this end in view, they generally station "pickets" to guard the approaches to their places of work and persuade other workmen to keep away. The mere act of "picketing" was formerly considered "intimidation," and, therefore, a criminal offence. Under the Criminal Law Amendment Act 1871, however, "intimidation" ceased to be criminally punishable unless it was of such a

character as to justify a magistrate in binding over the intimidators to keep the peace; and it has been decided that the Conspiracy and Protection of Property Act 1875 has made no change in the law on this point (see *Curran v. Treleaven*, 1891, 2 Q.B., 545).

Sir R. Giffen, when controller-general of the commercial, labour, and statistical departments of the board of trade, calculated from a comparison of the board of trade wages statistics with the census returns that the amount annually paid in wages to British manual labourers is about £633,000,000 (see WAGES), and from the figures given in the annual reports of the labour department on strikes and lock-outs (see LABOUR DEPARTMENT), it would appear that a further sum of nearly £1,500,000, which would otherwise be paid in wages, is annually lost on average, during strikes, to the workers employed by the firms immediately affected. According to the report on the strikes and lock-outs of 1892 (*Parl. Papers*, c. 7403 of 1894), 700 disputes, having an average duration of 32 days, and throwing out of work 371,799 persons employed in the 3000 establishments directly concerned, at an aggregate loss in their wages of about £3,900,000, occurred in the course of that year. These figures relate to a period not only of bad trade, but also of considerable industrial disturbance; and they will appear the more significant when it is remembered that they take no account of the economic effect of the strikes upon the trades that depend upon the affected industries for their material or custom. It may be observed, however, that a temporary cessation of work may sometimes serve a useful purpose in enabling the employers to clear off their surplus stocks, and that the loss in wages, amounting, as it does after all, only to a fraction of 1 per cent of the total wages paid annually, is, in many cases, made up for by increased activity after the strikes are over.

It appears from the report of the royal commission on labour that by far the largest proportion of disputes, strikes, and lock-outs have direct reference to the increase or diminution of the standard of wages, or the introduction of fixed price-lists. Many other disputes relate to the standard of hours, a question which, in many cases, forms part of a conflict with regard to wages. Other conflicts are undertaken by trade unions to obtain the "recognition" of employers, to strengthen and enlarge their organisation, to limit the number of youths entering the trade, to prevent the employment of non-unionists or sometimes that of women and children, to defend unionist colleagues or assert unionist rules and customs, and, generally speaking, to protect the monopoly of workmen already in the organisation. But, in all cases, the ultimate object is to obtain as large a share as possible of the receipts of the in-

dustry, and to exercise a voice as to the general conditions under which it is carried on. Many disputes are connected with special customs or circumstances in particular works, with attempts to alter or prevent the alteration of various working arrangements, with questions of piecework, overtime, holidays, meal-times, and the introduction and abolition of systems of fines, deductions, and so forth. Some are of a merely personal nature, being connected, for example, with the unpopularity of particular officials. "Sympathy" or "on principle" strikes are those in which men engaged in one occupation strike without alleging any special grievance of their own, expressly in order to support men engaged in some other occupation who are involved in a conflict with their employers. A common instance of this kind of strike, in recent times, has been the refusal of dock labourers to discharge or to coal ships manned by non-unionist crews. There are also cases where a number of employers close their works in order to support a particular employer against whom a strike is being directed. Finally, there are the "demarkation" disputes, in which organised bodies of workmen, employed in some complex trade, like shipbuilding, are at issue with regard to the province of work belonging to each section. In this last case, employers, though not directly concerned in the disputes, yet have to bear the inconvenience and expense of the strikes or stoppages of work to which they lead (see *Fifth and Final Report of the Royal Commission on Labour*, p. 39, par. 100).

The history of strikes is the history of a series of struggles on the part of trade unions to substitute collective for individual bargaining between employers and workmen. It is noticeable that, as organisation in any given trade becomes more perfect, strikes become less frequent, though more severe. For, strong organisation on both sides makes possible both the formation of representative joint-boards to discuss differences and the enforcement of arbitrators' awards. The more advanced section of the labour leaders are of opinion that, in most cases, "the points at issue are not such as admit of decision upon any principles that both parties accept," and they, accordingly, conclude that "the only complete solution of the problem is to be found in the progress of the industrial evolution, which will assign to the 'captains of industry,' as well as to the manual workers, their proper position as servants of the community." *Fifth and Final Report of the Royal Commission on Labour*, pt. i. pp. 145 and 146; *Parl. Papers*, c. 7421 of 1894. But the remarkable increase that has taken place in the course of the last few years in the number and effectiveness of boards of conciliation and arbitration encourages the hope that industrial peace may be best secured by their agency.

Statutory provision for the settlement of labour disputes by regular tribunals with power to enforce their awards has existed ever since the middle of the 14th century. But from the time that the legislature allowed the conditions of service to become a matter of free contract, neither employers nor workmen have ever been induced to make use of the judicial machinery provided for them, but they have always preferred to form voluntary tribunals of their own. The act of 5 Geo. IV. c. 96, passed in 1824 and amended in 1837, which empowered magistrates to nominate arbitrators with judicial authority on the application of either party, was never appealed to, and the acts of 1867 and 1872, enabling disputants to confer similar judicial powers upon boards chosen by themselves, proved equally unsuccessful. The policy of these acts, however, still meets with some favour among politicians. Thus, one of the members of the royal commission on labour, Sir John Gorst, reported in favour of an act enabling the central government and county councils to form boards consisting of representatives of employers and employed in equal numbers and independent chairmen, with power to compel parties to industrial disputes to appear before them and give evidence (see *Fifth and Final Report of the Royal Commission on Labour*, pp. 148, 149; *Parl. Papers*, c. 7421 of 1894). The majority of Sir John Gorst's colleagues were of opinion that "no central department has the local knowledge which would enable it to attempt with success the creation of such institutions, and that the intervention of local authorities cannot be usefully extended at present beyond experimental action with regard to industrial tribunals to decide cases arising out of existing agreements" (see *Fifth and Final Report of the Royal Commission on Labour*, p. 100, par. 301; *Parl. Papers*, c. 7421 of 1894). The Conciliation Act, 1896, has since been passed, repealing the Acts of 1824, 1867, and 1872, and empowering the board of trade to employ persons to investigate the causes and circumstances of particular strikes, and assist the disputants to come to terms.

STRINGENCY IN THE MONEY MARKET is produced, not by any actual scarcity of currency, but by fear lest, owing to loss of credit, there may be a greater demand for liquid funds than can be readily supplied. A crisis of this character, when intensified and prolonged, becomes a Panic (see *CRISES*). The most notable instances, during recent years, of stringency stopping short of panic, are the crises of October 1878 and of November 1890. In the former the stoppage of the City of Glasgow Bank, on the 2nd of October, was the first indication of loss of credit. Several other failures followed, but in the end the necessities for forced liquidation proved less than had been expected. The bank rate was not raised beyond 6 per cent, and though the banking reserve fell from 44 per cent to 28 per cent of the liabilities, both the bullion and the active circulation increased by about two millions. In November 1890 the crisis arose out of the heavy liabilities of Baring Brothers and some other firms interested in South American finance. Arrangements were made for the liquidation of the Barings' estate under guarantee by the bankers and merchants of the city of London, and of other important cities, and for a special import of gold from France. The circulation remained almost stationary, the bullion and the reserve rapidly increased, and the danger subsided without requiring the increase of the bank rate beyond 6 per cent. [See *STRINGENCY*, Appendix.]

STRUZZI, ALBERTO (17th century), an Italian by birth or descent, was naturalised in Spain and became an officer in the household of one of the Royal *Infantas* (see *SPANISH SCHOOL*).

His *Discurso sobre el Comercio de estos reinos de Castilla*, published 1624 (no place mentioned), is perhaps the earliest work which advocates absolute international free trade. It precedes the *Discourses upon Trade* (1691) of DUDLEY NORTH by almost three-quarters of a century; and though LUNETTI, his contemporary and countryman, advocated the suppression of the Neapolitan customs duties in his *Politica Mercantile* (Naples, 1630), he still upheld the legal regulation of the rate of exchange, and did not admit free export of money. In his *Biblioteca de Economistas Españoles*, and his *Historia de la Economía Política en España* (ii. pp. 338, 339), Colmeiro gives the following account of Struzzi's decidedly liberal views on the subject. Trade is free by the natural law of nations. The diversity of the territories of nations compels free exchange of goods; this ensures plenty and cheapness both for agricultural produce and manufactures. Prohibition causes waste; it is evaded by smuggling, and any attempt to repress smuggling is fruitless; one might as well attempt to keep people out of an open field merely by putting up a gate at the entrance. Free trade leads to a natural return for the goods which leave the kingdom; gold and silver ought not to be retained in Spain

under penalty of forfeiture of the king's taxes and dues. As Spain is unable to provide her colonies with the manufactures required, to exclude foreign goods is equivalent to driving out of Spain half the amount of the precious metals which have been extracted in the New World, or to showing foreign nations the way to carry them off themselves. Struzzi concludes with this sentence: "It is easy to talk about the prohibition of [foreign] goods, but to do this is no easy matter." See also Cossa, *Saggi di Ec. Pol.*, p. 47 (Milan, 1878).

E. Ca.

STYLE OR TRADE NAME. It is usual for traders, whether trading singly or in partnership with others, to adopt a name under which the trade is carried on, which need not necessarily be the name of the person or persons who carry on such trade. English law allows complete liberty in this respect. A man may trade under any name he chooses to adopt, and may carry on a number of separate trading-establishments under a number of different names. One trader may use a trade name implying that several persons are carrying on the business together, and several partners may carry on a business under a single name. The only limit to this complete freedom in the choice of trade names is imposed by the necessity of respecting the rights of others.

If a person uses the trade name of another person with the intention of making his customers believe that they are dealing with such other person, he may be restrained from using such trade name—though it may be his own name; but in case of a person using his own name, the intention to deceive must be proved, whilst in the case of a person using the trade name of another not being his own name, the intention to deceive is presumed (see *Reddaway v. Banham* [1896], A. C.; *Tussaud v. Tussaud*, 44 Ch. D.).

In continental countries the rules about trade-names are much stricter. In Germany a single trader starting a new business may not use any name except his own surname with or without Christian names (*German Mercantile Code*, § 16; after the 1st January 1900 one Christian name at least, written out in full, must form part of the trade name—*New German Mercantile Code*, § 18), and the trade name of a newly-established firm must contain the name of one of the partners at least, and if it does not contain the names of all of the partners, must add an indication showing that there are other partners (e.g. the words "and Company"); (*German M.C.* § 17; *German N.M.C.* § 19). The trade name of a single trader or of a firm may, however, remain unchanged notwithstanding the accession or retirement of any partner, and any person or persons purchasing an existing business may continue the use of the former trade name if authorised to do so by the former owner or owners of such business (*German M.C.* §§ 22 and 24; *German N.M.C.* §§ 22 and 24). The German law also provides that a new trade name must be distinguishable from any existing trade name used in the same place (*G.M.C.* § 20; *G.N.M.C.* § 30).

The provisions of the French law are similar—

(*Code de Com.* § 20), but in France the trade name of a single trader cannot be continued by his successor or successors, and the trade name of a firm may not contain any names not being the name of one of the actual partners (*Code de Commerce*, § 21; as to Switzerland, see *Swiss Code of Obligations*, § 872).

In many continental countries all trade names must be registered, and in these countries it is always possible for all persons by searching the register to ascertain who at a given moment are the owners of a business carrying on trade under a given trade name (see for instance *G.M.C.* § 19; *New G.M.C.* § 21; *Swiss Code of Obligations*, § 861). The absence of such a provision in English law has frequently been the cause of inconveniences and loss. It is often most difficult to ascertain the name of the owner of a business or to find out whether any of the persons whose names appear in a firm name are still partners in the firm using such firm name, and it is much to be regretted that the attempts made from time to time in this country to remedy these evils by legislation were frustrated by the passive resistance of persons who probably did not realise the extent of the mischief which they helped to perpetuate. If compulsory registration of trade names were introduced, the freedom of choice in the selection of a trade name which is characteristic of British as distinguished from foreign law, would cease to have any prejudicial effects. E. S.

SUB-CONTRACT—or the system under which Jones contracts with Smith to do some work for Smith, and with Brown that Brown should do it or part of it—is, like agency, almost as universal as trade. Two kinds of sub-contractor have recently attracted attention. First there is the middleman. He figured in the Devon (1845) and Bessborough (1881) commissions as the lessee who lived by rackrenting sub-tenants, unchecked by that custom, public opinion, and remote self-interest, which sways British landowners, and therefore—the conditions of competition being unequal—woe followed in his wake. Similarly, where poor people cluster in large towns, some sub-lessors have left the same trail (*Report of S. C. of H. of C. on Artisans' Dwellings* (1882), vol. vii. p. 35; *Report of Royal Commission on the Housing of the Working Classes* (1884-85), vol. lxxx. p. 21), although others have bettered and brightened the houses which they sub-let, Mr. Casby and Miss O. Hill being found in the same ranks. Again cases have been cited where Brown consisted of desperate destitute immigrants whose ways and language Jones knew and Smith did not, or where prices have fallen and Smith has been ashamed to pay Brown less than customary prices, so that it pays for Jones to buy from Brown and resell to Smith at competition prices. Jones, in the former case, is better known as “the Jew” of the tailoring trades, and in the latter case as the “fogger” of the chain- and nail-making trades; but both cases are very rare, and both

“Jew” and “fogger” have other functions. None of these intermediate parasitic interests can last long, and a little more or a little less competition than that which created, invariably kills them.

Secondly, the artisan contractor or, more usually, sub-contractor—who is quite distinct from the middleman—is a worker of the same kind as his labourers, and he represents the integration, they the division, of labour. Fletcher, one of the assistant commissioners on hand-loom weaving (1839-41), described him thus: before 1815 there were in Coventry (1) a “master-manufacturer” who bought thrown silk and had it dyed, (2) then let it out to the “master-weaver” or “undertaker,” (3) who with his family warped and wound it, and (4) his journeymen, helped by (5) unpaid apprentices, did the rest under his supervision with his looms in his house. Then (2) returned the perfected article to (1), who warehoused it in London. Estimates for waste, and prices as between (1) (2) and (4), called list prices, were until 1815 customary, afterwards a matter of contract and competition, so that (2) was henceforth contractor or sub-contractor. Then competition evolved the London non-manufacturing shopkeeper, squeezed out (2) and (3)—the “undertaker” (2) becoming (1) “little master,” or the “master-manufacturer” (1) dealing direct with the 4th class through one of its members (a foreman)—and assimilated (4) and (5); soon no producers were left except a dead level of labourers on the one hand, and on the other hand a master, large or little, who sometimes produced independently, sometimes under contract with non-manufacturing shopkeepers. Here sub-contract emerged for a moment at the point at which the mediæval passed into the factory system. Next CAIRNES in his essay on “Co-operation in the Slate Quarries of North Wales” (*Essays*, p. 166) rediscovered him in a new disguise—(1) a lessee who works a quarry sub-lets part of the quarry and quarrying to (2) “bargainers”; (3) the family is usually absent; and (4) journeymen—misspelt “germyms”—are often (5) learners. Cairnes, McCulloch, and Thornton have praised the system as akin to co-operative production, Brassey, *Lectures on the Labour Question* (1878), pp. 124-128, as akin to piecework. These cases, which still exist, deserve the praise bestowed on them, but are carried on under peculiar conditions; thus the principal contractor or lessee seldom parts with control over the ultimate employees for fear of Mines and Quarries' Acts and strikes, for the men work in the open and may combine; and he sometimes stipulates for usual wages (*Report of Labour Commission* (1894), vol. xxxv. pt. ii. p. 42); and, in Brassey's cases, selects his sub-contractor with the utmost care. Finally, this species was re-discovered about ten years ago, and called by

the hated name of "sweater"; for it was then a popular fallacy to identify sub-contracting and SWEATING; and nail- and chain-making, and cheap tailoring, and a few other unskilled and therefore overcrowded trades, were adduced in support of this theory. The history of nail- and chain-making is a replica of that of handloom weaving. About 1870 list-prices, estimated waste, and unpaid learners, were being superseded, and the non-manufacturing shop-keeper or "fogger" first appeared; and master-manufacturers' factories with their improved discipline and machinery began to grow on the ruins of the doomed domestic workshops, and the "master worker," passing through the stage of sub-contractor into that of "little master," began to cut himself adrift from the master-manufacturer, and to buy his own iron from, and to sell his own chain and nails to, the "fogger." Briefly, the old system is dying, and the new being born. Cheap tailoring is permanent, but its forms perpetually change: (1) is usually a shopkeeper who begins on his materials, then lets them out to the (2) "garret master"; for it is the same story over again, but (4) and (5) are fused, the ill-paid learners being called "greeners," button-holing is often sub-sublet, and the "garret master" turns "little master" in hard times. This "garret" or "little master" is he who chastises his employees with whips and himself with scorpions, but it is impossible to condemn the system without condemning competition, which would be useless, or home work and work in the homes of one's friends, which would be unnatural. Granted that where unrestricted competition, which does not include competition between the skilled, is grafted on the mediæval stock, danger results, yet the danger may be lessened: our war office introduced stipulations against out-workers (c. 1882); the London county council (1889) insert in their contracts stipulations for usual or trades union hours and wages, all School Board (1889) and government (1891) contractors undertake to pay specified or usual wages, or wages above a minimum, and similar provisions have been widely adopted by public bodies, and the Factory Act 1891, § 27, compels certain tradesmen to register out-workers. Similar clauses have passed into bye-laws, state laws (New York), and even constitutions (Utah), in America. One solution clearly lies in this method of increasing the employers' responsibility without impairing the sub-contractors' independence. But this solution only touches some artisan sub-contractors and contractors; others, and all the little masters—who are economically indistinguishable—are left untouched. It may be doubted whether the evils associated with the latter can be removed except by sanitary legislation, by example, by publicity, and public opinion. The tap-root of the evil is an ignorant recklessness on the part of

customers as well as of employers as to how, when, or where a thing is done, provided that it is done.

**SUBINFÉUDATION.** Land held in fee simple could not at common law be alienated so as to make the alienee hold of the chief lord unless the alienation extended to the whole of the land held by the same tenure. But the owner of a fee simple could always alienate by creating a sub-tenure, the alienee holding direct from such owner. The creation of a sub-tenure was called subinféudation. Subinféudation was abolished by the statute *QUIA EMPTORES*, temp. Edward I.

[Challis on *Real Property*, London, 1892.]

J. E. C. M.

**SUBSIDIES.** The word is defined by Cowell (*Interpreter*) as "an aid, tax, or tribute granted by parliament to the king." That it was a parliamentary grant is the characteristic distinguishing it from the customs which were from time immemorial raised by royal prerogative. There were several kinds of subsidy. (1) The subsidy in excess of the customs and designated from the commodity to which it referred. (a) Such was the subsidy of wool and leather, linked to the ancient custom on wool and leather. (b) Another subsidy of the same class linked to the new customs by which duties were imposed upon imports and exports of wine and cloth by aliens. This subsidy, under the name of poundage (see *TONNAGE AND POUNDAGE*), was subsequently extended to every species of merchandise, whether carried by aliens or denizens, and under that of tunnage was a subsidy granted upon every tun of wine imported by aliens or denizens. (2) The subsidy on lands and goods in lieu of the ancient feudal levies, granted from about the middle of the 14th century. They took the place of the obsolete scutages and carucages, and were the precedents for the land-tax and income-tax of modern times (see *TAXATION*). All these subsidies, conformably to their origin, were limited in duration.

I. S. L.

SUBSTITUTION, LAW OF. See LAW OF SUBSTITUTION.

SUCCESSION (SCOTS LAW). The guiding principle of Scots law, applied with but one exception of recent introduction, is that in matters of succession the relationship to be considered is relationship through the father, and through the father only. It will be convenient to make the explanation of the rules of succession hinge round the first personal pronoun.

If, then, I am a Scottish landowner, I may make my will as I please in respect to my land; but if I die without a will or a settlement, and thus leave my land to the ordinary law of intestate succession, my eldest son succeeds to it, or his heirs; failing them, my second son or his heirs, and so on; and failing all sons or their heirs, it passes as an undivided whole to all my daughters, who become heir-portioners, that is, they acquire equal interests in it, except that the eldest daughter gets the mansion-house, garden, and orchard, and in the event of a division of the estate, has the first right to claim her share of land out of the land immediately surrounding the house. It does not matter whether my sons are all by the same marriage or not; the list of them must be exhausted before my daughters can succeed. If I leave no descendants, my brother succeeds; that is, if I am the eldest brother of the family, my next younger brother or his heirs, and so on downwards; if I am the youngest, the next older or his heirs, and so on upwards; if I am a middle brother, first the next younger brother or his heirs and so on downwards; and on failure of them, my next elder brother or his heirs, and so on upwards. If I have no brothers of the full blood, my landed estate then goes to my full sisters (or their heirs) as heirs-portioners, as explained before. In the event of there being none such, the next in the order of succession are my half-brothers, being my father's, not my mother's sons, and their heirs, in a downward or upward order, as the case may be; and the next to them are my half-sisters, daughters of my father, or their heirs, who would take as heirs-portioners as before. In no case would landed property go to half-brothers or sisters the children of my mother, or their heirs, even though the estate may originally have come through my mother's family, for my father himself, if he be alive, stands next in the order of succession, and if he be not alive, his brothers and sisters first of the full blood, then of the half-blood, being children of my paternal grandfather, or their heirs, succeed in the same order as my own brothers and sisters or their heirs would have done. If all this fail, the succession goes back to my paternal grandfather and his descendants, such as a son of his by another marriage, and then to his brothers or sisters or their heirs, all as before and so on

until an heir is found; and in the event of failure to find any heir, the estate reverts to the crown as *ultimus haeres*. In all this scheme, a person is always represented by his heirs, so that for example in the event of my having no issue, and my late only brother having only left daughters, the estate will go to these my nieces, who represent my brother as his heirs, while he, if he had been alive, would have been my heir. Such is a general account of the rules in succession to heritable or real property. Now let us turn to the rules in succession to movable or personal property. In this there is no preference given to sex or seniority: all who are equally nearly related divide equally, with one exception, which is that the heir to the heritable (*i.e.* real) property, if he is also one of the next of kin, is kept out of any share in the personal property unless he is willing to collate his heritage, that is, to throw his real property into hotchpot and divide all equally. It must, however, be kept in mind that under Scots law, even if a man makes his will, it can have no effect as regards personal property over more than the law allows. The moment he dies, his wife and children acquire a vested right to part of his movable property; one-third to the widow, and one-third to the children equally; or if there be no children, one-half to the widow; or if he survive his wife, one-half to the children equally. The only case in which he can make a will to take effect over his whole personal property is that in which he leaves neither wife nor child. In all this it is assumed that there have been no settlements or renunciations to vary the normal course of events. The only part of his movable or personal property in respect to which a man can die intestate is the part which it had been in his power to bequeath, and this is the only part to which the term "succession" is applied in the technical language of Scots law. Limiting ourselves then to such portion of the movable estate as might be bequeathed, the following are, speaking generally, the rules of succession to that portion in the event of there being no will. If I leave children, these children or their representatives will, whether they be male or female, or whether they be by one marriage or by more than one marriage, divide the available fund into equal shares: and if any of them be already dead, leaving their children to represent them, the respective shares of my deceased sons or daughters go to their children, my grandchildren, share and share alike within the limits of each family. But if I leave no descendants, then if my father be alive he takes one-half; if he be not alive, my mother, if living, takes one-third: subject to such deduction, if any, my full brothers and sisters or their representatives get the fund, share and share alike, those who have died before me being represented by their respective families of children; and if there be no full brothers or sisters, then my father's other children, my half-brothers or sisters, if there be any, or their representatives, get the fund on the same terms. Next, if all the preceding fail, and if there be half-brothers or sisters of mine who are my mother's children, or descendants of these, one-half of the available fund is to be distributed

among them. At this point, the rule that a family represents its deceased parent fails us, and we have to take the groups of persons actually existing in the same relation to me at the time of my death. Thus, subject to any such deductions as have already been referred to in favour of my father or of my mother, or of my half-brothers and sisters on the mother's side, my movable property next goes to be divided equally among all my paternal uncles and aunts of the full blood who actually survive me; and if they have all died already, to be divided equally among all my first cousins on the father's side, who happen to survive me; and failing them, equally among their children actually surviving me, and so on. Then if these relatives of the full blood all fail, the next in order of succession are the similar paternal relatives of the half-blood (through the father). In default of all the preceding, the same order of succession is applied to my father's paternal uncles and aunts, to his first cousins, and so on, first of the full blood, and then of the half-blood, and then to my grandfather's, and so on until at length, in default of heirs in movables, we arrive at the crown as *ultimus hæres*.

**SUCCESSION DUTY.** See **DEATH DUTIES**; **TAXATION**.

**SUGDEN**, EDWARD BURTONSHAW, Baron St. Leonards (1781-1866), judge and jurist, was solicitor-general, 1829-30, lord-chancellor of Ireland 1835, and again 1841-46. He was lord high chancellor 1852, and was at the same time raised to the peerage as Baron St. Leonards.

He published among other things *A cursory Enquiry into the Expediency of repealing the Annuity Act, and raising the Legal Rate of Interest* (London, 1812, 8vo). This was issued in a series of letters. He deplores the iniquity of the sale of annuities, showing them to be a mere shift to evade the usury laws by raising money at an illegal rate of interest. The principal evils attending such sales are (1) the enormous interest—from 25 per cent, given on such loans; (2) the want of power in the grantor to redeem or repurchase the annuity. The bill for the repeal made all annuities redeemable, prohibited dealings with infants, moderated the allowance for brokerage, and gave the courts summary jurisdiction to set aside annuities under or over-valued. The bill did not, however, succeed in repressing grants of life annuities. Letters vii. and viii. deal with the inefficacy of the usury laws.

Sugden subsequently expanded these ideas into a volume entitled *Considerations on the Rate of Interest, Redeemable Annuities, and Foreign Loans* (London, 1817, 8vo).

The work opens with a brief recital of the former objections to usury; and quotes Bentham's justification of interest. It then enumerates the legislation on the subject from the 37 Hen. VIII. onwards. Sugden boldly advocates the raising of the legal rate of interest by 2 per cent, which would bring it to 7, instead of the 5 per cent at which it then stood. He blames the usury laws then in force for the commercial

stagnation of the country, since loans cannot be procured on reliable security at 5 per cent. If the rate of interest were raised, the author insists that the usury laws would be no longer evaded by the sale of annuities. A. L.

**SULLY**, MAXIMILIEN DE BÉTHUNE, Duc de (1560-1641). The Duc de Sully was the friend in childhood, the companion in arms, and minister of Henri IV. from his accession to the throne to his death. A Huguenot by religion, he did not follow his master when he became a Roman Catholic, though Henri advised him to do so. He belonged to that class of statesmen and economists who, like COLBERT and Chaptal, devoted themselves entirely to promote the prosperity of France.

Opposing the theory of the mercantile school (see **MERCANTILE SYSTEM**), and anticipating by more than a century the doctrines of the **PHYSIOCRATS**, Sully held that the source of wealth lay, not in commerce, in colonisation, and in coin, but in the products of the soil. It was he who said to the king that "husbandry and pasture were the two breasts which supplied nourishment to France (*les deux mamelles de la France*), and the real mines and treasure stores of Peru." He even opposed, though fortunately without success, the efforts of Henri IV. to acclimatise the mulberry and the silk industry in France. He said that France was not suited to such baubles:—in this he was obviously not a good prophet.

He regarded the manufacture of cloth with more favour, but he occupied himself principally and successfully with the reformation of the finances and the development of agriculture. Thus, "to prevent any misfortune to the country people," he busied himself in making roads, canals, and treaties of commerce—with Spain in 1604, England in 1606. The ordinary and extraordinary revenues of the treasury were raised by him in ten years—between 1600 and 1609—from 20,000,000 to 32,000,000 livres. This was done notwithstanding that he reduced the public debt and diminished the heaviest taxes on the peasant, such as the **TAILLE**. He desired to change the vexatious tax on salt, the **GABELLE**, into a monopoly to be worked by the state, as has since been done with tobacco. The assassination of Henri IV. prevented the realisation of this original plan.

Sully wrote his own memoirs under the title of *Économies Royales*. The first edition, 2 vols. folio, appeared in 1638. It has this curious feature that the author always speaks in the second person. The traditional explanation of this is that his secretary is said to have been instructed by Sully to describe his career in the form of an address to himself, saying, "You did such and such things on such a day." The most complete edition appeared in the *Collection des Mémoires relatifs à l'Histoire de France*, vols. xvi. xvii. A small edition, containing selected passages, with

an introduction by M. Chailley-Bert, appeared in the *Petit Bibliothèque Économique*, published by Guillaumin. C. G.

**SUMPTUARY LAWS.** The legislation of Greece and Rome included many laws of this description, which imposed severe restrictions on dress and entertainments.

Among the most extensive sumptuary laws of the middle ages are those of Philip IV. of France (reigned 1285-1314), who limited the number of dresses to be worn as well as their cost, and regulated food and dress according to rank. The sumptuary legislation of England, which we may take as generally illustrative of mediæval legislation on the subject, from the middle of the 14th to the middle of the 16th century, is chiefly directed against extravagance in dress, and is a sign of the diffusion of wealth which followed the growth of commerce and the break-up of the old distinction of classes. The principal English law dealing with food, the statute *De Cibaritis Utendis*, restricted the meals of all classes alike, to two courses, with a third course on the principal feast-days, "and each mess of two sorts of victuals at the utmost, be it flesh or fish, with the common sorts of pottage." This law was passed in 1336, when Edward III. (reigned 1327-1377) was in need of supplies for war, which were not readily forthcoming, and its object was to check the extravagance of the people "whereby they are not able to aid themselves nor their liege lord in time of need, as they ought." The statute contains no penalty for its infringement, and though it was not repealed until 1856, it was probably never enforced even at the time of its enactment. The English victories in France and the spoil brought into England gave rise to much display and extravagance in dress; and in dress, the distinction of class which was bound up with feudalism was chiefly apparent, for among the higher classes it had reached a state of luxury and display when the houses and manner of living of all ranks were still comparatively simple. Hence, in 1363, by an act "for the outrageous and excessive apparel of divers people against their estate and degree, to the great destruction and impoverishment of all the land," regulations were laid down for the dress of each class. Carters, ploughmen, and others whose goods did not amount in value to 40s. were to wear no cloth, but blanket and russet and a girdle of linen; those of higher degree were to dress in cloth of different prices according to their rank, the statute providing that all makers of cloth should supply the various qualities. A limited class only were allowed to wear cloth of gold or silver, silk or fur which came from abroad, and thus this statute, repealed the next year, was, like other English laws of this description, favourable to native industry. The importation in the 15th century of silken goods and other things, mostly for use in dress, and the "excessive and inordinate array and apparel" of both men and women, "to the impoverishing of this realm of England and to the enriching of other strange realms and countries," led to the prohibition, in 1463, of the importation of foreign wares, and to the elaborate regulation of the apparel of different classes. Ermine, velvet, satin,

and "counterfeit cloth of silk resembling to the same," were prohibited to those below the rank of knight; and padding of clothes, and shoes with pikes more than two inches long, were forbidden. In 1482, materials to be worn were again regulated with the aim of compelling English people to wear native fabrics; woollen cloth made abroad was forbidden to those below the rank of lord, and importation of wrought silk was prohibited. Although the act of 1482 sets forth that for want of enforcement of former sumptuary laws, the "realm has fallen into great misery and poverty and like to fall into more greater," it is less stringent than that of 1463; women above the rank of labourer's wife are altogether exempted from it. The sumptuary laws of 1463 and 1482, as compared with the statute of 1444, regulating wages and the price of clothes given as part of wages, show a considerable rise in prices. While legislation was endeavouring to keep gold and silver in the kingdom, and the coinage was being repeatedly debased, sumptuary laws restricted the extravagant use of the precious metals in dress, and in 1515 those below the rank of knight were forbidden to wear a gold or gilt chain on pain of forfeiture. These laws were an expression of the general protective policy of England. While Edward III.'s statute of apparel set forth that it was directed against the "apparel of divers people against their estate and degree," in the later sumptuary legislation only economical considerations are advanced. The rich fabrics, which it was sought to limit to a few, were made out of England, and the object of the laws was not so much to encourage thrift as to prevent "the draining out of our treasures" into the ready hands of foreigners. Legislation against the importation of foreign manufactures was to some extent evaded by smuggling. "Infinitely more effectual than the preventive service of the ports were the sumptuary laws. People who broke these laws went about with the evidence of their offence on them" (Rogers). Edward VI. (reigned 1547-1553) and Elizabeth (reigned 1558-1603) enforced abstinence from flesh on fast-days in order to promote seamanship, and were careful to point out that their motives were not such as could be considered superstitious. The last sumptuary measure passed in Great Britain was a Scotch law of 1621. Most English laws of this nature were repealed in 1603. The economists of the 17th century looked unfavourably on sumptuary legislation, considering the consumption of luxuries good for trade, but the use of certain foreign fabrics has since been forbidden, and in 1745 a penalty of £5 was imposed on selling or wearing French lawn, with a direct view to the development of industry in England.

**SUPPLEMENTARY ESTIMATE.** Whenever the vote assigned by parliament for any given head of expenditure during a current financial year has been expended, it is not lawful for the treasury to pay sums in excess of the vote without further parliamentary sanction. It is therefore necessary for the government of the day either (1) to submit to parliament a fresh estimate which may provide in advance sums of money to cover votes which are expected to be exceeded—this, of course, is the proper and legitimate course,—or (2) to obtain the sanction of parliament for expenditure on votes which have been already unavoidably exceeded—a course which has received the sanction of usage and convenience in many cases.

This further estimate is known as a “supplementary estimate.” The term is in use also in all the British colonies, their financial systems being modelled more or less on that of Great Britain.

In the United Kingdom the supplementary estimates are usually taken in parliament in February, or about four weeks before the close of the financial year (see **SUPPLY**). C. A. H.

### SUPPLY.

- (1) Conditions of Supply, p. 488; (2) the Supply of Commodities, p. 488; (3) Diminishing, Constant and Increasing Returns, p. 489; (4) Components of Supply Price, p. 489; (5) Supply Price as connected with Rent and Quasi-Rent, p. 489.

Supply, pp. 488, 489; Supply and Demand, p. 490; Supply, Parliamentary, p. 490.

In the article on **SUPPLY** AND **DEMAND**, it is explained that (1) the *conditions of supply* of any commodity are known when the price which would lead sellers to offer any given amount of the commodity has been ascertained. This price in general would vary with the amount offered. Hence every commodity has its law of supply, which expresses the variations in supply-price which are correlated with variations in supply-amount. There are special difficulties in constructing such a law of supply, which do not arise generally in the construction of a law of **DEMAND**. For the supply of any commodity depends on the co-operation of many different kinds of productive agents, and the simultaneous and successive union of many different productive processes. Hence the supply-price of a commodity depends upon the current prices at which the services of the agents of production can be obtained, and the proportions in which these services have to be combined in producing the commodity. In the theory of the exchange value of commodities (see **EXCHANGE**, **VALUE** IN), it is necessary, for the sake of simplification, to assume that the rate at which each kind of agent has to

be remunerated has been determined by general social conditions. These rates of remuneration are thus given independently of any conditions affecting the variations specially attaching to the supply of the commodity under consideration. On the other hand, the theory of **DISTRIBUTION** is concerned with the economic forces which determine the rates at which the several kinds of agents are recurrently remunerated. And here it is convenient to assume that the prices at which each kind of commodity can be sold have been determined independently of the rates at which the agents are remunerated. But this latter assumption requires very considerable modification if we are to avoid circular processes of reasoning.

(2) *The supply of commodities.*—The term *price* is a convenient abbreviation for a sum of money paid for a *unit* of any kind of commodity. The term *aggregate price* may be used for a sum of money paid for a certain given *amount* of the commodity. Hence the *aggregate price* is always the arithmetical product found by multiplying the *price*, per unit, by the *amount*. The supply-price of a commodity is found by adding together the prices which have to be paid to the different agents who contribute to the production of a *unit* of the commodity. In this connection the prices of the agents may be called the *component prices*, and the sum of these prices may be called the *resultant supply-price*. The term *expenses of production* is sometimes used in a slightly different sense from that of *supply-price*. For when different businesses are competing in the supply of the same kind of commodity to the same market, what are called the *expenses of production* in one business may be found to differ from the expenses of production in another business. And even in the same business the expenses of producing the earlier units may be less than those of producing the later units. Now the supply-price must be equal to the expense of producing that unit which is most expensively produced. This unit is technically called the *marginal unit*, and the expense of producing it is called the *marginal expense*. Hence we have the law:—*The supply-price of a commodity for any amount is equal to the marginal expense, per unit, incurred in producing that amount.* It follows that the aggregate supply price may be in excess of the aggregate expenses of production. This excess is called producer's surplus or **PRODUCER'S RENT** (*q.v.*), or, we may say that each *unit* (except the marginal unit) is produced at an expense less than the price for which the unit is sold; this difference constitutes the producer's surplus *for that unit*. Before referring to the difficulties connected with the theory of producer's surplus, it is necessary to point out its connection with diminishing or increasing returns.

(3) *Diminishing, constant, and increasing returns.*—The supply of a commodity is subject to diminishing, constant, or increasing returns, according as the price at which it is offered increases, remains constant, or diminishes as the amount supplied is increased. The production of every commodity is subject to two opposing tendencies; for as the scale of production is enlarged, it is necessary to have recourse to less economical combinations of land, labour, and capital, so far as more labour and capital have to be concentrated on a given piece of land; and, on the other hand, opportunities arise for the more economic use of division and co-operation of labour, and of aiding labour by machinery and so on. If the former tendency overbalances the latter, the commodity is subject to diminishing returns; if the two tendencies balance one another, to constant returns; while, if the latter tendency overbalances the former, the commodity is subject to increasing returns. An increase in the aggregate scale of production thus entails changes in the prices at which *all* the units in the aggregate can be produced. We cannot then find the aggregate expenses of production on a larger scale by merely adding the expenses of the new units to those previously incurred on the smaller scale. The marginal expense may increase or diminish as the scale of production is enlarged. Where we speak of *marginal expense*, we imply the existence of a *producers' surplus*. Such a surplus may be spoken of in the case of INCREASING RETURNS as well as in that of DIMINISHING RETURNS. This can be shown diagrammatically by constructing what Professor Marshall calls a *particular expenses curve* for each different scale of production. The particular expenses curve indicates at the same time the marginal expense and the producer's surplus, corresponding to each aggregate amount produced. The supply-curve is the *locus of the terminal points* of all the different particular expenses curves.

(4) In analysing the *components of supply-price*, it is legitimate and convenient to neglect the variations in the expenses at which the different units are conceived to be produced, and thus to defer consideration of producer's surplus. The prices of all the agents are understood to be determined by the general forces of competition. When an agent is employed in any particular industry, the price which he can demand is a price independent of the conditions of that particular industry; for it is the price *which he could have secured if he had been employed in some other alternative way*. In this sense, even a piece of land hired by a farmer for any particular agricultural use has a current price, viz. the price which some other farmer would be willing to pay. The individual farmer, therefore, regards "rent as entering into the expenses of produc-

tion." Similarly, the wages paid to different classes of labour, and the interest for the use of any capital that is borrowed, are determined at current rates depending on general social conditions. There remain *profits*, i.e. the return to the undertaker of the business, who also owns some of the capital employed in it. So far as, under the influence of competition, society may be said to have to pay business ability at a certain rate, we may finally include *profits* in the supply-price of any commodity. The analysis of supply-price can of course be carried out into much greater detail, which will be found in the modern text-books of economics (see *COST OF PRODUCTION*).

(5) *Supply-price as connected with rent and quasi-rent.*—When the total amount of a commodity is conceived to have been produced at a different expense in different competing businesses, the supply-price is the same as the marginal expense, and any unit, except the marginal unit, sells for a price greater than its expense. The excess of the selling price of the unit over its expense of production is the producer's surplus for that unit. The expenses of production must now be defined more exactly. When we contrast the expenses of production with the producer's surplus, it is understood that the expenses have been incurred under the *anticipation* of a remuneration which will be covered by the price of the commodity. It is this *anticipation* which operates in determining the amount of the commodity that is produced. Any remuneration which is obtained independently of the influence of anticipation in determining the amount produced is of the nature of a producer's surplus. Now we may consider the effect of anticipation as exerting its influence over a longer or a shorter period of time. (a) If a period sufficiently long to provide the specialised capital, material or personal, in adaptation to the anticipated demand is taken into consideration, then the expenses of production will include the *expenses of producing such specialised forms of capital*. The only kind of remuneration that here constitutes producer's surplus is the remuneration for the use of *natural agents* (see *AGENTS OF PRODUCTION*), of which the quantity applied in the industry cannot be increased under the stimulus of anticipation. Such a natural agent would be *land used for agricultural purposes*. Hence we arrive at the well-known doctrine of RICARDO that "the rent of land used in agriculture does not enter into the expenses of production which determine the supply-price of agricultural produce." (b) If now we consider a shorter period of time, commencing after specialised capital has been already created, then the expenses of producing this capital cannot any longer operate as an influence determining the amount of the commodity produced. The

remuneration received by the owners of such specialised capital is excluded from the expenses of production, and constitutes a *quasi-producer's-surplus*; i.e. an element which, for the shorter period under consideration, does not influence the amount of the commodity produced, and thereby determine its price. So far the theory of producer's surplus has been shown to depend on considerations of the *period of time* during which the influence of anticipation is conceived to operate. A further qualification is needed, which depends on the *range of alternative uses* to which an agent can be put. Thus the Ricardian theory of agricultural rent would have to be differently interpreted, according as we consider *agriculture in general*, or only some particular agricultural produce, such as *wheat*. Any piece of land could be applied to the production either of wheat or (say) of barley. The producer's surplus, which corresponds to the price of *wheat*, is not the whole rent of the land, but only the excess of the rent over that rent which could have been obtained if the land had been turned, say, to the growing of barley. It is this excess value which may be strictly said not to enter into the determination of the price of wheat. For if a *tax*, not exceeding the above value, were levied on the wheat-growing land, while barley-growing lands were exempt, the burden of the whole tax would fall on the receiver of rent, and there would be no rise in the price of wheat. The true surplus, which does not enter into the price of *wheat*, is, therefore, only the excess of the rent on wheat-growing lands over the rent that could be obtained by some alternative mode of employing the land. Thus if the tax on any piece of land that is growing wheat exceeded this value, the land would, in time, be turned, say, to barley-growing; the area for wheat-growing would be restricted, and the price of wheat would rise. Summing up, we find that the theory of producer's surplus has to be differently interpreted (1) according as a *longer or shorter period of time* is considered, during which the influences of anticipation are allowed to operate, and (2) according as a *larger or smaller range of alternatives* is considered in regard to the directions in which an agent may be employed.

[The above treatment of the problems of supply follows in the main the lines laid down by Prof. Marshall, *Principles of Economics*, vol. i. In particular see bk. v., chs. v. viii. ix. xiv.; and bk. vi., chs. v. viii. ix.] W. E. J.

### SUPPLY AND DEMAND.

- (1) The General Theory of Supply and Demand, p. 490;
- (2) Consideration of the Term Supply and Demand, p. 492;
- (3) Equilibrium between Supply and Demand, p. 493;
- (4) Joint and Alternative Demand, Joint and Alternative Supply, p. 494;
- (5) Connection between the Theories of Distribution and of Exchange, p. 495.

#### 1. The General Theory of Supply and De-

*mand.*—The central problem of economic theory is an enquiry into the balancing of two opposed classes of motives, the one consisting of *desires* for certain sources of satisfaction or enjoyment, the other consisting of *aversions* to certain forms of sacrifice or toil necessarily undergone in order to gain command over those sources of satisfaction. The simplest case of balance between desire for a COMMODITY and aversion to a DISCOMMODITY is found when a man directly satisfies his own wants by his own work. The problem is solved by applying two simple principles which are complementary to one another. The first principle is the LAW OF DIMINISHING UTILITY, which may be expressed as follows: The utility afforded by any increment of a commodity diminishes with increase in the amount of the commodity possessed. The second principle is the Law of Increasing Disutility, which may be expressed in corresponding terms thus: The disutility incurred by any increment of a discommodity increases with increase in the amount of the discommodity undergone. Thus, if a man has to work to obtain his food, we may measure the amount of commodity acquired by the *weight* of the food, and the amount of discommodity by the *time* he works. The two laws state: (1) Every additional ounce of food yields him a smaller increment of utility; (2) Every additional hour of work yields him a greater increment of disutility. It is then obvious that the balance between desire and aversion is reached by working just so many hours and thus obtaining just so much food, as that the additional disutility of the last hour's work is equal to the additional utility of the food obtained by that last hour's work. In EQUILIBRIUM, the marginal disutility of the last piece of work equals the marginal utility of the last piece of food. The result may be expressed in another way which is important in further developments. Each hour's work involves a certain disutility which is rewarded by a certain amount of food yielding utility. The economic problem is thus solved by *maximising the surplus of utility over disutility*. This surplus is a combination of producer's and consumer's surplus, which, in the simplest case, accrues to the same individual man. This surplus is a purely psychological conception, and cannot be measured in objective units. On the other hand, the amount of food and the amount of work *can* be measured in objective units; the former in *lbs. weight*, the latter in *hours*. We have then to conceive of one law of variation which connects the amount of food with the amount of utility, and a second law of variation which connects the amount of work with the amount of disutility. These two laws are purely psychological, depending on the individual's private character. But it will be seen that these two laws alone

are not sufficient to solve the problem. For nothing has been said as to the relation between the amount of work done and of food produced. We cannot assume that every fresh hour of work will produce an equal increment of food; and hence we must introduce a third law of variation, which will explain how much food corresponds to each several quantum of work. This law mediates between the law connecting amount of utility with amount of food and the law connecting amount of disutility with amount of work. At the basis of the theory of supply and demand we thus find three kinds of laws of variation: (1) The law of utility connecting commodity acquired with pleasure afforded; (2) the law of disutility connecting discommodity undergone with discomfort incurred; (3) the law of efficiency, connecting discommodity undergone with commodity acquired.

It is only the third of these three laws of variation which can be objectively ascertained. Whereas the variation of utility is always subject to the principle of diminution, and the variation of disutility to the principle of increase, the variation of efficiency which connects the objectively measured amounts of commodity and discommodity, may be subject to a principle either of increasing, of decreasing, or of constant returns. The further investigation of the law of efficiency will be taken up later.

We will now consider how it is possible to give an objective measure of utility and of disutility. This is most simply effected by means of *money*. If a man has money, he may put a *price* on his satisfactions and his sacrifices; and, thereby, they become measurable through their exchange-value. In this way the law of variation of utility is transformed into a law of variation of *demand* for a commodity, which assigns for every several amount of the commodity the *price* at which that amount will be purchased. Similarly, the law of variation of *disutility* is transformed into a law of variation of *supply* of a service, which assigns for every several amount of the service the price at which that amount will be offered. It will be seen that the laws of supply and demand in their simplest form are identical. For the supply of a service may be regarded as a demand for the income derived from that service; and the demand for a commodity may be regarded as a supply of money offered for the commodity. In both cases we may speak of some utility to be acquired and of some sacrifice to be incurred. The law connecting the amount sacrificed with the amount acquired will be as follows:

Any change favourable to the individual, in the terms on which he can secure an acquisition in return for a sacrifice, will induce him to *demand* a larger amount. When the terms are comparatively unfavourable, this larger

amount will be obtained by an increased offer; until with increasingly favourable terms, the offer reaches a maximum; after which, when the terms have become comparatively favourable, he will be securing an increasing amount in return for a lower offer. There is thus a certain *price* which will induce him to make the highest offer. This point might be called the critical point in the curve connecting amount offered with amount demanded. He would always be increasing his acquisition under increasingly favourable terms; but for sub-critical points, this would involve an *increasing* outlay of sacrifice, and for supra-critical points, this would involve a *decreasing* outlay of sacrifice. A few figures will make this clear. Consider a man's annual demand for coal. At the price £7 a ton, the amount demanded might be 1 ton involving an outlay of £7; at £6 a ton, amount 1½ tons, involving outlay £9; at £5 a ton, amount 3 tons, involving outlay £15; at £4 a ton, amount 4 tons, involving outlay £16; at £3 a ton, amount 5 tons, involving outlay £15; at £2 a ton, amount 6 tons, involving outlay £12; at £1 a ton, amount 7 tons, involving outlay £7. Here the critical price is £4 a ton, with maximum outlay £16. As price falls, the elasticity of a man's demand may be normally expected to decline; so that, while at relatively *dear* rates, he is induced to spend *more* as the article falls in price, at relatively *cheap* rates he is induced to spend *less* as the article falls in price. Separating the dear and the cheap rates, there is the *critical rate*, at which his expenditure reaches its maximum.<sup>1</sup> The same principle applies as regards the supply of services in production. For example, if a man's wages are relatively *low*, he will be induced to work *longer* hours for a higher wage per hour; but, if his wages are relatively *high*, he will be induced to work *shorter* hours for a higher wage per hour. In both cases the increase in the *rate* of wages per hour will lead to an increase in the *total day's wage*. The same applies to capital. If the rate of interest is relatively *low*, the capitalist is induced to increase his investments under the stimulus of a higher rate of interest; but if the rate is relatively *high*, he will be induced to diminish his investments under the stimulus of a higher rate of interest. In both cases, the increase in the *rate of interest* will involve an increase in the *total income* derived from capital investments. It might be thought that the teachings of history are in direct opposition to this last theoretically obtained result. But the answer to this objection will throw further light on the real meaning of the law. The law presupposes *constancy in the conditions of supply*

<sup>1</sup> It is not strictly necessary to assume *only* one maximum point; but the above account is sufficiently accurate for most cases.

of capital, or of demand for the income that can be derived from investments. Now during the period in which the rate of interest has fallen, the conditions affecting the supply of capital have changed enormously. The accumulated wealth—out of which the savings of the community are derived—has been rapidly increasing; and the *habit* of saving has at the same time probably been fostered. This accumulation of wealth in its turn has been partly due to the discoveries made in the industrial arts. These discoveries have been chiefly operative, as supplying fresh opportunities of displacing labour by capital; so that their *primary* effect would have been to *raise* the rate of interest and lower the rate of wages. But the secondary effect has been to increase the amount of capital relatively to labour to such an extent that the rate of interest has fallen. In this case it is practically misleading to regard the conditions of supply of capital as independent of the conditions of demand for capital. For as the demand for capital is raised—owing to industrial inventions,—the income of that class out of whose resources most of the new investments are made is at the same time increased; and thus the very same conditions which produce a change in the *demand* for capital produce also a change in the conditions affecting the *supply* of capital. When it was said that at a relatively low rate of interest an increase in the rate would lead to larger investments, and a relatively high rate of interest would lead to smaller investments, it must be remembered that what is relatively low at one period may be relatively high at a later period; if the amount of accumulated wealth at the former period is considerably less than that at the later. At the present time we could say that a rate of  $4\frac{1}{2}$  per cent is *relatively high*, while fifty years ago it would have been *relatively low*.

2. *Considerations of the Term, Supply and Demand.*—Both the terms supply and demand are often used in a loose way, which renders it impossible to express economic theory in a quantitatively exact form. For this purpose it is necessary to define and distinguish the three phrases “conditions of supply,” “supply-amount” and “supply-price,” and the three phrases “conditions of demand,” “demand-amount,” and “demand-price.” The conditions of supply of a commodity or service must always be considered as independent of the conditions of demand for that commodity or service—at least in the abstract theory. In speaking of *given* conditions of supply, we mean that the following determining factors are assumed to be constant, viz. the character and resources of those who offer the commodity or service, their individual or collective efficiency, and the knowledge of the industrial arts. In the same way, the conditions of demand are said to be *given*

when we assume the following determining factors to be constant, viz. the resources and the tastes of those who wish to buy the commodity.

Corresponding to any given set of conditions of supply, we construct supply-schedules or SUPPLY-CURVES (*q.v.*). This gives the relations of variation between the supply-price and the supply-amount. It is expressed in a series of hypothetical or conditional statements; thus: “If the price were so much, the amount offered would be so much; if the price were so much again, the amount offered would correspondingly vary, and so on.” The relations thus expressed are spoken of as relations between supply-price and supply-amount.

Similarly we construct demand-schedules or DEMAND-CURVES (*q.v.*) corresponding to any given set of conditions of demand. This again is expressed in a series of hypothetical statements: “If the price were so much, the amount demanded would be so much, and so on.”

Hence neither the conditions of supply nor the conditions of demand are sufficient alone to determine either the price or the amount at which the sale or purchase will be transacted. In all cases the *two* sets of conditions taken together are needed to determine the two unknowns—*price* and *amount*.

The old controversies as to whether it was demand or supply which settled price have been finally abandoned. It is now seen that where price seemed to be determined by one or other of these two agencies exclusively, this was because the amount was tacitly assumed to be fixed by the conditions of the other agency, or *vice versa*. Thus we have four possible limiting cases which appear at first sight to be exceptions:

(1) Where the amount supplied cannot be varied we may say roughly “Price is determined by (the conditions of) demand.” [Inelastic Supply.] *E.g.* natural agents; pictures of great artists.

(2) Where the amount demanded cannot be varied we say roughly “Price is determined by (the conditions of) supply.” [Inelastic Demand.] *E.g.* absolute necessities in a stationary population.

(3) Where the supply-price cannot be varied we can say “Amount is determined by (the conditions of) demand.” [Constant Returns.] *E.g.* long-established manufactures of staple commodities.

(4) Where the demand-price cannot be varied we can say “Amount is determined by (the conditions of) supply.” [This last case could hardly arise, except under the influence of governmental interference, or in very exceptional cases of the force of custom or habit, such as the penny newspaper.]

The *price* and *amount* which are determined

so as to satisfy conjointly the conditions of supply and the conditions of demand are spoken of as the equilibrium-price and the equilibrium-amount in reference to those conditions. It is not meant that no transactions take place in the market except at the equilibrium-price. What is meant is that when this equilibrium-price and the corresponding equilibrium-amount are reached, then the conditions of supply and demand would not tend to produce any readjustment of price. For most practical purposes we may limit ourselves to *stable equilibria*, and in this case we can express the actual facts more precisely. Any accidental variation from the price that corresponds to stable EQUILIBRIUM will bring into operation forces tending to restore the price to its equilibrium value. An equilibrium is stable under the following conditions: viz. when for amounts less than the equilibrium-amount, the supply-price is less than the demand-price, and for amounts greater than the equilibrium-amount, the supply-price is greater than the demand-price. Thus, if the required supply has been underestimated, producers find that they are getting a higher price than is sufficient to remunerate them; this encourages a larger supply and leads to a fall in the demand-price. Conversely, if the supply required has been overestimated, producers find that they are receiving a lower price than is sufficient to remunerate them; this checks the supply, until the demand-price rises to its equilibrium value.

### 3. *Equilibrium between Supply and Demand.*

—The equilibrium between supply and demand of commodities depends essentially upon the action of producers in *anticipating* the demand. So far as the forecasts made by those who supply a market are correct, we can say that the amount supplied is such that the supply-price is equal to the demand-price. Hence the element of *time* enters into any consideration of equilibrium. For the processes of production occupy a longer or shorter period of time before the commodity is finished and transferred to the consumer in a condition for direct use or enjoyment. The most serious difficulties that arise in connection with the equilibrium of demand and supply depend upon the interval of time which elapses between the earlier applications of labour and capital and the final transference of the finished commodity into the hands of the consumer. Prof. Marshall has proposed to distinguish the discussions of equilibria between demand and supply according to the length of the period which we may take into consideration in defining supply-price. The supply-price corresponding to any amount may be defined in general as the price at which, under the circumstances of the case, it would be worth the while of the producers to sell that amount. But in this anticipation any *differences in the circumstances of the case* would be

liable to make important differences in the supply-price calculated in reference to those circumstances. For instance, if expenditure has already been incurred in creating specialised capital, either material or personal, the estimate of the price at which it would be worth while supplying the commodity might be very different from that based on the state of things previous to this expenditure, when the outlay could be freely directed towards the production of suitable buildings and machinery, and towards the training of suitable skill and knowledge. The circumstances in which the amount of specialised material and personal capital is given will thus constitute the conditions of supply for a relatively short period between production and consumption; and the circumstances in which no capital has been fixed and specialised for the production of the commodity will constitute the conditions of supply for a relatively long period between production and consumption (see PRICES, LONG-PERIOD SUPPLY, SHORT-PERIOD SUPPLY). The equilibrium obtained by equating the *long-period supply-price* with the demand-price is called the *normal equilibrium*; and that obtained by equating the *short-period supply-price* with the demand-price is called the *sub-normal equilibrium*. Finally, if we limit the period to its utmost, we shall regard not only the fixed instruments of production as given, but even the amount of the finished commodity itself. In this case, unless the sellers are in a position to withhold their offer and can speculate for a rise in price, the conditions of demand taken by themselves may be regarded as determining the price at which the commodity will besold. Such an equilibrium is called a *temporary equilibrium*. In each of the three cases, the equilibrium-price is a theoretically determined or *ideal* price. With this *ideal* price we must contrast and connect the actual or *market price*. The market-price oscillates about the theoretically determined equilibrium-price. Thus, during the day, say, the actual price may fluctuate above and below the price corresponding to the temporary equilibrium. Again, the actual prices occurring during a short period would fluctuate above and below the price corresponding to a sub-normal equilibrium; and those occurring during a long period would fluctuate about the price corresponding to a normal equilibrium. Roughly speaking, we can say that the normal price is the average of the actual prices taken over a long period; and that the sub-normal price is the average of the actual prices taken over a short period. For the prices ruling throughout any period might be expected to fall as often and as much above as below the anticipated price, owing to deficiency or excess in the amount offered during the period. Of course the market-price would throughout approximate more closely to the equilibrium-price the more

quickly the commodities were consumed and reproduced.

But further when we regard the equilibrium-price as the average of the varying market-prices, we presuppose constancy in the conditions of demand and supply during the period over which the average is taken. Owing to changes of fashion or taste, the conditions of demand may be continually varying; and owing to changes in the industrial arts, the conditions of supply may be continually varying. Hence it would generally be impossible to determine the equilibrium-price by averaging the variations in market-price during any period of time.

4. *Joint and Alternative Demand, Joint and Alternative Supply.*—The general theory of distribution and exchange requires us to note that the amounts and prices of different commodities are often very closely connected either through the conditions of demand or through the conditions of supply or both. There are four typical cases in which this dependence is strikingly manifest. These are (1) *Joint Demand*, (2) *Joint Supply*, (3) *Alternative Demand*, (4) *Alternative Supply*.

The following brief definitions may be given:—

- (1) A demand for "A and B" is called a *joint demand*;
- (2) A supply of "A and B" is called a *joint supply*;
- (3) A demand for "A or B" is called an *alternative demand*;
- (4) A supply of "A or B" is called an *alternative supply*.

The terms above given are chosen to indicate in each case whether the interconnection comes primarily from the side of demand or from the side of supply. But it will be found in each case that the phenomenon can be regarded from the opposite point of view.

Thus we shall find that,

- (1) *Joint Demand* involves *Complementary Supply*;
- (2) *Joint Supply* involves *Complementary Demand*;
- (3) *Alternative Demand* involves *Competitive Supply*;
- (4) *Alternative Supply* involves *Competitive Demand*.

In the further explanations which follow the relations will be described in an exact form which is often only approximately realised in actual economic phenomena. An ideal simplicity is introduced in order to give greater clearness to the exposition. We shall derive formulæ for each of the four cases separately, but it will be convenient at once to anticipate the results by pointing out the analogies that will be disclosed between the four cases. It will be found that in passing from the formula of joint demand to that of joint supply, or from the formula of alternative demand to that of alternative supply, we shall have merely to interchange throughout the terms *supply* and *demand* or *demand* and *supply*. And again, in passing from the formula of joint demand to that of alternative demand, or from the formula of joint supply to that of alternative supply, we shall have merely to interchange throughout the terms *price* and *amount* or

*amount* and *price*. These symmetrical results will be found helpful in obtaining a general survey of the problems investigated.

In the cases of joint demand and joint supply, we shall find that whereas the amounts of the two constituent articles vary in the same direction, their prices will tend to vary in opposite directions. In the cases of alternative demand and alternative supply, on the contrary, the amounts will vary in opposite directions, while the prices will vary in the same direction.

*Joint demand, involving complementary supply.* This deals with cases in which things are not demanded separately, but have to be used in conjunction with one another in order to meet the needs of consumers; such as *wood* and *bricks* in the building of a house, *blades* and *handles* in the manufacture of a knife. The connection here is from the side of demand, while the conditions of the supply of the two factors may be assumed to be independent of one another. The processes of supplying the two factors *complement* one another, so as to produce a commodity which it is worth while for the ultimate consumers to purchase. Thus the supply-price at which any given amount of the finished article will be offered is the sum of the supply-prices of the several factors which contribute their part in the total productive process. Equilibrium between demand and supply is, therefore, reached at that amount for which the demand-price of the finished article is equal to the sum of the supply-prices of the several factors which co-operate.

*Joint supply, involving complementary demand.* This deals with cases in which things cannot be produced separately, but are produced together by a single process, such as *beef* and *hides*, or *wheat* and *straw*. The connection here is from the side of supply, while the conditions of the demand for the two commodities may be assumed to be independent of one another. The two things are produced by the same process, so that the expenses of producing both the things together are the same as the expenses of producing one of them alone. The demands for the two commodities *complement* one another in making it worth the while of producers to meet the two independent needs. Thus the demand-price at which any given amount of the productive process will be called for is the sum of the demand-prices of the several commodities which are jointly produced in the process. Equilibrium between supply and demand is, therefore, reached at that amount for which the supply-price of the productive process is equal to the sum of the demand-prices of the several articles jointly produced.

*Alternative demand, involving competitive supply.* This deals with cases in which the same ultimate need can be met by one or other of two commodities equally well, so that either

can be used as an equivalent for the other, or instead of the other, it being understood that the more of the one article is used the less of the other will be in consequence needed. Thus it can be said with approximate accuracy that the demand for non-intoxicating stimulants is an *alternative demand* for tea or coffee. The connection here, as in joint demand, is from the side of demand, while the conditions of the supply of the two articles may be assumed to be independent of one another. The sources from which the alternative demand is met *compete* with one another, because the more that is taken from one source the less *ceteris paribus* will be taken from the other. The simplest possible case of alternative demand, or competitive supply, is that in which precisely the same quality of article is supplied from different sources, as corn from America and corn from Russia. Let us return, however, to the case of *tea and coffee*, and state the simplest assumptions necessary for regarding the two commodities as strictly alternative in demand. We assume that a certain amount of tea, say 2 lbs., yields always the same utility as a certain amount of coffee, say 3 lbs. Hence the conditions of demand will cause the price of 2 lbs. of tea to be always equal to that of 3 lbs. of coffee, however the actual price and amount of tea and coffee may vary. With these quantities as units, *the price of tea is always equal to the price of coffee*. Then the supply-amount of non-intoxicating stimulants which will be offered at any given price is the sum of the supply-amounts of tea and of coffee. Equilibrium between demand and supply is, therefore, reached at that price for which the demand-amount of non-intoxicating stimulants is equal to the sum of the supply-amounts of tea and of coffee.

*Alternative supply, involving competitive demand.* This deals with cases in which the same industry or the same productive agent can be applied to the production of one or of another utility indifferently, it being understood that the more of the one utility is produced, the less of the other can be in consequence produced. Thus it can be said that a piece of land can be applied either to pasture or to other agricultural purposes; or, with approximate accuracy, that the dairy business can be applied indifferently to producing *cream or butter*; the poultry business to the production either of *chickens* or of *eggs*. The connections here, as in joint supply, are from the side of supply, while the conditions of the demand for the two articles may be assumed to be independent of one another. The needs which are met by the alternative supply may be said to *compete* with one another, because the more is supplied for one need, the less, *ceteris paribus*, will be supplied for the other. The simplest possible case of alternative supply,

or competitive demand, is that in which precisely the same kind of service or product is applied to meet different classes of consumers, as coal for domestic and coal for industrial uses. Let us return, however, to the case of cream and butter, and examine the simplest assumptions necessary for regarding the two commodities as strictly alternative in supply. We assume that a certain amount of cream, say one pint, involves the same expenses of production as a certain amount of butter, with skimmed milk thrown in, say 1 lb. Hence the conditions of supply will cause the price of one pint of cream to be always equal to that of 1 lb. of butter, however the actual price and amount of butter and cream may vary. With these quantities as units, *the price of cream is always equal to the price of butter*. Then the demand-amount of dairy productions, which will be required at any given price, is the sum of the demand-amounts of butter and of cream. Equilibrium between demand and supply is, therefore, reached at that price for which the supply-amount of the dairy industry is equal to the sum of the demand-amounts of butter and of cream.

The most important problems under the above four heads relate to temporary disturbances in the supply or in the demand of *one* of the connected commodities. The problem is then to discover the virtual or derived schedule of demand or of supply of the commodity of which the supply or the demand is temporarily disturbed. The following formulae will be seen to be of general application:—

*Joint demand.*—If the supply of handles is temporarily disturbed, then, for each several amount of knives, the virtual demand-price for handles = the demand-price for knives *minus* the supply-price for blades.

*Joint supply.*—If the demand for beef is temporarily disturbed, then, for each several amount of slaughtered bullocks, the virtual supply-price for beef = the supply-price for slaughtered bullocks *minus* the demand-price for hides.

*Alternative demand.*—If the supply of tea is temporarily disturbed, then, for each several price of non-intoxicating stimulants, the virtual demand-amount of tea = the demand-amount of non-intoxicating stimulants *minus* the supply-amount of coffee.

*Alternative supply.*—If the demand for cream is temporarily disturbed, then, for each several price of the dairy productions, the virtual supply-amount of cream = the supply-amount of the dairy processes *minus* the demand-amount of butter.

5. *Connection between the Theories of Distribution and of Exchange.*—The investigation of the problems of joint and alternative demand, and of joint and alternative supply, is necessary in order to bring into connection the theories of

DISTRIBUTION and EXCHANGE. Distribution deals with the prices and amounts of the several agents of production. Exchange deals with the prices and amounts of the several commodities for consumption. The demand for consumption-goods is a *direct* demand; that for the agents of production whose services complement one another in producing finished goods is an *indirect* demand. Thus the formulæ of joint demand giving the virtual or derived demand for any factor, has to be applied in determining the indirect demand for the several agents of production. Again, the supply of productive agents is a *direct* supply; that of the finished commodities is an *indirect* supply, and hence the formulæ of joint demand have again to be applied in determining the supply-price of a finished commodity. Moreover, every agent of production may, at different stages in the productive process, apply himself in either one of various employments; and hence the formulæ of *alternative supply* become of essential importance. The element of *time* is essential in considering the effect of *alternative* openings possible for an agent; for so far as his employment has been already specialised, these possible openings are restricted in number. The theories of PRODUCER'S RENT or producer's surplus are founded upon this consideration. All the problems of distribution will thus be seen to depend upon the investigation in particular of *joint demand* and *alternative supply*. The laws of the direct demand for consumption goods, and of the direct supply of production agents, were formulated in the first section of this article. It was there pointed out that a *law of efficiency* of production was needed to mediate between the ultimate principles of *demand* and *supply*. Everything has its own law of efficiency. In examining the law of supply of finished commodities, it is convenient to regard the prices of the *agents* as already determined. We then can calculate the resultant supply-price by adding the supply-prices of the co-operating agents, on the assumption that they will co-operate in such proportions as will secure the most efficient result. This is the assumption underlying the law of substitution. In examining the law of demand for productive agents, it is convenient to regard the prices of the *finished commodities* as already determined. The calculation of the demand-price for an agent here requires chiefly subtraction instead of addition. The determination involves very serious complexity. Briefly we can say that the demand-price of an agent is found by subtracting from the price of the finished commodity the supply-prices of the remaining agents. Rather more accurately: the demand-price corresponding to any amount of an agent's services is found by determining its net marginal efficiency; *i.e.* the value which would be added to the total product by em-

ploying an additional unit of its services, on the assumption that the amounts and prices of all the other agents are kept constant. This indicates the lines on which the complex problem of distribution has to be solved.

W. E. J.

### SUPPLY, PARLIAMENTARY.

General Remarks, p. 496; Estimates, p. 496; Motions and Resolutions, p. 497; Appropriation Act, p. 497.

*General Remarks.*—A parliamentary term for the grants of money made by parliament to meet the crown's demand for "aids and supplies" for the maintenance of the public service, used in the speech from the throne at the opening of each session. That demand is necessary, for, whilst the right of "granting aids and supplies to the crown is in the Commons alone," unless the crown has recommended the expenditure they cannot vote the smallest grant of public money; and even when a grant of money is finally sanctioned by the appropriation act, it cannot be issued by the treasury department from the CONSOLIDATED FUND, unless the issue is authorised by an order under the sign manual of the sovereign. By royal command, also, estimates of the annual public expenditure containing statements of the total sums required with details of the expenditure divided into sub-heads and items are submitted to the House of Commons, who thereupon refer these estimates to a committee of the whole house, known as the committee of supply, appointed at the beginning of every session, and kept on foot until the supplies for each financial year have been voted.

*Estimates.*—The estimates presented at the opening of each session are the ordinary estimates for the service of the current year, for grants on account, and for supplementary and excess grants. Estimates, also, for a vote of credit to cover extraordinary naval or military charges, and for occasions creating exceptional expenditure arising during the session, are occasionally presented. As the parliamentary session commences but few weeks before the close of each financial year, on the 31st of March, the maintenance of the public service during the opening months of each financial year, which commences on the 1st of April, must be provided for. Grants on account, *i.e.* grants in advance upon the estimated annual expenditure, are therefore a sessional necessity. Supplementary grants are either for sums in addition to grants already demanded for the current financial year for services sanctioned by parliament, or for grants caused by fresh occasions for expenditure arising since the presentation of the annual estimates. An excess grant arises when a department has by advances from the civil contingencies fund, or from "extra receipts," carried expenditure upon a service beyond the amount granted for that service

during the financial year. As a vote of credit is demanded to meet unexpected expenditure for undefined services, an estimate is presented of the total sum required, without the detail given in ordinary estimates. Exceptional grants may also be required to defray the cost of imperial undertakings apart from the current service of the year; such as grants for the purchase of the Suez Canal shares, to maintain the dignity of the crown, or to reward its distinguished servants.

*Motions and Resolutions.*—Motions are proposed in the committee of supply which become, when agreed to, the resolutions of the committee, that the sums specified in each estimate be, for the object therein defined, granted to her majesty during the financial year for which the demand is made. Such a motion, if not by consent withdrawn, must either be refused by the committee, or be accepted, with or without a reduction of the amount therein stated, no increase of a grant, nor modification of its destination, being permitted. Each resolution of the committee is, upon their report, submitted separately to the consideration of the House.

The resolutions for a money grant of the committee of supply, and of the House, are, however, inoperative, unless the House by another resolution authorises the treasury to draw a sum out of the consolidated fund (see CONSOLIDATED FUND, vol. i. p. 389) sufficient to provide the "ways and means" for the payment of the grant. The committee of ways and means is accordingly appointed, at the commencement of each session, simultaneously with the committee of supply, for the consideration of these resolutions; and the chairman of the committee of ways and means acts as chairman of committees of the whole House. In former times the principal duty of this committee was to initiate by their resolutions the taxation that was required to create a sufficiency of "ways and means" to meet the annual demands of the crown for the public service. Nowadays, as all the sources of taxation are rendered permanent by statute, except the duty on tea, and the income tax, the control of the committee over taxation is restricted to the consideration of the BUDGET statement made yearly by the chancellor of the exchequer, wherein he explains his calculation of public income and expenditure for the current financial year, and obtains the annual continuance of the tea and income taxes, with such modifications as may to the committee seem expedient. The increase or imposition of taxation, not demanded by the crown, is beyond the power of the committee.

As has been previously mentioned, the committee of ways and means is charged with the duty of voting the resolutions which authorise grants out of the consolidated fund "towards

making good" the grants for the public service resolved upon by the committee of supply, and by the House. It is upon the report of the closing resolution to this effect, which provides the issue of the balance of ways and means required to cover the supply grants voted for the current financial year, that the appropriation bill is brought in. This bill authorises the issue of that balance from the consolidated fund, and enacts—hence the title of the bill—that each grant of supply voted during the session shall be expended on the service for which it has been voted, and to which it is thereby appropriated.

*Appropriation Act.*—As the treasury cannot touch the consolidated fund save under the authority of an act, and as the appropriation act cannot be passed until the financial business of each session is completed, a process usually ranging over a period of six or seven months, a more prompt issue must be made at the commencement and during the progress of each financial year of the grants voted for the service of the crown. Bills accordingly are passed from time to time during each session, known as consolidated fund bills, which empower the treasury to issue out of the consolidated fund, for the maintenance of the departments for whose use the grants are voted, such sums as they may require in anticipation of the final sanction conferred by the appropriation act.

R. F. D. P.

SUPPLY-CURVES are designed to represent the relation between the price of a commodity and the amount supplied at that price. In the construction which Prof. Marshall has made familiar the quantity is measured on the horizontal axis, the corresponding price on the vertical axis. The converse construction is employed by Cournot.

The simplest species of supply-curve might be constructed thus: "If for the moment we assumed that production depended solely upon the exertions of a certain number of workers, already in existence and trained for their work," we might "set forth theoretically . . . various amounts of exertion and therefore of production" with "the prices which must be paid to induce the available workers to put forth these amounts of exertion" (Marshall, *Principles of Economics*, bk. iv. ch. i. § 2, 3rd ed., of a "supply-schedule" corresponding to the "demand-schedule" of bk. iii. ch. iii., which may be "translated into a curve"). The matter is not so simple when we no longer suppose production to depend upon the exertions of a given set of workers, but to be affected by the "external" and "internal economies" and the pressure on the resources of nature which may attend production on a large scale, and even by the growth of knowledge, population, and capital (*Principles of Economics, passim*; in particular the notes on pp. 450, 503-504 and 518, 3rd ed.). If now

for each amount of production we take a point representing the corresponding "normal supply-price," the *locus* of these points is the normal, or "long-period," supply-curve.

The relation of this secondary supply-curve, as it may be called (cp. *Economic Journal*, vol. iv. p. 436), to the primary one at first described is very delicate. According to Mr. H. Cunyng-hame, to every point on the secondary there corresponds a primary curve, one of the "successive cost-curves" (*Economic Journal*, vol. ii. p. 41). Attention should be called to Mr. Cunyng-hame's view that the composition of the demand-curve is exactly parallel to that of the normal supply-curve. The former, he holds, is not "a phenomenon depending on time" (*ibid.* p. 38). Are we to extend this remark to the parallel case of supply-curves; and to regard the whole series of "successive cost-curves" as simultaneous, in the same sense as the parts of an ordinary demand-curve are intended to represent existing co-dispositions?

[Supply-curves of some kind are employed by all the mathematical economists.] F. Y. E.

**SURENCHÈRE** (Fr.). Higher bid. According to French law, real property offered for sale by auction (*à l'enchère*) in the course of judicial proceedings is not definitely sold to the highest bidder until a period of eight days has elapsed after the date of the auction. During that period any interested party may make an application to the court for a second auction, accompanied by an offer of a price exceeding at least by one-sixth the highest price-bid at the auction. This offer is called *surenchère*, and if the price offered by the applicant (*surenchérisseur*) is not reached the latter must purchase the property at that price or make up the difference. Similar proceedings may take place in the case of a mortgagee selling by private contract, and in the case of a bankrupt's real property being sold by the trustee in bankruptcy, but in these cases the period allowed for the *surenchère* is somewhat longer, and the amount of the excess is not required to be more than one-tenth.

[Code de Procédure, §§ 708-710, 832-833, 965; Code de Comm., 573; Code Civil, 2185.] T. L.

**SURETY**. He who becomes bound for another. A surety who discharges the liability of the principal is entitled to an assignment of all the securities, if any, held by the creditor (see **GUARANTEE**).

[De Colyar on *Guarantees*, London, 1885.]

J. E. C. M.

**SURPLUS**. The effect on price of a short supply of a commodity of such prime necessity as wheat has formed the subject of many speculations, and these have even taken the form of a definite estimate, as in the table given by DAVENANT, of the extent to which "a defect in the harvest may raise the price

of corn." These figures were adapted to an algebraic formula by JEVONS (*Theory of Political Economy*, ch. iv.), who found that Davenant's data agreed very closely with the results given by

$$\text{price of corn} = \frac{\cdot 824}{(x - \cdot 12)^2}$$

$x$  being the proportion of the supply to that of a normal or average year. The price given by the formula is the proportion of the actual money price to that of a time when the supply is normal.

If the same formula be applied to indicate the result of crops more abundant than the average, the indications it gives are as follows:—

Percentage excess of supply above average . . .	5	10	20	30	40	50
Percentage reduction of price resulting . . .	10	19	33	44	53	59

The meaning of this is simply that, assuming JEVONS's formula to represent the DEMAND CURVES for corn, not merely for prices higher than the average, but for prices below the average, the effects on price of excesses of supply in the degrees named in the first line of figures are given by the corresponding figures of the second line.

It need hardly be stated, however, that there is no special reason for believing that Davenant's data are sufficient to give for our time, even if they should do so for his own, the demand curve for corn. Not only so, but every separate commodity will have its own peculiarities in this respect, so that, were we able to state the numerical connection of enlarged supply with reduced price for the case of corn, the connection could not be held to apply to other important markets.

The extent of the fall of price necessary to carry off an increase of supply will depend on the nature of the commodity and on the extent of its previous use. If the lower price extend its consumption to large classes of the community, a very large increase of supply may take place without greatly disturbing the price after it has fallen to the necessary point to tap the new stratum of consumers. If, on the other hand, no ordinary fall of price can thus bring the commodity within the reach of large numbers of new consumers, and if, further, the actual consumers have already nearly as much of the commodity as they care to use—a state of things by no means inconceivable—the lowering of price necessary to dispose of supplies but moderately in excess of the normal may be quite large. If new channels for disposing of the commodity, where its utility is but little below what it had in the uses to which a normal supply was applied, are not discoverable, the surplus may be only disposable in uses where its utility is far below that attained in ordinary uses, and the fall of price be, consequently, large. The whole supply being assumed disposed of in the same market, the price of the surplus will

also be the price at which the ordinary supply will be sold. Should it be possible to dispose of the surplus at a price other than that at which the ordinary supply finds a market, without, in fact, disturbing the price received for the ordinary supply, the loss which producers would suffer from the fall in the price of their whole output may be diminished or entirely obviated. In this case the surplus supply would, from the point of view of the ordinary market, be as if non-existent.

What is stated above may be more briefly expressed by saying that the effect on price of a surplus of supply is entirely dependent on the elasticity of demand of the particular commodity in question. This elasticity of demand is of course very closely connected with the possibility of substituting the commodity in question for other commodities, or *vice versa*, according as the relative prices show opportunity for advantageous substitution, or not.

If  $y$  be the price at which a quantity  $x$  of the commodity can find purchasers, the equation  $xy^n = c$  is that of a demand curve showing at every point an elasticity of demand equal to  $n$  [see Marshall, *Principles*, mathematical note iii.]. Such a demand implies that, as a result of a small fall in the price, the amount demanded increases by an amount varying inversely as the  $(n+1)^{th}$  power of the price. To reduce the price by one-half, the supply must be multiplied by  $2^n$ . If  $n=1$  we have the case of a *constant outlay demand*, in which the amount spent on the commodity is the same at all prices; every fall in price results in a proportionate increase of the amount bought. The absolute increase of amount bought varies inversely as the square of the price, or, which is the same thing for this case, directly as the square of the amount previously bought.

In the general case, the percentage decrease of price consequent on a given small increase of supply is  $\frac{1}{n}$ th part of this percentage increase of supply, at all points on the demand curve at which the elasticity is  $n$ . If  $n$  be greater than unity, the total cost of a supply  $x$  increases with  $x$ . If  $n$  be less than unity, the total price obtainable for an enlarged supply falls short of that for which the smaller supply would sell, and the sellers would gain on the whole, by combining to destroy a part of their supply.

The equation obtained by Jevons differs little, when  $x$  is not far from unity, from that of a demand curve in which the elasticity is constant and equal to  $\frac{2}{3}$  throughout. The result of a given small percentage surplus of supply is a fall of price of double this percentage.

In general, then, the question of how great the fall of price will be which results from a given surplus of supply, is answered by obtaining the measure of the elasticity of the demand

with the ordinary supply. This is only strictly true for cases where the elasticity of demand is constant, but it is sufficiently near to the truth when the surplus is but a small percentage of the total supply. We may expect that demand curves in general will show varying elasticity. In that case, a surplus of supply which is more than a *small* percentage of the whole supply will cause a percentage fall of price greater or less than in the case of constant elasticity, according as the elasticity of demand is decreasing or is increasing as we pass from the point representing ordinary supply to the points representing supply in excess of the ordinary. Corresponding statements may be made for the case of deficient supply.

In what precedes, it is taken for granted that the surplus supply, be it great or small, is not held off the market, but disposed of in the existing conditions of demand. In so far as circumstances permit of retaining a store for anticipated higher prices, the fact of extra supply being available does not produce its full effect on the price of the market. By being in reserve, in case prices should rise sufficiently, it limits the rise, but not being thrown on the market at all at prices below a definite figure, cannot depress prices beyond that point, at any rate if we exclude the influence of trade-connections, etc., influences tending to modify the effects of unfettered competition.

The word "surplus" has, in what precedes, been employed to designate all the excess of supply above the ordinary—a distinctly vague conception. The ideas on which the discussion has been based are those of a steady supply and a steady demand in a market with an equally steady price for the commodity. Into such a steady market is introduced the modifying influence of a growth of supply. The addition to the supply is what is here called "surplus." It cannot be said to be in excess of demand except on the hypothesis that the price do not fall. It is not "surplus" to the consumers who, at the reduced price, are able to obtain goods beyond their reach at previous prices. In one sense of the word, goods cannot be in excess, cannot be truly a surplus, so long as there remain any purposes to which these goods would be applied if they were free, but to which, having a cost price, they are not actually applied. In the more usual sense, however, any supply the disposal of which requires a reduction of price may be denominated a surplus supply. It may be observed that an enlarged supply would not, in this sense of the word, imply any "surplus," if it were accompanied by such a development of demand that the whole could be disposed of without any reduction of price below the customary level. In so using the word, agreement with the ordinary language of business is preserved (cp. arts. ELASTICITY OF DEMAND).

SURPLUS VALUE. See MARX, H. K.; VALUE.

**SURVIVAL OF THE FITTEST.** Natural selection, which tends to the preservation of creatures more adapted to the medium they have to live in, and to the disappearance of those less so, is, beyond doubt, a *vera causa* in the organic world. It leads, in general, to the physical improvement of breeds, and, if the general Darwinian hypothesis be correct, may be a real factor in the production of new species, though Darwin does not claim for it that it affords a complete explanation of their origin (see DARWINISM). Its consequences can be modified by human intervention, which may prefer, and therefore protect, weaker individuals or races among the lower animals; for it is obvious that qualities, such as gentleness and capacity for affection, which might render a creature less formidable, and therefore less successful, in a state of nature, may make it more useful and acceptable when domesticated or employed as an auxiliary of man.

In the case of man himself, as in that of other animals, there is a natural tendency to the survival of the physically soundest and strongest; and some theorists have not shrunk from carrying the Darwinist idea so far as to assert that it is desirable in the interest of society that the existence of the physically weak should not be prolonged by the care of their fellows, but that they should be allowed to disappear as "unfit." But, as has been well said, a great proportion of those to whom the world owes most would never have been considered in a physical point of view the strongest, and were not seldom among the weakest, whilst, on the other hand, many of the physically strongest could well have been spared. "Fitness" is relative to all the conditions; and physical advantages may be extremely important in some times and places, and of comparatively little account in others. In the more advanced stages of human development they are greatly outweighed by intellectual and moral superiority. Even in warfare, whilst the tall and muscular man formerly was the leader, it is now often a person of comparatively feeble frame, to whom nature has given a resolute spirit and a genius for command. Another suggestion founded on Darwinian principles, and more plausible in character than that above referred to, has been made, namely, that those who are likely to transmit some form of disease or infirmity to their descendants should be prevented from marrying. The result at which this proposal aims is certainly desirable, if it could be attained by moral influence; and such influence might and ought to be used for the purpose; but to attempt to effect the object by coercion would be a proceeding at once tyrannical and ineffectual. Neither this sort of compulsion,

nor the old expedient of infanticide, is at our disposal for the improvement of the race, being rendered impracticable by feelings which the progress of society has itself developed. We must take the human material as supplied to us, and modify it as far as possible, in the public interest, by judicious treatment—by physical education and hygiene, and, in general, by better conditions of life.

When we consider the social, as distinguished from the physical, "struggle for life" (a Darwinian phrase which must not be taken as expressing, in this application, more than a half-truth), natural selection is, here too, a real agency. But it is a serious error to suppose that its operation is always beneficent. For, while the respectable elements in our natures sometimes lead to success, the lower and even the vicious ones do so also. Viewing contemporary life, if we use CARLYLE's threefold scale of the vulpine, the beaver, or *unmoral* industrial, and the genuinely human qualities, we must admit that the first often have a large share in winning success and predominance. A steady and vigilant selfishness, a dogged refusal to acknowledge the claims or others wherever they can be disputed, and a constant endeavour after personal gain, will sometimes render a man "fit" for the medium he lives in, and assist him in improving his position. One who rudely elbows his way through a crowd will often make progress where a more modest person, with greater regard for others, will be retarded or altogether brought to a stop. As Huxley has said, "the creature that survives a free-fight only demonstrates his superior fitness for coping with free-fighters, not any other kind of superiority." Some who have not been able to sustain themselves in the stress of competition, but have succumbed to the pressure, though less "fit" for the struggle, may have been superior to the successful in all the higher elements of human character. Similar remarks will apply to cases in which success is won by dishonest arts, by mean compliances, by flattery of the wealthy or the powerful, by unworthy self-advertisement. Those who do not stoop to such expedients may be distanced in the race of life, but society is a loser by their failure. In the social sphere, as in the physical, judicious human intervention may do much to correct the evils which arise from the uncontrolled action of natural forces. Persons who, by intellectual gifts of the nobler order and by moral superiority, are really fitted to be useful, though likely to be crushed in the warfare of competition, may be rescued and sustained. And, by "artificial selection," those who for the welfare of society ought to fill positions of influence may be elevated to those positions, even when incapable of attaining success by energetic or politic self-seeking.

**SUSPENSE ACCOUNT.** In bookkeeping an account sometimes raised for temporarily holding an item, whose final disposition is not yet settled. R. W. B.

# **SUSPENSION OF SPECIE PAYMENTS.**

One of the most important instances of a general suspension of cash payments was that which commenced in this country in 1797. The enormous expenditure abroad on our army and navy during the first years of the war against Napoleon, as well as the loans and subsidies granted to some continental states, caused a steady export of bullion (see **DRAIN OF BULLION**). An Order in Council was addressed to the Bank of England on 26th February 1797, requiring it to cease giving out cash in payment until the sense of parliament could be ascertained. Soon after the meeting of parliament an act was passed (3rd May 1797), known as the Bank Restriction Act, requiring the bank not to pay cash except for sums under 20s. This act would have expired 24th June in the same year, but on 22nd June it was continued until the following session, and, in November 1797, another act was passed extending the restriction until six months after the termination of the war. In consequence the note issues, both of the Bank of England and of the country bankers, were largely increased, and being inconvertible, caused gold to go to a premium. In 1800 the price of standard gold rose to £4: 5s. per ounce, and continued to fluctuate at more or less premium until 1819. In 1811 it was quoted at £4: 17: 6, and in 1814, as high as £5: 8s. per ounce. Conversely stated, the value of the £5 note was then at its lowest point, £3: 10: 10, being nearly 30 per cent discount.

Peace was finally concluded in November 1815, and the Restriction Act should have expired six months later, but it was continued till July 1816, 1818, and 1819 successively. In 1817 the bank gave notice that it desired to pay certain of its notes in gold, but it was prevented from doing so by parliament. In 1819 Resumption was provided for by Peel's Act (59 Geo. III. c. 49), which required the bank to resume specie payments by stages, redeeming its notes in gold bullion at the following rates:—

From 1st Feb. 1820 to 1st Oct. 1820 at £4: 1s. per oz. std.

From 1st Oct. 1820 to 1st May 1821 at £3: 19: 6 per oz.

From 1st May 1821 to 1st May 1823 at £3: 17: 10½ and thereafter in gold coin.

In 1821 the bank obtained an act permitting it to pay all its notes under £5, which was done by payment in sovereigns, then first coined. In preparing for the resumption of specie payments the bank found no difficulty whatever in accumulating an ample

stock of coin and bullion, and the whole history of the events of this period fully justifies the conclusion that in a solvent country with a sound currency the quantity of money in use will be regulated by the requirements of trade and of prices. The following table gives a view of the currency, in periods of five years each, showing the *average* circulation of the bank and of the country bankers, and the *total* of gold and silver coined from 1792 to 1831:—

Period.	Average Note Circulation.		Total Coinage.
	Bank of England.	Country Banks.	
	£	£	£
1792-1796	11,637,470		7,436,293
1797-1801	14,023,530	No return before	6,657,303
1802-1806	16,733,330	1814.	1,851,625
1807-1811	19,811,410		1,299,859
1812-1816	25,153,520	18,935,400	2,324,973
1817-1821	25,237,230	14,186,950	23,172,781
1822-1826	21,469,520	10,961,800	22,283,903
1827-1831	20,691,710	8,798,500	9,134,894

A general suspension of specie payments also took place in the United States at the time of the civil war. At the beginning of 1861 the paper currency consisted entirely of notes of the various banks amounting to about 40 millions sterling. The acts of 17th July and 25th August 1861 authorised the issue of treasury notes, redeemable in coin on demand, but they were received with dislike. In December 1861 specie payments were suspended, and the issue of government legal-tender notes was authorised by act of 25th February 1862. Their amount rapidly increased, till, in 1865 the total of demand notes in circulation was about 150 millions sterling. Their value in gold as rapidly decreased, and in 1864 it fell to 35·1 cents per dollar, equal to a price for gold of 285 per cent. In 1866 the Treasury began to redeem them, at the rate of 4 million dollars per month, by cancelling them as received for taxes, but redemption was suspended by congress in 1868. The act of 14th January 1875 provided for the resumption of specie payments, directing the cancelling of legal-tender notes to be continued, and requiring the secretary of the treasury to prepare and provide for their redemption in coin upon the 1st January 1879. For this purpose, besides using the surplus revenues, he was authorised to create and sell for coin interest-bearing bonds of the United States. Under these powers bonds for \$90,000,000 (say £13,000,000) were sold, realising \$95,500,000 (say £19,000,000). This amount was not applied in reducing the amount of legal-tender notes, because the act of 31st May 1878 prohibited any further reduction, and required the treasurer to pay them out again after redemption. It has, however, since been always regarded that \$100,000,000 (say

20 millions sterling) of the balance in the treasury should be reserved for note redemption. But the general resumption of specie payments was carried into effect before the time contemplated by the act, and on 17th December 1878 gold touched par. The following table gives the highest price of gold in each year from 1861 to 1878:—

1861—104	1867—145½	1873—119½
1862—134	1868—150	1874—114½
1863—152½	1869—162½	1875—117½
1864—285	1870—123½	1876—115
1865—233½	1871—115½	1877—107½
1866—167½	1872—115½	1878—107

SÜSSMILCH, JOHANN PETER (1708-1767), was the author of the earliest works which can be described as "statistical" in the modern sense of the term. Süßmilch was a Prussian army-chaplain who in 1742 published a remarkable book entitled: *Die göttliche Ordnung in den Veränderungen des menschlichen Geschlechts, das ist gründlicher Beweis der Göttlichen Vorsehung und Vorsorge für das menschliche Geschlecht aus der Vergleichung der Geborenen und Gestorbenen, der Verheiratheten und Geborenen wie auch insonderheit aus dem beständigen Verhältniss der geborenen Knaben und Mädchen u. s. f.* This very long title was materially shortened in the next edition, which was not issued until 1761. The title then ran thus:—*Die Göttliche Ordnung in den Veränderungen des menschlichen Geschlechts aus der Geburt, dem Tode, und der Fortpflanzung desselben erwiesen*. The 4th edition (3 vols.) was printed in Halle and published in 1798 at the *Realschule*, Berlin, carefully edited and revised. Süßmilch's book deservedly won him high consideration among men of science, and also, which in those days did not necessarily follow, in the official world, for he became an *Oberconsistorialrath* and a member of the royal Prussian academy of sciences. Süßmilch was the first systematic student of "political arithmetic" (see ARITHMETIC, POLITICAL), as Sir William PETTY termed investigations into what are now known as "vital statistics," who was not satisfied with merely recording facts, but deduced general laws from them. This is no disparagement to his predecessors, for they had even less materials to work upon than Süßmilch. Such was the success of *Die Göttliche Ordnung* that it was not long before there arose a school of "mathematical" statisticians who perversely refused to admit that any elucidation of figures was needed, maintaining that they told all that was required. Süßmilch himself was really in advance of his time; he was a shrewd man as well as a very

painstaking and learned one, and made excellent use of the imperfect materials at his disposal.

S., W. See W. S.

SWAN, COLONEL JAMES (1754-1835), American merchant, politician, soldier, and author, helped to throw the tea-chests into Boston harbour, and was also aide-de-camp to General Warren at Bunker's Hill in 1775. In 1787 he left for France, a ruined man, but having speedily accumulated a fortune, returned in 1795 to his former associations in the States. His next thirty years were occupied in litigation, and the greater part in a Paris prison. In March 1830 his prosecutor died, and Swan was liberated. But he remained in Paris till his death.

He published *A Dissuasion to Great Britain and the Colonies from the Slave Trade to Africa* (Boston, U.S.A., 1773, 8vo). In the opening dedication to the governor of Massachusetts, Swan describes himself as a "Scotsman." He shows slavery to be derogatory to the spirit of Christianity, encouraging internal war among the African tribes, that the traders may buy the prisoners for slaves. He details the horrors of the slave-ships, points out the preferable economic advantages of amicable commercial relations with the negroes, and obtaining (pp. 31, 32), in return for our trifling wares, their ivory, gum, spices, and gold. If this were done he assures us that where British merchants "now export twenty shillings worth of commodities thither, they would then export an hundred pounds" (p. 32).

In *An Address to the President, Senate, and House of Representatives of the United States, on the means of creating a National Paper by Loan Offices which shall replace that of the discredited Banks, and supersede the use of Gold and Silver* (Boston, Mass., 1819, 8vo), Swan proposed that the United States should, on the credit of its 800,000,000 acres of unsold land of the value of 1,600,000,000 dollars, issue 150,000,000 dollars "in current bills, bearing interest at 3 per cent per annum." "That amount," he continues (p. 9), "is not a tenth part of the capital, and that credit would be so much the more solid since not a dollar of these bills could be put into circulation but from loans made to individuals with three solvable signatures; or to merchants on the deposit of goods for sale; or to proprietors on mortgage of real estates with bonds of the borrowers; all these loans to be had on paying 6 per cent per annum, and as the current bills borrowed of Government bear 3 per cent interest, these loans would be really offered at 3 per cent interest instead of 6, the legal usage for money."

Swan also wrote and published *National Arithmetic*, by J. S. (1786, 8vo).—*Causes qui se sont opposées aux progrès du commerce entre la France, et les États-Unis de l'Amérique, avec les moyens de l'accélérer . . . en six lettres adressées à M. le Marquis de La Fayette. Traduit sur le manuscrit anglais du Col. S.*, Paris, 1790, 12mo.—*Courtes*

*observations sur l'état actuel des manufactures du commerce et des finances de l'Europe, et sur celui de l'agriculture en France, et les moyens de l'améliorer*, Paris, 1828, 8vo. A. L.

SWANIMOTE. See FORESTS, MEDIEVAL.

SWEATING. A term that has somewhat recently become naturalised in economic technology, but of which the precise signification is still uncertain. It was originally a slang expression, denoting a system of SUB-CONTRACT (*q.v.*) in certain industries, of which the clothing trade in all its branches is the most conspicuous, and was so applied by Charles KINGSLEY in his novel of *Alton Locke*, published 1849, and his tract *Cheap Clothes and Nasty* by Parson Lot, which made its appearance a little earlier. In the latter a definition of it is afforded in the following terms:—"Part of the work, if not the whole, is let out to contractors or middlemen—sweaters, as their victims significantly call them,—who, in their turn, let it out again, sometimes to the workmen, sometimes to fresh middlemen; so that out of the price paid for labour on each article, not only the workmen, but the sweater, and perhaps the sweater's sweater, and a third, and a fourth, and a fifth, have to draw their profit." This definition agrees with one furnished nearly half a century later, in an elaborate report on the sweating system of Chicago, forming Part II. of the report of the bureau of labour statistics of Illinois (1892), where the whole matter is dealt with at length, and most intelligently. In the opinion of the writer of this report, the "sweating system is one of respectable antiquity, and is a surviving remnant of the industrial system which preceded the factory system, when industry was chiefly conducted on the piece-price plan in small shops or the homes of the workers. . . . In practice, sweating consists, he says, of the farming out, by competing manufacturers to competing contractors of the material for garments, which in turn is distributed among competing men and women to be made up. The middleman, or contractor, is the sweater (though he may also be himself subjected to pressure from above), and his employés are the sweated or oppressed. He contracts to make up certain garments at a given price per piece, and then hires other people to do the work at a less price. His profit, it is pointed out, "lies in the difference between the two prices" (pp. 357, 358). On the other hand, these definitions do not agree with the conclusions arrived at by a special committee of the House of Lords, appointed in 1888 to investigate the same subject. After an exhaustive enquiry, this committee reported that sub-contracting was not synonymous, or even conterminous, with sweating. The middleman is "the consequence, not the cause, of the evil"; and is "absent in many cases in which the evils complained of abound" (vol. v.

par. 181). The sweating system may exist under any method of employment, when "the conditions of the labour market afford abundant materials to supply an unscrupulous employer with workers helplessly dependent on him" (185). "In some cases the man known as a sweater is merely an agent, knowing nothing of the business. Sometimes he acts the part of a foreman, and directs the work of every branch, understanding the whole business thoroughly. Sometimes he works as hard as any of his employés" (par. vii.). Their definition of sweating is, "taking advantage of the necessities of the poorer and more helpless classes of workers" (171); or, "grinding the faces of the poor,"—as still more compendiously expressed by a prominent witness, Mr. Arnold White (par. 172).

These quotations reveal a fundamental difference of opinion on the part of two competent authorities, speaking from either hemisphere, and it is to be remarked in addition that no English political economist, or historian of eminence, has ventured yet to make any specific use of this term. In Mr. Howell's *Conflicts of Capital and Labour*, it occurs but once (p. 114), the passage being little more than the incorporation of another from Mr. Brentano's *History and Development of Gilds* (p. 129) referring to the repeal of 5 Eliz. c. 4 (in 1814), the "immediate consequence of which," this writer says, was "such a growth of the system of *sweaters* and half-pay apprentices, that the journeymen were driven to famine, and the female workers to prostitution." It is in fact a very unfortunate term in more ways than one and were better perhaps discarded altogether where scientific accuracy is aimed at.

Such as it is, however, and regarding its use in the limited sense of having a direct relation with sub-contracting, in which it seems to have originated, there are, according to the American authority referred to, two principal modes in which the sweater operates: "he will furnish shop-room and machines to some, and allow others, usually the finishers, to take the work to their living and lodging-rooms in tenements." Some remarks on the former of these modes of industry will be found under the heading TOOL RENT; the latter is one that has from time to time aroused public attention and sympathy, both at home and abroad, ever since the inquiry of the Second Children's Employment Commission (1862-66), if not earlier; and which, under the name of Home Work, was again (1894) a prominent subject of controversy in view of the grave evils still found to be associated with it. It is obviously an exceedingly difficult matter to deal with. On the one hand, it would certainly seem a highly arbitrary and oppressive act to forbid, or even attempt to regulate very strictly this work; on the other, it is truthfully argued

that such methods of employment inevitably bring down the wages of better-organised labour, tend to lower the standard of living, and are often pursued under terribly insanitary conditions. It is known that such considerations affecting labour were a principal concern of the mediæval guilds, and in certain modern trade unions a campaign against all home work has been inaugurated, while in all it is discouraged in a greater or less degree. The question remaining for decision is, whether this campaign should be made general; and, in particular, should be enforced by the mandate of the state. In some countries, as Switzerland and a few of our own colonies, an experiment of this kind has been already tried, and the English factory act of 1891 contained a provision of the nature of a preliminary step in the same direction. The 27th section of the 54 & 55 Vict. c. 75 imposed the obligation on "the occupier of every factory and workshop . . . and every contractor employed by any such occupier in the business of the factory or workshop . . . if so required by the secretary of state," to "keep in the prescribed form and with the prescribed particulars lists showing the names of all persons directly employed by him . . . outside the factory or workshop, and the places where they are employed . . . and every such list shall be open to inspection by any inspector under the principal act, or by any officer of a sanitary authority." A still more recent one (1895), 58 & 59 Vict. c. 42, requires further that such lists be sent to the inspector of factories for the district twice a year, and another provision, sec. 16, has for its object to prohibit work being taken home to be operated on "except during the period of employment." The secretary of state (home secretary) has, in virtue of the powers herein conferred upon him, scheduled certain manufacturers accordingly. They are: the manufacture of articles of wearing apparel; the manufacture of electro-plate; cabinet and furniture making, and upholstering; the manufacture of files (see SUB-CONTRACT).

SWIFT, JONATHAN (1667-1745), dean of St. Patrick's, Dublin, the austere Rabelais, the party pamphleteer from whom Rousseau learnt

to detest politics and society, the high churchman from whom Voltaire and Lessing learnt their religion, the author of *Gulliver's Travels*, is a writer to whose economic views critics are often unjust. *The Humble Petition of the Colliers, Cooks, Cook-maids, etc.*, against the use of focussed rays by a supposed company instead of fires, represents that this "will utterly ruin . . . your petitioners . . . and trades on them depending, there being nothing left to them after the said invention but warming of cellars and dressing of suppers in the wintertime." And "whereas the said" company "talk of making use of the moon by night as of the sun by day, they will utterly ruin the numerous body of tallow chandlers," and so the tallow tax will fail. The fable of BASTIAT is chiefly based on his expansion of this parable in the seventh of his *Sophismes Économiques* (1846), of which his admirers still say "nothing is more brilliant, nothing more French." Swift's *Maxims controuled in Ireland*, suggested perhaps by Sir W. TEMPLE (*Works*, ed. 1814, vol. i. p. 177), exposes, after the manner of Bastiat, popular economic fallacies which deceived Temple, LOCKE, and CHILD, whom he had studied; e.g. that a large population, high prices for land, dear provisions, and big towns (cp. BARBON) must imply wealth, and that low interest must be due to much money. For "must," he says, you should write "may"; thus, in trading countries like Holland and England, low interest and high capital values for land were effects of the causes alleged, but in Ireland of the absence of trade, and therefore of a demand for loans. He perceived "that in the arithmetic of the customs two and two, instead of making four, make sometimes only one" (A. Smith, *W. of N.*, bk. v. ch. ii.). Otherwise Swift belongs to his age. Thus the king of Brobdingnag's belief that "whoever could make two ears of corn or two blades of grass to grow . . . where only one grew before would deserve better of mankind . . . than the whole race of politicians," and the echo of this belief at the end of the last of the DRAPIER'S LETTERS resembles Molesworth's ideas (1723), and afterwards became a favourite motto with A. YOUNG. He thinks with Locke that taxes fall mainly upon land, which, like HARRINGTON, he overrates (*Works*, ed. 1824, vol. iii. p. 518); and his anger against ploughlands being turned into sheep-runs makes him akin to LATIMER, Boulter (*Letters*, 24th February 1727), and, as he himself said, to Ajax. He pillories the trading spirit in his abuse of the Dutch; and wishes a weavers' corporation to regulate prices and 'qualities, and to punish offenders by "warnings" (*Works*, vol. vii. pp. 49, 50, 137). He denounces "the restriction" and urges Irishmen to raise by way of reply what Berkeley called "a wall of brass a thousand cubits high" round Ireland; and thinks that this could be

done by a resolution to consume home-made goods instead of "unwholesome drugs and unnecessary finery" imported from India and elsewhere (*Proposal for the universal use of Irish Manufacture*). His sumptuary mercantilism is the same as that of Sir W. TEMPLE, POLLEXFEN and BERKELEY. For the rest he advocated national education and beggars' badges, and adopted Temple's fallacy that high rents caused high prices, PRIOR's facts and fallacies on absentees, and Molesworth's views on rack-rents; he deplored with Temple the destruction of timber, and opposed Boulter's lowering of the gold coin, and Berkeley's proposal for a bank; and like Prior, Berkeley, James King, Simon, and others, he advocated an Irish mint in his DRAPIER'S LETTERS (1723-24). In these Swift's economic objection to Wood's copper—if stripped of its figures, which Swift meant to be figures of speech<sup>1</sup>—was that the coin being hammered and not milled was easily forged, was base, excessive, and not convertible by the patentee; further, the patent did not make it legal tender, so that when this was known it would at once lose its mint value unless it should, by an abuse of the royal prerogative, be made full legal tender, in which case it would drive out gold and then depreciate. Swift did not, nor could any writer at that time, analyse the latter process, and he omitted a third possibility, that it might be made limited legal tender.<sup>2</sup> If this omission was uncandid what shall we say of his critics Leslie Stephen (*Swift*, pp. 153 *et seq.*) and Moriarty (*Swift*, 1893, p. 211), who assume that the coin was legal tender up to 5½d. ? Further, token coins, if redundant and difficult to convert, are open to these objections, so that the omission weakens but does not vitiate the argument. Lastly, facts and dates indicate that there was a likelihood that these coins would be made legal tender either to an unlimited or to a dangerously high extent. Wood boasted, 9th February 1722, that his coins were or would be made legal tender (Coxe, *Walpole*, ii. 371); and from Lady-day 1722, when his coining rights began, to 16th September 1723, the terms were unknown even in Dublin Castle; had the whole amount, £100,800, been floated

<sup>1</sup> Swift, in order to make this plain, wrote that Wood's patent was for "four-score and ten thousand pounds" (cp. *Works*, vol. x. p. 78; vol. xi. p. 35) in his first letter, £140,000 in his second. In his pirated third edition (1735) Faulkner changed these allegorical figures to £108,000, a figure which occurs correctly in the fourth letter in another context. Swift's figures as to the commercial value of Wood's coin presuppose fraud on the part of Wood; this charge was corroborated with regard to the first year's coins, disproved with regard to the second year's coins (Monck Mason, p. 340). But the figures vary from  $\frac{1}{4}$  to  $\frac{1}{2}$ , and are not serious.

<sup>2</sup> His critics miscite his reply to Wood's proposal that Wood and his agents should force 5½d. at a time on some class of people; which is that this would not make it legal tender generally, so that the first recipients would lose (vi. 379). When he discusses a possible proposal to force it on people generally by proclamation (p. 383) he mentions no limit.

in the dark, the hands of ministers must have been forced and most of Swift's fears realised. Again, the crown rent was £100, and Walpole's report valued it at £800; under the Armstrong-Knox patent of 1680 the copper need not be quite so good, and was only limited legal tender, but the rent was only £16. Further, there was virtually no silver in Ireland (Sir J. Browne, *Scheme*, 1729; British Museum, Add. MSS. 34358, pp. 74, 79); and every one was either bimetallic or silver-monometallic; and only thirty-three years before James II. had substituted full legal tender brass for silver. Further, the customs officers were practically ordered (Coxe, *l.c.* p. 393) to receive these coins without limit, and in the efforts referred to in Coxe (*l.c.* pp. 346-438) and Monck Mason (*l.c.* app. note c) to dissuade ministers from making them legal tender, no limit is mentioned. Lastly, it was clear ever since the first letter that the patent would always be onerous; yet when it was revoked, 14th August 1725, the treasury paid Wood instead of Wood paying the treasury; a compact with Wood to make the coins legal tender would explain this. Ruding cites against these arguments Walpole's *Report of the Privy Council*, 24th July 1724, which disclaimed any intention to make the coins legal tender; and argues that because danger was averted it was not real. Yes, but Swift's first *Letter* was published November (?) 1723,<sup>3</sup> and doubtless caused the report, just as the second letter doubtless caused its publication, and the third letter criticised it; in the next two letters the storm centre shifts from economics to politics; the next is retrospective, the last prospective. Or it will be said "how absurd to think that Walpole would do what James II. did and in the same way!" Of course the patent was a mere blunder; if the coin were private it ought to have been, like promissory notes, convertible into legal tender coin by the issuer; if public, it ought to have been legal tender; and it was neither. But blunders often have the same effect as crimes. To conclude, Swift described, with popular but not misleading rhetoric, a grave economic peril which he more than any one averted.

[Public record office, patent rolls, 8 Geo. I. pt. v. No. 5, bears out Monck Mason's abstract of Wood's patent, *History of St. Patrick's* (1820), p. 326 n., so that the dates in Leslie Stephen, Froude, etc., are wrong. The errors mentioned in notes 1 and 3 occur in Faulkner's (1735), Hawkesworth's (1755), the Edinburgh (1761), Sheridan-Nichols' (1801), W. Scott's (1814, 1824), J. B. Daly's (1887), H. Craik's (1892),

<sup>3</sup> Faulkner's reprint (1725) misprints "four" for "three" in the third paragraph of the first letter, and so makes the date autumn 1724. A similar sentence occurs in the seventh letter (vol. vii. p. 52) where "four" is correct; the seventh is therefore a year later than the first letter, and its date is the end of October 1724. Lord Middleton probably refers to the first letter as written but not yet published, 1st November 1723 (Coxe, vol. ii. p. 372).

and we believe every edition since 1735. The economic case against Wood is put into economic language by D. B. in *Some reasons showing the necessity . . . for continuing to refuse Mr. Wood's coinage*. Faulkner's reprints (1725) says D. B. was Swift, but he was clearly David Bindon, author of *Essay on the Gold and Silver Coin current in Ireland* (1729). D. B.'s figures are practically the same as those approved by Lecky, *History of England in the 18th Century*, vol. ii. p. 424 n. Massie (British Museum Lansdowne MSS. 1049) also ascribes to Swift a *Letter to a Country Gentleman about Coin in Ireland* (1736), unknown to Scott, Craik, etc. The *Humble Petition* is sometimes ascribed to J. Arbuthnot. There are references to Swift in Macpherson, *Hist. of Commerce*, vol. iii. 392 n.; Hume, *Works*, ed. Green and Grose, vol. iii. pp. 332, 344.] J. D. R.

**SYCEE.** The silver ingots commonly used in China as currency are known under the general title of sycee. The word conveys the idea of pure silver, having been derived from *Se-see*, meaning silk-fine, that is to say pure enough to be drawn into a fine wire or thread. The millesimal fineness of this silver varies from about 960 to 990, being thus as nearly fine as the rough method of assay employed by Chinese merchants can verify.

The usual shape of sycee ingots bears some resemblance to that of a Chinese shoe, and such ingots have come to be generally known as "shoes" (see CASH and TABL). F. E. A.

**SYNDICATE.** This word is used to describe a body of persons who combine for the purpose of some financial transaction. The most common syndicates are the so-called underwriting syndicates, who, in return for a commission, undertake to take over so much of any public issue of stock exchange securities as shall not be taken over by the public. As a general rule the members of a syndicate do not enter into any regular partnership arrangements, but it is sometimes found advantageous to register a syndicate as a limited company (see RING; TRUSTS). E. S.

**SYNDICATS PROFESSIONELS (Fr.).** Trades unions. The present legislation on such associations was established by a law of the 21st March 1884. Unions of workmen had existed in France from the earliest times, and even survived the revolutionary law of June 1791, abolishing all trade guilds and corporations; but their powers were restricted by arts. 291-294 of the penal code, which prohibit meetings of more than twenty persons without authorisation for the discussion of religious, literary, political, or other subjects, and incitements to crime or misdemeanour by speeches or exhortations, or the reading, display, publication, or distribution of any writings whatever; and by art. 416 of the same code, which punished by imprisonment for six days to three months, and fines of from 16 francs to 300 francs, or either of those penalties, any workman, master,

or contractor for work, who, by means of fines, prohibitions, proscription, or exclusion, after a concerted plan, should have restricted the free exercise of labour or an industry. The law of 1884 enacts that arts. 291 to 294 of the penal code shall not be applicable to workmen's syndicates, and abrogates art. 416 of that code. The subsequent sections declare that associations, even of more than twenty persons, may be freely formed without authorisation; their object must be exclusively the study or protection of economic, industrial, commercial, or agricultural interests. The unrestricted right of combination has not tended to improve the relations between masters and workmen. Strikes and coalitions to impose on masters the exclusion of non-syndicated workmen, which were formerly punishable under art. 416, are now more frequent than ever. The only corrective to the abuse is that judges sometimes award damages against the syndicate to the aggrieved workman. T. L.

**SYNTHESIS AND SYNTHETIC METHOD.**—The synthetic method is often identified with deduction in contrast with induction, which is called the **ANALYTICAL METHOD** (*q.v.*). This identification may be explained as follows:—Deduction is primarily defined as a process of inference from more general to less general propositions. Now the most general propositions of such a science as economics are extremely abstract; and the process of deducing specific conclusions leads to the formulation of increasingly concrete propositions. The concrete are obtained from the abstract by a combination or *synthesis* of elementary principles; and the conclusions are obtained by investigating the effect of a number of different causes acting together. To apply the synthetic method we must know (1) the effect of each of a number of different causes; and (2) a principle for calculating the effect of a combination of such causes when the effects of the separate causes are known. The original premisses of the synthetic method are chiefly derived by induction from common experience of human motives and natural forces. For example, we can inductively obtain the general nature of the conditions of demand for any commodity, and also of the conditions of **SUPPLY**. By a mental synthesis of these two sets of conditions, we can calculate the price and amount at which transactions in that commodity will take place. Again, we may learn inductively from common experience the nature of the factors required to co-operate in the production of a commodity and of the conditions connecting the price and amount at which these factors are supplied. By a mental synthesis of these conditions, we calculate the conditions for the supply of the finished commodity. The method leads to more concrete results when the separate effects of **CUSTOM**, **HABIT**, ignorance, inertia, etc., are taken

into account, and the joint result of these several influences is calculated. Special importance attaches to the calculation of the effects of MONOPOLY and COMBINATION.

But it is doubtful whether the terms synthetic and analytic should be used to indicate the contrast between the DEDUCTIVE and INDUCTIVE METHODS. For both in deduction and in induction both analysis and synthesis are employed. In fact it will be found that Professor Marshall repeatedly uses the phrase analytical method to represent what is here called the synthetic method; see in particular *Principles of Economics*, bk. i. ch. vi. Thus he writes (p. 92, note 1) "those who rate highly the importance of analytical methods are glad to acknowledge the great services which the historical method, in the hands of really able men, renders to economics generally, and even to economic analysis." Here, and throughout the chapter, the terms analysis and analytic method are pointedly referred to what is otherwise known as the *a priori*, or deductive treatment of economic problems. And it is undoubtedly true that analysis is much more prominent than synthesis in the calculations carried out by deductive economics. For the first step is to extricate from amongst the complicated forces known to operate in society, those which bear on the special problem. When any piece of deductive reasoning is presented for criticism, the questions to be asked are "*is the analysis correct?*" Have all the forces which would operate in the case presented for discussion been taken into account? Or has the reasoner omitted to notice that condition A would have been followed by condition B, or counteracted by condition C, and so on." Such considerations naturally present themselves as involving the mental process of analysis; and the mental synthesis which accompanies or follows the analysis strikes one as relatively unimportant. Turning to the inductive method, which rests on a historical and comparative examination of events presented in actual experience, it might be said that here the process of collecting and connecting facts is a sort of synthesis. But this view could not properly be maintained. For the term *synthesis* should be used to denote the mental combination of different characteristics by which we apprehend a complex phenomenon. It should *not* be used to denote the bringing together of various complex phenomena with the purpose of comparing them and extracting their essential points of agreement and difference. Of course, however, no analysis is complete unless supplemented by a process of synthesis in which we reconstruct in thought the complex whole first apprehended as an unanalysed unity. Since an analysis of complexes and a synthesis of elementary conditions are together involved both in deduction and

induction, it becomes important to point out how the analysis or synthesis differs in the two methods. The obvious difference is that in the A PRIORI method we construct *imaginary* cases, illustrative of the forces which we know from general considerations to be in common operation; whereas in the A POSTERIORI method we consult the records of events which provide *actual* cases. Now these illustrative cases can be much more adequately analysed than any cases provided by history, because the latter are indefinitely complicated and contain an unknown number of unknown factors. A complete analysis of real instances is impossible. Thus, induction rests on a necessarily superficial analysis of concrete cases aided, if possible, by a wide comparative survey needed to compensate for the necessary superficiality of the analysis. Deduction offers a complete analysis of the illustrative or hypothetical cases with which it deals; but of course its results cannot be straightway applied in explanation of facts in all their circumstantial detail (see ANALYTICAL METHOD; DEDUCTIVE METHOD; HYPOTHESIS; INDUCTIVE METHOD). W. E. J.

SYSTÈME was the name given to the whole mass of financial measures promoted by LAW from June 1716 till his flight from France, December 1720. Law had begun to develop his plans in an unpretending and cautious manner. A joint-stock discount bank in which private individuals were partners, discounting commercial bills at 5 per cent, issuing notes payable to bearer at sight, in bank crowns—notes of 10, 100, and 1000 crowns—the crown (*écu*) was worth 5 livres at that time—opening banking accounts and current accounts.

The capital of this bank was 1,200,000 crowns, divided into shares of 1000 crowns each, standing in the name of 1200 persons. The whole amount was paid up at once, but at the rate of 25 per cent in specie and 75 per cent in government notes, which stood then at a discount of from 75 to 80 per cent of their face value. The actual capital in specie was hence only 375,000 livres (*Tournois*). The actual issue of notes was in no way limited, and by September 1718 it attained the amount of 51 millions of livres. The public were attracted; confidence in the paper, though slightly hesitating at first, soon became unbounded. It should be explained that Law, in issuing it, made some concessions to public favour. The plan was only, in his eyes, a stepping-stone, for, as subsequent events proved, he desired to establish a state bank and paper money, and was a partisan of the MERCANTILE SYSTEM. The government of the regency and the Duke of Orleans in particular welcomed Law's plans warmly—consequently the General Bank became from December 1718 the Royal Bank, the king repurchasing the shares at par. Encouraged by this first success, Law started an enterprise of greater importance which was no less well received by the public. He established a company, this time with a capital of 100 millions

livres, divided into 200,000 shares to bearer of 500 livres each, payable in government notes. We may observe that shares to bearer were now seen in France for the first time. The state was bound to pay to the new society, named the *Compagnie d'Occident*, interest at 4 per cent on the 100 millions of notes withdrawn from circulation. The first annuity, 4 millions, was to form the floating capital for the new enterprise, which was called by the public the *Compagnie du Mississipi*. Its object was to trade with Louisiana, Canada, and the west coast of Africa, with all the rights of sovereignty over those countries. The shares were paid in full, and the duration of the company was fixed at twenty-five years, dating from 6th September 1717. The subscription was only completed in July 1718. The foundations of the *Système* were laid, but the brothers Paris (see PARIS DUVERNEY) sought to undermine them, and, availing themselves of the plan originated by Law, they set to work to compete with it. They valued the royal farms (see FARMER-GENERAL) at 48,500,000, which they divided into shares. This was the *anti-système*, but it was short-lived, and when a year after, 28th October 1719, Law offered 52 millions, the grant to the *anti-système* was cancelled in favour of Law, an arbitrary proceeding, though not thought so then. The notes did not at that date form a forced currency, but the state treasurers had orders to receive them. Besides this the bank opened offices in the country to facilitate their circulation; this became necessary since the bank crown, which formed an ideal and invariable coin, had just been replaced by the *livre tournois*, a coin subject to arbitrary modifications in value; this fatal decision having a reactionary effect, the old notes of 10, 100, and 1000 crowns were exchanged against the new ones of 10, 100, and 1000 livres. It is true that the public, beginning to feel the influence of the fascination which Law exerted, neither understood the meaning of this change nor took any notice of it.

At this date, 4th September 1718, the farm of tobacco came to an end. Law took it at 4,020,000 livres instead of 2 millions, the former rate; as the state owed him 4 millions annually this only left 20,000 livres to be found by the company, on the other hand, the company found in this monopoly a favourable outlet for the produce of its colony, Louisiana.

In May 1719 a share of the *Compagnie d'Occident*, payable, it will be remembered, in depreciated state notes, was worth only 300 livres; the shares soon rose to par. From this time the *Système* took a feverish turn which inevitably proved fatal. To the privileges which it already possessed those of trade with the West Indies and China were added, and on this occasion the *Compagnie d'Occident* took the name of the *Compagnie des Indes*, which it retained until 1769. To pay for this privilege Law was obliged to issue 50,000 shares payable in twenty months, of 550 livres each, being thus at 50 livres premium. From this moment the infatuation of the public was such that in spite of being compelled to present four original shares called *Mères* in order to be able to subscribe to one new one called *Fille*, the operation succeeded. Encouraged by this success, Law made a tender for

the mint at 50,000 millions, and issued on this occasion 50,000 new shares of 1000 livres this time, 5 old shares (4 *mères* and 1 *fille*) having to be presented to be able to subscribe one new one—a *petite fille*. It should be added that as in the case of the preceding issue, twenty months were allowed in which to pay up by monthly instalments. The operation was another success for Law. His boldness was encouraged. His turn for gambling led him on to the end of his tether. He attempted the most amazing operation ever yet heard of, the re-paying of the annuities and the value of the offices—1,500,000,000 livres.

To realise this sum, gigantic as it was for the period, Law opened successively three subscriptions at close intervals, 13th and 28th September and 2nd October 1719, for 100,000 shares each issued at 5000 livres, payable in tenths each month, but of which only the first four-tenths could be paid. It may be added that for this triple subscription it was no longer necessary to present again the old shares to which they were in some degree related. As to the value of these shares it continually rose, and the prices of the above-mentioned issue were only the enfeebled reproduction of it. Thus in November 1719, after the aforesaid decree and in consequence of it, they rose to 10,000 livres; they did not long remain at that figure, and in January 1720 they reached their maximum of 18,000 livres.

Finally, it may be said that after having opened the subscription for payment in specie, the holders of state paper of whatever class it might be for every determination of state debt, income, pension, or office, were able to subscribe as a privilege, but by a chance only too easily explicable the shares which these creditors might lawfully have claimed by right were not any longer disposable, having been taken by others. There only remained to them the opportunity of being paid off in notes at par, and with these notes of buying shares, no longer at 5000 but at 10,000 livres. Their disappointment may be understood, but their complaints were lost in the hubbub of the market. Reckoning up the successive issues, there were 600,000 shares which produced at the price of issue—deducting what was not paid—777,500,000 livres, that is, a premium of 477,500,000. In reality 624,000 shares were created, but the rate realised for the last 24,000 is unknown, as they were issued by order of the regent himself. With respect to the issue of notes, it may be understood that the enormous amount of the transactions swelled it extremely. In fact it amounted to 3,070,750,000 livres, as the cashier of the bank chronicled. We are now at the end of this mad and wild speculation, in which nearly every one took part. As to Law, bold but cool-headed gambler as he was, just as success never intoxicated him, he never lost his *sang-froid*, fighting courageously against the storm. He gambled more for pleasure than for gain, as his disinterestedness afterwards showed. The public, when once their cupidity was thoroughly aroused, gave themselves up shamelessly to uncontrolled gambling—to that stock-jobbing which gave the Rue Quincampoix, the street which witnessed this fit of madness, such an unhappy

reputation. From this time the ascendancy of the influence of Law over the public began to decline; many people realised their holdings.

Law at first strove against the tide by the issue of decrees; we may mention that of the 11th March 1720, which suppressed the legal currency of specie whether gold or silver—afterwards confusing the position and the rights of creditors and shareholders—that of the 21st May following, which fixed the rate of exchange between notes and shares. Clearly the regent himself gave up the *Système*, though he did not desert Law. Indeed the decree of the 21st May was attributed to the enemies of the *Système* and not to its author. At bottom Law believed that the existence of an inconvertible paper money without a basis of any metal was possible. Also he urged on the issue of notes and the proscription of all precious metal or real value which might take their place; gold, silver, jewels, were the object of his antagonism,—to possess them was to be the enemy of the *Système*. In this Law was a bigoted sectary.

All that remains of the history of the *Système* is a series of contradictory acts, some in favour of the paper currency, some in favour of forced concessions to public opinion or to actual facts. From these arose overwhelming disorders up to the time when Law was compelled by the general indignation to quit France, never to return. The regent, always friendly to Law, sent him at this moment a passport and money. He accepted the passport alone—the only property he carried away with him being 5 millions in valueless bank notes, 800 louis, and 2 rings each worth 2000 crowns; one of these he sent as a gift to Madame de Prie, who had helped him to escape. His fortune when he came to France had been a million and a half.

TABULAR STANDARD (see also INDEX NUMBERS) is simply, to borrow Professor Nicholson's concise and admirable definition, "an official index number" (*Money and Monetary Problems*, p. 31). The practical object which those who now advocate the adoption of the tabular standard propose is the attainment of a perfectly stable currency for the payment of rents or other deferred contracts. The proper construction of an index number for the regulation of the currency is explained on page 386, Vol. II., of this Dictionary. In other words, the employment of such a standard is expressly limited to *deferred* payments; in these it is proposed (if we may make a local application) that account should be taken by means of a tabular standard of changes in the purchasing power of the sovereign. It is not very easy to mark out the sphere of an inquiry into the tabular standard, but it is clear that the theory of index numbers is a wider field in which the practical correction of the monetary standard is only one of the aims proposed. This will be made clear by a reference to the history of the subject. The compilation of a history of the theory of a tabular standard is generally ascribed to Jevons. But as a matter of fact he borrows almost everything from Joseph Lowe, who, in his *Present state of England*, 1823, as a preliminary to propounding his own scheme, discusses those of previous writers.<sup>1</sup> He mentions at the beginning of ch. x. the works of Bishop W. FLEETWOOD, Adam SMITH, and Sir Frederick EDEN on the fluctuation of prices, and finally Sir George Shuckburgh Evelyn's "endeavours to ascertain a standard of weights and measures." This interesting essay was published in *Philo-*

*sophical Transactions* for 1798, pt. i. p. 176. Lowe is very severe upon Evelyn, and forgets to give the credit due to originality. He refers to the paper as "a tabular statement, which from the clearness of its form, and the confidence of its deductions, obtained much more credit than it deserved, being far from correct even in the fundamental points." In this view he is no doubt influenced by the criticism in Arthur YOUNG's *Inquiry into the progressive value of Money in England*, 1811. We append Sir George Evelyn's table in a much abbreviated form. It will be seen that he has clearly grasped the principle of a consumption standard. His inclusion of day labour is interesting, as its exclusion from most of the recent index-number systems has been a favourite ground for criticism.

Years.	Wheat.	Twelve Miscellaneous articles, viz. an ox, cow, poultry, etc.	Butcher Meat.	Day Labour.	All.
1550	100	100	100	100	100
1675	246	239	166	118	210
1740	197	492	266	250	287
1760	203	492	400	275	342
1795	426	752	511	436	531

Arthur Young, in the pamphlet above referred to, objects that the grounds of calculation are far from accurate. "Butcher meat"<sup>2</sup> is put on par with wheat; although with the mass of the population it does not form a fifth part of the consumption. Each of the twelve miscellaneous articles is considered of equal importance, and manufactures of every sort are omitted. Put into modern language, his objection amounts to this: the articles are badly selected and are not "weighted" according to their

<sup>1</sup> See Jevons, *Investigations in Currency and Finance*, pp. 122, 123, n.

<sup>2</sup> A. Young wrote "Butcher meat."

relative importance. The section in which Sir George Evelyn introduces his "tabular standard" (he is the inventor of the term as well as the thing) is of particular interest. He twice apologises for leaving the mathematical precision of weights and measures for such mean subjects as the prices of provisions and the necessities of life, but concludes with the hope that, however he may "appear to descend below the dignity of philosophy in such economical researches," he may "find favour with the historian at least, and the antiquary." The following is Evelyn's description of his method:—"It would carry me infinitely too wide to give a detail of all the facts I have collected: I shall therefore content myself with a general table of their results, deduced from taking a mean rate of the price of each article at the particular periods, and afterwards combining these means, to obtain a general mean for the depreciation at that period, and lastly, by interpolation reducing the whole into more regular periods, from the conquest to the present time."

He gives a list of his authorities,<sup>1</sup> and mentions that the various changes which took place during the different reigns, in the weight and alloy of the coins, are allowed for in the table. Thus Evelyn may be regarded as the first writer who definitely proposes a tabular standard; while Joseph Lowe, in the work already quoted, is the first to lay any considerable stress upon its practical value. In § 2 of ch. x. he describes it as a "plan for lessening the injury from fluctuation, and giving a uniform value to money incomes."

Lowe is followed by G. POULETT SCROPE in *An Examination of the bank charter question, with an inquiry into the nature of a just standard of value and suggestions for the improvement of our monetary system*, London, 1833. He there suggests a tabular standard, or table of reference:—"The table need only be sufficiently extended to afford, in the mean price of the whole number of articles contained in it, a standard of value (in its true sense of general purchasing power) as near to complete invariability as can be desirable for any practical purposes." After pointing out the "perfect equity" of such a standard, he attempts to prove its "vast utility" by dwelling on the commutation of tithes, on charity endowments, and on leases. There can be no good agriculture, he argues, without leases. But prudent landlords and solvent tenants "are prevented

from entering on the lottery of a long lease at present by the uncertainty that prevails as to the value of money. . . . The use of a tabular standard would obviate all the disadvantages which are justly objected to in corn rents, and give complete security that the rent agreed to shall not vary in value." Scrope advises that the employment of the tabular standard should be entirely optional. He rightly scouts the objection that interested persons, or any combination of them, could possibly, by any efforts, make any appreciable impression on an average "calculated on the mean prices of a long list of articles in all the great markets of Britain through six or twelve months." Scrope's *Principles of Political Economy*, 1833, reproduces the reasoning of the pamphlet. In a note at the end of ch. i. of the pamphlet, he observes, "after the greater part of the above was written, I have found in Mr. Lowe's valuable work a proposal to the same effect." No such acknowledgment is to be found in G. R. PORTER's *Progress of the Nation*, 1838, 2nd ed. 1851, who, with a naïve assertion of originality, suggests that "it would be highly instructive if tables of prices were made and recorded." Jevons wrongly regards Porter's scheme as identical with that of Scrope. But Porter, a writer of very inferior calibre, seems to have entangled himself and his standard inextricably with other and quite irrelevant aspects of monetary theory. Thus on p. 425 of the 1851 edition, it is clear that he proposes the tabular standard as a remedy for countries with a "local and inconvertible currency." His table will not, he thinks, be needed where a general rise in prices occurs in countries with a gold or silver standard. But under such conditions as led to the famous bullion report (see BULLION COMMITTEE, REPORT OF), "it must be at all times," says Porter, "an interesting and a valuable question to determine whether prices are actually rising or falling or stationary; and to ascertain the degree of such a rise or fall as an indication of the state of the currency." He states, however, the proper principles of a tabular standard, and appends a table compiled in accordance with them, showing the average monthly fluctuations of fifty commodities between the years 1833 and 1837. Porter therefore thinks that the practical value of a tabular standard becomes evident when it is used as a test of the proper behaviour of an inconvertible paper currency. Jevons, in his *Investigations in Currency and Finance*, ch. iii., regards Porter as the author of a method similar to his own. But Jevons, like Scrope, had "almost completed his calculations" when he made the discovery. Porter's mean of fifty articles for the years 1833-37 gives fluctuations which resemble in direction, but greatly exaggerate, those indicated by Jevons's mean of forty articles.

<sup>1</sup> In the construction of Evelyn's table, besides most of the old chronicles and historians, the following books were consulted:—

Bishop Fleetwood, *Chronicon Preciosum*, 2nd ed. 1745. *Libri Garderobae*.—J. Bree, *Sketch of Establishments*, 1791.—*Collection of Ordinances of Royal Household*, Edward III.—William III., 1790, Anon.—*Archæologia*, vol. ii.—Combrune, *Enquiry into Prices of Wheat*, 1000-1765, 1768. Smith, *Wealth of Nations*.—Sir James Steuart, *Principles of Political Economy*, 1767.—Henry, *History of Great Britain*, 3 vols., 1771 (A. Smith's copy).

In ch. xxv. of his *Money*, Jevons argues very strongly in favour of a tabular standard. Now, after sixteen years, the "foresight" shown by Elizabethan statesmen by their act obliging the colleges of Oxford, Cambridge, and Eton to lease their lands for corn rents, would not receive the encomium of a practical economist.

Jevons regards the "multiple legal tender" as an extension of the bimetallic principle for lessening fluctuations by spreading them over a larger area. The only real difficulty which he foresees is that of deciding the proper method of deducing the average. Mr. L. L. Price, *Money and its relation to Prices*, pp. 37, 38, is more pessimistic. "Objection may be raised to the employment of such a standard on the ground of unfamiliarity, or perhaps of a certain refinement of calculation, which is likely to confuse or alarm the plain man, and it may easily prove to be cumbrous or even impossible." Another objection urged by Mr. Price is that it is exceedingly awkward to separate your standard of deferred payments from your medium of exchange. Nevertheless it is highly important that both functions should be satisfactorily performed, and "the instructed economist" would be ready to recognise that "to satisfy this criterion, it is not necessary, it is even unlikely, that the medium and the standard should be identical." Assuming, however, the desirability and practicability of a tabular standard, we are still in the dark as to how it may best be constructed. On this head the reader should refer to the article on INDEX NUMBERS. But a word should be said here on the report of the British Association for 1889, which contains a memorandum by Professor F. Y. Edgeworth on the Index Numbers Committee Report. An explanation is there given of Professor Foxwell's method, which aims at the correction of the currency. This method is distinguished by "the conception of quantity produced, or rather sold, *per unit* of time." This is strictly a currency standard, and the idea of the inventor is "to obtain not the exact amount of metal which should be added to or subtracted from the currency in order to keep it perfectly stable, but rather that ratio in which, if the quantity of currency were increased, other things remaining constant during the increase, the level of prices would be restored."

It will be seen that such a scheme is not adapted to the interests of creditors or annuitants. Nor does it profess to be. A far more fatal objection may be brought against it, viz. that the number of times in which articles change hands is unknowable. The weighting would have to be done by guess work, and a preliminary mean would have to be agreed on as between the guesses of selected experts. Nevertheless, Professor Edgeworth considers that the currency standard deserves more attention than

it has received. The index number advocated by Prof. Foxwell would be based on all vendible commodities, no distinction being made between articles of consumption and agents of production. The relative importance of each article would be proportioned to the demand which it makes upon the currency. In other words, Professor Foxwell, "in averaging the respective price variations, would assign to each an importance proportioned to the corresponding value, or rather to that value multiplied by the number of times it changed hands."

Theoretically, therefore, the currency standard is distinguished from the consumption standard in two ways. It includes the prices of labour as well as of commodities; and, in weighting it, pays regard to the work entailed on the currency. In practice, however, we need not expect to find the difference very considerable. The variations shown by different systems of index numbers have been surprisingly small; and Professor Foxwell's method is likely in the words of its exponent to prove "less revolutionary in practice than destructive in theory." An error which may be considerable in the weights becomes inconsiderable in the mean. Meanwhile, the system which commands and deserves the greatest practical consideration is that proposed by Sir Robert Giffen and the committee of the economic section of the British Association. These reports for the years 1887, 1888, 1889, with the memoranda drawn up by Professor Edgeworth, may fairly be regarded as the *locus classicus* for the theory of index numbers and their application to the correction of the monetary standard (see INDEX NUMBERS). F. W. H.

TACITUS, C. CORNELIUS, the historian, was born before 61 A.D., and died after 117 A.D. His chief remaining works are the *Historice* and the *Annales*, both fragmentary, and the *Vita Agricole*. His short treatise *De situ, moribus, et populis Germanice* is of special interest, for, being fuller and written at a much later date than Caesar's brief notices, it furnishes a distinct picture of the social and economic condition of the ancestors of the English and German nations. Tacitus sketches their organisation in peace and war, describing their national councils—the *principes*, and their *comitatus*—the judicial assemblies, the duties of the priests, the honourable position of the women, and the condition of the slaves, including the free men who had gambled away their liberty. Then he affords (cap. 26) a glimpse of the Teutonic tribal community, with its scattered homesteads, and briefly mentions the annual allotment of the land to the free men in proportion to their public importance, and the change each year of the area of cultivation devoted to corn. For the questions of interest arising from this treatise see Seeborn's *English Village Community*, and Stubbs's *Const. Hist.*, i. pp. 18-41; Pollock, *Land Laws*. R. H.

TACK, TACKING. A technical expression of the English law of mortgages. In Scotland it is used for lease, leasing, and is now practically obsolete.

TÆL. The monetary unit of China is a weight of silver known as the tael. This weight is not identical throughout the empire, varying from that of the government tael (579.198 grs.)

of silver of about 900 fine, to that of the tael of Hankow which weighs about 517 grains. The Canton tael weighs 580 grains, and this is the weight generally used in dealings with foreigners (see CASH and SYCEE). F. E. A.

TAIL. See ENTAIL, LAW OF.

TAILLE. The *taille* is one of the most famous taxes in history. In its origin it was the same as the English TALLAGE (*q.v.*), *i.e.* it was a demesne tax, levied by the king on the royal demesne, and by the great seigneurs on their own lands. As France became more unified and the monarchy stronger, the ÉTATS-GÉNÉRAUX occasionally granted the king a general *taille*. This was resented by the lords as an infringement of their rights and as diminishing the contributions of their vassals to themselves. But the overwhelming national impulse which followed the appearance of Jeanne d'Arc, and led to the recovery of the English conquests, gave the crown a signal victory over the great nobles. In 1439 the states-general at Orleans passed the famous ordinance, which authorised the formation of a standing military force under the control of the king. For the support of the troops the king was authorised to levy a general *taille*, and the nobles were forbidden to levy *taille* on their estates or to obstruct the collection of the payments due to the crown. From this time the *taille* becomes a national and royal tax instead of a local and seigniorial charge.

The ordinance of 1439 is usually said to have established the permanent *taille*, and this is substantially, though not verbally, accurate. There is nothing in the ordinance about the permanence of the charge, but it seems to have been taken for granted as involved in the permanence of the army. On this assumption was based the subsequent claim of the crown to impose taxation without consent. The demand for renewed convocations of the states-general was met by the answer that the people ought to be spared the expense of these assemblies. Thus not only was the *taille* levied as an annual impost, but its amount was arbitrarily increased. The original amount was 1,200,000 livres, but before Charles VII.'s death it had risen to 1,800,000, and under Louis XI. to 4,000,000. In spite of the attempts of subsequent ministers, notably COLBERT, to diminish the *taille*, the receipts under Louis XVI. were reckoned at more than 90,000,000 livres. The tax had long ceased to be specially applied to military expenditure and was absorbed in the general revenue, of which it was the chief component. The enormous increase of the *taille* was the more serious for France because the incidence of the tax was extremely limited. The nobles, as owing personal military service, were from the first entirely exempted from payment. At all time payment of the *taille* was a sign of *roture* (see ROTURIER). And by the 18th century the

privilege of exemption was very widely extended. It was shared by the clergy, by the magistracy, by the holders of the innumerable offices which were created from time to time for sale, by members of the university, by municipal corporations, and by a number of towns which had purchased immunity by payment of a commutation. Thus as the burden of the *taille* increased, there was a corresponding diminution of the classes and persons subject to its exaction. Practically it was a tax on the agricultural classes, levied directly either on the value of the land or on the profits of cultivation.

In some provinces of France the *taille* was a land-tax, the *taille réelle*. In these provinces the assessment was based upon a *cadastre*, *i.e.* a sort of small Domesday book compiled at regular intervals (see CADASTRAL SURVEY). The obligation to pay the real *taille* depended not on the status of the cultivator but on the original tenure of the land. Land which had once paid *taille* continued to pay it even though it had passed from a *roturier* into noble hands. The provinces in which the *taille* was real belonged almost entirely to the *pays d'états*, and in them the collection was entrusted not to royal officers but to agents of the provincial estates. But the amount which the province was forced to contribute was always determined by the royal council on information received from the intendant.

In all the other provinces the *taille* was personal and was levied on the presumed profits of the cultivator. The assessment was perfectly arbitrary, and was usually based on the stock used in farming or on a man's mode of life. The French peasant was subjected, in fact, to a dilemma like that of MORTON'S FORK: if he lived in comfort, his power to contribute was obvious; if, on the other hand, he lived meanly, then his savings must be considerable. The unit of assessment was the parish, and the responsible official was called the collector, and was elected by his fellow-villagers in the parish assembly. The collector received from the intendant a statement of the amount due from the village, which was usually fixed every three years. This sum he divided arbitrarily among the villagers, according to his own estimate of their wealth, and then proceeded, accompanied by a constable, to collect the amount due from each. If he failed to produce the required sum, his property and person could be seized as security for the deficit. The office was so loathed, that it was considered necessary to choose a new collector every year. Not only was the holder frequently ruined, but he was naturally the object of his neighbours' hatred and distrust. Turgot declares that "the office of collector drives to despair, and generally to ruin, those on whom it is imposed; by this means all the wealthier families in a village are successively reduced to ruin." Few taxes

have been so disastrous in their results as the *taille personnelle*. Adam Smith has shown that it constituted a direct discouragement to the improvement of agriculture, and its social consequences were quite as lamentable as its economic defects. No man knew from year to year what he would be called upon to pay. If he was unfairly assessed, he had practically no remedy, and it was impossible for the assessment to be otherwise than unfair. The peasants who possessed any savings resorted to the most ingenious devices to conceal them. It was one of their chief aims in life to disguise from their neighbours the real state of their affairs. At the same time it was everybody's interest to ascertain or even to exaggerate the wealth of his neighbours, because an increase of their *taille* might result in direct relief to himself. Thus the result of this wretched system was to create in every district an inveterate habit of suspicion and concealment, and so to poison or to destroy all the amenities of neighbourly intercourse.

[Clamagérain, *Histoire de l'Impôt en France*.—De Tocqueville, *L'Ancien Régime*.—Adam Smith, *Wealth of Nations*, bk. iii. ch. ii., and bk. v. ch. ii.] R. L.

**TAILZIE.** See ENTAIL, SCOTLAND.

**TALE.** Payments into the exchequer were formerly made in one of two ways, *ad scalam* (or *ad pensum*), that is to say, *by weight*—when the money was weighed and the amount reckoned by its weight; or *numero*, that is by *Tale*, when the coin was simply counted, and each piece reckoned at its face value.

[Pipe Roll Society's publications, vol. v.]

A. E. S.

**TALENT, GREEK.** The ancient weight known under this name was equal to 60 minæ or 6000 drachmæ. Its weight has been estimated at about 57 lbs. avoird., and its value in sterling at about £240.

The modern Greek talent is a weight equal to that of 150 kilogrammes. This weight is, however, but little used.

F. E. A.

**TALENT, HEBREW.** A weight and also a money of account. Much uncertainty now exists as to the precise weight and value of the talent, the former being variously estimated at from 93 to 117 lbs. avoird.

The silver talent was the equivalent of 3000 silver shekels, and the gold talent of 10,000 gold shekels. The value of the silver talent in sterling is estimated at from £340 to £400, and that of the gold talent at from £5000 to £6000.

[Williamson's *Money of the Bible*.] F. E. A.

**TALLAGE.** Before the Norman conquest there was but little national taxation, and the ordinary expenses of the king were mostly defrayed by the revenue received from his demesne. The circumstances of the Norman conquest enabled the king to choose his demesne, and William I. was wise enough to

include in it most of the rising towns. The lands belonging to the crown at the time of Domesday come to be known as "ancient demesne," as contrasted with those lands which subsequently fell in to the crown by ESCHEAT or FORFEITURE. For special purposes the king could demand supplies from his demesne tenants, and these are called sometimes *donum* and *auxilium* (see AID), but more usually *tallagium*. These tallages are assessed by royal commissioners, but the chief towns, such as London, usually paid a composition, and levied an equivalent sum on the citizens by their own methods. In the 13th century various attempts were made to limit the king's arbitrary power of raising a revenue. In the great charter he was made dependent on the consent of the *Commune Consilium* for aids and scutages, but no mention was made of tallages. In 1297 Edward I. was compelled to confirm the charters with additional articles restraining his power of taxation. The articles which Edward actually agreed to do not mention tallages, but the record of Walter of Hemingburgh seems to prove that the barons proposed their inclusion. In the time of Charles I. the articles given in Hemingburgh were construed as being a genuine statute, and are quoted in the Petition of Right as the statute *de tallagio non concedendo*. But there can be no doubt that Edward did not resign the right of taxing demesne, and tallages continued to be levied by himself and by his son and grandson. It is probable that the barons were less persistent on this point than others, because a resignation of the royal right of tallage would involve a loss of their own power of tallaging their own tenants. But as the system of national taxation developed, and the powers of parliament increased *pari passu*, it was impossible to leave the crown in possession of such an independent revenue as it could obtain by the arbitrary taxation of the cities and boroughs which had grown up on the ancient demesne. A statute of 1340, though making no specific mention of tallage, seems to have had the effect of necessitating parliamentary consent for all direct taxes. From this time the separate taxation of demesne came to an end, and the whole community was taxed by parliamentary grants assessed upon personal property. But the special obligations of demesne tenants were still expressed in the fact that they paid a tenth while the counties outside the demesne paid a fifteenth (see also SPENDINGS).

[Stubbs, *Constitutional History*.—Dowell, *History of Taxation and Taxes in England*.] R. L.

**TALLIES.** An ancient form of voucher or receipt formerly used in all transactions whose nature rendered a voucher necessary. A piece of wood was taken, shaped roughly like a thick knife blade. In the edge

notches were cut to represent the amount of money or goods changing hands; notches of different sizes representing the different denominations of money or weight. The nature of the transaction was then written in duplicate on the two sides. The piece of wood was then split lengthways through the notches by means of a cut parallel to the sides, and each party kept a part, a thin piece of wood with notches in the edge and writing on one side. If either party disputed the payment the matter could easily be settled by fitting the two parts together and seeing whether they matched or not. If it became necessary to distinguish between the two parts of the tally, the part kept by the payee was called the counter-tally, the other part being called the tally. Tallies were used in the exchequer as lately as 1827 in giving receipts to accounting officers for interim payments on account. The tallies of that date are much larger than those in use in the middle ages, the former being often 3 or 4 feet long, while the latter seldom exceeded as many inches.

[Hall, *Curiosities and Antiquities of the Exchequer.*]

A. E. S.

There is an interesting reference to tallies in connection with Wm. Godwin: "In his old age a small sinecure office (yeoman usher of the exchequer, *Godwin's Life*, vol. ii. 322) was given to him by the Grey ministry, with rooms in connection with the House of Commons, and where he loved to show the old Star Chamber, which was so soon to be destroyed before his face, and to exhibit the tallies, the burning of which was to occasion the destruction" (*Miss Martineau, Hist. of the Peace*, iv. p. 80).

TALLY. See TALLIES.

TALLY SHOPS. See TRUCK.

TALLY TRADE. A system of "selling goods on short credit," the accounts of which are kept by an arrangement of tallies in the place of book or ledger accounts. These goods were thus retailed on these terms at the tally-shops which were commonly to be seen a generation ago, and are doubtless yet to be met with in remote districts—as also they were sold by pedlars who hawked them about the country, receiving payment for the same by weekly instalments. "The unconscionable tallyman," we read, "... lets them have ten shillings' worth of sorry commodities, or scarce so much, on security to pay him twenty shillings by twelvemonth a week" (*Four for a Penny*, Davies, 1678, Harl. Misc., 148).

The term "tallyman" is also applied to one who "sells by sample goods to be delivered afterwards, or who takes orders for such goods" (*S. Dowell, Taxes in England*, iii. 38). *Vide* also Mayhew, *London Labour and London Poor*, i. 422, quoted from in the *Century Dictionary*, art. "Tallyman."—*Disraeli's Sybil*.

A. L.

TALON. Securities to bearer (see BEARER) are generally provided with a sheet containing a number of certificates, entitling the holder to the interest specified thereon at the time named thereon, which are successively detached as they fall due, and are called "coupons"

(see COUPON). Sometimes "coupons" are not furnished for the whole time of the currency of the security, and in such a case there is frequently a certificate entitling the bearer to a new coupon-sheet at the time of the old coupon-sheet being exhausted. This certificate is called the "Talon." E. S.

TAMMANY HALL. A political society in New York city that for many years has exercised a powerful influence in city and state and even in national politics. The name is also given to the building of the society, and to the political party organisation separate from the society, though largely controlled by it. It derives its name from an Indian chief who is said to have welcomed William Penn and made the first treaty with him. The society was founded in 1789, called the Columbian Order. Tammany was taken as its good genius, and when it was incorporated in 1805, the name Tammany society was added. It had for officers a grand sachem and twelve subordinate chiefs of tribes, a wiskinski (door-keeper), a sagamore (master of ceremonies), etc. The Indian names for its officers are still retained.

Its purpose was apparently social and charitable at first; but it soon began to exercise political influence, and doubtless contributed much to the selection of Aaron Burr as vice-president. Its chief field of activity has been New York city, whose officers for many years have been largely in its control. It has been most widely known from the scandals connected with its highest officers during the period of the "Tweed ring."

William M. Tweed, in early life a chair-maker, later a fireman, had made himself so popular in politics in his ward and later in the city, that he had been elected to the state senate and to congress. He and three or four other Tammany officers, through his control of the party organisation, got so complete a control of the city that, holding in their own hands and those of their creatures the chief offices of the city and some of the courts, they were able to plunder the city treasury almost without stint. Through their judges they naturalised voters; with their ill-gotten money they bought them. By their influence in elections they so controlled the state legislature that laws were passed amending the city charter so as to put even more power into their hands, and the governor elected by their influence could veto any hostile legislation. They sold contracts; bought property, and made city improvements to increase its value; then by their appointees lowered the burden of taxes for betterments on it. They let contracts to companies in which they were interested, nearly \$3,000,000 (£600,000) being paid them in two years for

printing and stationery alone, while paying contracts were scarcely less profitable.

False claims against the city were presented by them, audited by themselves, and paid. A new court house estimated in 1868 to cost \$250,000 (£50,000) had cost in 1871 from \$8,000,000 (£1,600,000) to \$13,000,000 (£2,600,000), according to different authorities, and it was still unfinished. Contractors were compelled to add sums to their bills, which were taken by the ring.

At length one of the subordinate accomplices, dissatisfied with his treatment by the leaders, attempted to gain more by threats, and finally in revenge for failure gave information regarding the practices of the ring to the *New York Times*, which published it.

This attack was followed by others; the best men in the democratic party and in Tammany turned against the corrupt leaders. They were cited before the court; their candidates were opposed in the next election, and finally, some of the corrupt members of the ring fleeing, others resisting the action of the courts, the people defeated nearly all the Tammany candidates but Tweed at the polls, and broke the power of Tammany. Tweed, though re-elected to the state senate by his own district, was soon arrested, tried, convicted, and sentenced to prison for twelve years. Later, released on a technicality, he was re-arrested on a civil suit by the city on a claim of \$6,000,000 (£1,200,000) damages, escaped, fled to Spain, was sent back, and died in prison, 1876.

The breaking of the ring put Tammany into the control of the better element; and, under John Kelly as grand sachem, within a few years, it again controlled New York city. After his death control passed to Richard Croker, who, until his refusal to continue in his position, 1894, managed its political affairs with consummate ability.

Again, in 1894, an investigation proved that the policemen and other officers were levying blackmail on citizens and securing illicit gains for Tammany leaders. A popular revolt wrenched the control of the city government from their hands, and until 1897 Tammany had practically no voice in the city government. In 1897 Richard Croker was again placed at its head; its opponents were divided, and it won a complete victory, which gave it control of the city government.

Its careful organisation, unison of social features with its political activity, and especially its unquestioned adherence to the spirit of democracy in its broadest, freest sense, with its unscrupulous use of city patronage in the promotion of its interests among the poor, binds the great mass of the poorer, more ignorant voters of New York city to it, and so closely that we may expect it continually

to reappear in power as often as it puts itself even temporarily on the side of right and good government.

No other political organisation has so successfully and permanently controlled the mass of voters, who, with real power in their hands, have been willing to yield almost absolute control to their leaders, so long as the latter were successful in carrying elections, and discreet in distributing the spoils of office.

J. W. J.

[The example of Tammany Hall is given as one of the most prominent instances of the influence of faction and corruption on local matters. This has been of late years considerable and very injurious. It opens the question whether a better method of election of local officers than that at present existing might not be devised.]

**TANISTRY.** An ancient Irish custom, by which the lands of a deceased lord descended, not to his nearest relative, but to the most capable and powerful of his near relatives. This custom was a natural result of the disturbed state of the country, which made a strong hand necessary to hold any land at all. Equally naturally, by causing continual quarrels in families, and quarrels in Ireland were not settled without fighting in those days, the custom tended to perpetuate the unsettled state in spite of all efforts to the contrary. When the reform of Irish affairs was undertaken in the reign of James I., tanistry was declared illegal.

[Hallam, *Constitutional History*, vol. iii. ch. xviii.]

A. E. S.

**TANTEO.** A privilege granted to Spanish manufacturers, empowering them to prevent the export of raw material, such as silk, wool, corn, etc., produced in Spain, and which was required in their trade.

[Canga Argüelles, *Diccionario de la Hacienda* (London, 1826).]

E. CA.

**TAPIA, CARLO (DI) MARCHESE DI BELMONTE** (17th century). Born at Lanciano (Abruzzi), a magistrate with jurisdiction over the provision markets in the kingdom of Naples. He wrote a treatise on *Abundance*, in which he shows the need of modification in the system of food supply then existing, so as to meet the requirements of the day, of which, as a magistrate responsible for the corn supply of the kingdom, he had practical knowledge. Tapia analyses the system of food supply more scientifically than the other Italian writers of the day, either because he is more moderate in theory, or because he regards the question as a magistrate and not as a moralist. He classifies the causes of famine into those that are supernatural, natural, and accidental, and explains the regulations as to food supply then enforced by governments and practically upheld by all writers. He does not, like these, express absolute aversion to trade as a means of subsistence, and recognises the injury incurred by the prohibition of export of corn; he would

allow the export of any surplus in order that agriculture might not suffer through restriction. Though Tapia advocates a fixed legal price for corn, he suggests that, in doing this, account should be taken of cost of production, in order, partially at least, to satisfy both sellers and buyers.

*Trattato dell' abbondanza* (written earlier), Naples, 1638.

[See Gobbi, *L'economia politica negli scrittori italiani del secolo XVIIe. XVII.*, Milan, Hoepli, 1889.—*La concorrenza estera*, etc., Milan, Hoepli, 1884.—Fornari, *Delle teorie economiche nelle provincie Napoletane*, Milan, Hoepli, 1882.] U. R.

**TARE AND TRET.** These terms are becoming obsolete in practical commerce, but are still found in books on arithmetic. *Tare* is an allowance for the weight of the box or package containing goods bought; *Tret* an allowance of 4 lb. in 104 lb. for waste; **CLOFF**, another term now obsolete, was an allowance of 2 lb. in 3 cwt., made in order that the retailer might cover the loss incurred in dividing the goods into small parcels for sale, and sell the whole for the same weight as he bought it.

[*Penny Cyclopædia*, Art. "Tare."] A. E. S.

**TARGIONI, LUIGI** (18th to 19th century), a Neapolitan writer, the author of several pamphlets, the most important being one on the means of providing for the numerous poor in the kingdom of Naples. Targioni attributed the increase of begging to the raising the nominal value of the coins, to the condition of agriculture—the excessive taxation, and the deficiency of means of communication. The improvement of these conditions was the only method of providing work for able-bodied men. Targioni advocated compelling the rich to help the poor in order to provide for the incapable.

*Saggi fisici, politici ed economici*, 1786.—*Idee relative ai mezzi migliori per mantenere ed impiegare i poveri*, 1802.—*Memoria sulla agricoltura e la pastorizia*, etc., Naples, 1814 (see Fornari, *Delle teorie economiche nelle provincie napoletane II.*, 1888). U. R.

**TARIFF**, a Moorish term which has come into our language through the Spanish, *la tarifa*, properly the enumeration of prices. It is not unfrequently used in English in a perfectly general way, as in the case of the tariff of a hotel. Its usual signification in financial or economic language is the schedule of duties charged on the importation of any articles into any given country. That is what is always understood by the tariff of a country (see **IMPORT DUTIES**). C. A. H.

**TATHAM, William** (1752-1819).

An American engineer, attorney, colonel, etc., but born and resident in England 1752-69, 1789, 1796-1805, wrote six books or pamphlets on waterways: (1) *Two Tracts relating to the Canal*

*between Norfolk and North Carolina*; (2) *Plan for insulating the Metropolis* (1797); (3) *Remarks on Inland Canals* (1798); (4) *Political Economy of Inland Navigation* (1799)—this, his most important work, incorporates (2) and (3), and is mainly practical, but refers to Sir J. Stewart's theories on self-interest, population, and the scope of political economy as authoritative, pp. 65 *et seq.*; (5) *National Irrigation* (1801)—mainly abstracted from the reports organised by the British board of agriculture; (6) and two reports *On the Navigation of the Thames*. His (7) *Communications concerning the Agriculture and Commerce of the United States* (1800)—a supplement to a communication to the board of agriculture; (8) *Essay on the Culture and Commerce of Tobacco* (1800); (9) *Oxen for Tillage* (1801); (10) *Circular Architecture* (1803); and reports on (11) Tennessee, and (12) Virginia, are drier but practical. His (13) *Collection of Sundry Documents respecting Himself* (1797), is autobiographical.

[Appleton, *Cyclopædia of American Biography* (1889).] J. D. R.

**TAULA DE CAMBI** (Catalan for table of exchange). In 1401 a bank of exchange and deposits was founded under this name in Barcelona; its operations spread rapidly, and in a royal charter granted in 1472 by King Juan II. it is described as "*Tabula insignis, celebris et tutissima*." In Valencia, where, as in Catalonia, the laws against usury were not so stringent as in the rest of Europe, a bank was also established under the same name by royal charter, and worked under the supervision of the municipal authorities of the city.

[See Colmeiro, *Historia de la Economía Política en España*, i. pp. 411-12.] E. CA.

**TAVEREEL** (or **TAFEREEL**)

*Het groote Taverel der Dwaasheid*. "The great picture of Folly, representing the rise, progress, and decline of the trade in Shares, Bubbles and Wind, in France, England, and the Netherlands, in the year 1720. Being a collection of all the Rules and Projects of the Companies started for Assurance, Navigation, Commerce, etc., in the Netherlands, both those actually carried out and those rejected by the governments of particular provinces.

"With Engravings, Comedies, and Poems, by several amateurs, in mockery of these shameful and fraudulent concerns whereby in this year so many families and persons, gentle and simple, have been ruined and impoverished, and whereby genuine business has been brought to a standstill, both in France, England, and the Netherlands.

"So long as money-loving man  
Is full-equip't with gold and gear  
He falls sure prey to charlatan  
Whom grasping fools feed all the year.

"Printed for the warning of posterity in the year fatal to so many wise men and fools, 1720."

The above is a free translation of the title-page

of a singular anonymous folio volume, without name or place of publication, but perhaps published by Isaak Stokman, Amsterdam, whose name occurs on pamphlets often included in the collection. The list of companies and undertakings was, however, published by C. Hoffeling at the Hague in 1721. The elaborate frontispiece representing the Share-Booth or Vestibule of Quinquenpoix (the Exchange Alley of Paris in those days), the account of the various Dutch companies (25 pages) at the beginning, and the series of Dutch comedies (52 pp.) and Dutch poems (35 pp.) at the end, are common to most copies; but the number and the order of the engravings differ very greatly in the different copies. They are usually between sixty and ninety in number, including the portraits of John LAW, who is the *bête noire* of all the artists. Nearly all the cartoons have interpreting verses or mottoes in Dutch; French occurs rarely, English more rarely still. A full account is given of the whole book in Frederik Muller's *Tavereel der Dwaasheid*, reprinted from the *Beredeneerde beschrijving van Nederlandsche Historieprenten*, pt. ii. (Fred. Muller, Amsterdam, 1876). See also the catalogue of satirical prints in the British Museum, vol. ii., 1837, No. 1612-1693. J. B.

## TAXATION

History, p. 517; General Principles, p. 518; Tax Systems, p. 519; Classification and Incidence, p. 520; (1) Taxes on Land, p. 520; (2) On Houses, p. 521; (3) On Property and Capital, p. 521; (4) On Income, p. 521; (5) Customs, p. 521; (6) Excise, p. 522; (7) On Communication and Transport, p. 522; (8) Stamps, p. 523; (9) Death duties, p. 523.

HISTORY.—“A tax<sup>1</sup> is a compulsory contribution of the wealth of a person or body of persons for the service of the public powers” (Bastable, *Public Finance*, 1895, p. 249). The contribution is not necessarily one of money or goods, for compulsory military service and FORCED LABOUR (*g.v.* and CORVÉE) must be reckoned in the category of taxes. Dealing here, however, with money and goods only, we find that a contribution of such was, until comparatively recent times, as a rule merely a supplement to other sources of public revenue, such as crown lands and mines, penalties, feudal aids, etc. Hence Blackstone, writing in 1765, terms these last the “ordinary” revenue of the English kings, whilst he classes taxes as “extraordinary” (*Commentaries*, bk. i. ch. 8).

In ancient Egypt there was no taxation proper, the payment by the peasants to the king of one-fifth of the produce of their lands being rather in the nature of a *métayer* rent than a land-tax (see Herodotus, bk. ii. 109).

In Greece the ordinary revenue of the Athenian state, arising from tribute and the silver mines at Laureion, was supplemented by taxes in the shape of customs and tolls, a percentage on rates, fees for state protection, law-

court fees, and fines. The extraordinary revenue required for war purposes was obtained partly from voluntary contributions, partly from a graduated income or property tax. Rich citizens were further liable to special burdens, called *leiturgies*, as the giving of plays and the equipping of ships (Gilbert, *The Constitutional Antiquities of Sparta and Athens*, 349-376).

With the Romans the system of taxation was better organised. Dowell (1st ed., pt. i. ch. iii.) gives the following as the principal taxes in use by them at different times and in different countries—tribute from lands, taxes on houses and animals, successions, income taxes on senators, tradesmen, and others, poll taxes; with, as indirect taxes, duties on exports and imports, and on commodities sold at auction, or in the public market (see also Clamagérans, *Histoire de l'impôt en France*, i. 1-108).

With the decline of the Roman power the system of taxation also fell into confusion. According to Hallam (*Middle Ages*, ch. ii. pt. ii.) “the early European kingdoms knew neither the necessities, nor ingenuity of modern finance. From their demesne lands (see DEMESNE), the kings of France and Lombardy supplied the common expenses of a barbarous court. Even Charlemagne regulated the economy of his farms with the minuteness of a steward. . . . Their actual revenue was chiefly derived from free gifts, made, according to an ancient German custom, at the annual assemblies . . . of the nation, from amercements paid by alodial proprietors for default of military service, and from the *freda* or fines accruing to the judge out of compositions for murder.”

In England the rent of the royal demesne sufficed originally for all ordinary purposes, but in Anglo-Saxon times we find occasional land-taxes in the shape of Shippgeld (see SHIP-MONEY) and DANEGELD, and a HEARTH-TAX. Subsequently the incidents and casualties of the feudal tenures afforded for nearly six centuries a considerable revenue, the charges being, however, rather occasional extortion from individuals than systematic taxation. Expenses of wars were provided for partly by levy of scutage in lieu of KNIGHT'S SERVICE, and TALLAGE (*q.v.*), all the demesne contributing to the latter sums, fixed after negotiation with the exchequer officers. Towards the end of the 13th century scutage and tallage were practically superseded by general taxes on movables, granted from time to time by parliament. These were known from 1334 to 1623 as FIFTEENTHS and TENTHS, and were represented by a lump sum. About the same period also CUSTOMS DUTIES began to be important as permanent sources of revenue. From 1377 poll-taxes were tried at intervals till 1698, but were unpopular on

<sup>1</sup> Tax, short for *taxatio*, from low Latin *taxare*, is the same as assessment. It occurs in the Statute Book first in 1327. . . . (Dowell, *History of Taxation*, 2nd ed. p. xii.)

account of their directness and inequality. Early in the 15th century special taxes were imposed occasionally on landowners and holders of rent-charges. These developed later into forms of a graduated income-tax. In the Tudor period SUBSIDIES, raised nominally by a poundage rate on lands and goods, were granted to supplement fifteenths and tenths. This system of direct taxation, together with increasing duties of customs, supplied the crown with revenue until, under Charles I., parliamentary control temporarily ceased. By this time almost all the demesne had been granted away. During the Commonwealth MONTHLY ASSESSMENTS took the place of subsidies, and the EXCISE was introduced. After the Restoration, the various direct taxes hitherto levied merged by degrees into a LAND TAX of varying but moderate amount, the rapidly increasing needs of the state being met by additional duties of customs and excise, by stamp, house, licence and death duties, and by an income tax, till by the close of the Napoleonic wars hardly a luxury, or even a necessary, hardly a manufacture, escaped charge. The subsequent history of taxation in this country is one mainly of repeal, reduction, and adjustment, under the combined influence of the diminution of pressure, the study of general principles, and the growth of democracy (Dowell, 2nd ed., vols. i. and ii.).

GENERAL PRINCIPLES.—The grounds for adopting the different kinds of taxes at various times, and in various conditions of society, were practical rather than theoretical, and it was only towards the end of the 18th century that the general principles which should govern taxation began to be seriously considered. These may be expressed in the well-known maxims of Adam Smith (*Wealth of Nations*, bk. v. ch. ii. pt. ii.).

(1) "The subjects of every state ought to contribute towards the support of the government, as nearly as possible in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state."

(2) "The tax which each individual is bound to pay, ought to be certain, and not arbitrary. The form of payment, the manner of payment, the quantity to be paid, ought all to be clear and plain to the contributor, and to every other person."

(3) "Every tax ought to be levied at the time, or in the manner, in which it is most likely to be convenient for the contributor to pay it."

(4) "Every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state."

These maxims, which may be shortly described

as inculcating equality, certainty, convenience and economy, although adopted by most economic writers, have of late been subjected to hostile criticism (e.g. F. A. Walker, *Political Economy*, §§ 587-589). Bastable (*Public Finance*, p. 388), surveying the most prominent attempts to supply a fresh series of precepts, lays down the following principles for the guidance of the practical financier:—Taxation should be (1) productive; (2) economical—that is, inexpensive in collection and of a nature to retard as little as possible the growth of wealth; (3) justly distributed; and (4) elastic. That it should be (5) certain, and (6) convenient, he regards as matters of less interest, these canons being now generally observed. In the event of conflict between the several canons, a solution of the difficulty should be reached by the surrender of the less important rule. Thus, the successful administration of the state being the final object, convenience, or even equity, may have to yield to productiveness. (See also Dowell, *Income Tax Laws*, 4th ed. p. lxi.).

Reverting to Adam Smith's four maxims, it may be observed that the last three are obvious rules or administrative precepts respecting *taxes*, to be followed in the case of each separate tax. But the first is a rule of *taxation*, and is applicable to the tax system in general. Taking the rule as a whole, it has been urged that its precise meaning is open to doubt. The last six words, "under the protection of the state," "are either irrelevant, or else they mean that the protection enjoyed affords the measure of the duty to contribute" (F. A. Walker, *Political Economy*, § 588). If this interpretation were correct the rule would embody the favourite doctrine of the 17th and 18th centuries, that taxes are a *quid pro quo*—the price paid for the services of the public authorities. This doctrine was employed as a plea for universality of taxation at a time when, whilst receiving at least equal benefits, certain privileged classes were exempted, as in France before the Revolution, when the peasant bore the whole cost of government. It is, however, no longer accepted. "It is now generally agreed that we pay taxes not because the state protects us, or because we get any benefits from the state, but simply because the state is a part of us. The duty of supporting and protecting it is born with us" (Seligman, *Essays in Taxation*, p. 72. See also Ely *Taxation in American States and Cities*, pp. 13-18). To some small extent, indeed, it may be possible to measure the value of the services rendered by government in matters of law and police, and to exact payment in the shape of fees; but it is manifestly impossible to assess each individual for the benefit accruing to his person and property by the maintenance of national existence and social order (Sidgwick, *Political Economy*, pp. 560, 561; Cohn, *Science*

of Finance, §§ 83, 84, 97, 108). In fact, as Bastable (p. 253) states, "The equivalence between the amount of taxes paid and the benefits obtained is rather to be found in the case of the community as a whole than of any special part of it."

For the taxation required to defray the greater part of the governmental expenditure of a modern state, some other principle of distribution than payment in proportion to services received (called the Social Dividend theory, see F. A. Walker, *Political Economy*, § 583) must therefore be sought. It is to be found, as Adam Smith indicated, in payment according to respective ability, a phrase which is, however, not now interpreted as implying strictly in proportion to revenue, for equality of taxation means (J. S. Mill, *Political Economy*, bk. v. ch. ii. § 2) equality of sacrifice. To secure this equality the necessities of life should go free, superfluous consumption only being charged. "People should be taxed, not in proportion to what they have, but to what they can afford to spend" (*Ibid.* § 4). The exemption of necessities in a country with a system of poor-relief would seem to be a matter of course, for "If government risks some of the evils of communism in order to secure the poorer citizens from want of the necessities of life, consistency requires that it should not endeavour to take by taxation from the poor who remain independent a part of what it would have to give them if they sought its aid" (Sidgwick, *Elements of Politics*, p. 174). In opposition to this practical view of the exemption of the minimum of existence, see the view in Cohn that the state is part of the necessities of life, and its demands therefore part and parcel of the demands of subsistence (*Science of Finance*, §§ 222, 242). In the *Final Report of the Royal Commission on the Financial Relations between Great Britain and Ireland*, dated 1896 [c. 8262], one of the conclusions drawn is that identity of rates of taxation does not necessarily involve equality of burden. This conclusion is based partly on arguments that what may be luxuries or superfluities in one country are necessities in another (e.g. p. 40). Whether equality of sacrifice does not require that taxation should be progressive, i.e. that the percentage of charge should rise with the amount of the income, is a problem practically attempted to be solved in recent times by progressive income taxes and death duties. This attempt is due perhaps rather to financial necessity and the growth of democracy than to the force of economic reasoning (see GRADUATED TAXATION). (See Edgeworth, "The Pure Theory of Taxation," *Economic Journal*, vii. 550, for the view on utilitarian grounds, that *minimum*, rather than *equal*, sacrifice is the sovereign principle of taxation.)

**TAX SYSTEMS.**—Taxation based on the foregoing general principles may be raised under various systems. The most simple and logical plan would seem to be to claim from each taxpayer his contribution in one amount having reference in some way to his income. But such a method, though often advocated by theorists, as also have been single taxes on expenditure, land, rent, realised property, and capital (see IMPÔT UNIQUE; SINGLE TAX), has not in practice been adopted by any country. At the present time there is a strong agitation in America in favour of a single tax on land-values. The many special objections, fiscal, political, moral, and economic, to a tax of this description (see Seligman, *Essays in Taxation*, pp. 64-94), would not apply to a single tax on income, but the difficulty of making a correct assessment, and the irritation that would be caused by the collection of such a large and undisguised impost, are sufficient obstacles to a successful attempt in this direction. A multiple or plural system is thus practically necessary. The taxes forming it may be either "direct," on income—rent, interest, earnings—and property; or "indirect," on commodities (see, however, DIRECT TAXATION, INDIRECT TAXATION, for various interpretations of these terms). The bulk of the taxation revenue of a modern state is raised by a judicious mixture of both forms, the intermediate class of charges on transfers, communications, etc., being used as supplementary only. Such a combination, whilst it minimises the effects resulting from the unpopularity of direct taxes, and the disturbance of industry caused by indirect, has an additional advantage in its elasticity, which makes it possible to adjust receipts to expenditure without undue inconvenience to the taxpayers. "The steady growth of the receipts from commodities in times of prosperity, the definite yield of direct taxes, and the power of altering the rate of the income-tax, taken together, provide the conditions for securing such growth or contraction of receipts as may be thought most desirable" (Bastable, *Public Finance*, p. 336. See, however, Blunden, "The Position and Function of the Income-Tax in the British Fiscal System," *Economic Journal*, ii. 637, for an objection to the use of the income-tax in normal times to adjust taxation). Plehn, *Introduction to Public Finance*, pp. 148-168, states that the great reforms of 1893, made under the leadership of Dr. Miguel, place Prussia far in advance of all other countries in the theoretical perfection of her tax system. In England, he says, special difficulties and objections have been met with little reference to any general plan, the result being a steady approach to a better state of affairs, with only an occasional intensification of existing evils, due to the attempt to cure symptoms rather than to

seek the underlying causes of the trouble. He animadverts strongly on the entire absence of system in American taxation.

**CLASSIFICATION AND INCIDENCE.**—Before proceeding to consider the particular charges which the threefold system of taxation indicated above might embrace, it is desirable to allude to the difficulty experienced in making a satisfactory classification of taxes. Besides the varying division into "direct" and "indirect," a distribution of taxes into "real" and "personal" is sometimes found,—taxes on land, houses, and goods being regarded as "real," and capitation and income-taxes as "personal." This distinction is inconvenient for purposes of classification, all taxation, including that nominally charged on things, being in the last resort paid by persons. Owing, however, to the frequent possibility of shifting the burden as originally imposed, the determination of the actual person by whom a particular tax is ultimately paid is a very difficult problem. Adam Smith, holding that every tax must be finally paid from one or other of the different sources of revenue mentioned by him—rent, profit, and wages—or from all of them indifferently, proceeded to group taxes under those three heads, with sub-divisions. This classification, which English economists have endeavoured to follow as far as possible, is also open to the objection that taxation falls on persons, not things; persons, moreover, often receiving their income from more than one of the different economic shares in distribution mentioned. Further, the ultimate source of taxation is not now deemed to be revenue only, but the collective wealth of the country, including, at any given time, both capital and revenue. "To provide that taxation shall fall entirely on income, and not at all on capital, is beyond the power of any system of fiscal arrangements" (J. S. Mill, *Principles*, bk. v. ch. ii. § 7). "Any tax is certain to take some wealth that would otherwise have been devoted to the aid of production, and also some that, if left to the taxpayers, would have been consumed unproductively. . . . The real aim should be to so direct it [taxation] as to interfere to the smallest extent with the action of the forces that promote accumulation" (Bastable, *Public Finance*, p. 275). The defects in the economical mode of classification have led to what Bastable (p. 261) terms the "empirical" or "fiscal" one, which takes the actual kinds of taxation and arranges them in the most convenient way. The categories thus formed, mostly by German economists, vary considerably. Cohn adopts Wagner's (*Finanzwissenschaft*, § 451) classification into taxes on earnings, on possession, and on consumption, "with the thought that it may serve the purpose of bringing uniformity and agreement into the systematic treatment of taxation"

(*Science of Finance*, § 332). But whatever broad divisions may be adopted, the charges imposed in a modern state usually range themselves under some of the following heads:—Taxes on (1) land, (2) houses, (3) property and capital, and (4) income; (5) customs, (6) excise, (7) taxes on communications, (8) stamps, (9) death duties.

In any consideration of the best mode of combining these different kinds of charges in order to produce equality of taxation, it should be borne in mind that, as before indicated, the real and the apparent incidence of a tax often differ. Reference has been made below to the conclusions arrived at with regard to the incidence of different kinds of taxes by Prof. Seligman, in whose essay "On the Shifting and Incidence of Taxation" (*American Economic Association*, VII., Nos. 2 and 3, 1892) all the theories previously advanced are examined. In certain cases the views of Bastable (*Public Finance*) are given. But whatever theory be adopted, it is important to observe that in practice the apparent pressure of the burden may be a factor of greater moment than the actual (see e.g. *Report from Select Committee on Town Holdings*, pp. 214, 292, p. xviii.).

**1. TAXES ON LAND.**—These, which are of very great, if not of the greatest, antiquity as a source of revenue, were originally charged by reference either to the gross produce of the land cultivated, as in ancient Egypt, or to its area, as in Rome and England at one time. The former method was partly adjusted to the productiveness of the soil, but the latter, which is still adopted in some of the British colonies, took no account whatever of the differences in fertility. A moderate approach to equality of charge was indeed sometimes (e.g. Humbert, *Essai sur les Finances et la Comptabilité chez les Romains*, note 899) made by arranging the lands in classes taxed at different proportions or rates. Even a classification of this kind is but a rough and ready mode of reaching the true value of the land for taxation purposes—that is, the net yield after the expenses of cultivation have been deducted. To ascertain the net yield, a minute system of valuation is necessary, the valuation being based either, as in France (where it is preceded by CADASTRAL SURVEY), on estimates of produce, prices, and cost of cultivation, or as in England, for the purposes of the INCOME TAX, on the rent at which the land is worth to be let. The tax raised on the valuation may be either "apportioned" or "rated." In the first case, a total fixed sum is collected from each district, the lands being charged at the pound rate necessary to produce it (e.g. the English LAND TAX, the French *Impôt Foncier*); in the second, all the lands of the country are charged at a fixed pound rate or percentage (e.g. the English income tax, Sch. A). Cohn approves the former system (*Science of Finance*, § 377) as affording the local authorities a support and standard in making correct assessments. It may, however, become inelastic, and practically, as in England, reduce the land tax to a rent-charge. Under such a system, besides, the burden tends to become unequal in different

districts, and this inequality has serious consequences where, as in France, local revenue is raised by additional charges (*centimes additionnels*) proportioned to the state tax (Leroy-Beaulieu, *Science des Finances*, 1892, i. p. 321). The amount of revenue now raised by the taxation of land is in most countries considerable, the tax possessing special advantages as a source of income for local purposes (see *Taxation of Lands and Buildings in European Countries, etc.*, P.P. [c. 6209] and 181/91).

If a tax on landed profits or property be a part of a general income or property tax (e.g. the English Income Tax, Schedule A), it cannot be shifted and will be borne by the landowner (Seligman, *Incidence*, p. 96). If imposed as an exclusive tax on cultivating owners, it will even then be apt to remain where first put (pp. 97-98). If charged on the tenant-farmer (as the English local rates are), the tax will fall on the landowner in the case of pure competitive rents, and will be divided between landowner and tenant in the case of non-competitive rents (p. 100).

2. **TAXES ON HOUSES.**—Houses were originally taxed only as included with the land on which they stand—their separate assessment being a development of taxation. In England the HEARTH MONEY or chimney tax of feudal times was succeeded by the window tax, finally replaced in 1851 by the INHABITED HOUSE DUTY. Houses, including in the term shops, factories, and premises generally, invite taxation by the ease with which they can be assessed, and the evidence they afford of the wealth of the occupier. Like land, they are therefore usually made to contribute largely to both imperial and local revenue. Bastable (*The Taxation of Ground Rents, Economic Journal*, iii. 255) argues against the proposal to charge a special tax on the ground rent of houses.

A tax on houses levied according to rental value and assessed on the occupier (as the Inhabited House Duty and local rates are in England) rests in the main ultimately on the occupier (Seligman, *Incidence*, pp. 117-128. See however Bastable's criticism, *Public Finance*, 2nd ed. p. 419; also G. H. Blunden, *Distribution of Rates and Taxes, Journal of Royal Statistical Society*, 1896, p. 644).

3. **TAXES ON PROPERTY AND CAPITAL.**—Except in the shape of lands and houses, property, including its interest-bearing form, capital, is now rarely made a subject of taxation apart from death duties or a general income tax. The reason is no doubt mainly the practical difficulty of correct assessment, resulting from the varied forms that, in civilised countries, property takes, and the consequent facilities for evasion. The almost invariable history of the general property tax, common in the Middle Ages, is that, originally developed out of a land-tax, it has in the course of time reverted to its primitive form, personality having gradually slipped out of assessment (see CATASTO). It has therefore, in most countries, been supplanted by separate taxes on land, houses, wages, profits, interest, etc., or in quite modern times by an income-tax (Seligman, *Essays in Taxation*, pp. 23-61). In Switzerland and the United States, however, the

property tax is still used for cantonal and state, as opposed to federal, purposes. In France the *impôt sur les valeurs mobilières* is found as a special charge on income derived from capital in shares of companies, the alleged justification being that the holders are idle capitalists whose liability is limited (Leroy-Beaulieu, *Science des Finances*, i. p. 418). In England the small stamp duty recently charged on the share capital of companies is intended rather as a check on excessive nominal capital than a tax on a form of wealth. Prussia and Holland have recently introduced special taxes on property (Seligman, *Essays in Taxation*, 322-335; H. B. Greven, *Fiscal Reform in Holland, Economic Journal*, iii. 534; A. J. Cohen Stuart, *Progressive Taxation in Holland, Economic Journal*, viii. 325, and art. FINANCES, NETHERLANDS). Cohn maintains that it is the office of the property tax to fill up a gap left by the income tax through its inapplicability to property which yields no profits, such as a private picture-gallery. It is only when applied to such property that it is anything more than an income-tax under a different form (*Science of Finance*, §§ 241, 242, 353, 354). A tax on personal property, which is not capital, cannot be shifted. A tax on mortgages or other loanable capital will as a general rule fall on the borrowers (Seligman, *Incidence*, p. 139).

4. **TAXES ON INCOME.**—Income is now so generally recognised as the normal source of taxation that it is somewhat surprising to find that it has been only after property and other taxes have failed to produce the revenue required that the plan of a direct tax on income has been adopted. Three of the component parts of income—rent, wages, and profits—had indeed early been laid under contribution by means of land taxes, poll taxes, and licences to trade, the last mentioned being now represented in England by the licences required by auctioneers, etc., but the first tax on income as such was the invention of W. PITT in 1798. The unpopularity of this tax led to its abolition in 1816, but it was revived in 1842 for purposes of fiscal reform, and now may be assumed to have taken a permanent place in the English system of taxation. (For the practical difficulties in applying the progressive principle to the British Income Tax, see Blunden, "A Progressive Income Tax," *Economic Journal*, v. 527. Burns, "A Graduated Income Tax," *Westminster Review*, Nov. 1896, suggests how the difficulties may be overcome.) In France there is at present no income-tax (see Leroy-Beaulieu in *L'Economiste Français*, 8th February 1896 *et seq.*, for the tax recently proposed), but its place is partially taken by the PATENTE, introduced in 1791, under which trades, occupations, and professions are arranged in certain classes with a view to a rough approximation to a charge on the

amount of profits. In Germany and Austria taxes on industry are found, modelled more or less on the *Patente* (see J. A. Hill, "The Prussian Business Tax," *Quarterly Journal of Economics*, viii. p. 77. This tax is now devoted to local purposes). Austria has in addition a progressive general income tax, based on individual economic ability (R. Sieghart, *The Reform of Direct Taxation in Austria*, *Economic Journal*, viii. 173). Italy has a heavy income-tax of the English type, but with differentiation of the classes of income, and the Swiss Cantons supplement their property taxes by charges on income, in many cases progressive (see Palgrave, "Progressive Taxation as levied in Switzerland," *Journ. Stat. Soc.*, 1888). In America an income-tax was imposed for five years from 1st January 1895 (Seligman, "The American Income Tax," *Economic Journal*, iv. p. 639), but was subsequently held by the Supreme Court to be unconstitutional.

A general income-tax, being simply a combination of taxes on the separate ingredients of income—rent, interest, profits, and wages,—its incidence as a whole must depend upon the laws applicable to each separate part. Speaking broadly, it cannot be shifted (Seligman, *Incidence*, p. 178). A tax on profits will, if confined to the profits of some particular occupation, in the long run, be shifted to the consumer. If it extends to all profits, it will be borne by the producer (pp. 164-167). A trade-license tax, if fixed and high, will tend to be borne by the producer (p. 169). Given a monopoly in a trade, any fresh tax (whether imposed by way of license or otherwise) will fall on the producer (pp. 160, 162, 168). A special tax on professional men (e.g. Solicitor's Certificate Duty), will not be shifted (p. 172). A tax on wages will fall on the workmen, unless as the result of a long and fierce struggle it can be shifted to profits (p. 176).

5. CUSTOMS.—Taxes on commodities, or on consumption, may be levied either as customs at the ports or frontier, as excise with supervision over the producer, or by a state monopoly of production. The tax in all three cases is intended to fall on the consumer, the fundamental principle of a tax on consumption being (Cohn, *Science of Finance*, § 359) "that it accepts the demand of the taxpayer for consumable goods as the standard by which to measure his ability to contribute to the public expenditures." As regards customs (see CUSTOM; CUSTOMS DUTIES; IMPORT DUTIES), England is almost the only country that uses such duties purely for fiscal purposes, and confines them to luxuries. In France, food, raw materials, and manufactures are all subject to import duties, and there is no due relation, such as exists in England, between the customs and the internal taxes. A similar system prevails generally among the other continental nations.

A tax on either absolute necessities or expensive luxuries, whether imposed as an import or an excise duty, will, on the assumption that a corresponding rise in price will not affect demand, be shifted in its entirety to the consumer. A similar tax on comforts and minor luxuries, that is, the general mass of commodities, will be divided between the consumer and the producer in proportions varying with the elasticity of the demand and the ratio of produce to cost (Seligman,

*Incidence*, pp. 147-152. See also Bastable, *Public Finance*, pp. 347-351, 509-511).

Export duties, in early times a part of the customs, and popular as a charge (as then believed) on foreigners and a restriction on exportation, are now found only in countries with exceptional products, as, for example, India with opium and rice, Brazil with coffee, the West Indies with sugar (see EXPORTS, DUTIES ON).

In such cases the tax may be partly passed to the foreign consumers. Otherwise, an export duty will be chiefly paid by the country imposing it (Bastable, *Public Finance*, p. 531).

6. EXCISE.—AN EXCISE on similar commodities produced within the country should, unless protection rather than revenue is aimed at, or unless (Cohn, *Science of Finance*, §§ 366, 368) there are insuperable practical difficulties, accompany the imposition of customs duties at the ports or frontier. Thus in England each customs duty has its countervailing excise duty if the article taxed is capable of production in this country, except indeed, as is the case with tobacco, its production here is forbidden. On the other hand, if it is intended to raise revenue by the taxation of commodities produced at home, a corresponding customs duty must be charged on the same commodity if imported (see COUNTERVAILING DUTY). In England the internal taxation of commodities is confined to luxuries, and is for imperial purposes only. In France such taxation is applied to necessities, —e.g. salt, food, and fuel—as well as luxuries, and is used for municipal as well as state purposes (see INTERNAL CUSTOMS AND TOLLS; LOCAL FINANCE; OCTROI). A system of internal taxation somewhat similar to the French prevails on the continent generally.

The inclusion of necessities is due rather to the inadequacy of other sources of revenue than to a determination on abstract grounds to tax the poorer classes. The selection of articles for internal taxation depends mainly on the amount of revenue required to be raised by this means. For administrative reasons the articles should be few in number, and if a large revenue is needed they must be in general use among the people. In order not to infringe the fourth of Adam Smith's maxims, they should be such as will suffer least from excise restrictions on production; and for a like reason raw materials—the duties on which would have to be advanced for a long period—should be excluded from the list. By a state monopoly of production, as existing e.g. in France for tobacco, probably the largest revenue may be raised with the smallest amount of restriction. Under such a system an AD VALOREM DUTY becomes practicable (Cohn, *Science of Finance*, § 379). But where, as in the case of alcohol, it is desirable to secure the continual development of new processes, production is best left to private individuals. It must be remembered that in the taxation, whether by monopoly or a duty,

of tobacco, alcohol, and OPIUM, there is a moral ground, real or alleged, the object being not only to raise a revenue but to check the consumption of an article regarded as tending to be injurious (Bastable, "Taxation through Monopoly," *Economic Journal*, i. 307). A moral ground may also partly be alleged as the origin of the ASSESSED TAXES in England, which were chiefly of the nature of sumptuary charges. Such as survive—licences for carriages, men-servants, etc.—are now collected as excise, and paid over for local purposes. Taxes of this kind are an unpopular and decaying form of impost, both here and abroad (see Leroy-Beaulieu, *Science des Finances*, i. ch. ix.). They cannot be shifted. Cohn regards the English system of consumption taxes as one-sided, in that it charges the majority of the population for the benefit of that portion which does not smoke or drink. He, writing in 1889, would wish to see an increase in the scope and number of our taxable articles, and a more adequate equalisation of the burden by further special taxation of the upper classes (*Science of Finance*, § 365).

7. TAXES ON COMMUNICATIONS AND TRANSPORT.—In England the POST OFFICE, a state monopoly, is carried on at a profit, and the surplus, being applied as revenue, is a tax on commercial and private correspondence. A higher charge than is necessary to meet expenses is a check on trade, and an undesirable form of taxation. In other countries the postal service is generally carried on at a loss; and this is the case also with another form of government enterprise—state railways, the receipts from which rarely cover expenses, including interest on debt. The Prussian railways are a conspicuous exception, and the profit arising from them is a tax on transport. The making of such a profit was no part of the original policy of state acquisition, but Cohn ("Railways and Waterways in Germany," *Economic Journal*, iv. p. 543) speaks of the surpluses with approval as a kind of taxation which affects those strata of the population which are most able to pay taxes. As regards railways in private hands, a small amount of revenue is raised in England by the Railway Passenger Duty, a special tax on part of the gross receipts from passengers. The present law is founded on the report of the select committee of the House of Commons appointed in 1876, which however recommended the repeal of the duty whenever the state of the public revenue would permit (pp. 312, 376). In France a considerable sum is raised by a tax on goods and passengers carried on the railways, and in America there are state taxes on either the gross or net earnings of the lines. In so far as these taxes fall on goods and travellers on business (see Bastable, *Public Finance*, pp. 536-7), they act in restraint of trade, and are undesirable.

8. STAMPS.—This term denotes merely the

mode in which certain taxes are collected. When charged in respect of law proceedings and juridical acts, STAMP DUTIES, so far as they exceed the level of fees for services rendered, are open to objection, the administration of justice being a general interest affecting rich and poor, litigants and non-litigants, alike. In England and France a small amount only of revenue is raised in this manner, but in Germany the fees contain a larger tax element. As charges on commercial transactions and transfers of property, stamp duties are, however, largely used in England, France, and Italy. They are easy to collect, and although tending to check trade and production, are, when charged at low rates as in England, open to little practical objection as a subsidiary source of revenue.

According to Bastable (*Public Finance*, pp. 546-7), stamp duties on commercial instruments, such as bills and receipts, may be regarded as falling on business gains, whilst those on transfers of land and other property are probably divided between buyer and seller.

#### 9. DEATH DUTIES. SUCCESSION DUTIES.

—Duties on the transfer of property from the dead to the living, though theoretically objectionable as tending to fall on capital, and thus to retard the growth of wealth, are almost universally regarded as an essential constituent of a well-arranged system of finance. In practice, so long as small estates passing to widows and children are lightly charged, and adequate measures are taken to prevent evasion, perhaps the only limit to the rate of duty is the danger of diminished productiveness through either genuine gifts *inter vivos*, or, eventually, the stoppage of accumulation. Seligman, discussing the various arguments for an inheritance tax, as death duties are called in America, advocates a charge of this kind as a supplement to an income or general property tax, in order to reach the real faculty or ability of the individual, which has been increased by an accidental or fortuitous receipt. He also regards the tax as a convenient method of applying the principle of differentiation in the taxation of income derived from property and labour (*Essays in Taxation*, 121-135. See also Max West, *The Inheritance Tax*). The principle of graduation according to the amount of property left by the deceased has now been adopted in England, more especially since the introduction of the estate duty (Finance Act, 1894), (*38th Report of Commissioners of Inland Revenue*, 19-28; Seligman, *Essays in Taxation*, 307-311; Bastable, *Public Finance*, 556-560). A tax on inheritances or bequests cannot be shifted.

TAYLORS, MERCHANT. The tailors were among the most thriving artisans of mediæval London, and their organisation as a craft probably dates from the middle of the 13th century. In 1327 the tailors and linen-armourers represented to the king that they had been accustomed "to hold their gild once every year to rule their mystery and order the state of their servants," and prayed for the confirmation of the same. This was granted by a charter, which gave them also the control over the admission of tailors to the freedom of the city. The number of members would seem to have then been twenty-four. During the same period there existed a religious fraternity of St. John Baptist of tailors in the city of London, which was probably at first formally distinct from the organisation of the craft as such. But, if so, the two had coalesced by 1390, when Richard II. confirmed the privileges of "the gild and fraternity of tailors and linen armourers" "in honour of St. John the Baptist," and empowered them to elect annually, from among themselves, a master and four wardens.

From that time onward their history resembles, in its main features, that of the other LIVERY COMPANIES of London (see also CORPORATIONS OF ARTS AND TRADES, GILDS, LIVERYMEN, and MERCERS). By a charter of 1408 the fraternity was formally incorporated; by one of 1439 it was authorised to make search concerning the mystery within the city and suburbs. Henry VII., by his charter of 1502, of his "special grace" "transferred and changed the gild and fraternity into the name of the gild of merchant taylors of the fraternity of St. John the Baptist"; on the ground that "the men of the mystery, . . . from time whereof the memory of man is not to the contrary, do

use, occupy, and exercise in all quarters and kingdoms of the world, all and every kind of merchandises, to the renown, honour, and benefit of our kingdom." During the 15th century a divergence of interests between masters and journeymen made itself felt, leading to the formation of a fraternity of "yeomen," which gave the company some trouble (see JOURNEYMEN'S SOCIETIES). The company also began to be enriched by the bequests of deceased members, and to be made the trustee of lands devised for benevolent and religious purposes. In 1547 it surrendered to the crown, in accordance with the statute to that effect, its religious endowments; redeeming charges amounting to about £100 by selling lands which fetched £2000, and by paying that sum to the crown. In 1561 the company established the school in London which it has since maintained, and which has remained in close association with St. John's College, Oxford, founded a few years earlier by Sir Thomas White, merchant taylor and lord mayor. Between 1550 and 1571 the company vigorously defended, especially against the cloth-workers and haberdashers, the alleged right of its members to exercise any occupation, and succeeded in preventing any prohibitory legislation. Their success must have hastened the decay of the gild system in London; henceforth, though the companies survived as social bodies, they gradually dropped their connection with the occupations from which they had arisen. The internal constitutional history of the Merchant Taylors' Company is obscure. But it would seem probable that the subordinate organisation known as the Bachelors' Company was composed in the 17th century largely of working tailors, and that the refusal of the court of assistants in 1691 to reappoint officers for the bachelors may be regarded as marking a distinct withdrawal from interest in the tailoring occupation; though the formal testing of cloth measures in Bartholomew Fair by officers of the company was kept up until the abolition of the fair in 1854. In 1837 it was stated that "the greatest number of the company were members of the stock exchange or corn factors." In 1882 the number of liverymen was 226, the corporate income £31,243, and the trust income £12,068. In all considerable English towns there were similar, though less flourishing, fraternities of tailors in honour of St. John the Baptist. That in Bristol possessed ordinances dating from 1392, and began to call itself "the company of merchant taylors" in the latter part of the reign of Elizabeth. It became extinct with the death of the last surviving member in 1824.

The tailors were, in many towns, among the most powerful of the crafts; for their struggles with the municipality of Exeter see *English Guilds* (Early English Text Soc.), and Mrs. J. R. Green, *Town Life in the 15th Century*, vol. ii. ch. vii.

Their social importance may be explained, in the main, by the elaborateness and costliness of attire among the upper and middle classes in the later middle ages. But it was doubtless increased in some places, such as London, by the share which their occupation led them to take in more or less wholesale trade—a subject which awaits investigation. Some light may perhaps be cast upon the position of affairs in London by that in certain continental towns. In Stralsund the company of *Wandschneider*, explained as cloth dealers, belonged to the *Kaufmannstand*, while the *Schneider* belonged to the *Gewerkstand*. In Lübeck the *Gewandschneider* were grouped with the merchants travelling to foreign parts, and reckoned among the *bürgerliche Collegien*, and yet the *Schneider*, another body, was second among the four great *Handwerksämtern*, to which the other seventy-two crafts were subordinate.—V. Maurer, *Städteverfassung*, ii. §§ 337, 354.

[W. Herbert, *Livery Companies* (1834), vol. ii.; now superseded by C. M. Clode, *Memorials of the Guild of Merchant Tailors* (1875), and *Early History of the Guild of Merchant Tailors* (1888), 2 vols.—both works printed by the company for private circulation. For the recent history of the company the *Report* of the royal commission on the livery companies (1884) must be consulted, or the summary in W. Carew Hazlitt, *The Livery Companies of the City of London* (1892). For Bristol, Francis F. Fox, *Merchant Tailors of Bristol* (1880), printed for private circulation.] W. J. A.

**TEINDS (SCOTLAND), *i.e.* TITHES.** In early times it came to be held as part of the common law of Scotland that, by reason of divine law, a tenth part of the fruits of the land of the laity ought to be paid to the clergy, and the latter were accustomed to claim and receive this. Substantially the bulk of the tithes or teinds in Scotland were those imposed upon cultivated land, and even these were practically, if not wholly, imposed only upon corn. These constituted the parson's tithes, the rectorial teinds, or *decimæ garbales*; and as the obligation to pay one-tenth of the corn to the parson ran along with the right to retain the remaining nine-tenths, the parson's right to his one-tenth could never lapse from non-user. At the same time there were local customs according to which petty tithes, or "vicarage teinds," were levied, ostensibly for the maintenance of the parson or rector's substitute or vicar. If the vicar were appointed by the patron of the church, the representative of the original founder of the church, these petty tithes were paid directly to the vicar; but if not, they were paid to the parson himself, to supply him with means to pay his own vicar. The history of the right to teinds is a record of confusion; and during the centuries preceding the Reformation we find that by one means and another the religious houses ousted the parsons and vicars to a large extent, and that the right to claim and receive teinds became vested in them in many places; and more, that many laymen contrived to be-

come possessed of them at the expense of the religious houses. This latter process was greatly accelerated immediately before the Reformation, when it became almost a general practice for the religious orders to grant away their own lands, which up to that time had remained exempt from tithes, "*cum decimis inclusis et nunquam antea separatis*," as the phrase went; and a title to that effect is still recognised as exempting the land to which it applies from liability to pay teind. When Scotland emerged from the confusion of the Reformation, and the accompanying wasteful grants to needy nobles and courtiers of the period, it was found that the parish clergy had practically ceased to have any interest in the teinds, the right to claim and receive which had come to be vested either in the crown or in the titulars of teinds—that is, persons entitled to the teinds in virtue of crown grants of teinds or of church lands—or in the patrons who represented the original founders of the churches, or in those who had acquired church lands from churchmen. These were practically all laymen, and their exercise of the right was found to be most oppressive; for example, they would refuse to come and gather their tenth sheaves until some special bargain was driven, for until they did so the remainder of the crop could not be taken off the fields. On the other hand, the parish clergy had no satisfactory means of support, and the confusion became so great that in 1628 Charles I. induced all parties concerned to submit the whole arrangements to his arbitration and to revision by him, the alternative apparently being that the crown would assert its own rights as against the existing holders of the teinds. King Charles issued an award which was the basis of the present system. According to this, instead of one-tenth of the fruits of the land, the teinds were to consist of one-fifth of the rent or annual value of the land. Then there was a right given to have this rent valued once for all, so as to fix in money the annual value of the teinds. The great majority of the lands in Scotland have had their rents valued for this purpose very long ago, so that the teinds have in modern currency very small values, and do not approach one-fifth part of the rents of the present day. But there are some instances, come upon from time to time, in which no such valuation has ever taken place; and in such cases the teind amounts to one-fifth the actual rent at the present day, with this exception, however, that where the land in question has been covered by the houses of a town, it is taken at a full agricultural value; in Edinburgh £4 per acre, so that the corresponding teind is 16s. per acre. Next we have to mention a peculiarity of the existing system, which is, that whatever may be the value of the teinds within a parish, it is only in some cases that the minister of the parish

receives the whole of them. The theoretical rule would be that he never does so, because the teinds are held as property for their own advantage by the heritors—that is, by the proprietors of land and houses liable in payment of public burdens—and the heritors do not pay the teinds as such to the clergy, but are at the same time bound to make a suitable provision out of the teinds for their support. If the whole of the teinds happen to be required for this purpose, the whole will be absorbed in meeting this obligation, but not otherwise; and if this be the case, the teinds are said to be exhausted. When a minister thinks his actual stipend is too small he may raise an “action of augmentation,” an action to get his stipend augmented or increased. This action he brings against the heritors before the teind court. He pleads the increase of his parish in population, the increased cost of living, etc. etc.; the heritors apply themselves to prove that he can live quite comfortably on his existing stipend, or perhaps that there are no unexhausted teinds left in the parish. Assume that the minister satisfies the court that he ought to have an increase, and that there are unexhausted teinds in the parish from which an increase may be granted, it is awarded to him in terms of so much oats, so much barley, etc., the conversion of which into terms of current coin is a mysterious arithmetical operation, dependent for its result, year by year, upon the verdict of a jury summoned yearly for this purpose by the sheriff of each particular county. This old-world method of paying the minister nominally in grain and really in money, the amount of which varies with the current prices of grain, has had the effect of impoverishing the Scottish clergy, never too sumptuously provided for, considerably during recent years; but the minimum money stipend is in current practice taken as £150. If an augmentation be granted as just explained, the next step is a “locality” that is an allocation or apportionment of the burden among the heritors concerned. This is a proceeding which has seldom failed to set neighbours by the ears more or less; for unless there have been a previous “locality” in the same parish, the records of which can be referred to, it involves raking up old titles to prove exemption or to prove old valuations, or to solve questions of alleged postponed liability, while the interest of a heritor's fellow-heritors is to show that he cannot produce any old valuation, and is therefore liable to contribute on the footing that his teind is one-fifth of the actual present-day rent or annual value of his property. At the same time there are certain rules which it is not necessary here to consider as to the order in which the teinds will be applied to the purpose of giving the minister a suitable stipend; for example, the first to be encroached upon will be any teind belonging to the parish and found in

the hands of the crown, not having been ever granted to any layman, should any such be discovered; and the last to be touched will be any teind already appropriated to one of the four Scottish universities.

[Connell on *Teinds*.]

A. D.

The present value of parochial teinds is about £240,000 yearly, and there is an estimated value of £138,000 “unexhausted teind” available for future augmentations of stipend; 880 parishes participate in the distribution. There is a bill now before parliament for compulsory valuation of all unexhausted teinds, etc., so as to put an end to the confusion, actual or potential, at present existing.

**TELEGRAPHIC TRANSFERS.** Since the introduction of transatlantic cables a new mode of effecting international payments has come into use, the operation of which appears from the following illustration:—

A in New York purchases from B, a London stock-broker, shares to the value of £10,000. They are purchased on the 25th of the month for the 30th, which is the next settling day; and as B has resold the shares for delivery in New York on the 10th of the next month, they cannot be carried over, and B must be in possession of the £10,000 on the 30th. A therefore purchases from C, a banker in New York, a telegraphic transfer to B for £10,000, upon which C immediately telegraphs to his correspondent in London, D, to pay A £10,000. C must of course reimburse D, and this may be done in various ways; if the exchange in New York is so much in favour of London that it pays to send gold, he may send gold; if this is not the case he may send stocks or shares for sale, or employ other means of remittance; but the most usual mode of covering cable transfers is the remittance of long-dated bills of exchange, and the price for telegraphic transfer depends, therefore, on the price of such bills. In fixing the former price the following circumstances have to be taken into consideration:—(1) the loss of interest while the bill is travelling; (2) the discount on the bill calculated from its date of arrival in London; the actual rate will be taken as the basis of the calculation, but a small percentage will be added by way of insurance premium in view of a possible rise in the rate; (3) the bill stamp; (4) a *del credere* commission for C, who runs the risk of the bills he purchases; (5) a reasonable profit for C and D.

Therefore, if the price of sixty days sight bills on London in New York is \$45 (which means that for \$45 a bill for £100 can be obtained), the price of cable transfers on London in New York is calculated in the following manner:—

	\$	cents.
Cost of bill	455	0
Interest 8 days at 4 per cent . . . . .		0 43
Discount 63 days at 2 per cent . . . . .		1 70
(the market rate being $\frac{1}{2}$ , and $\frac{1}{4}$ being added so as to cover the risk of a rise)

Profit for C and D, $\frac{1}{2}$ per cent . . . . .		0 97

A cable payment of £100 would therefore approximately cost 488 84

The business of selling telegraphic transfers cannot be carried out properly, unless elaborate arrangements of a permanent kind are made between the parties ordering them and the parties by whom they are effected. These arrangements include the preparation of telegraphic codes with secret keys—so as to avoid the risk of acting on fraudulent telegraphic orders—constant telegraphic communication as to the standing of the mercantile firms on whom the foreign house usually purchases bills as to rates of discount and their tendency, etc., and involve so much labour and expense that the transactions for which they are required cannot be remunerative unless they are undertaken on a somewhat extensive scale. As the amounts paid must be advanced whilst the bills sent by way of cover are travelling, it follows that only such companies and firms as are possessed of considerable liquid means can undertake to effect cable payments. Such payments cannot, therefore, be obtained to an unlimited amount.

On the other hand, it will be seen from the calculation given above, that it must generally be cheaper for a person having to make remittances to distant countries to buy bills instead of telegraphic transfers, even after making allowances for discount, bill stamps, etc. These transfers are, therefore, not used as a means of remittance except in connection with certain special classes of business transactions. Among these, stock exchange arbitrage dealings, which necessitate very quick payments, are the most prominent, but there may be other circumstances under which it is profitable to incur the additional cost involved by the employment of this mode of remitting money to distant places. If, for instance, a merchant in Hong-Kong, from which place a letter to London takes about six weeks, has to make a certain payment in London at a certain date, it may be of the greatest benefit to him to avail himself of the six weeks' additional space of time, which he gains, by employing the cable instead of the steamboat as the carrier of his remittance; this will occur if money, during the intervening six weeks, can be employed to great advantage, or if he has reason to believe that the rate of exchange will be more favourable later on. Where large amounts have to be remitted, the circumstance that the purchase of cable transfers involves less risk than the purchase of bills, may also be a motive influencing the parties concerned.

In actual practice telegraphic transfers are used in few countries only. The largest volume of transactions occurs in transfers purchased in New York and effected in London in connection with arbitrage dealings in American stock-exchange securities, but cable payments to be effected in London are also purchased in some eastern places—Bombay, Calcutta, etc. In the latter case they are probably purchased, as a general rule, with the intention of deferring the fixing of the rate of exchange to the exact moment when the payment is to be effected. The drafts on India which the Indian government negotiates in London are also sometimes issued in the form of telegraphic transfers. *E. S.*

TELEGRAPHS. See the POST OFFICE.

TELLERS OF THE EXCHEQUER. These were officials belonging to the lower chamber or exchequer of receipt (see EXCHEQUER, EARLY HISTORY OF) appointed to count all money paid in. Four was apparently the usual number, although from Pipe Roll, 1 Richard I., it seems that ten tellers accompanied the treasurer and chamberlains to Salisbury for the collection of a tenth (Madox, T., *History of Exchequer*, ii. 303). Originally in a subordinate position, the tellers became officials of some dignity in Tudor and Stuart times, when their work was done by deputies (Hall, *Antiquities of the Exchequer*, p. 81). The tellers' office undertook both the receipt and the payment of money. A note of all money paid in was entered in a book; of this a transcript on parchment called a bill or teller's bill was at once made and thrown down a pipe into the tally court, where a TALLY (*q. v.*) was struck indicating the amount paid in for which the teller was responsible (Thomas, F. S., *Ancient Exchequer of England*, pp. 26, 134). The clerk of the pells also recorded on the pell of receipt every teller's bill; the earliest extant is dated 4 Hen. III. (*ibid.* 92). Upon disuse of tallies a memorandum of the teller's bill known as "the bill of the day" was drawn up. The tellers also issued payments upon warrant (*ibid.* 134). One key of each teller's chest was kept by the clerk of the pells, who charged the tellers daily with the amount received, and deposited it in the chests. The

tellers were also under the control of the auditor of the exchequer, who examined their chests at his discretion (*ibid.* 130). With the abolition of the receipt department of the exchequer by 4 & 5 Will. IV. c. 15, the office ceased to exist in 1834.

TEMPLARS, THE KNIGHTS. The leading facts of the history of this military order are well known: at the time of the first crusade they were founded to defend pilgrims to the Holy Land against the infidel; they enjoyed exemptions, granted by special papal bulls, from ordinary ecclesiastical jurisdictions; they acquired immense wealth, became unpopular both in England and in France, and, in the latter country, were suppressed by an unscrupulous stroke of authority of King Philip the Fair, who condemned the grand master Molay and other dignitaries to death, and confiscated, in 1307, a large part of the wealth of the order. Though in England such extreme proceedings were not taken, Edward I., in 1295, carried away by force from the Temple a sum of £10,000, and Edward II., shortly after his accession, seized £50,000 in silver, besides gold and jewels, which had been deposited in their treasury (Cunningham, *Growth of English Industry*, p. 254).

During almost the whole of the 13th century the house of the Templars in Paris acted as bankers to the kings of France, the royal princes, noblemen, rich burghers, and merchants. Its dealings in this capacity were for the first time submitted to a searching and exhaustive analysis by M. Léopold Delisle in his *Mémoire sur les Opérations financières des Templiers* (*Mémoires de l'Académie des Inscriptions et Belles Lettres*, vol. 33, 1889), of which the following is a summary.

Owing to the sanctity ascribed to their precincts, monasteries were, during the middle ages, favourite places for deposits of the precious metals, jewels, chattels, etc., but the *Commanderies* of the Temple distinctly acted as bankers by (1) being chosen as depositories for disputed funds, (2) granting loans and acting as securities for the fulfilment of contracts, (3) transmitting monies and paying them at a distance, and (4) accepting and effecting payments for customers who had a running account with them. All these operations have been identified by M. Delisle and are authenticated by original documents printed in his appendix. Deposits in cash were sometimes locked up in special *hutches* marked with the names of the owners, in which case they could not be touched without the express consent of the depositors, but generally the Order was allowed to make use of the deposits at its discretion, but of course under its responsibility.

Fragments of one of the books kept in the Temple at Paris for the daily receipts of money, and printed in the appendix (pp. 162-223), afford an insight into their daily transactions, and show how the payments effected were either put to the credit of the owner of an account (*super talem*) or carried over to another account such as *in parvo libro novo, in magno libro*, etc. For each day the name of the brother in charge heads the entry; and at night the monies received are as a rule transferred to the central office (*Solvit in turre*). About 800 different names are entered in the relatively short space of fifteen months (12th March 1295 to 4th July 1296); the reference to about ten distinct other registers, such as *in magno libro ad debemus*, etc., show that the Templars understood the advantages of systematic book-keeping.

From 1202, the Temple became the central treasury of the kings of France, and under Lewis IX. the royal auditors even held their meetings in the Temple; it also paid the pensions granted by the king, the amounts of which were transferable. From the balance-sheets, which have been preserved (1286-1295), it appears that the king was sometimes debtor and at other times creditor. Towards the very end of the 13th century Philip the Fair established a separate royal Treasury in the Louvre and kept the latter entirely under his own management. The accounts of the Temple with the king at the time of its suppression appear to have been destroyed, probably from sinister motives.

In the defective state of records it is impossible distinctly to state what remuneration the Templars secured for their financial services, beyond the extensive and "perpetual" fiscal privileges granted by the kings, and some special and commercial exemptions, which they temporarily enjoyed. In other words, did they actually charge interest on their loans? That they paid such (*pro custibus solutis*) on account of the king to merchants and bankers is demonstrable, but beyond this nothing can be ascertained. Still, there is evidence that they acted on the principle admitted by AQUINAS that a man who lends money may without sin contract for a compensation in case of delay of repayment (see LOAN, CANONIST DEFINITION OF); thus in the collection of old French judicial sentences known under the name of *Olim*, a judgment occurs concerning a loan of £3000 made by the Templars with the stipulation that in case of non-payment at the prescribed term, they would be entitled to a fine of another £3000 (*Olim*, éd. Beugnot, vol. ii. p. 128). M. Delisle mentions this transaction, but perhaps does not lay sufficient stress on its bearing.

[See also Addison, *History of the Knights Templars*, 1842.—H. de Curzon, *La Maison du Temple de Paris*, 1888.—Michelet has edited the documents concerning their trial in the *Monuments Inédits de l'Histoire de France*, 2 vols. 1841.]

E. CA.

TEMPLE, SIR WILLIAM (1628-99), diplomatist and essayist, was the only English thinker of that epoch who saw clearly through "the state of nature" and the "social contract," and who traced law and trade-morals to custom, the state to the family, and modifications of the state to conquest and treaty (*Essay upon*

*the Origin and Nature of Government* (1671?), *Works*, ed. 1814, vol. i. p. 1). These anticipations of Savigny and Maine are almost uncanny; the more so because his *Observations upon the United Provinces* (1672) (*Works*, vol. i. pp. 163-185), and *Essay upon the present State of Ireland* (1667) (cited, by T. P. Courtenay, *Memoirs*, vol. i. p. 380), and *Advancement of Trade in Ireland* (1673) (*Works*, vol. iii. p. 1) exactly reflect contemporary views about wealth and poverty under the respective images of Holland and Ireland. He starts, like FORTREY, with a dense population, which raises rents and the price of necessities and so (1) sets money free for trade, (2) and creates the economic sense which with MISSELDEN and HOBBS he usually calls "frugality and industry," but sometimes with the older moralists "avarice" (*Works*, vol. i. p. 141). He seems to think that wealth is the necessary result of these two data; and that the economic sense—on which he lays chief stress—is developed by physical and political conditions. Like FORTREY (1663) and the author of *Britannia Langvens* (1680), and unlike the author of *England's Greatest Happiness* (1677), and BARBON, and MANDEVILLE, he condemns imported consumable luxuries partly with the usual balance-of-trade arguments, partly because they sap the economic sense; and unlike FORTREY he condemns home-made luxuries on the latter ground (vol. i. p. 177; vol. iii. p. 8). Like R. COKE (1670), he wants to stamp out idleness and foster new manufactures by means of workhouses. He is keenly alive to the value of "mutual trust" which good government, banks, traders' corporations authorised to search and stamp exports (contrast MILLES and W. S.), land registries, and low customs will easily effect. Like all mercantilists he is nationalist to the core, and though he wishes the good of Ireland, he wishes that of England more. He condemns the "raising" of the chief Irish coin as likely to drain away other coins, and the cattle-trade prohibition (1666) as not likely to benefit Ireland, nor, which is more important, to raise English rents; and he wants to encourage horse-breeding and linen manufactures in Ireland but to discourage cloth manufactures, which must be set apart for England. His panacea is more population (cp. PETTY, *Treatise of Taxes* (1662)); therefore let the state tax bachelors (cp. Louis XIV.'s edict of 1666, the proposals of WALES and MASSIE) and invite foreigners (cp. VIOLET); these measures, along with state control and regulation (he seems to forget markets), will raise up trade out of nothing—as was the case in Holland—then just past its zenith—and will be the case in Ireland. His belief that external necessity inevitably moulds character, and that character is all that is wanted to enrich a nation, is the main feature which distinguishes him from all those who since Sir

W. RALEGH turned their eyes to Holland, much as German economists now turn their eyes to England. His theory of population merely flowed from these premises.

[Sir W. Temple is largely quoted and approved in *Britannia Linguens* printed in *Select Collection of Early English Tracts on Commerce* (1856); and in *Enquiry how far it may be expedient . . . to permit the importation of Irish Cattle* (1743). And see F. I. Herriott, *Sir W. Temple on the Origin and Nature of Government* (1891); *K. sächsische Ges. der Wiss.*, Abh. Bd. II.; W. Roscher, *Zur Geschichte der eng. Volkswirtschaftslehre*, p. 125; Hume, *Essays*, Pt. ii. Essay viii.] J. D. R.

TEMPLE, WILLIAM, a clothier of Trowbridge (18th century), "who has immense erudition in his own way" (Lord Woodhouselee's *Memoirs of the Hon. H. Home of Kames*, iii. 161), published his *Vindication of Commerce and the Arts*, 1758, under the pseudonym of B. I., M.D. (or I. B., M.D., on the title-page of McCulloch's edition). It was written to refute the conclusions of a university prize essay by W. BELL, who had asserted agriculture to be the main cause of populousness, and had contemned commerce and the arts as useless and pernicious. Temple, on his side, attributed "populosity" to more various causes—to good laws, religious toleration, encouragement of foreign commerce and immigration, climate, the employment of foreign mercenary soldiers; and he denied that agricultural pursuits and rural simplicity could give a strong enough spur to industry to increase population or to produce wealth beyond the accustomed necessities and comforts of the workers. If these could be produced by three days' labour, labourers would only work for three days. A great plenty and a great industry must be incompatible, chiefly for want of the spur of necessity, but also from the temptation to drink. "The only way to keep a populace temperate is to deprive them of the means of debauchery by paying them low wages." To strike an average between times of plenty and of scarcity, Temple put forward the curious suggestion that in the former a tax should be laid on necessities to form a sort of state provident fund in times of dearth, sickness, or other distress, payments per head being recommended to encourage population.

Commerce and the arts were then treated, in opposition to the views of the essay he was attacking, as productive not of penury but of plenty and prosperity.

[Cunningham, *Growth of English Industry and Commerce*, *Modern Times*, pp. 560 n. and 689; another pamphlet, *Essay on Trade and Commerce*, and a refutation of part of Smith's *Chronicon Rusticum*, are here ascribed to the same author.]

E. G. F.

TENANT-AT-WILL. A tenancy-at-will means a tenancy which either the landlord or the tenant may terminate at any moment by the mere expression of a wish to that effect. Such a tenancy may result either from express agreement (no particular form being required by law) or it may arise by implication, as where a tenant for years continues in possession after his lease has expired. As tenancy-

at-will is unfavourable to agriculture, the common law always regarded it with disfavour, and the courts would lay hold of any indication of a wish to create a more permanent tenure (e.g. the stipulation of a yearly rent) to turn a tenancy-at-will into a tenancy from year to year.

[Williams, *Principles of the Law of Real Property*.] F. C. M.

TENANT RIGHT. Tenant right hardly admits of accurate definition. It may be described as a beneficial interest in the land which remains in the tenant when his lease has expired. It may originate in a claim to compensation for improvements which the tenant has made, and which are not exhausted at that date. Or it may originate in a claim not to be evicted at that date so long as he pays his former rent, or at least a rent not determined merely by the discretion of the landlord. For if the landlord may ask what rent he pleases, the right of the tenant to remain on condition of paying rent would be nugatory. Or the tenant right may be founded on both of the above claims by the tenant. Tenant right may be either customary or legal. Various customs securing compensation for improvements to the outgoing tenant have prevailed in different parts of England. The Agricultural Holdings Act of 1883 has created a statutory right to such compensation. In Ulster and elsewhere in Ireland, custom imposed a check upon the arbitrary raising of rent when the tenant's term had expired, and thus gave rise to the Ulster tenant right. The Irish Land Acts (see LAND LEGISLATION, IRISH), giving fixity of tenure at judicial rents, have created a statutory tenant right available all over Ireland. The tenant who wishes to quit his farm may sell this tenant right, which usually fetches a very considerable sum.

[See articles AGRICULTURAL HOLDINGS ACTS and LAND LEGISLATION, IRISH, and the authorities therein referred to.] F. C. M.

TENEMENT. The strict meaning of tenement is anything that can be the subject of tenure at common law, i.e. land, seignories, peerages, advowsons, and probably chief rents. But in practice the word has been extended to cover all hereditaments that savour of land or realty, i.e. any estate or interest in land that on the death of the owner intestate would devolve on the heir. A tenement is the only property that can be entailed under the statute *De Donis*. Personal property, therefore, cannot be entailed, as it does not come under the definition of a tenement.

[The meaning of the term is discussed in the *Law Quarterly Review*, vol. v. p. 526, and vol. vi. p. 69. See also Challis on *Real Property*, London, 1892.] J. E. C. M.

TENURE OF PROPERTY. See LAND TENURES.

TERCIAS REALES, two-ninths of the

ecclesiastical tithes which had been granted to the kings of Castile by the Popes Alexander II. and Urban II., to assist them in their wars against the Moors. These grants were made perpetual by the Popes Innocent VIII. and Alexander VI. in 1487, 1493, and 1494. In course of time a great part of this revenue was alienated; yet, as late as 1800, Canga Argüelles (*Diccionario de la Hacienda*) computes that they still yielded 15,000,000 of reales (say £150,000) to the Treasury. E. ca.

**TERCIO DIEZMO** (third tithe). When Catalonia and the kingdom of Valencia were wrested from the Moors, the Christian conquerors became possessed of the tithes which the Moors had levied on the produce of land. King James I. of Aragon granted two-thirds of these tithes to ecclesiastical purposes, but reserved one-third under this name to the state. After having been a plentiful source of revenue, these *tercios diezmos* were almost completely lost through donations, usurpations, and alienations in times of pressing financial wants.

[See Canga Argüelles, *Diccionario de Hacienda*, London, 1826.] E. ca.

**TERM OF YEARS.** A person holding land on lease is said to be the owner of a term of years, or of an "estate for years."

See ESTATE; LEASE.

E. s.

**TERMINABLE ANNUITIES.** There is scarcely any subject in state finance on which so many misconceptions are held as this.

It is frequently alleged (1) that it would be practicable, as well as advantageous, to raise large loans by the grant of equated or fixed annuities of an unvarying amount per annum for a long or short term of years as the case may suggest, in preference to the usual plan of perpetual annuities with or without power of redemption by repayment of the capital at par at specified future dates; (2) that it would be possible to establish a stock exchange market for terminable annuities, and to enable sales and purchases and transfers to be registered of any subdivided or fractional parts, as is done with imperial government or local government stocks; and was suggested so recently as in 1895, by a bill promoted by the London county council to consolidate and amend the law relating to the raising and provision of money, for its expenditure, and to issue terminable annuities to be called Metropolitan Annuities.

It was intended by the bill referred to, that the dividend warrants for payment of such terminable annuities should either state what portion represented principal and what portion interest, or that separate warrants should be issued for the portion of each instalment which represents interest, so as to save the holders of the security from income-tax on capital. The bill was not proceeded with, on the election of a new council, so far as regards this provision in their bill of 1896; so that income-tax is, as hitherto, deducted from the whole of the dividends on terminable annuities that may be granted by local authorities, in the same way as it is deducted from the whole of similar annuities granted by the government or local authorities, unless the subdivision or separation of the instalments of sinking fund to repay principal, and of the portion to meet interest on the periodically diminishing indebtedness to the original lenders, is explicitly set forth in a deed executed by the borrowers, at the outset of any special transactions and with the express view of excluding all instalments of principal from the incidence of the income-tax. But loans secured by deeds such as this are not negotiable or stock-exchange securities, like those which the county council bill of 1895 sought to introduce. It is an error, both scientific and practical, to suppose that such a thing could ever be brought about. Both the sum

repaid, and the interest on the sum remaining unpaid, vary, at each instalment, in every terminable annuity of a fixed or equated amount, for each year of the term for which it is granted. It is a geometric proportion (1) of increase of principal or sinking fund at each instalment; and (2) of corresponding decrease of interest consequently. How loans of greater or less magnitude, and with such perpetually shifting conditions, could be consolidated so as to become negotiable securities, or stock-exchange values, and to be transferable in fractional sums, would be quite impossible for the most ingenious of financiers to arrange. The British government, since 1555, have, with the solitary exception of the Red Sea telegraph loan, then carried through by a temporary annuity of £36,000, expiring 1903, which is quoted as a stock-exchange security, not been able to issue any terminable annuities publicly dealt with, or not subject to income tax on the full amount of each of the instalments. This applies to the whole of the terminable annuities in existence as in 1897, and the capitalised value of which at that date was about 50 millions, the possession of which (with the exception of the life annuities) is held by the government itself, as against its savings banks and other departmental liabilities, the annual charge for interest and sinking fund being £7,140,743. In the same way, although local authorities in England and Wales and London and county councils, had, in 1897, an indebtedness of about 272 millions, which included many millions borrowed from insurance companies in exchange for terminable annuities, either of equated equal amounts for terms of years, or of amounts diminishing by instalments repayable at fixed periods, none of these are in any sense of the word negotiable, divisible, or stock-exchange values, and are mainly held, and intended to be kept, as investments by the original subscribers until the terms of years for which each annuity was granted shall have expired. The teaching of the last two centuries of our financial history, as well as the opinion of modern men of business, is decidedly against any attempt to raise large public loans on terminable annuities being either successful, or consistent with popular wants or economy in finance. As regards the past, we annex a few remarks. The public debt of England was inaugurated in the first years of the government of the revolution. The large expenses of its French and Irish wars forced the executive to impose heavy taxes on the country. Nevertheless the large revenue from this source was not enough to supply sufficient ways and means. It was necessary to have recourse to loans. These were at first contracted by the plan which, from ancient times, had been followed by the kings and parliament, namely by pledging as security certain special taxes, generally customs duties and excise monopolies. This system completely failed. The deficit at the end of the year 1690 had grown to about £3 millions. In 1692-94, an attempt had been made to obtain money by the offer of life annuities, both by way of *TONTINE* and also by the offer, at any age of the lives, of 14 per cent on one life, 12 per cent on two lives, and 10 per cent on three lives. In this way 1 million had been raised by tontine, and £300,000 pounds by life annuities. In 1694, 1 million was raised in exchange for an annuity of £140,000 for a fixed term of 16 years. This represents the extravagant rate of more than 11 per cent interest. The bank of England was founded in the same year. The loan of £1,200,000, at 3 per cent, which it advanced to the government, was the foundation of the public perpetual debt. In 1695, the holders of annuities on one life at 14 per cent at any age were offered, on payment by them of an additional sum in cash, an exchange into annuities for a term of ninety-six years certain. The length of time these terminable annuities had to run caused them to be called "long annuities." The rate of interest for the term of ninety-six years, after allowing for the further cash payment on the conversion, was no less than 8 per cent, and £134,122 a year of life annuities were thus exchanged for long annuities. The improvidence of raising money at so high a rate of interest soon became obvious to many economists and practical men, and numerous were the projects submitted to Charles Montague, afterwards EARL OF HALIFAX, for his guidance as chancellor of the exchequer, to raise funds at the more reasonable rate of 5 per cent by "transferable funds of perpetual interest." Thus early, that is in 1694-96, was it thoroughly well understood that money could only be raised on terminable annuities upon comparatively costly terms. They continued, however, to be raised in this way, notwithstanding the adoption of

the perpetual annuity plan for some loans. In 1717 the national debt was about 40½ millions. Of this, 19 millions had been raised by perpetual annuities at an average, from 1692 to 1717, of about 5½ per cent, and 21½ millions by terminable annuities at rather over 7½ per cent interest, or at a loss of extra interest of no less than 2 per cent. The inevitable waste of money, and the inferior, if not absolutely impossible, negotiability of terminable annuities on the stock market, was foreseen in the clearest manner by PATERSON, founder of the Bank of England: *vide* his "Conferences of the Wednesday Club." Down to 1745 the annual charge imposed on the exchequer for interest and sinking fund together paid to holders of terminable annuities never exceeded £200,000 per annum. In 1760 it had grown to £232,000. In 1761 took place the first new creation of long annuities according to the more modern system of issue of such securities subscribed for afterwards at different times, but having, for each issue, a common date of ending, 5th January 1860, and offered to the public, not as the main means of raising a loan, but solely as an auxiliary. In point of fact, from 1762 to 1813, nineteen different loans were subscribed in consols, with a small amount of long annuity given in as a *douceur*, or supplementary advantage. Take for example the loan of £12,000,000 at par raised in 1762, for each £100 paid £100 of consols bearing 4 per cent perpetual interest (afterwards reduced to 3 per cent) was allotted to subscribers, together with £1 per annum of long annuity, having ninety-eight years to run, that is expiring at the common date of expiry before mentioned, namely 5th January 1860. The year 1813 saw an end to the issue of terminable annuities as a *douceur* to subscribers to consols loans, but, with the close of the loan of that year, the total annual charge for terminable annuities had grown to £1,359,453. In 1855, however, an experiment in the same direction was again made, 16 millions sterling were added to the national consols debt in that year, and £116,000 per annum of temporary annuities, for thirty years, expiring in 1885, were also issued. The writer of this article has before him a minute he made on the relative prices of the two classes of security. He may be allowed perhaps to quote it as an illustration in point. "The price, on the day we are writing (12th April 1862), is 15½ for an annuity having twenty-three years to run. Buyers can therefore secure themselves a return of 3½ per cent. The price of consols is about 94, which represents a return of only 3¼ per cent, or ¼ per cent less than that from the temporary annuity. The cause of this is, in part, the far less number of buyers, or, to use the familiar phrase, the worse market for terminable as compared with perpetual annuities; and in part the well-known fact that the burthen of income tax is felt to weigh much more heavily on the temporary than on the perpetual annuity, being imposed on sinking fund or capital in the case of the former as well as on the interest, whilst in the case of the latter it falls on the interest alone; there is a confiscation therefore of part of the capital in the one instance, whilst the perpetual annuity escapes it for the simple reason that it is all interest only." The question of incidence of income tax on the sinking-fund, part of a temporary annuity, has been fully discussed in the article ANNUITY in the first volume of this Dictionary. F. H.

TERMON LANDS is the Irish term for church lands, which in the old Irish financial system enjoyed entire exemption from taxation. C. A. H.

TERRITORIUM. After the conquest of a country, the Romans always hastened to consolidate their power by planting colonies in it. A separate *lex colonica* was passed, which settled the number of the colonists; directed the formation of *civitates*, or colonial towns; and gave to each *civitas* its *territorium*, which was either to be *juris Italici*, that is allodial, or in *possessio*, and so theoretically resumable by the state. Other details were settled by the same law, and the *territorium* was then marked out in accordance with it by *agrimensores*. Roads east and west, intersecting each other at the spot where the city was to be founded, divided the territory

into four *regiones*. Lesser roads, or *limites*, cut up these *regiones* into rectangular plots or *centuriæ*, commonly of 200 *jugera*, each forming the estate of a colonist. When two or three *centuriæ* were assigned to one man, the estate was called *latus fundus* (Siculus Flaccus, Lachmann, p. 157); but such an estate would not exceed 375 English acres, and must not be confused with *LATIFUNDIUM* (*q.v.*). An elaborate system of marked stones defined the *centuriæ*, and mounds, pits, or stones distinguished the boundaries of different *territoria*. The conquered races were generally left as *coloni*, free, though attached to the soil.

[C. Lachmann, *Gromatici Veteres*.—H. C. Coote, *The Romans of Britain*.—Elton, *Origins of English History*.] R. H.

TERTIUS DENARIUS. This, the third part of the profits of his jurisdiction, belonged in early times to the ealdorman of the shire. Under Edward the Confessor, the earl appears to have had the third penny of the county, which included one-third of the *firma burgi* of the towns (*Domesday Book*, i. 1, 203, 246, 336, 337) (see *FERM*). In the Pipe Rolls, from 2 Hen. II., the earl had a third of the revenue from the pleas of each county. The payment can be traced as late as 1336.

R. H.

TESAURO, GASPARE ANTONIO (17th century), a Piedmontese jurist, wrote a treatise on the alterations in the value of the coins, *augmentum monetarum*, as it was called by the writers of that period—and defined by Tesauro as "the raising the nominal value of the current coins by the public authority irrespective of their metallic value." Tesauro examined the various methods in which this alteration was effected, and the complicated judicial arguments it led to, especially in payments and in contracts which did not fall due for a long period.

The introduction to Tesauro's treatise, on the money requirements for facilitating negotiations, is of importance from an economic point of view.

*Tractatus de augmento monetarum*, 1609. [See Supino, *La scienza economica in Italia*, etc. 1888.—Gobbi, *L' economia politica*, etc., 1889.] U. R.

TESTA DE NEVILL. This name is given to the whole of the return, otherwise called *Liber Feodorum*, printed by the record commission in 1807; but it strictly applies only to the parts of it incorporated from a roll so entitled, a fragment of which is extant. The record is probably to a considerable extent a compilation from much older materials. There are descents of land (*e.g.* Sowe, p. 87), from the conquest, and an interesting manorial extent is included (p. 186). It gives an account of the estates of tenants *in capite*, and of their widows and heiresses; of fees held of tenants *in capite*; of fees in frankalmoinage; of

serjeanties held of the king; of churches in the king's gift; of escheats; and of the sums due from each tenant for scutage and aids. It thus shows the way in which the country was parcelled out in great estates under Henry III. and Edward I., to whose reigns it chiefly relates (see DEPOPULATION).

[Scargill Bird, *Guide to Public Records*, p. 114.—W. Rye, *Records and Record Searching*, ed. 1897, p. 39.] R. H.

TESTAMENT. See WILL, BEQUEST BY.

TESTAMENTUM signifies in Roman law a will or testament by which a person appoints a universal successor (*heres*) to succeed him after his death. Besides the appointment of a universal successor which is essential to a Roman will, and distinguishes it from a codicil, a will might contain charges on the succession by way of legacy and other provisions. For the history of the testamentum and the modes of its execution, see Smith's *Dictionary of Greek and Roman Antiquities*, s.v. E. A. W.

TESTOON was the name given to the debased nominal twelve-penny silver pieces coined and current 1543-60; the standard twelve-penny piece coined 1504-43, and after 1560 being called shilling (see RECOINAGES, and for value, the SHILLING). Holinshed (*Description of England*, ch. xxv.) gave the name of testoon to the sixpence; and it may be doubted whether it ever passed current at more than that sum. The word means a coin with a head on it, and came immediately from France; the first, those of Francis I., = 10 sous; the last, those of Louis XIV., = 20 sous 6 den. It was originally derived from the Italian testone, which was not finally superseded till 1865; in Tuscany the coin equalled 2 lire. In Portugal the tostão in 1802 contained 42·5 grains pure silver, and therefore all but equalled our sixpence. It is now identified with the 100 reis-piece; which, being token money, is slightly debased (see REI).

[W. A. Shaw, *History of Currency* (1896), p. 422.—Ducange, *Glossarium*, s.v. "Moneta Argentea."] J. D. R.

THACKRAH, CHARLES TURNER (1795-1833), a Leeds physician and physiologist, wrote a report on lodging-houses to a Leeds committee (1819), and *The Effects of Arts, Trades, and Professions on Health and Longevity* (1831, 2nd ed. 1832). This remarkable book, after showing that "the duration of human life is considerably less in the West Riding, the manufacturing districts, than in the other parts of Yorkshire," and especially in Leeds, states, after the manner of Ramazzini, the writer's experience of diseases incident to trades, and his belief that most were preventable.

THALER. See DOLLAR, History of; and DOLLAR, Maria Theresa.

THELLUSSON, PETER (d. 1797), was a wealthy banker and merchant, the provisions of whose will led to the passing of an act of parliament bearing his name. He was the son of Isaac de Thellusson, Swiss ambassador at the court of Louis XV. Settling in London as a merchant, about the year 1750, Peter Thellusson acquired enormous wealth, and this he disposed of by will in such a way as to result in prolonged and costly litigation. First, he bequeathed large fortunes to all the members of his family; and then he left the residue of his wealth to trustees, to accumulate during the lives of his three sons, and afterwards of all their sons. Considering that at the time of his death the testator's estates were valued at £4500 a year, and that his personal property amounted to £600,000, some idea may be formed of the gigantic nature of his prospective arrangements. The will further provided that the accumulated fund—estimated as likely to produce some £19,000,000—was to be used to purchase estates for the eldest lineal descendant of his three sons. The accumulation of property was to proceed for twenty-one years beyond the life of the last of the testator's grandchildren.

Such an unparalleled concentration of property induced the legislature to prohibit similar dispositions in the future. Accordingly, in the year 1800, the Thellusson Act was passed. The act restricted the accumulation of income—except for the payment of debts, etc.—to a period of twenty-one years from the death of the settler, or some other of the limited periods, described in the act. This act, as a matter of course, had an application to Thellusson's will, which was, however, contested on other grounds. After protracted litigation on the subject, which ended in 1859, the property was found to be so much encroached on by legal expenses that the actual sum inherited was not much beyond the amount originally bequeathed by the testator.

[*Acts of Parliament.—The Annual Register*, 1797.—*Chambers's Encyclopædia*, vols. viii. and x.] C. B. S.

THEORY. The term *theory* is perhaps most frequently used in opposition to *fact*. Economic theory and economic history are contrasted; and theoretical enquiries are regarded as having little or no bearing on practical questions. A certain ambiguity, however, is involved in contrasting theory with fact, and theoretical with practical enquiries. When *theory* and *fact* are placed in antithesis, the distinction relates

to the abstract or general on the one side and the concrete or particular on the other side. But when a *theoretical enquiry* is contrasted with a *practical enquiry*, the former is understood to be concerned with the *explanation of facts* and the latter with the *regulation of conduct*. We have, therefore, to recognise a four-fold rather than a two-fold distinction in the treatment of economic problems: viz. (1) abstract positive; (2) abstract regulative; (3) concrete positive; (4) concrete regulative. It may perhaps be maintained that the distinction between the abstract and concrete is more fundamental than that between the positive and regulative aspects of economic doctrine.

Apart, however, from these distinctions all will be prepared to agree that theory deals with the *explanation of facts* and history deals with the *collection of facts*. We have then to examine the mutual relations between the explanation and the collection of facts. It is sometimes thought that facts speak for themselves, that, when a record of events is presented in their chronological relations, the causal relations will straightway be manifest; and thus history will give rise to theory. But without some sort of theory it is impossible to connect facts even according to their chronological significance. For many events that are temporally contiguous are not causally connected; and many events that are causally connected are not temporally contiguous. Thus Dr. Keynes writes (*Scope and Method of Political Economy*, 2nd ed. p. 281): "A knowledge of theory, *i.e.* of previously established general propositions relating to economic phenomena, teaches the historian what kinds of facts are likely to have an important economic bearing. Even when engaged in the mere collection and registration of events, it is often advantageous, as Jevons has pointed out in the case of the physical observer, that our attention should be guided by theoretical anticipations. . . . Knowledge of cause and effect in the economic world is, accordingly, of assistance for discriminating between the facts to be specially noted and those that may without risk of error be disregarded." The value of the historian's work is to be estimated, not so much by the accuracy and exhaustiveness with which events are described and dated, as by the clue which his presentment affords for penetrating into the obscure relations of cause and effect. "The narration of events is influenced by the narrator's theoretical views." The same series of events may even be so presented as to suggest or confirm *opposite* views in economic theory. For example, Carey "collected a great mass of evidence in support of his proposition that the general progress of cultivation has been from lands which would be regarded as poor in an old and settled country, to those which would

be regarded as rich." These facts were collected with the view of attacking Ricardo's doctrines on DIMINISHING RETURNS and rent as applied to agriculture. But, as Professor Marshall proceeds to maintain, many of these cases really afford instructive illustrations of those doctrines when rightly understood. It is necessary that theory should be used in guiding the historian's selection and interpretation of facts; and, therefore, it is essential that the theory should be sound, since it is impossible for theory to be altogether discarded. It may, however, be maintained that theories should be used only *provisionally*, and that the historian has merely to take care that his theories do not bias him in his interpretation of facts, and that theories should be adopted and maintained only so far as they are confirmed by an unprejudiced survey of particular facts. This is true, but it does not give sufficient weight to the necessity for other means of establishing theory besides that afforded by agreement with historical facts. We may rightly hold to a theory in the face of facts, if the theory has been established by an analysis of general laws of human or physical nature. In such a case, the apparent contradiction between theory and fact will lead us, not to reject the theory, but to modify our apprehension of the fact. It will lead us to search for a completer and exacter analysis of the case; to look for some concurrent conditions which have influenced the action of the force whose law has been formulated in the theory. In this way our knowledge of facts is actually determined by our understanding of theory. That there is danger of perverting our account of facts under the influence of preconceived theory is undeniable; but there is some truth in the paradox, "Take care of the theory, and the facts will take care of themselves." For economic phenomena become increasingly complicated as civilisation advances, and it is impossible without the intellectual machinery of ideas to obtain an adequate grasp of the interactions between the various conflicting and co-operating factors which contribute to the production of an "economic fact."

Dr. Keynes, in chapter ix. of his *Scope and Method of Political Economy*, has pointed out the various ways in which historical and theoretical enquiries are mutually related. He treats first of the functions of economic history in theoretical investigations. He points out how a study of the phases through which industrial conditions have passed helps us to perceive more distinctly the characteristics of significance in our present organisation of industry with which theory has to deal. He then shows how economic theories, reached by abstract reasoning, can be *illustrated* by history; and how these illustrations confirm theory, and aid the student in grasping the severely abstract form which

the reasoning often involves. He next points to the function of history in *criticising* theory, which leads to the qualification or limitation of doctrines that may have been laid down too unreservedly. And finally, he examines how far economic theories can be *established* by history with or without the aid of deductive reasoning. He then turns to consider the functions of economic theory in historical investigations, and points out that "just as it is a function of history to criticise theory, so it may be regarded as a function of theory to criticise history. Theory often cannot tell definitely what actual results will follow from any given change; but it can determine the kind of effects that are probable or possible, and it can often particularise the conditions under which each will occur. . . . It is often competent to declare that a given effect cannot have been due to the assigned cause, or at least that this cannot have been the case under the stated conditions." He lastly shows how the history of economic theories throws light on the course of economic events, owing to the continual interactions between facts and ideas.

When the importance of theory is depreciated it is frequently done on the ground that *common sense* can decide economic questions for itself without the apparatus of a highly technical science. In answer to this contention it would seem enough merely to point to the contradictions disclosed in the deliverances of common sense, as found in different countries and at different epochs, in regard to almost every economic problem of practical importance. Can common sense deal with the questions of free trade *versus* protection, of monometallism *versus* bimetallism, of state insurance and of poor relief, even when restricting its consideration to the purely economic aspects of these problems? Surely the extremely opposed conclusions to which practical men familiar with business affairs have arrived in attempting to decide these thoroughly practical and urgent issues, constitute a convincing ground for maintaining the essential need of theory as a basis for the guidance of practice. W. E. J.

THIERS, LOUIS ADOLPHE (1797-1877), born at Marseilles, died at Saint-Germain-en-laye (Seine-et-Oise). We shall not discuss Thiers as a statesman here, and will only mention that if this incomparable orator, this devoted and patriotic citizen was a protectionist all his life, he was for all that a resourceful and versatile financier and a genuine follower of Baron LOUIS.

We will pass over his great historical works:—*L'histoire de la Révolution* (1823-27) and *Le Consulat et l'Empire* (1845-62), powerful and full of interest—charming in style, from the pages of which political economy, though the author did not intend to bring it in, is never long absent.

Besides this, he wrote with much charm in the only published number of the *Revue Progressive* (1826) "l'Histoire de Law," or rather the history of his system.

The publication of this work in 1848, during the empire (reprinted 1858, 18mo) had its origin in alarm caused by the errors of the socialists. His book *De la Propriété* owed also its origin to his desire to oppose these errors, but he did not perceive that at the same time he struck a severe blow at protection. His *Discours*, which so often deal in his own manner with economic subjects, have been collected and reprinted, in 15 vols. 8vo, by M. Calmon.

Some aphorisms which have won popularity with the enemies of the science, such as, "Taxation is the best investment," and, "Political economy is dull reading," were ascribed to Thiers, and he never denied their paternity. A. C. f.

THIRLAGE, a feudal right in Scotland by which an obligation was imposed on the inhabitants of a district to grind their corn at a particular mill. The lands thus astricted were known as the "thirl" or "sucken." Nearly every manor had a mill, and in some cases there were several, each with its own thirl. A proportion of the grain ground was charged as the "multure," or fee for the use of the mill; out of every boll a certain measure went to the mill owner, half as much to the miller, and a quarter as much to the miller's man. Thirlage was a right, not a SERVITUDE, and was conferred by grant, expressed or implied, or by prescriptive possession, founded on written title. It formed the subject of many grants by king or baron to religious houses. An abbey would sometimes receive the right to a mill, or a certain annual sum secured on a mill, sometimes it would be exempted from multure dues. A landowner could let his thirlage-dues for eight, nine, or even twenty-one marks per annum, or demand a like sum as a composition instead of them. Besides having to bring their corn to be ground at the mill, the VILLEINS were obliged to repair the dams. In the case of country mills, thirlage applied only to corn ground in the thirl; in the case of borough mills, to all the corn within theucken, whether produced there or imported. The owner of the mills at Leith tried to levy multures on all the flour brought to the port for the use of Edinburgh, until his extortion was stopped by parliament (8 Parl. J. IV. c. 15, James IV. 1489-1513). In the Highlands the thirl was called "sincam," and the multures "cis." (For example as a national tax, see MACINATO.) L. R. H.

THISTLE RENT. When sheep were driven from one part of the country to the other in the middle ages, the owners of the lands through which they passed received payment for allowing them to graze. This payment was called *Thistle Rent*.

[Cowel, *Interpreter*.]

A. E. S.

THOMAS, PIERRE ÉMILE (1822-1880), a French engineer, was, 8th March 1848, appointed director of the famous ATELIERS NATIONAUX (q.v.). Here he contrived to maintain order, but was abruptly dismissed 27th May.

His *Histoire des Ateliers Nationaux*, published a few weeks later, and summarised in the *Quarterly Review* for June 1850 (vol. 87, pp. 118-141), is full of bitter recrimination against some of the ministers of the period. It is mainly a pleading *pro domo*, but interesting through the number of original documents inserted. At the end of 1848, Thomas was officially sent on a mission to the French colonies, where slavery had just been abolished, to organise a system of free labour. His official report *De la réorganisation du travail libre et de l'immigration européenne aux Antilles* was printed in 1849 at the *Imprimerie Nationale* in Paris. Thomas, who was a strong advocate of free trade, published in 1850 a pamphlet entitled *Des conditions vraies de la science économique, de la théorie de la rente et du principe de la population*, and in 1852 a French translation with notes of the *Organisation of Industry* by T. C. BANFIELD (q.v.). E. ca.

THOMASIUS, CHRISTIAN (1655-1728), an eminent member of the protestant branch of the German cameralists of the 17th and 18th centuries (see CAMERALISTIC SCIENCE; GERMAN SCHOOL OF POLITICAL ECONOMY), was the son of a professor of rhetoric at Leipzig, and afterwards became a teacher of jurisprudence at that university. An ardent adherent of PUFENDORF, a teacher of natural law, he became, though strictly religious himself, engaged in a dispute with his orthodox colleagues. He made many enemies by lecturing after 1688 in German instead of Latin. In 1690, he fled from the persecution of his opponents to Halle, where the elector of Brandenburg allowed him to continue his lectures at the school for young noblemen (Ritterakademie) of that place. He had there a large following of students, and this led the elector to found the university at Halle, 1694. At this rapidly developing university, of which he was soon made principal, the prince being the head, Thomasius gave instruction in all branches of jurisprudence, including economics. His proposal to establish chairs of CAMERALISTIC SCIENCE at the universities was carried out a year before his death, as in 1727 King Friedrich Wilhelm I. of Prussia appointed Professor S. P. GASSER to the chair at the university of Halle, and Professor T. C. DITHMAR to that at Frankfurt on the Oder.

From an economic point of view, Thomasius may be placed between SECKENDORFF and SCHRÖDER. Thus he was nearer in mind to the earlier Cameralist, Ossa of Saxony, whose work *Prudentia regnativa*, 1556, he republished in 1717 with notes. He gives no fresh views in this; his other numerous works have little to do with political economy.

Thomasius did far more by stimulating the desire to study than by any original work. A resolute opponent of the "trial of witches," of judicial torture, and the inquisition, he must be considered as one of the harbingers of the period of enlightenment. By his use of the German language in his pamphlets, and in a monthly publication he brought out towards the end of his life, he must be regarded as the founder of journalism in his country.

[Luden, *Christian Thomasius nach seinen Schicksalen und Schriften*, Berlin, 1805. — Hinrichs, *Geschichte der Rechts- und Staatsprinzipien*, bk. iii., Leipzig, 1852. — Bluntschli, *Geschichte des allgemeinen Staatsrechts*, München, 1864. — Roscher, *Geschichte der deutschen Nationalökonomie in Deutschland*, München, 1874. — Nicoladoni, *Chr. Thomasius, ein Beitrag zur Geschichte der deutschen Aufklärung*, Dresden, 1889.] A. O.

THOMPSON, THOMAS PERRONET (1783-1869), the midshipman-fellow of Queen's, the British general who invented an enharmonic organ and an Euclid without axioms, is better known as proprietor of the *Westminster Review* (1829-36), M.P. for Hull (1835-37) and Bradford (1847-52, 1857-59), and author of tracts in favour of a limited inconvertible paper money (*Westminster Review*, 1824, rep. 1830; *Catechism on the Currency* (1848); Hansard, 3 S. vol. cxvii. pp. 899-901), and best of all as the radical anti-corn-law pioneer and author of *The true Theory of Rent* (1826); *Catechism on the Corn Laws* (1827, 18th ed. 1834), and other writings abstracted by R. Cobden (1842). The "true theory" ascribed rent, along with diminishing returns, to rising prices due to the pressure of a growing demand upon a limited supply. RICARDO, against whom the pamphlet was aimed, also wrote of the high price of corn as "causing" rent (*Works*, ed. McCulloch, p. 40); but also wrote of diminishing returns as "causing" increased rent (*ib.* p. 202; although he usually wrote "regulating" a word which Thompson wrongly construed as "causing"). What was correct in this criticism had been anticipated by a writer in the *Quarterly* (vol. xxv. p. 476); and Malthus, *Third Report on Emigration*, 1826-27 (qu. 3341), and J. B. SAY endorsed it. He also combated Ricardo's and J. S. Mill's view that agricultural improvements would lower rent; but all three disputants underrated the effects of increased demand for secondary necessities of life. He also regarded land tax and tithe—this was before the commutation—as mere deductions from rent, not with Ricardo as taxes on the consumer. But his theoretical writings are always unsatisfactory. His *Catechism on the Corn Laws*, praised by Lord King, J. Hume, and J. S. Mill (*Westminster Review*, vol. vii. pp. 178-186), was the first and one of the most brilliant examples of economical polemics which the free-trade movement evoked. The method was doubtless

suggested by J. B. Say's *Catéchisme* (1815); but its point and humour are original.

His *Exercises, political and others* (1842), collect his writings up to date. His *Audi alteram partem* (1858-61) and *Catechisms on the Ballot* (1855, 1864) are political.

[A. Bisset, *Notes on the Anti-Corn Law Struggle* (1884), pp. 36-85.—A. Held, *Soziale Geschichte Englands* (1881), pp. 325 *et seq.*—S. Smiles, *Howitt's Journal*, vol. ii. p. 66.—C. W. Thompson, *Memoir* (1869).] J. D. R.

THOMPSON, WILLIAM (? 1785-1833), a socialistic theorist of some distinction, was a native of the county of Cork. He was a man of singularly pure, unselfish, and public-spirited character, and an earnest student of moral, social, and political science. In Bowring's edition of the works of Jeremy BENTHAM is given a letter from the philosopher to Thompson, who had consulted him on the subject of establishing a "Chrestomathic" school in Cork. This is followed by a second letter (September 1819) in which he invites Thompson to stay at his house while in London. Thompson afterwards resided with Bentham for several years; but besides the above, there is no further mention of him in Bowring's book. He was under the influence of OWEN as well as Bentham, and hence we find in him a combination of radicalism with socialism—of the love of freedom with the desire for equality; and these tendencies remained unreconciled, the latter finally predominating. His principal work is an *Inquiry into the Principles of the Distribution of Wealth most conducive to Human Happiness* (1824). It "fell still-born from the press," says William Pare, who republished it in a considerably abridged shape in 1850. Thompson died at Clounksen, in the barony of Roscarbery, county of Cork. He made a will leaving the great bulk of his property, consisting of freehold estate in that county, to trustees for the purpose of propagating his principles and aiding in their practical application. He also bequeathed his books to the library of the first co-operative community that should be established in Great Britain or Ireland. Following the example of Bentham, and wishing, like him, to protest against what he considered a mischievous prejudice, he directed that his body should be publicly examined by a lecturer on anatomy, and the skeleton preserved in an anatomical museum. His editor states that these directions were complied with, notwithstanding strong opposition on the part of the neighbouring peasantry. But the disposition of his property was contested by some of his relatives; and, when Pare re-edited the *Inquiry*, litigation respecting it was still going on in the Irish court of chancery.

The title of Thompson's principal work may be regarded as implying a protest against the ORTHODOX Economists, who declare, as did SENIOR for example, that they are concerned, not with happi-

ness, but with wealth, and are perhaps even bound to omit all considerations which have no influence on wealth. For happiness, Thompson holds, the distribution of wealth is more important than the increase of its amount, chiefly because a right distribution tends to moral improvement. To this subject, accordingly, his work is devoted. He sets out from the principle of utility, conceived according to the Benthamite formula, and from the economic assumption that labour is the sole source of wealth, as well as the sole measure of value. He then lays down the following as the three natural laws of distribution: "(1) All labour ought to be free and voluntary, as to its direction and continuance; (2) all the products of labour ought to be secured to the producers of them; and (3) all exchanges of these products ought to be free and voluntary." The operation of the second law would lead to inequality of distribution; but, according to him, equality, as the means of the greatest happiness, should be the rule, except in so far as inequality is admittedly necessary to guarantee the security of enjoyment required for the stimulation of human energies and the consequent continuance of production. As things now are, the labourer receives, instead of the entire produce of his labour, only a bare maintenance, a large part being absorbed by the claims of the landlord for rent and the capitalist for profit. These claims he does not absolutely dispute, but thinks that their amount should be greatly reduced. Under the present organisation of industry, however, he believes the reconciliation of equality with security to be but imperfectly attainable, and he accordingly proposes to substitute for the present economic order, resting on individual competition, a new system, essentially that of Owen, founded on mutual co-operation in communities based on voluntary association. In the course of the discussion here summarised, it becomes plain, as Menger has observed, that Thompson had conceived and worked out the theory of surplus value, which has been commonly attributed to ROBERTUS or MARX. In meeting actual or possible objections to his system, he goes into an interesting polemic against the doctrines of MALTHUS. He hoped that the régime of voluntary equality in the distribution of wealth and the means of enjoyment would be attained, if only restraints were removed, through the action of reason, early education, and the diffusion of knowledge; and repudiates any use of force to establish it. Thompson's faults of style have interfered with the effect of his work. His treatment is prolix, there is a good deal of repetition, and some undue elaboration of commonplaces. But the book is throughout elevated in moral tone, and, notwithstanding its erroneous or visionary elements, contains much that is suggestive and awakening.

His other publications were: *An appeal of one-half of the human race, Women, against the pretensions of the other half, Men, to retain them in political, and thence in civil and domestic slavery; in reply to a paragraph in Mr. (James) Mill's celebrated Article on Government, 1825.—Labour Rewarded. The Claims of Labour and Capital conciliated; or how to secure to labour the whole products of its exertions, 1827.—Practical direc-*

tion's for the speedy and economical establishment of Communities on the principles of Mutual Co-operation, United Possessions, and Equality of Exertions and of the means of enjoyment, 1830.

In the last-named work, whilst he maintains the necessity of freedom in entering a community; when a member has once entered, freedom is entirely sacrificed to equality. The nature of the labour to be performed by each member is determined by a universal vote, which practically means that it is fixed by the elected administrators of the community.

[Pare, preface to his edition of Thompson's *Inquiry*.—Lippert in *Handb. der Staatsw.*—Held, *Zwei Bücher zur sozialen Geschichte Englands*.—Menger, *Das Recht auf den vollen Arbeitsertrag*.—J. S. Mill, *Autob.* (ed. 1873), p. 125.] J. K. I.

THONISSEN, JEAN JOSEPH (1816-91), was born at Hasselt (Belgium), and died at Louvain. A statesman and an authority of the first rank on criminal law, Thonissen in politics belonged to the Roman Catholic party, and while he was a sincere supporter of the Belgian constitution, he gave it a second place to the encyclicals of the pope,—in short he was ultramontane.

In 1871, a Roman Catholic cabinet attained power for the first time in Belgium. Thonissen refused then to take part in it, he had little ambition for power, and he preferred to retain his chair at the Roman Catholic university of Louvain, where from 1848 to 1884 he gave instruction in penal and criminal law. It was only on 16th June 1884 that he became a minister of state, but in October 1887 his health obliged him to resign office.

As a lawyer his works, and in particular his *Etudes sur le droit pénal chez les anciens* (4 vols. 8vo, 1868, 1869, and 1875), made his reputation. He considered capital punishment as useless for the repression of crime, and frankly sought to abolish it.

As an economist he employed his elegant, calm, and lucid style to contend with socialism by proof from history. Thus in 1850 he wrote *Le Socialisme et ses Promesses* (2 vols. 18mo), and in the following year *Le Socialisme dans le passé* (8 vols. 18mo). These two works remodelled, formed the following *Le Socialisme depuis l'antiquité jusqu'à la constitution française du 14 janvier 1852*. "Ideas," he wrote in the introduction of this book, "should be combated by other ideas. . . . The intelligence of the masses must be raised, and morality brought home to their hearts." But, according to him, to bring morality home to the heart could only mean to reclaim it to Roman Catholicism. "There can only be one form of worship," he exclaimed, 19th February 1873, in the tribune of the chamber of representatives, where he had been sent by the electoral college of Hasselt 1863. Thus he protested against freedom of religion, as during the same session he protested against freedom of the press.

His loyal and open mind, his cordial and sober bearing in private life, earned him, however, general esteem even among his political opponents.

A. C. F.

THORNTON, HENRY (1762-1815), banker, was M.P. for Southwark from 1783 till his death. He was one of the founders of the Sierra Leone Company (see AFRICAN COMPANIES, EARLY), of which he was for a time chairman. Thornton shared the views of his friend William Wilberforce, and was the representative of business among a group which, though small, was a marvellously well-equipped body of men, and of whom W. PITT was the most prominent. Thornton was in favour of a graduated income-tax and paid his contribution himself to the exchequer "on the scale of his ideal not his legal debt." (See *Contemporary Review*, vol. lxviii. art. on "F. F. Stephen" by Miss J. Wedgwood.) He was also the author of several devotional works, which were very popular.

Thornton published in 1802 *An Inquiry into the Nature and Effects of the Paper Currency of England*, London, 8vo; the value of which is attested by T. Tooke in his *History of Prices*, vol. iv. p. 85. It was reviewed by F. Horner in the first number of the *Edinburgh Review*, November 1802, with the aim of moulding the irregular materials of the original work into a useful arrangement (see *Memoirs of F. Horner*, vol. i. p. 203). Horner's analysis treats the subject under four heads: (1) he considers the principles involved in the general theory of paper credit; (2) and (3) he summarises Thornton's account of the system of credit and paper money established in England, and his statement of the difficulties of the Bank of England in 1787 (see *Bullion Committee, Report of*); and (4) he quotes and discusses Thornton's views with regard to the influences of the paper currency upon prices. Thornton's book contains a temperate defence of the action of the legislature in suspending cash payments. He also published in 1811 *The Substance of two Speeches on the Report of the Bullion Committee*, London, 8vo.

[*Gentleman's Magazine*, vol. lxxxv. pt. i. p. 182.]

H. E. E.

THORNTON, WILLIAM THOMAS (1813-1880), economist, in 1836 entered the London house of the East India Company (g.v.). On the transfer of the government to the crown, Thornton was appointed secretary for public works in the India office, which post he held till his death. He was made a C.B. in 1878. Besides the economic works mentioned below, he published several volumes of verse, and translated *Horace*.

Thornton's earlier works were *Overpopulation*, London, 1846, 8vo, and *A Plea for Peasant Proprietors*, London, 1848, 8vo, a new edition of which, enlarged and improved, appeared in 1874. His work *On Labour*, London, 1869, 8vo, is of greater interest. The first chapter contains an elaborate criticism of the theory of price, as depending upon the equation of supply and demand. Thornton's own view is that price is determined by competition, which competition, again, depends upon the estimates formed by the competitors, of prospective supply and demand,

the competition being, in nearly all cases, between the dealers. The price of labour is determined in the same way except that the competition is between the customers and not the dealers. "In a state in which labourers are too poor to combine . . . the price of labour is determined . . . by combination among the masters." Incidentally in a footnote, Thornton attacks the theory of the WAGES FUND (*q.v.*). His arguments called forth from his friend and colleague J. S. MILL (*q.v.*) a complete retraction of his former view. The chapter "on the claims and rights of labour" contains a vigorous onslaught upon the position of those who advocate, on the grounds of justice, what has since been much before the public under the phrase of "a living wage" (see WAGES). Nevertheless, Thornton shows genuine sympathy with the working classes. At a time when trades unions were not strong, as they are now, in public opinion, and when the Sheffield outrages had only recently occurred, he recognised in unions the best means for workmen to strengthen their position. Under the heading of "labour and capital in antagonism," he discusses in turn the "Ends of trades unionism," "its ways and means," and lastly "its good and evil." Sympathetic, however, as is his attitude towards unionism, he regards it, in great measure, as educational, and as tending in the end to bring about a closer alliance between capital and labour. The goal to which he looks forward is "capital and labour in alliance," and the conclusion of the book contains a sympathetic notice of industrial partnerships (see PROFIT-SHARING), co-operative stores and co-operative societies (see CO-OPERATION). A poetic epilogue sets forth "Labour's Utopia." Thornton also wrote *Indian Public Works and cognate Indian Topics*, London, 1875, 8vo.

[*Annual Register*, 1880, p. 175.] H. E. E.

THRALL. A person in *thralldom*, from the Anglo-Saxon *thral*, a slave (see SERVUS). R. H.

THREE-FIELD SYSTEM (with Two-FIELD SYSTEM). The open or common arable fields of mediæval manors were most frequently divided into three sections, which appear to have been very often called the East Field, West Field, and South Field. From these have been derived numerous local names in all parts of England. These hedgeless fields were divided into *furlongs* by wide balks of grass, each *furlong* consisting of parallel acre or half acre strips (*seliones*), each divided off from the next by a narrow balk of turf. At one end of each furlong, where the plough turned, was a slip called the *headland*, which ran transversely across the ends or heads of the strips. The holding of each tenant, whether freeholder or villein, was scattered in strips all over these *fields*, and the strips which formed the *demesne* of the lord of the manor were often intermingled with the others. These were cultivated by the joint labour of his tenants. Two of these *fields* were under crop, while the third lay fallow for twelve months; or rather, from the August harvest of one year to the autumnal ploughing

and sowing of the next. Thus field A, which had been sown with wheat in the previous autumn, would be reaped in August; and B, which was sown with barley in the spring, would also be harvested about the same time; but C would have been lying fallow from the harvest of the previous year. The following year A would yield a crop of barley; B would lie fallow; and C would be under wheat. In the third year A would be fallow; B would have grown wheat; while C would have yielded a crop of barley; but oats, rye, or beans would of course have been grown occasionally instead of barley. In this way, out of a villein's virgate, or holding of about 30 acres, 20 would always be under crop. The system is shown clearly by the words which Vinogradoff quotes from an Inquisition of 20 Hen. III. n. 14, in the Record office: *sunt ibidem 360 acra terre . . . et seminatae sunt per annum 240 acra.*

On the *two-field system*, which was merely an alternation of crop and fallow on the arable land of a manor divided into two sections or *fields*, there would only be 15 acres of each virgate cultivated annually. It was, however, doubtless the custom to alternate the crop on the half which was in use, wheat being succeeded after the fallow year by barley, oats, rye, or beans.

It is probable that the villeins (see VILLANUS) who joined their teams to work the eight-oxen ploughs belonging to the lord of the manor joined them similarly for their own common cultivation. The scattered slips of one villein in the east field, for instance, were thus being ploughed indiscriminately with their own by his neighbours, while he and some associates were reciprocating by equally indiscriminate ploughing in the west field, the south field meanwhile lying fallow.

These hedgeless, and so *open fields*, needed temporary fencing to keep the cattle, allowed to wander over the fallows, from trespassing on the crops, and one of the laws of Ina (Wilkins, *Leyes Anglo-Sax.*, p. 21, § 42), in alluding to this, shows that the general system was at work in the 7th century. Its opening words, "if churls have a common meadow or other partible (*geddél*) land to close in," *i.e.* to fence, clearly relate to open-field cultivation with its land partible into virgates and their component strips.

The meadows reserved for the hay crop were similarly fenced in for the necessary part of the year (see LAMMAS - LANDS), and were shared, as were wood, waste, and brushwood, in due proportion to the amount of each man's arable holding.

This curious system possibly points, as Vinogradoff observes, not to the manor, but to the primitive VILLAGE COMMUNITIES (*q.v.*), in which all had annually apportioned shares, and no one owned any part of the arable land

in severalty. This system, which still survives in Russia and elsewhere on the continent, has left many traces in modern England, and since the middle of the 18th century, thousands of enclosure acts have been passed to effect the transition to present methods. People now living have experienced great difficulty in consolidating property which has devolved upon them in the state of scattered acre plots a mile or more apart.

[Scrutton, *Commons and Common Fields*.—Seaborn, *Village Community*.—Vinogradoff, *Villainage in England*.—G. L. Gomme, *Village Community*.] R. H.

**THREEPENCE.** English silver coin, first struck in the reign of Edward VI.

From the year 1663, when the practice of milling the edges of silver coins was introduced, the pieces of lower denomination than the sixpence were no longer struck for general circulation, though they were manufactured each year in small quantities for distribution with the Maundy alms. Thus the threepence, in common with the other Maundy coins (4d., 2d., 1d.), is still issued with a smooth edge.

From 1663 to 1844 no threepences were coined for general circulation. In 1845, however, £16,434 in coins of this denomination were struck, in addition to the small quantity required as Maundy coin; and from that date to the present time threepences have been coined for general use in every year except 1847, 1848, 1852, and 1869, when coins for the Maundy distribution only were struck.

The following list gives the weights of the coins of this denomination since their introduction in the reign of Edward VI. :—

Reign.	Year.	Weight.	Fineness.	Value in silver 925 fine at 5s. 6d. per oz.
Edward VI. . .	1552	grs. 24	925	3½d.
Elizabeth . .	1560	24	925	3½d.
"    to	1601 to }	22·25	925	3d.
George III. .	1816	21·82	925	3d.
George III. and subsequently	1816 and onwards }

## THRIFT.

1. *Natural Conditions*, p. 539; 2. *Political Conditions*, p. 539; 3. *Opportunities for enjoyment and religious and moral ideas*, p. 539; 4. *Opportunities for saving and the reward of saving*, p. 539.

Thrift may be defined as that disposition which leads us to prefer future wellbeing to present enjoyment. As the wealth which can be extracted from natural objects has limits, whilst the desires of man are unlimited, it would be easy even for the most favourably-situated to consume in idleness, in riot, or in sheer waste, the whole of the return to their labour. That mankind do not usually act thus

is due to the faculty of forethought. Thrift is made possible by foresight; it is strengthened by habit and instruction. Wealth itself is most rapidly increased not by saving at all costs, but by such saving as is compatible with high productive efficiency. Economists have found it no easy matter to note the circumstances favourable or unfavourable to thrift, as they appear to operate now one way and now the other.

1. *Natural Conditions*.—The spirit of thrift may be encouraged or depressed by conditions of soil, climate, and situation. In some countries nature discourages thrift by anticipating every want; in others by making the return of self-denial petty or uncertain. Natural conditions which call for energetic effort, and ensure its reward, encourage thrift; and, accordingly, thrift is most conspicuous among the peoples of the temperate zone. The utmost frugality and simplicity are often practised in tropical countries, but this is commonly due to a low state of the arts of production combined with a dense population; in other words, it is the result of necessity.

2. *Political Conditions*.—The influence of political conditions on the spirit of thrift is manifold. In general, order and security stimulate thrift. If men are to save, they must be assured that they will be allowed to keep the wealth which they lawfully acquire. Political freedom or self-government may strengthen habits of thrift by making men more manly and rational. But these considerations do not exhaust the subject. The tyranny which excludes a people from public life and social distinction sometimes intensifies thrift by making wealth the sole object of desire. Thus the Jews of the middle ages seemed to absorb as by magic the wealth of the Christian kingdoms in which they were regarded as an inferior race. The Christian peoples subject to the Ottoman Porte are noted for their spirit of accumulation.

3. *Opportunities for Enjoyment, and Religious and Moral Ideas*.—These exert an immense influence upon the practice of saving. It is only in exceptional ages that any considerable part of mankind has any great range of pleasures; but in such ages, e.g. the prosperous period of the Roman empire or the nineteenth century, the expenditure on pleasure becomes enormous. Self-indulgence reacts on temperament, and the public become more and more averse to the privation implied in frugality. Religious ideas may modify these tendencies; there can be little doubt that an austere form of religion, if it does not break individual energy, favours the growth of riches. The Lowland Scotch, the New Englanders, and, in a less degree, the English mercantile class, from the time of the Commonwealth to the commencement of this century, are instances which will occur to all students of national character. But whilst individual examples of asceticism occur in the most luxurious age, abundant opportunities of pleasure sap the force of ascetic doctrines with the body of the people.

4. *Opportunities for Saving, and the Reward of Saving*.—An abundance of safe and profitable

investments for accumulated capital tends to promote the spirit of thrift. Throughout the middle ages capital was scarce, and therefore commanded high rates of interest, but the openings for its safe employment were few. In modern times these openings have been multiplied. Savings banks, co-operative and building societies, have made it easy to invest petty savings, and have thus diffused the spirit of accumulation. But these facilities for investment have, in combination with other causes, promoted the growth of capital to such an extent that the return on capital has seriously diminished, and the reward of the sacrifice involved in thrift has dwindled in proportion. How the fall in the rate of interest will affect the spirit of thrift is a difficult and interesting question. Men must continue to save as an insurance against want of employment, illness, or old age; and what they save they will continue to invest, though the return on their investments may become small. Hope is the most powerful spur to thrift as to every other exertion of will, and it must be enfeebled when the reward of exertion grows steadily smaller and smaller. That reward will disappear altogether if the state should push to extremes the policy of relieving the incapable from the consequences of their incapacity at the expense of those who could provide for themselves. It is as true now as when Burke employed the quotation: "Magnum vectigal est parsimonia." Many incidental references to the causes which affect thrift are to be found in almost all systematic treatises of political economy, such as Adam Smith's *Wealth of Nations*, Mill's *Principles of Political Economy*, Marshall's *Principles of Economics*; and the literature of philanthropy abounds in suggestions for encouraging thrift. Socialist literature contains many passages in depreciation of thrift, and Mummery and Hobson's *Physiology of Industry* is an ingenious argument against extreme thrift; but the subject is hardly one which admits of discussion in separate treatises. F. C. M.

**THRYMSA.** An imaginary coin or money of account used by the Anglo-Saxons to denote three-fifths of a shilling when its value was fivepence, or about three-fourths of it when worth fourpence. It was therefore perhaps equivalent to threepence; but the matter is not free from difficulty. The *vergild* of a ceorl in the days of Æthelstan was 266 *thrymsæ*, which were equal to 200 Mercian shillings (Wilkins, *Leges Anglo-Sax.*, p. 71).

R. H.

**THÜNEN, JOHANN HEINRICH VON** (1783-1850) was son of a landed proprietor in Oldenburg. He received his early education at the high school of Jever, which was near the place of his birth, and was afterwards thoroughly instructed in the theory and practice of agriculture. He settled in Mecklenburg-Schwerin on the estate of Tellow, which he had purchased, and which became famous for the perfect system of cultivation which he carried out there. In 1830 the university of Rostock conferred on him the honorary degree of doctor of philosophy.

He was a noble-hearted and public-spirited man. Deeply impressed with a sense of the probability of a formidable conflict between the capitalist employers and the artisan class, he devoted serious attention to social questions. The desire to do something towards averting such a catastrophe prompted alike his theoretic researches and his practical efforts. He thought it monstrous that, as the economists admitted, a working man obtained for his labour the bare cost of his maintenance, and he studied for a long time the problem of normal wages, *naturgemässer Arbeitslohn* (see articles on **WAGES**). He believed himself to have discovered its solution; but his theorem on the subject has not been generally accepted. "Setting out," says Cossa, "from arbitrary and insufficient premises, he arrives at the conclusion that the required amount is the geometric mean between *a* and *p*, where *a* is the value of the things necessary for the maintenance of the labourer and *p* that of the products which are the fruit of his labour." Such was his confidence in the correctness of this formula that he desired  $\sqrt{ap}$  to be engraved on his tombstone. It may here be observed that, whatever be the worth of the proposition as an abstract theorem, Thünen himself, in his experience at Tellow, found it incapable of practical application from the impossibility of determining the fruit of the labour of each individual, and accordingly adopted a different system—similar, however, in spirit and tendency—that, namely, of **PROFIT-SHARING**, which he was one of the first to introduce.

His principal work, in which this doctrine of natural wages finds a place, is entitled *Der isolirte Staat in Beziehung auf Landwirtschaft und National-oekonomie* (1st vol. 1826, 2nd ed. 1842; 2nd vol. 1850-1863; 3rd vol. 1863). It is brightly written, and takes rank as an economic classic. The primary object of the work was to establish certain principles by which agriculturists could ascertain the best system of cultivation to be adopted under given conditions, and in particular to determine the natural territorial distribution of those systems according to the distance from the market. He had studied the theory of **RENT** independently of **RICARDO**, and arrived at results similar to his; but he thought the "rent of situation," though not indeed ignored by the English economist, had not been sufficiently considered by him. He applies to the problem the same method which Ricardo habitually followed, the study of an imagined state of facts, in which abstraction was made of all the non-essential features of the real case. He supposes an isolated region, without navigable rivers or canals, similar throughout as regards fertility; and he asks according to what law the distance from the centre, where the sole market is situated, modifies the system of cultivation to be pursued in the several concentric belts of territory. That distance is, of course, only one

of the elements of the practical question which the cultivator has to decide, the system to be adopted as the most profitable depending also on the capabilities of the soil, the price of labour, and other data; and the effects of these other conditions would require to be studied separately in a similar manner. But the method followed is legitimate, provided that no real element is finally left out of account. It is difficult, however, to verify results arrived at in this way; and they have, like those of Ricardo, lost much of the practical value which might otherwise belong to them by the opening of the home markets to the productions of distant countries.

The first part of *Der isolirte Staat* was translated into French by Laverrière (1852), and the second by Wolkoff (1857).

[Roscher, *Gesch. der N. O.*, p. 879.—Cossa, *Introd. to the Study of P. E.*, English ed. p. 404.—Lippert in *Handb. der Staatswissenschaften*.—Sedley Taylor, *Profit-Sharing*, 1884.] J. K. I.

**TICAL.** The standard of value and the money of account in Siam is the tical, a silver coin weighing 233·5 grains of silver 902 fine. It is rated as equal to three-fifths of a Mexican DOLLAR (*q.v.*). The tical is divided into thirty-two pies, the PIE (*q.v.*) being itself divided into ats and half-ats. Two hundred cowries are generally accepted as the equivalent of the pie, but since the coinage, in 1887, of copper pies, ats, and half-ats, the use of cowrie shells (see COWRIE), as currency, has been largely discontinued.

The Siamese currency system is as follows:—

2 half-ats	= 1 at	} bronze coins.
2 ats	= 1 pie	
4 pies	= 1 fuang	} silver coins.
2 fuangs	= 1 salung	
4 salungs or 32 pies	= 1 tical	} moneys of ac-
4 ticals	= 1 tamlung	
20 tamlungs	= 1 cattle	} count.

F. E. A.

**TILLAGE DUTIES** is a term found in the Irish financial system before the union with Great Britain. In the early years of the reign of George II. an act was passed to encourage tillage of the soil and inland navigation (3 Geo. II. c. 3, Irish). Commissioners were appointed to carry out the act, and to them power was given to levy certain small duties on dice, cards, plate, coaches, and other articles of luxury. C. A. H.

## TIME BARGAINS.

Defined, p. 541; Contracts for Future Delivery, p. 541; Options, p. 541; Time Bargains in Specified Goods, p. 542; Time Bargains in Goods Described by Quality, p. 542; Produce Clearing Arrangements, p. 542; German Legislation on Time Bargains, p. 542; Effect of German Legislation on Business, p. 542.

**TIME BARGAINS** are contracts entered into between two parties for the transfer at a fixed price of a certain quantity of a commodity, security, or right from one to the other on a specified future date or within a specified time from the date of the contract. In colloquial language they fall under two heads,

viz. (1) sales or purchases for "future" or "forward" delivery; (2) options.

(1) *Contracts for future Delivery.*—In practice the parties to these contracts are the body of persons forming "the market" in the article or security dealt in and the persons doing business with them. The terms employed to denote such contracts vary in different departments of business. On the stock exchange all contracts are for future delivery unless otherwise specified, the "contract note" stating that such and such a security has been bought or sold for the next "settlement"—that is within, at longest, nineteen days from the date of purchase; the intervals between stock exchange settlements being usually about fifteen days, and only occasionally longer, except for consols, in which there are monthly settlements. In practice actual delivery of securities may take longer owing to various causes, such as delay in obtaining signatures to transfer deeds, but, in theory, the contract should be fulfilled on the date mentioned. If a buyer or seller wishes to take or make *immediate* delivery, the bargain is entered as "for cash"; but such bargains can only be made, except as a matter of negotiation, in consols and a few other stocks of the highest class. For these latter two prices are regularly quoted in the official list—one "for money" and the other "for the account." Even in their case, however, the price *par excellence* is the "account" price, and any one inquiring "what are consols now," would receive that price as a reply.

In other great markets, such as those for wheat, cotton, iron, and other leading commodities, the usual practice is to quote a price for "prompt" delivery and a series of other prices for a fortnight, and for one, two, three, or more months "forward." The customs in these markets vary from time to time, being changed to suit the altering conditions of business. In wheat and cotton it is often possible to make contracts six or seven months "forward," either for delivery or sale; in iron the most usual forward terms are "one month" or "three months," but there have been periods in the history of the Glasgow pig-iron market when "cash in a fortnight" was one of the recognised modes of settling transactions. In all these cases the principle is the same, namely, that the parties agree that a certain quantity of a given article shall be transferred for a consideration at a given date.

(2) *Options.*—An option contract gives the buyer of the option (called on the stock exchange the "giver," because he "gives" money for the option) the right to purchase, or sell, a specified amount of a certain commodity or security, during a period the termination of which is stated in the contract. It is more frequently employed in the case of securities

than commodities. The stock exchange dealer in options quotes a price expressed as so much per cent of the nominal value of the stocks he is prepared to do bargains in on this system. If he "takes money" for the right to buy a security from him, he is selling a "call." If he receives the consideration for the right to sell to him, he sells a "put." Dealings are also not unfrequently made in "put and call" options; and in this case the "taker" of the money contracts either to buy from or to sell to the "giver" at the latter's option, within the period named. The price for this option is of course higher than for "single" options (see PUT and CALL).

There is nothing in the principle of a "time bargain" which makes it necessarily a speculative transaction for either party. (See the evidence given by Mr. G. W. Medley before the Royal Commission on the London stock exchange, 8437 *et seq.*).

It is important to note that those who attack "time bargains" as encouraging speculation, almost invariably mean bargains in which the party whom we may call the "customer," as opposed to the merchant, dealer, or "jobber," makes a sale. In other words, they disapprove of *sales for the fall*, and think that they can be prohibited, failing to perceive the elementary truth that for every seller there must be a buyer. It is strange that this fact with all it implies is so often forgotten. It is absolutely necessary for any one who wishes to understand the phenomena of markets to keep it firmly in his mind.

[Arthur Ellis, *Market Fluctuations*. The evidence given before the Royal Commission on the London Stock Exchange, 1877, in which various witnesses, besides Mr. Medley referred to above, gave their views on "time bargains."]

[See CLEARING SYSTEM; DEALER; EXCHANGE, STOCK; FUTURES; GRADING; JOBBER; MARKET; OPTIONS; PRODUCE CLEARING; PROMPT; PUT AND CALL; SETTLING DAY.] W. H.

It should be pointed out that in the case of stock-exchange transactions, which are nominally settled on the half-monthly, and in the case of consols on the monthly account-day, the really speculative transactions are not generally closed on the next account-day, but carried over (see CARRYING OVER). No doubt the difference between the contract price and the market price of the day must, when the account is made up, be paid; but, as in the case of many time bargains in produce, the margin must also be constantly kept up, this does not differentiate stock-exchange time bargains from produce time bargains. The real difference between the two classes of transactions is, that the produce speculation is for a definite, the stock-exchange speculation for an indefinite period.

Stock-exchange OPTIONS are very rarely sold for the next account-day. Sometimes a very long time is given. In this case therefore the vendor of the option, who runs an unlimited risk, speculates for a definite long period, without having to pay up differences or to keep up a margin, as he would have to do in the case of a speculative unconditional sale on the stock exchange or of a time bargain in produce.

Time bargains in produce must be divided into two classes. In the one case specified goods are sold, in the other case a quantity of goods described by quality, but not otherwise specified, is sold.

(A) *Time bargains in specified goods*.—If a cargo of sugar shipped per *Castalia* which left Mauritius on the 1st February, is sold, the purchaser need not take delivery till the cargo arrives, which may take three months. As

a general rule the ships which carry such cargoes call for orders in the Channel and the purchasers are frequently speculators who try to resell the cargo either in the United Kingdom or some continental port. On arrival of the ship in Falmouth, or whatever other port may be selected, the captain telegraphs to the consignee of the ship, who informs the purchaser, who then directs the ship to proceed to the port to which he has sold the cargo. In this case the vendor is not a speculator, but the purchaser generally is—he does not intend to take delivery himself, but to resell before arrival.

(B) *Time bargains in goods described by quality*.—These are generally of a more speculative character than those first named, because both vendor and purchaser may be speculators; the former may sell goods he does not possess with the intention of repurchasing at a cheaper price, the latter may not intend to take delivery, but to sell with a profit, and only to pocket the difference. But time bargains of this nature are frequently entered into by the purchaser for entirely non-speculative purposes. Thus a spinner who uses certain qualities of cotton, and has sold yarn to the consumer for several months ahead, must buy the qualities of cotton used by him for delivery at the time he wants them. *In his case the omission to make a time bargain would be speculation.*

*Produce Clearing arrangements* deal exclusively with time bargains in goods described by quality. The working of these time bargains cannot be properly understood unless these clearing-house arrangements are studied. There are three important clearing-houses of this nature in England:—

(a) The Cotton Association in Liverpool for time bargains in cotton (see CLEARING SYSTEM, COTTON CLEARING).

(b) The Corn Association of Liverpool for time bargains in wheat and grain generally.

(c) The London Produce Clearing-House for all kinds of produce, which is chiefly used for time bargains in coffee (see CLEARING).

It should be pointed out that time bargains in goods described by quality are necessarily confined to certain kinds of goods produced in quantities which can be easily classified by reference to certain standard types. With some kinds of goods (e.g. wool) this is impossible. Such goods are therefore generally bought by sample obtained from the specified lot which the vendor has to sell. It would be interesting to examine, by the aid of statistics, whether the fluctuations in this class of goods are less violent than the fluctuations in those which are sold by description. The result would throw some light on the economic advantages or disadvantages of time bargains.

*German legislation on time bargains*.—The subject of time bargains was gone into very carefully by an imperial commission in Berlin which took evidence four or five years ago under the chairmanship of Dr. Koch, the governor of the Reichsbank.

The report of the commission led to the passing of the German *Bourse Law* of 1896, which, however, went much further in the direction of state interference than the recommendations contained in the report, and the proposals of the original Government Bill. The statute in question, which came into force on 1st January 1897, after defining the term "time bargains" in a somewhat complicated manner, and so as to exclude contracts of the nature described above, sub. (A), deals with the class of transactions to which it refers in two separate ways: (a) it prohibits time bargains (1) in mining and industrial shares, and in shares in companies not having a capital of at least 20,000,000 marks (£1,000,000); (2) in corn and flour; (3) in such stock-exchange securities or kinds of produce as the federal council or the authorities of any stock exchange or produce exchange may by order declare to be subject to the prohibition; (b) as regards such classes of time bargains as are not prohibited under the rules referred to sub. a, it provides that they cannot be entered into except by persons registered as dealers on a register, to be kept for the purpose by the authorities by whom the local mercantile registers are kept and open to public inspection, and paying an admission fee and an annual registration fee.

Time bargains in prohibited securities or produce, and all time bargains between parties not being both registered in accordance with the above-mentioned requirements, are void, as well as any contracts of agency or partnership with reference to any such time bargains. It is also provided that time bargains of the first-mentioned kind may not be effected through any official

broker, or referred to in any printed list of quotations (*Börsengesetz*, §§ 48-69).

*Effect of German legislation on business.*—The effect of these provisions as regards trade in produce—more especially corn—has been partly to decentralise business by withdrawing it from the great markets for time bargains to provincial places in which business in specified goods is transacted, which in several respects is an advantage; but it also appears that a great part of the business in question has been driven away from Germany altogether. This may, however, in part be due to the spirit of non-compromising opposition with which the act was met by the traders concerned. Several means of evasion have been attempted, but their legality is disputed. It is clear that the act has not stopped or hindered speculation, for which there are always so many channels open that the obstruction of one or two must of necessity be ineffective; but the restriction of speculation was not the principal object of the act, which, especially as regards corn, was intended to promote a greater steadiness of prices, on the assumption that fluctuations must be more violent as long as time bargains are allowed, as these may be entered into to an unlimited extent, whilst business in specified goods is naturally restricted to the stock of goods in existence. The time during which the act was in force has been too short to allow any reliable conclusion to be drawn as to its effectiveness in this respect, but it seems probable that a prohibition extending to one country only cannot have a permanent influence on prices. As regards stock-exchange transactions, the effect has been to divert the speculation from time bargains to cash business with borrowed money or borrowed securities, which affords exactly the same facilities for gambling transactions as business in time bargains.

## TITHES.

General Statement, p. 543; Tithe Commutation Act 1836, p. 545; Terms of Commutation, p. 545; Impropriated Tithe, p. 545; Incidence of Tithe, p. 545.

TITHES were originally free-will offerings, but gradually became compulsory, first by church law, afterwards by statutes. Much of the law concerning them was the growth of practice sanctioned by the courts. The earliest authentic mention of them, as customary in England, seems to be in a document of the end of the 7th century (Haddan and Stubbs, *Councils*, iii. 191, 203). Neither the contested points of date and of the tripartite division, nor the process by which a large proportion of tithes was acquired by religious houses or impropriated by laymen, need be dealt with here; but the fact that a large part of the country has in consequence been for many centuries tithe-free is of real economic interest. Pope Pascal II. (1099-1118) exempted all the lands of abbeys, monasteries, etc., from the payment of tithes; Adrian IV. (1154-1159) restricted the exemption to Cistercians, Templars, and Hospitallers; Innocent III. (1198-1216) added the Præmonstratensians; the Lateran council of 1215 ordained that only lands held before that date by these four "privileged orders" should be tithe-free. At the dissolution of the monasteries the bulk of the monastic lands

made over to the king by 31 Hen. VIII. c. 13 remained, or became, by statute exempt from tithes; but the lands of houses dissolved before that year, 1539, were made subject to tithes if they had been free before. Forest land in the hands of the crown or its lessee, but not of its feeoffee, were also free from this charge.

Tithes were the tenth part, free of the cost of cultivation, but not of collection, of the yearly increase of the land "by the act of God," not of the substance of the ground except in a few customary and local instances. They were of three kinds—predial, arising immediately from the soil; mixed, arising from things nourished by the soil; personal, arising from the profits of industry. Predial tithes were paid by grain of all sorts, hemp and flax, hay, fruit, herbs, saffron, acorns (under certain conditions), rushes, wood of less than twenty years' growth, and, in the case of some non-timber trees, even of older growth; mixed tithes were of colts, calves, lambs, wool, pigs, fowls or their eggs (not both), ducks, geese (but perhaps not turkeys), milk or cheese (not both), pigeons, and bees (in the form of wax and honey). Personal tithes were the tenth of the *clear* profit of tradesmen and artificers, with the tithes of mills and of fishing which were reckoned as personal—in the latter case the tenth fish was usually commuted for a small sum of money. Only in a few exceptional instances was tithe paid on mines, quarries, limekilns, and salt; and it is only in the city of London and a very few other towns that houses and building lands have been subject to tithes until commuted by the City of London Tithes Act of 1879 (42 & 43 Vict. c. 176).

Corn, hay, and wood composed the great or rectorial tithes; all others belonged to the class of small or vicarial tithes. In 1836 the former were usually reckoned at from 5s. to 7s., the latter at from 3s. to 4s. an acre.

That disputes should arise was not wonderful. A claim put forward by a parson just before the Commutation Act of 1836 to the tithe of turnips grown to feed sheep, when tithe would be paid later on of the same sheep in the form of lambs and wool, illustrates one side of the question (*Parliamentary Debates*, 1835); but it is pretty certain that the clergy suffered oftener than the farmers from unfair treatment. Vexatious claims, unjust resistance to just claims, the inconvenience caused to the clergy by their being obliged to receive their dues in kind, and to collect them themselves into their tithe-barns off the different farms in the parish, often produced most undesirable friction between tithe-owners and tithe-payers, between pastors and their flocks. In later times, as the pressure of population increased the value of land, and as enclosures became common, such a charge upon cultivation no doubt hindered the outlay of capital upon the land, and thus economic argu-

ments were added to social and moral objections to tithes in kind, or even to tithes at all. Many enclosure acts, especially after 1750, included clauses for endowing the parson with glebe land, apparently usually a seventh or eighth part of the land enclosed, in lieu of tithes (*Parliamentary History*, xxii. 47, for debate in

Lords on such a clause, 1781); one reason for the change being that, after enclosure, corn land, if titheable, was in danger of being converted to pasture which was tithe-free. Another method of remedying the inconvenience of payments in kind was by voluntary agreement between the parties to commute the tithes into

## AVERAGE PRICES FOR SEVEN YEARS.

General average for the 61 years					97	19 4 $\frac{1}{2}$

a corn rent payable in money, or by arranging some other "modus decimandi"; but such agreements had to be renewed with each incumbent, as none could bind his successor.

*Tithe Commutation Act of 1836.*—A general alteration of the whole system was first made after several attempts by the Tithe Commutation Act of 1836, 6 & 7 Will. IV. c. 71. By this law tithes were converted into a rent charge, a corn rent payable in money calculated on the average tithe paid in each parish during the seven years previous to 1836, and fluctuating yearly in value according to a septennial average of the prices of wheat, barley, and oats. The table on the preceding page (Willich) shows the fluctuations in prices and rent charge since that date.

Personal tithes, except of mills, and the CORN RENTS (*q.v.*) already substituted in some cases, were not touched by the act of 1836; the former have become nearly obsolete, the latter were allowed by 23 & 24 Vict. c. 93 to be commuted into a rent charge in the ordinary way. The tithe on hop grounds, orchards, and gardens was to be specially valued for rent charge upon a seven years' average, with provisions for change of cultivation on such lands and for lands newly cultivated in these ways; and this "extraordinary" tithe, though affected by subsequent laws, still remains a charge upon such lands except where it has been redeemed under the act of 1886, 49 & 50 Vict. c. 54. Power was given in 1836 to the clergy to sell or pull down the now useless tithe-barns.

As tithe rent charge and rent bear no relation to each other, they do not rise or fall together. Between 1836 and 1876, land rental, according to Sir James Caird, rose from 33 to 50 millions, tithes remaining at 4 millions. Of late years, as in the decade ending 1897, rent in many parts of England, especially in the corn-growing districts, dropped more in proportion than tithes. But sometimes with increasing produce the tithes have become greater than the rent, especially on hop lands and where the cost of cultivation is high, as tithes do not share in the expenses of cultivation. In the old poor-law days, however, when labourers' wages were supplemented by the poor rate, tithes, which are subject to rates, did practically bear part of the cost of tillage.

By the Tithe Act of 1891 the liability to pay tithe rent charge was imposed on the owner of land notwithstanding any contract to the contrary between such owner and the occupier. See *TENDS* (Scotland).

E. G. P.

*Terms of Commutation.*—The average value for the seven years ending with 1835 was taken for wheat, oats, and barley severally. Then it was asked how many bushels of each at cost price would make £33:6:8, the aggregate to be £100, and in each parish its tithe was fixed at so many of these £100. It worked out thus: wheat, 7s. 0½d. × 94·96; barley, 3s. 1½d. × 168·42; oats, 2s. 9d. × 242·42. These multipliers are the fixed multipliers in use ever since, and each year the three prices are taken for the year to 31st December, then the average prices for the last seven years are multiplied by the above fixed multipliers, and the sum is the T. R. C. for the next year. One effect of the process is that variations in the price of oats count for more than those in barley, and for wheat the least of the three.

As the years 1828-35 showed corn at a higher price than was being obtained on the continent at the time, M'Culloch pointed out that the amount of tithe then laid upon each parish would prove high if foreign corn ever came in, and would tell against British agriculture regarded as a whole, landlords' rents included (as an industrial competitor). This is so from that point of view. But there are reasons, arising out of the details of the apportionments, for holding that the commutation really diminished the share of the owners of the tithes.

*Impropriated Tithe.*—When the tithe is allotted to some corporation or individual for other purposes than the discharge of the pastoral offices it is said to be either "appropriated" or "impropriated." It is appropriated when the beneficiary is a church body: thus deans and chapters of cathedrals, universities, and colleges (considered as "ancient and religious" foundations and quasi-ecclesiastical), the ecclesiastical commission; it is impropriated when it is due to laymen or laywomen. In former times the appropriating corporation usually supplied the duty by means of one or more of its own members, but vicarial tithes were allotted in some parishes for this purpose, and gradually it became possible to draw the tithes, and neither perform the pastoral duty nor pay for its being done. The prevalence of the title of vicar indicates the extent to which expropriation of the greater tithes was carried. The Tudor legislation was even more expropriating than this would show, for most of what is now clerical tithe was not left with the church purposely, but has arisen from the improvement of lands then waste or of little value.

Much tithe has been extinguished by being exchanged for land or corn-rents or fixed sums, by over 2000 private acts of parliament.

The distribution of the tithe of England and Wales at 1896 values is: incumbents, £1,920,000; appropriators strictly, *i.e.* ecclesiastical bodies doing work for the church, £544,000; lay impropriators, with no work attached, £613,000; colleges and schools, Oxford and Cambridge, Eton, etc., open to all comers, £157,000.

*Incidence of Tithe.*—There is a good discussion of this in M'Culloch's note xxvii. to his edition of the *Wealth of Nations*. Adam Smith had simply laid it down: "Taxes upon the produce of land are in reality taxes upon the rent; and, though they may be originally advanced by the farmer, are finally paid by the landlord." Ricardo has said that the consumer is affected by increase of price so long as resort has to be made to land which will only give profits plus wages; the tithe in such case must come out of an enhanced price. M'Culloch points out (1) that such a rise in price would diminish consumption. In order to prevent this, landlords would reduce rents, and probably the actual result would be that part of tithe would be raised in one way and part in the other. (2) That if there is any land untithed it will not have to raise its prices, and the tithed land will have to reckon with this. (3) If there is admission of foreign produce it will be in a similar position.

As to (2), in M'Culloch's day there was one-third of land, according to rental-value, tithe-free; and this proportion

has gone on increasing. But as to (3), we now import four-fifths of our wheat, immense quantities of substitutes, and even of meat and vegetables, and therefore the tithed land is only a fraction of the whole in the circle of agricultural competition; prices are therefore determined apart from it, practically, and the tithe is definitely a charge on rent. In so far as land-rents are returns for capital invested, and are not monopoly-rents, tithe acts as a charge upon agriculture as an industry.

Parliament has now fixed a two-thirds limit as a proportion to annual rent of lands beyond which tithe cannot be claimed, *i.e.* on agricultural lands. A. C.

**TITHING.** Originally perhaps a tenth of the hundred, but no proof remains that this proportion was strictly maintained. Tithings are still found in Somersetshire and Wiltshire. C. H. Pearson (*Middle Ages*, i. 250; and *Historical Maps*, p. 59) remarks that the hundreds of Devon usually contain ten parishes, and argues that the parish corresponds to an old tithing or cluster of tithings (see **TOWNSHIP**).

R. H.

**TOCQUEVILLE (1805-59), ALEXIS CHARLES HENRI CLEREL DE**, was born at Paris. His father, the Comte de Tocqueville, became prefect of Metz and other towns under the restored Bourbon monarchy, and rose to be a peer of France. His mother was a granddaughter of M. de Malesherbes, the celebrated lawyer who defended Louis XVI. at the bar of the convention, and perished in the reign of terror. Educated partly at home and partly in the college of Metz, his literary talent distinguished him early. In 1826 and 1827 he made a long tour in Italy and Sicily, where he first exercised his faculty for the minute study of political and social phenomena. On returning to France at the age of twenty-one, he was nominated *juge auditeur*. But the narrow sphere of the duties of this office was intolerable to a mind so active and independent. Tocqueville was a man of strong though moderate political convictions, equally averse to revolution and to despotism, and loyal to monarchy if the monarch were sincere in the observance of the constitution. As Charles X. was incapable of understanding constitutional freedom, Tocqueville acquiesced in the revolution of 1830. But doubtful of the future, and convinced that the progress of democracy was irresistible, he resolved to travel in America and study the institutions of that typical democratic commonwealth, the United States. Together with his colleague and intimate friend, Gustave de Beaumont, he obtained leave of absence in order to examine some of the prison systems in force in that country. Tocqueville and Beaumont reached New York in May of 1831. They spent a year in travel and observation, varied by fatigues and hardships, peculiarly trying to Tocqueville's delicate constitution. It was this journey, in which every moment and every opportunity was utilised to the utmost,

which supplied the bulk of the materials for *De la Démocratie en Amérique*. Soon after their return Beaumont forfeited his official position by an act of conscientious firmness, and Tocqueville, sympathising with his friend, tendered his own resignation. Left the full use of his leisure, he wrote, in the two following years, two volumes of his great work. The manuscript was declined by the first publisher to whom it was offered, but the book achieved an immediate and universal success. Everybody read it, and all the most competent critics praised it. Soon after its publication he married Miss Mary Motley, an English lady, who proved a most affectionate wife to a most loving husband. Tocqueville had many English friends, and understood England far better than most Frenchmen. In 1840 he sent forth the two concluding volumes of *De La Démocratie en Amérique*. He had been returned to the chamber of deputies in the preceding year by the department of La Manche. During the next nine years he spoke and voted as a member of the constitutional opposition. He regretted the revolution of 1848, but thought himself bound to do what he could to promote the stability of the republic when once proclaimed. He held the post of minister of foreign affairs for some months in the year 1849. He was among the prisoners whom Louis Napoleon confined in the castle of Vincennes on the evening of the 2nd December 1851. Thenceforward Tocqueville retired from public life to his country house in Normandy, and to literature. He now commenced his second great book, *De l'Ancien Régime et la Révolution*. The first volume appeared in 1856. It was received with unanimous applause. So high did Tocqueville's reputation stand that at the end of a visit to England, which he made in the following year, a ship of the royal navy was placed at his disposal to convey him to France. But his health, never robust, now began to give way. Symptoms of consumption obliged him to quit Normandy for Cannes, where, after a winter of suffering, he died.

Tocqueville's collected works fill nine volumes, but his fame rests almost entirely upon *De La Démocratie en Amérique* and *De L'Ancien Régime et la Révolution Française*. These attest his wonderful gifts as a student of institutions. In Tocqueville were happily combined the appetite for facts and the habit of meditation. A most accurate observer of contemporary life, and a most indefatigable student of historical records, he was constantly accumulating materials upon which his acute and restless intellect was for ever at work. In spite of the immense knowledge which they embody, his books impress the reader rather as historical reflection than as history. A cultivated and sympathetic man of the world rather than a lawyer or antiquarian, he never forgot that institutions are the outcome of national character and circumstances. "It is the ideas and passions of

men, not the mechanism of the laws, which are the moving force in human affairs." He combined earnestness with impartiality. His experience of political life gave him new insight, but did not turn him into a sceptic or a partisan. His great qualities were accompanied with some inevitable defects. Possessing in the highest degree the logical faculty characteristic of Frenchmen, he was prone to refer all the peculiarities of a given epoch to one dominant principle such as the love of equality. Influenced by his own experience, he sometimes ascribed, let us say to democratic society in general, tendencies which were peculiar to Frenchmen. Cautious as he was in predicting, he made several predictions which have been falsified. But these are comparatively small blemishes on works so vast in conception and so solid in execution as those of Tocqueville. Valuable for their wealth of knowledge, their admirable arrangement, and their severely beautiful style, *De la Démocratie en Amérique* and *De l'Ancien Régime et la Révolution* are above all valuable for the stimulus which they give to reflection. Their formative impulse has been felt by minds the least in sympathy with Tocqueville and the least capable of resting in his conclusions. In private life Tocqueville was simple, upright, and lovable. In public life his delicate health, sensitive temperament, and rigorous sincerity, denied him any large measure of success.

#### TOKEN-MONEY. See MONEY.

TOKENS, HISTORY OF. Jettons or counters were employed early in the 14th century in England for reckonings of many kinds, and gradually passed into common use as small change. A jetton of the reign of Edward III. is extant. There is a statute (9 Edw. III. 2, c. 4) forbidding the circulation of *black money*, which was perhaps made of *billon*, a mixture of copper with a little silver, though some have understood it to mean *abbey-pieces* or *Nürnberg tokens*. Certainly in the year 1402 (*Rot. Parl.*, iii. 498 b) *signes de plombe* as well as *galey-halpenys* are referred to as current for lack of small change, and Erasmus (*Adagia*, ed. 1629, p. 130) writes, about 1510, of the *plumbeos Angliæ* then current. About 1574 tokens of lead, tin, and even leather, were in use. A leaden one, of Bristol, is extant, struck in 1591, and the same city obtained from Elizabeth before 1594 license to coin tokens; but in 1613 the *Domestic State Papers* (p. 184) refer to the abuse of tokens, and mention Lord Harrington's patent for farthing tokens of copper. In 1619 the state papers (p. 75) show a patentee for making farthing tokens, complaining of a man who had circulated a leaden issue; and in 1633 some offenders of this sort

were pilloried. An allusion again occurs in 1640 (p. 271) to farthing tokens. There had been various efforts made to issue a regal coinage of copper; but they failed, and the irregular coinage really passed current for centuries. Cromwell, just before his death, was preparing to substitute a genuine mint issue, but none of proper value appeared until 1665. This, however, together with a proclamation in 1672, stopped the enormous private issues which had begun in 1648, though one or two towns disobeyed for a time. In Ireland, which had had a copper coinage from the days of Elizabeth, tokens were first made in 1646 and ceased only in 1679. Between 1648 and the cessation, London and Southwark had issued 4044 varieties, the rest of England 7816, Wales 92, Ireland (from 1646) 779, and Scotland 1 (at Dumbar). They were chiefly farthings. The art shown on these coins was of a humble order. Square, octagon, diamond, and heart shapes occur. Several issues were of lead and even of stamped leather.

Neglect of public needs towards the end of the 18th century again led to a great private coinage, beginning with the Anglesea Druid penny in 1787 (not 1784, as commonly stated), and proceeding until, in 1797, the national coinage of copper was begun in earnest. The tokens were, however, not at once stopped, but 25th March 1813, and afterwards 1st January 1818 (the latter by statute 57 Geo. III. c. 46) were fixed as the last days for circulation, except at Sheffield and Birmingham, which places were allowed a few years' grace. Colonial tokens are found of a much later date, and indeed tokens are still used in England in an obscure way. Lack of small change had caused the issue; but the resulting profit had been great, and was not readily surrendered. Before 1800 there had been struck in England 2153, Wales 309, Scotland 245, Ireland 317, and in places not stated 248 varieties. The vast majority were half-pennies; but Birmingham issued a half-crown, and shillings and sixpences were coined in several places. The best Anglesea pennies and some others were excellent in point of art.

TOLLS, INTERNAL, MEDIEVAL. See INTERNAL CUSTOMS AND TOLLS.

TOMAN. A Persian gold coin of the standard weight of 52·8 grains of pure gold, equivalent in value to 9s. 4d. sterling.

The toman is rated as equal to ten *khraus*

(see KHRAN). The currency system of Persia being as follows:—

50 dinars = 1 shahi  
20 shahis = 1 khran  
10 khrans = 1 toman

The gold and silver coins of Persia are as follows:—

	Weight.	Fineness.
	grains.	
Gold, toman . . .	52·8	1000
„ half-toman . . .	26·4	1000
„ 2 khrans . . .	10·6	1000
Silver, 5 khrans . . .	355·0	890
„ 2 khrans . . .	142·0	890
„ khran . . .	71·0	890
„ $\frac{1}{2}$ khran . . .	35·5	890
„ $\frac{1}{4}$ khran . . .	17·7	890

**TONNAGE AND POUNDAGE.** Tonnage, sometimes written tunnage, was a duty on every tun of wine imported; poundage an *ad valorem* duty on every pound's worth of merchandise imported or exported. The practice had commenced 1347. The traditional and usual rate at which tonnage and poundage were fixed was—tonnage 3s. per ton imported, and poundage 1s. on every pound's worth of merchandise imported or exported, alien merchants being charged an extra 3s. on every ton of sweet wine, and an extra shilling poundage on tin. The levying of tonnage and poundage by Charles I., without the authority of parliament, was one of the constitutional questions which arose during his reign; it was, however, compromised by a grant being made by parliament of tonnage and poundage for life to the king. After the Restoration the ancient traditional rates were discarded, and the character of the levy was altered, tonnage and poundage being levied at whatever rate parliament considered the exigencies of the time to require (see Cusrom).

[*Rolls of Parliament*.—Hall, *History of the Customs Revenue*.]

A. E. S.

**TONTINE.** The tontine (name derived from that of the inventor Tonti, an Italian banker of the 17th century) has been defined as “an annuity shared by subscribers to a loan, with the benefit of survivorship, the annuity being increased as the subscribers die, until at last the whole goes to the last survivor, or to the last two or three, according to the terms on which the money is advanced.” The principle was in former times frequently applied in Great Britain, sometimes to assist private enterprises, more frequently to raise funds for the government. The speculative element was an attraction to many, the investor staking his money on the chance of his own life or that of his nominee being better than that of his neighbours. An example of the working out of a tontine is given by Mr. John B. Martin in his book, *The Grasshopper in Lombard Street* (London, 1892). In this he mentions (p. 100)

that Mr. James Martin, who died 1870, in his ninety-second year, “was the last survivor but one in a government tontine. At the time of his birth, in 1777, during the crisis of the American war of independence, the English government was content to borrow £228,600 (Irish<sup>1</sup>) at 7 per cent, each subscriber contributing £100 per share in his own name or that of his nominee, the principal being forfeited at his death, while the entire interest was divided among the survivors. James Martin was nominated as a subscriber to this tontine.” The profits of the survivors in the tontines were sometimes enormous. In the last year of Mr. James Martin's life his half-yearly income from the original investment of £100 amounted to

1870 January dividend for pre-  
ceding six months. £3875 0 4  
„ July dividend for preced-  
ing six months . . . 3891 10 2

**TOOKE, THOMAS (1774-1858)**, one of the many eminent Englishmen who have brought to bear on the theories of economics and finance the practical experience of business life, was born at St. Petersburg. At an early age he had the management of a large Russian house in London. He took an active part in many public movements, such as the starting of docks, railways, life assurance, etc., and became recognised as a leading authority on all questions connected with commerce and banking. In 1820 he was elected a F.R.S., and in 1853 a correspondent of the Institute of France. Tooke drew up in 1820 the *MERCHANTS' PETITION (q.v.)*, which summarised concisely and lucidly the arguments in favour of *FREE TRADE (q.v.)*, and was thus the pioneer of the free trade movement on its first appearance within the range of practical politics.

Tooke was the author of *On the Currency in connection with the Corn Trade and on the Corn Laws*, London, 1820, 8vo.—*Considerations on the state of the Currency*, London, 1826, 8vo.—*An Inquiry into the Currency Principles and the connection of the Currency with Price, etc.*, London, 1844, 8vo.—*Thoughts and Details on the High and Low Prices of the Last Thirty Years*, London, 1824, 8vo, afterwards altered and enlarged into *A History of Prices and of the State of the Circulation during the Years 1793-1856*, 6 vols., London, 1838-57, 8vo. This work, of the last two volumes of which Mr. W. Newmarch was joint author, is recognised by McCulloch (*Literature of Political Economy*, p. 196), while criticising the stress it lays on variation in the supply and cost of corn as opposed to variations in the quantity and value of money as “a standard work, valuable alike to practical and speculative inquirers.” In the first four volumes the subjects treated are (1) the prices of corn and the circumstances connected with them in the relations of cause and effect; (2) the prices of produce other than corn; and (3) the state of the circulation, under which head was comprised a review of the whole currency question. Tooke was opposed to the Bank Act of 1844, which he regarded as “one of the most wanton, ill-advised,

<sup>1</sup> £108 : 6 : 8 Irish = £100 English.

pedantic, and rash pieces of legislation" which had ever come within his observation. He pointed out with great clearness the disadvantages which must result from dividing the Bank of England into two departments, and from limiting the country note circulation. He considered the sudden and frequent alteration in the rate of discount to be closely connected with this legislation. It is to be observed that these arrangements were not followed in the German Bank Act of 1875, and that greater steadiness in the rate of interests charged by the *Reichsbank* has resulted during the period of autumnal demand (see arts. AUTUMNAL DRAIN; BANK OF GERMANY). The fifth and sixth volumes contain fresh topics, viz. railways and the railway system, the origin and progress of the free-trade movement; the state of finance and banking in France, and the effect of the new discoveries of gold.

### TOOL.

Tool, p. 549; Tool Rent, p. 549.

**TOOL.** The difference between a tool and a machine has been long a subject of controversy. Mr. Babbage (*Economy of Machinery and Manufactures*) saw very little difference between them. "A tool," he says, "is usually more simple than a machine; it is generally used with the hand, whilst a machine is frequently moved by animal or steam power. . . . The simpler machines are often merely one or more tools placed in a frame and acted on by a moving power." Dr. Ure was of much the same opinion, and popular writers, like Mr. Samuel Smiles (*Industrial Biography, Iron Workers and Tool Makers*, ch. x.), mostly follow in their wake. On the other hand, it is clear that, whilst a tool may well form part of the mechanism of a machine, it is not itself that mechanism; nor will any number of tools placed in mere juxtaposition be so; and in this connection the definition of a machine by a recent writer, Mr. Alexander B. M. Kennedy (*The Mechanics of Machinery*, p. 2), may be compared with the above. "A machine," says Mr. Kennedy, "is a combination of resistant bodies whose relative motions are completely constrained, and by means of which the natural energies at our disposal may be transformed into any special form of work." Two important characteristics, in which a tool is wanting, emerge from this definition, its potential division into parts, and the alleged circumstance of energy being "transformed," not merely transferred, when applied to move it. The same view is strenuously argued by Karl Marx (*Capital*, pt. iv.). "All fully developed machinery," he contends, "consists of three essentially different parts, the motor mechanism, the transmitting mechanism, and finally the tool" a machine "is a mechanism that, after

being set in motion, performs with its tools the same operations that were formerly done by the workman with similar tools." If these latter views be accepted as being the more correct, it would follow that a tool is an implement for merely transferring energy applied to itself alone, and when combined with other tools "whose relative motions are completely constrained," it becomes part of a machine.

[Charles Babbage, *Economy of Machinery and Manufactures*.—Dr. Ure, *The Philosophy of Manufactures*.—A. B. M. Kennedy, *The Mechanics of Industry*, Macmillan and Co., 1886.—Karl Marx, *Capital*, vol. ii., English translation.—R. W. Cooke-Taylor, *Modern Factory System*, ch. ii.—J. R. McCulloch, *A Dictionary of Commerce*, article "Tools and Machines."]

R. W. C. T.

**TOOL RENT** is a name given to the price paid for the use of an artificial instrument of production. In certain industries it has been common to hire out tools and machines to workers at a fixed price, the hirer being sometimes the employer of the workers as well, sometimes not. This has generally happened where the tools or machines were of a complicated construction, and therefore expensive to purchase, and at times or in places where the factory system had not made much way. In the stocking industry, for example, it was, until quite recently, a very common method of production, which prevails to some extent still. The charges in this instance took the name of "frame" rents, and in some cognate instances of "loom" rents, where a loom was the implement supplied. This system has been always open to many abuses. In the *Life of Thomas Cooper* (p. 139) there is a particularly good account of some of these, and a comparative estimate of its merits with those of the factory system, which are worth quoting. "A cotton manufacturer builds a mill," he explains, "and puts machinery into it, and then gives so much per week, or so much per piece of work, to the men and women and boys and girls he employs. But I found that the arrangement in the hosiery trade was very different. The stocking and glove manufacturers did not build mills, but were the owners of the 'frames' in which the stockings and gloves were woven. These frames they let out to the masters or middlemen at a certain rent, covenanting to give all the employ in their power to the said masters. . . . The masters employed the working hands, giving so much per dozen for the weaving of the stockings or gloves, and charging the man a weekly frame rent—which was, of course, at a profit above the rent the master paid the owner of the frame." The prominent position of the middleman was an ominous portent in this transaction, and the worker was subject, it seems, to many direct exactions at his hand. "He had to pay not only 'frame-rent' but so much per week for

the 'standing' of the frame in the shop of the master, for the frames were grouped together in the shops generally, though you would often find a single frame in a weaver's cottage as well. The man had also to pay threepence per dozen to the master for 'giving out' of work. He had also to pay so much per dozen to the female 'seamer' of the hose; and he had also oil to buy for his machine, and lights to pay for in the darker half of the year. . . . But the foul grievance was this: each man had to pay a whole week's frame-rent although he had only half a week's work. . . ." and so on, this authority finally giving his verdict in favour of the factory system in preference to this system of production. Tool rent was, however, known long before this time, and is specially mentioned and condemned in an act of parliament of Mary's reign (2 & 3 Phil. and Mary, c. 11), entitled "An Act touching Weavers," where we read of persons guilty of the offence of "engrossing looms into their hands and possession, and letting them out at such unreasonable rents as the poor artificers are not able to maintain themselves, much less to maintain their wives, families, and children." Clearly too it is a system as applicable to agriculture as manufacture, and, indeed, to any occupation in which tools or machinery play a part.

TORRE, RAFFAELE DELLA (17th century), the author of a treatise on exchange, which contains a comparatively liberal opinion, for the time, on the scholastic doctrine of usury.

Torre, while professing the most absolute respect for the principle of gratuitous loans, admits some practical means of evading it. After describing the different forms of exchange, he examines with great acumen the much-debated question of the lawfulness of exchange. He investigates what constitutes profit in different contracts; distinguishing loans from exchange; falls into the error of denying the usefulness of loans, in opposition to which he upholds the advantages of exchange; he therefore admits exchange, provided the price be a fair one, fair by which he means legal. According to him distance of place, and distance of time, the latter absolutely limited to the distance of place, in order to avoid loans in the form exchange, are necessary to constitute exchange.

*De cambiis*, Genoa, 1641 [Gobbi, *L' economia politica negli scrittori italiani del secolo XVI.-XVII.*, Milan, Hoepli, 1889.] U. R.

TORRENS, ROBERT, COLONEL (1780-1864), soldier and political economist, was born in Ireland, and entered the Marines in 1797, becoming captain in 1806, and major, for

services at Anhalt, in 1811. At the close of the great war he was placed on half-pay, and devoted himself to politics and literature, entering parliament, after various unsuccessful efforts, as member for Ashburton in 1831. He entered with great vigour into the scheme for colonising South Australia by means of the South Australian Company, of which he was chairman for several years.

Torrens was a prolific writer on economic subjects; his works took usually the form of letters to the ministry of the day. They lack polish of style, and as a rule are devoid of permanent merit. He was a great supporter of the so-called REC-PROCITY (*q.v.*) system.

The principal works which need be cited are as follows:

*The Economists refuted, or An Enquiry into the Nature and Extent of the Benefits conferred by Trade and Commerce, etc.*, London, 8vo, 1808.—*An Essay on Money and Paper Currency*, London, 1812.—*An Essay on the External Corn Trade*, London, 8vo, 1815; 3rd ed. 1826; 4th ed. 1827.—*A comparative Estimate of the Effects which a Continuance and a Removal of the Restriction of Cash Payments are Respectively Calculated to produce.* . . . London, 8vo, 1819.—*An Essay on the Production of Wealth*, London, 1821.—*Letters on Commercial Policy*, Lond., 1833.—*On Wages and Combinations*, Lond., 1834.—*A Letter to Lord Melbourne on . . . Bank reform*, Lond., 1837.—*A Letter to Sir Robert Peel on the Condition of England*, Lond., 1843.—*The Budget, or Commercial and Colonial Policy*, Lond., 1844.—*The Principles and Practical Operation of Sir Robert Peel's Act of 1844 Explained and Defended*, London, 1847; 2nd ed. 1857.

[*Gent. Mag.*, 1864, pt. ii. p. 385. Papers, South Australian Co. Reference in Ricardo's *Letters to Malthus*, 1837.] C. A. H.

TORRENS, SIR ROBERT RICHARD (1814-1884), author of the TORRENS ACT (*q.v.*), was son of Col. Robert TORRENS (*q.v.*). Born at Cork, he was educated at Trinity College, Dublin, and became collector of customs in South Australia in 1851. In 1856 he became colonial treasurer, in 1857 he entered the house of assembly, and on 27th January 1858 carried the act which bears his name, for the transfer of land by simple registration of title. In 1863 he returned to England, and in 1865 entered parliament, where he tried to press his views as to simplifying the transfer of lands.

He wrote *Political Economy and Representative Government in Australia*, 1855; *Reform of the Law of Real Property*, 1858; *Registration of Title of Land*, 1859. C. A. H.

TORRENS ACT. This act of South Australia, which introduced the system of transfer of title to land by simple registration, was the conception of Sir Robt. Richard TORRENS (*q.v.*), and carried into law entirely by his personal exertions. The idea was derived from the registration of shares in ships. Torrens, while colonial treasurer of South Australia, became

deeply impressed with the idea that one of the chief things required for the success of the colony was simplification of the transfer of land: he carried his views in the legislature in 1853 (act 15 of 1857-58). The benefits of the system became rapidly manifest. Victoria was the next colony to introduce it. Now it is the general system adopted in all Australasia. It has also been extended to Fiji, to the Leeward Islands, and to Trinidad in the West Indies.

Under this system the transfer of land is carried on by a government department. Great care must be exercised in registering a title for the first time, but when once a title has been entered in the official registers it cannot be questioned, its registration is sufficient evidence of its soundness, and it can be encumbered, disencumbered, or transferred by simple entry with proper formalities in the register.

It is generally admitted that the system conferred immense benefits on Australia; elsewhere it has usually been received with suspicion, and in an old country the expense of investigating and first registering an old title has prevented the adoption of the plan.

The English Land Transfer Act 1897 (60 & 61 Vict. c. 65) gives powers to the privy council which may be used for the gradual introduction of a compulsory system of registration of title to land in England (see LAND REGISTRATION; MORTGAGES, REGISTRATION OF). C. A. H.

TORRI, LUIGI (1719-1814), a nobleman of Verona. In one of his works, written for a prize competition, set by the academy of Verona in 1789, on trade-gilds, which he won (see MARACHIO), Torri eclectically expounds the reasons for and against the restrictions of freedom in trade, and without giving a decided opinion he says circumstances must be the guide.

Dreading the excesses of liberty, he admits a partial retention of the old systems. His book is a long treatise on trade, and in the last part he considers trade-gilds—though he recognises their abuses, he would retain and reform them by eliminating these. Torri's work is of importance in spite of its vagueness and want of originality; partly because he sums up the reasons given by the first writers of the day against trade restrictions, and particularly against trade-gilds; partly because he echoes the prevailing public opinion on secular institutions, traditionally respected, though their very serious drawbacks were recognised.

*Considerazioni sopra i mezzi conducenti alla prosperità delle arti e del commercio*, 1793 [see Alberti, *Le corporazioni d'arti e mestieri e la libertà del commercio*, etc., 1888.—Gobbi, *La concorrenza estera*, etc., 1884]. U. R.

TORT is the name for a wrongful act inflicting damage on another person and entitling the injured person to pecuniary compensation. In certain cases a party threatened or injured by a tort is also entitled to an injunction restraining

the commission of the threatened act or the continuance of a wrongful course. Assault and battery, slander and libel, unlawful imprisonment and malicious prosecution, fraud, trespass and wrongful conversion, are the most obvious instances of tortious acts. A tort may be, but is not necessarily, a criminal offence.

There is one material difference between the liability arising out of a contract and the liability arising out of a tort. The benefit as well as the burden of a contract is not affected by the death of either party; but in the case of a tort the death of the wrong-doer as well as the death of the person wronged, as a general rule, destroys the liability. Legislation has, however, engrafted various exceptions on this rule, the result being that injuries to property may now be sued upon by the deceased owner's personal representatives, but that personal injuries, not resulting in the death of the person concerned, must be considered as forgiven if the injured party has not instituted proceedings in his lifetime. The representatives of a person whose death has been caused by a wrongful act, neglect, or default have, by virtue of Lord Campbell's Act (9 & 10 Vict. c. 93; and see 27 & 28 Vict. c. 95), a right of action for the benefit of the wife, husband, parent, and children of the deceased.

[Pollock on *Torts*, 4th ed. 1895.] E. S.

TOTAL UTILITY denotes sum-total of satisfactions. The total utility of a commodity to a person is the whole of the pleasure which he derives from its consumption; the total utility of an occupation is the whole of the pleasure derived from the remuneration and in the exercise thereof. The total utility of commodities or actions, less by the attendant total disutility, constitutes their net utility or "net advantages" (Marshall); to maximise which is the end of the "economic man."

The economic measure of the total utility of an object to a consumer is "the maximum sacrifice that he is prepared to make in order to procure it for himself" (Dupont, "De l'utilité," *Journal des Économistes*, July 1853). The same, less by the sacrifice which he has actually to make, in the measure of the net utility. Thus the "relative utility" (Dupuit) or CONSUMERS' RENT" (Marshall) of a purchased commodity is the money-measure of its total utility less by the purchase-money. But it must be remembered that when the "maximum sacrifice" is very great, it can no longer be measured by money (*Principles of Economics*, p. 203, 3rd ed.).

The constructions which are employed to represent the total utility of an individual may be extended to the collective total utility, the Gesamtnützlichkeith of all parties. (In a régime of market.) The proposition that under the conditions of competition economic equilibrium is determined by rendering the collective total utility a maximum consistent with the

given conditions, forms the highest generalisation of economics (cp. Marshall, *Principles of Economics*, Mathematical Appendix, note xiv.).

### TOWNS.

Towns, Decay of (medieval), p. 552; Towns, Policy of the (medieval), p. 552.

TOWNS, DECAY OF (medieval). From 1433 to 1472 the Rolls of Parliament record the relief from taxation allowed to Lincoln, Great Yarmouth, Andover, Cambridge, Cheltenham, and other "towns, cities, and burghs desolate wasted and destroyed or over gretely impoverished." The cause is not always stated; but fires and incursions of the sea explain the distress in some cases. These facts might seem to be local and accidental were it not that more than sixty years later the statutes show that Canterbury, Cambridge, the Cinque Ports, Exeter, Gloucester, Lincoln, Northampton, Plymouth, Salisbury, Stafford, Yarmouth, York, and many other towns, English and Welsh, were in a semi-ruinous state. Houses were in danger of falling; uncovered vaults and cellars were a peril to passers-by; and streets were choked with rubbish. Seven statutes (26 to 35 Hen. VIII.) attempted a remedy by ordaining that if the owners did not rebuild, or at least wall off the sites, corporations might do so, and in that way acquire the freehold.

The cause of this ruin is not clear. The Wars of the Roses had reduced the population, and the harsh regulations of the craft-gilds respecting apprentices and journeymen were driving the industrial classes to work in villages, as for example around Worstead in Norfolk, in order to escape from burdens and restrictions.

The needs of the state again and the French wars had caused customs dues and taxes to become heavy burdens on merchants and craftsmen; and the manorial system had fallen into ruin, so that liberty, of which towns were at one time the chief centres, could be enjoyed in the country on easy terms. Probably therefore the temporary decay of the towns marks the period of transition which prepared the way for a new era of trade and industrial prosperity. It is possible that the rise of Manchester, Birmingham, and Sheffield about 1550 or later is a sign of revival.

The statutes from 4 Hen. VII. c. 19 to 39 Eliz. c. 1, which forbade the pulling down of towns, relate to places of about 200 inhabitants, and so to rural not urban life.

[Cunningham, *Growth of English Industry*.—C. Gross, *The Guild Merchant*, i. 51, 52.] R. H.

TOWNS, POLICY OF THE (medieval). During a well-marked period in the economic development of Europe, the whole of the commercial and industrial life of the time was concentrated in, and indeed confined to, the towns; was controlled, assisted, and limited by municipal regulation. This was a phase which began and ended at different times in different countries, but which may be regarded as generally culminating in the 14th and 15th centuries. During this period every town, from that which was hardly more than a village, and was subject to the authority of a strong monarchy, to that which had become an independent city-state, pursued a policy in its spirit and main features identical. Each burgess body avowedly pursued what it regarded as its own material interest as against the burgesses of all other towns, much in the same spirit as is shown to-day by the several nations; and, what we cannot find a modern parallel for, it followed the same self-regarding ends in relation to the inhabitants of the surrounding agricultural areas. It admitted the men of other towns to its markets only on the payment of tolls from which its own burgesses were exempt. It sought to benefit as much as possible by their presence, while preventing them from encroaching on what the burgesses regarded as their own exclusive rights; for instance, it was very common to exclude outsiders or "foreigners," as they were called, from all retail trade as well as from all direct dealings in the town with other "foreigners." Every town expected to obtain for its own consumption the surplus food grown in the country around, and sought to prevent the rustics from engaging in any industry which could compete with its own manufactures. The more powerful and independent the towns were, the more thorough were the measures resorted to, to secure these results. In Germany, where both the imperial and the territorial authorities were weak, the towns were able to proceed to extremes (as e.g. in the "staple-right") unknown in England.

But the regulations of the municipal government aimed not only at securing the interests of the town as against the world outside; they aimed at securing what were regarded as the interests of the great mass of the citizens as against members of the burgess body itself. This is especially true in regard to the purchase of victuals, though it is illustrated by regulations with regard to other articles of common use. The intention of the authorities was to bring the producers, i.e. chiefly the peasants from the country around, as far as possible into direct contact with the actual consumers. Dealers were not admitted to the market to purchase until after the ordinary householder had had an opportunity to satisfy his needs. None must come between the consumer and producer, and obtain what was deemed an

illegitimate profit by engrossing or by forestalling the market (see FORESTALLERS AND REGRATORS).

When the town governments were gradually compelled to surrender their powers to the territorial or national rulers, the latter very commonly adopted, for larger areas, the policy which the towns had pursued for their own benefit; and thus the mediæval towns contributed one element to what is now known as mercantilism (see MERCANTILE SYSTEM); while in their administrative organisation they furnished at least suggestions towards the formation of the later state bureaucracy.

As to the justification of the town policy, opinions differ—from that of those who regard it as short-sighted and self-defeating, to those who consider it as suited to the larger requirements of the economic stage then reached, though, of course, narrowly selfish in its immediate intent. Opinions likewise differ as to the degree of success with which it was carried out. Probably on both these points insufficient attention has been paid as yet to differences of time and place.

[There is a great mass of material to be found in the works on town history, especially those in German; beginning with K. D. Hüllmann, *Städtewesen des Mittelalters*, 4 vols. 1826, 1827, 1828, 1829. Recent sketches of the whole subject, with numerous bibliographical indications, will be found in Ashley, *Economic History*, vol. i. pt. ii. (Amer. ed. vol. ii.) ch. i., for England; and in K. Bücher's article "Bürger" in Conrad's *Handwörterbuch der Staatswissenschaften*, vol. ii. for Germany. G. Schmoller has sought to place the period of town dominance in its due relation to economic evolution in an opening chapter in his *Studien über die wirtschaftliche Politik Friedrichs des Grossen*, in his *Jahrbuch für Gesetzgebung*, 1884 (trans. under the title *The Mercantile System*, 1896); and in an article "Die Epochen der Getreideverfassung und -politik" in the same *Jahrbuch* for 1896 he has made perhaps the first attempt to distinguish the *nuances* of policy, in the action of the small, middle-sized, and large towns respectively.]

W. J. A.

TOWNSEND, REV. JOSEPH (1739-1816), of Clare Hall, Cambridge, and graduate of the university, Edinburgh, practised as a physician, but subsequently took orders. He is mentioned as a popular preacher. He was rector of Pewsey in Wiltshire, and domestic chaplain to the Countess of Huntingdon (see *Gentleman's Mag.*, and, as to his parentage, *Notes and Queries*, 6th series, vol. iii. p. 507). He was well read, a versatile and able writer. He travelled much both in Great Britain and on the continent.

Townsend's *Journey through Spain* reached three editions (1791, 1792, 1814), and may be compared with Arthur Young's *Travels in France*. He is probably best known for his *Dissertation on the Poor Laws*. He wrote *Observations on various*

*plans offered to the public for the relief of the poor* 1788.

His *Dissertation on the Poor Laws* is an important pamphlet (1st ed., 1786; 2nd, 1787; 3rd, 1817) in the poor law controversy of the 18th century. He argued in principle that the "whole system of compulsive charity" should be abolished. The Poor Laws, "beautiful in theory," "promoted the evils they were meant to remedy, and aggravated the distress they were intended to relieve." Prices had fallen, wages increased as six to four in the past century, and rents doubled, yet the poor rates had doubled in fourteen or even seven years, and in some manufacturing towns 10s. in the £ on the improved rental. Manufacture and agriculture were both alike checked. Further, under better economic conditions, there was less diligence on the part of the poor. This resulted from the rigid system of settlement (see SETTLEMENT, POOR LAW), coupled with the obligation placed on the parish to provide employment. The pauper, and not the independent family, had to be first considered. The former received not merely maintenance but the lesser luxuries also. The general inducements to labour were thus relaxed; and in this and other ways a larger number of persons and a higher class became pauperised. The poor laws were a limited communism. They defeated the natural law under which hunger or the fear of hunger incited to energy and schooled character—for the poor are not stimulated by the higher ambitions. They might, it was true, be compelled to labour, but compulsion was practically impossible. Industrial workhouses were no remedy; nor were workhouses with (what was perhaps called later) "the offer of the house." That was tantamount to a repeal of the poor laws for those who would not enter the "house." But there might be day workshops in parishes to train the poor in industry. The poor rate might be reduced nine-tenths in nine years; horses might be taxed, and oxen, which are cheaper to feed, used instead. Still, in the main, voluntary charity should be relied on and would suffice.

Many of the positions held by Townsend were challenged (cp. e.g. RUGGLES, T., *History of the Poor*; EDEN, Sir F. M., *State of the Poor*), yet on the main issues he may be deemed justified. In general, he adopted views similar to those of MONTESQUIEU (*Esprit des lois*, bk. xxiii. ch. 29), Lord Kames, and MALTHUS, but the peculiarity of his position is this; he was profoundly convinced of the social utility of voluntary charity, though opposed to any "certain and constant provision for the poor"—cp. his remarks on the effect of charitable gifts and doles, and also "Industrial Workhouses" in Spain (see *Journey*, I. 218, II. 115, ed. 1815); and hunger, he argued, was the natural penalty for idleness or incompetence. State relief was, he insisted, an apparent substitute for this. Yet it could only take its place if the rule of "the offer of the house" were strictly applied, and this was equivalent to the repeal of the law, so far as the able-bodied were concerned. And to this alternative he was strongly averse on the grounds of experience. Workhouses were ill-classified badly

mark also in their work the half-mile points, so that the territory is all surveyed into blocks of 160 acres. It requires then only the slightest knowledge of land measurement to divide these quarter-sections of 160 acres each into quarters, and the country is divided into 40 acre blocks. In fact we find in all settled parts of the country that has been thus surveyed, the farms in 40, 80, 160, etc., acre pieces.

The sections in each township are uniformly

6	5	4	3	2	1
7	8	9	10	11	12
18	17	16	15	14	13
19	20	21	22	23	24
30	29	28	27	26	25
31	32	33	34	35	36

Fig. 2.

numbered in the order shown in diagram, fig. 2, and land, instead of being described by metes and bounds, is simply located as on the map. For example, if block *C* on the diagram, fig. 3,

		C	

Fig. 3.

is 40 acres in section 22 in the township marked *A*, fig. 1, in *e.g.* Michigan, its description is the north-west quarter of the north-east quarter of section 22, in township 4 north, range 5 east, state of Michigan, or more accurately, range 5 east of the first principal meridian, which runs through Michigan, or as abbreviated N.W.  $\frac{1}{4}$  of N.E.  $\frac{1}{4}$  of sec. 22, T. 4 N.R. 5 E., Mich., and any farmer can find for himself the surveyor's marks locating his land.

The word "township," then, means the territorial division, divided and located as above. When civil government was set up in these states, instead of the towns growing first, and the county and state being aggrega-

tions of towns as in New England, the process was reversed. The state was divided into counties, and, under state law, the counties into towns. The territorial townships, however, make convenient boundary lines, so that a county regularly embraces from twenty to thirty townships. The townships being of convenient size for local government, the county is generally divided into local town governments on township lines. As long as the county is thinly settled a town (civil division) may contain two or more townships, and later be divided into two or more towns, each one coincident with a territorial township. The town takes a name, as Marion, Washington, Oakland. The township is described by its number and location.

Though the distinction of meaning given above is properly made, we still find the words often used almost interchangeably (see also LOCAL GOVERNMENT IN THE UNITED STATES). J. W. J.

TOYNBEE, ARNOLD (1852-1883), the second son of Joseph Toynbee, a well-known aurist, was born in London. Soon after his birth, his father removed to a house at Wimbledon in Surrey, where Arnold spent most of his childhood. His early preference for a soldier's career induced his father to send him to be prepared as a candidate for the army examinations. After his father's death ill-health and intellectual ambition led him to alter his plans. He returned home, became a student at King's College, London, and resolved to adopt the bar as his calling. A second change of purpose was due to the same causes which produced the first. He resolved on a life of study, and retired for many months to solitary lodgings in the country, first at Bracknell in Berks, and afterwards at East Lulworth in Dorset. In January 1873 he became a member of Pembroke College, Oxford. Finding himself ill at ease, he migrated two years afterwards to Balliol College, of which Dr. Jowett was then master. Hitherto he had been groping his way towards a suitable life. Now he had found it. Although continued ill-health made university honours impossible for him, he found in Balliol judicious teachers and sympathetic friends who recognised his rare gifts of intellect and character. The first proof of his singular personal influence was seen in the ascendancy which he exerted over many able, ambitious, and highly critical fellow-students. At this period of life he was passing through a spiritual crisis. Hitherto he had been chiefly interested in the study of history. He now became possessed with religious emotion. Naturally serious and compassionate, he now felt a new interest in the condition of the poor which became the ruling influence of his after-life. This feeling more than any other led him to concentrate his powers on political

economy as the science which explains the conditions of human well-being. In this sense it may be said that the spirit of charity made him a political economist. Himself a poor man, he had to consider how he could earn his livelihood after taking his degree, a question made difficult for him by bodily weakness and recurring ailments. Fortunately he had made so deep an impression on the master and fellows of Balliol that they entrusted him with the care of the numerous probationers of the Indian Civil Service who were then attached to the college. Soon afterwards he married and was eminently happy in his domestic life. His leisure he gave to political economy, especially to economic history. But zeal for doing immediate good forbade him to devote all his powers to study. Longing to mediate between those who study and those who labour with their hands, he formed the resolution of giving every year a certain number of popular lectures on economic subjects. He felt no unreasonable confidence that he could break through the prejudice which workmen feel for political economy, and convince them that economists do care for their welfare. In the course of the years 1880-1882 he lectured with success at Bradford, Newcastle, and Bolton. But he had fatally overstrained his powers. A zealous college tutor, an indefatigable student, the most active of local philanthropists, he never allowed himself any rest save change of occupation. The fatigue of two lectures, delivered at St. Andrew's Hall in London in January 1883, brought on a fatal illness, and he died of inflammation of the brain.

Toynbee's literary remains were published in 1884. They consist chiefly of a course of lectures on the industrial revolution in England which was to have been elaborated into a history. As they stand these lectures are a mere outline which must be superseded by more elaborate works. Yet they testify to the profound historical research and insight of their author. On the impetus which he gave to the then infant study of economic history in England, Toynbee's claim to a place among English economists must partly be founded. He was, however, singularly free from the besetting fallacy of economic historians, that the mere accumulation of economic facts constitutes political economy. Much as he prized and honoured research, he viewed its results chiefly as material for thought. He desired above all things to understand economic phenomena as a means to social reform. In the same volume were included an immature essay on RICARDO, a few popular addresses, and some brief fragments chiefly on those moral and spiritual themes which were always nearest his heart. But nothing that he has left in writing can convey an adequate sense of the beauty of his character, his rare nobility of nature, and his exquisite kindness.

One of Toynbee's many endeavours to make himself personally acquainted with the poor in

order that he might help them more wisely, suggested the foundation of the now famous University Settlement in Whitechapel which bears his name, though founded by others after his death. It has afforded the model of several similar institutions both in London and the United States.

[See Toynbee, *The Industrial Revolution*, etc., 1884.—*Progress and Poverty*, a *Criticism of Mr. Henry George*.—Milner, *Arnold Toynbee: A Reminiscence*.—Montague, *Arnold Toynbee*.—*Johns Hopkins University Studies*.—Price, *A Short History of Political Economy in England*, which contains an admirable estimate of Toynbee as an economist. TRACY, DESTUTT DE. See DESTUTT DE TRACY.

### TRADE.

Trade, p. 556; Trade Coins, p. 557; Trade Disputes, Law as to, p. 558; Trade, Foreign, Regulations of (to time of Commonwealth), p. 559; Trade, Large and Small, p. 561; Trade Mark, p. 562; Trade Name, p. 563; Trade, Revival of, p. 568.

TRADE is the occupation or business of buying and selling commodities. It is commonly divided into *foreign and domestic*, and *wholesale and retail* (see RETAIL and WHOLESALE). In ordinary use the term is but little distinguished from commerce, except that the latter connotes the idea of the circulation as well as the exchange of products. In another direction it is often used in close conjunction with manufacture, without any very clear distinction being drawn between them, as when a manufacturer, *i.e.* a producer, is said to be "engaged in trade." In this case it must be always understood that the manufacturer is one who produces for sale (see MANUFACTURE). By 22 Geo. III. c. 82, a BOARD OF TRADE for Great Britain was established "for the consideration of all matters relating to trade and foreign plantations," and definitely constituted four years afterwards (1786). The members of this board, which is a committee of the privy council, include a president and vice-president, the first lord of the treasury, the three principal secretaries of state, and other great officers; but in practice the president and vice-president have had the direction and management of it from the first. The vice-president of the board of trade ceased to exist in 1867, but since that time there has existed the office of the secretary. Many of its early functions have been since transferred to other departments of government, as the colonial office. On the other hand, several new duties have been imposed upon it; the supervision of canals and railways, harbours and lighthouses; the superintendence of the registration of trade marks, patents, and designs; the control of weights and measures; the direction of bankruptcy proceedings; and the registration and winding up of companies; increased responsibilities in regard to merchant shipping, etc. In 1832 a department was created for

collecting and arranging statistical information for the use of parliaments, and more lately a labour department, for circulating information on industrial subjects.

The trade, both home and foreign, of the United Kingdom is enormously vast and complex. Our imports and exports, taken together, are estimated, according to Lord Farrer, "to be nearly one-fourth the foreign trade of the whole world; and if the trade carried on with English capital between foreign countries were included, our foreign trade would be found to amount to much more." We are the greatest of brokers also, and carriers and money-lenders. "Good statisticians estimate our investments abroad at not much less than £2,000,000,000"; . . . and our ocean trade "is two-thirds or more of the ocean trade of the whole world." "The value of our ships is estimated to exceed £100,000,000; the amount of cargoes afloat under our flag at any given moment is very much larger; and the property covered by it in the course of a year is probably not less than £1,000,000,000." Of our domestic trade the same authority says, "The aggregate value is not given in any official statistics."

[T. H. Farrer, *The State in Relation to Trade*, English Citizen Series (Macmillan, 1888).—H. D. Trail, *Central Government*, same series.—R. W. Cooke Taylor, *Introduction to a History of the Factory System*, ch. i.] R. W. C. T.

TRADE, BALANCE OF. See BALANCE OF TRADE.

TRADE, CHAMBERS. See CHAMBERS OF COMMERCE.

TRADE COINS. For a very long period, probably from the earliest times of the trade between Europe and the East, a large part of the exports from eastern countries has been paid for by the import of coin. This has been due partly to the backward condition of those countries in regard to coinage, but chiefly to the absence of a desire for other western products.

The coins thus acclimatised have been chiefly three—the Spanish DOLLAR, or CAROLUS, the Mexican DOLLAR, and the MARIA THERESA, or Levantine DOLLAR (see also DOLLAR). The Spanish dollar, or Carolus, sometimes called the "pillar dollar," from the two pillars, said to represent the Pillars of Hercules, on the reverse, is no longer in use in Spain, but was still coined there till quite recently, for use in the Spanish West Indies and the Philippines, within which limits it was not strictly a "trade coin," but the currency of the colonies. For many years, however, it has been known in China and the Malay Peninsula, and was at one time preferred there to all other coins, but having varied considerably both in weight and fineness, it has gradually been supplanted, in China at least, by the Mexican dollar. It still holds the field in the interior of the Malay Peninsula, and in other countries more nearly adjacent to the Philippines.

The Mexican DOLLAR was originally coined as an exact reproduction, in weight and fineness, of

the Spanish dollar, namely  $8\frac{1}{2}$  dollars to the Castilian marc of silver  $\frac{2}{3}$  fine. This corresponds to 417.79 grains troy 902.7 fine, and although at one period the Mexican dollar varied somewhat, it has for more than half a century now been very close to the standard, and has thus almost entirely supplanted the Carolus in the trade of Hong Kong and the other treaty ports of China. For circulation the coins were formerly stamped with the "chop" or mark of one of the native merchant-houses, but latterly "chopped" dollars have declined in favour, and they are now generally circulated as imported. These dollars are still the standard coin of Mexico, but the greater part of the production of the mints there is exported either through the Mexican Pacific ports and San Francisco, or through London to Hong Kong, where they usually command a premium of 4 or 5 per cent over their melting value, the coinage charge in Mexico being 4.41 per cent. In the seven years 1889-1895 the silver dollars coined in Mexico were \$181,712,582, of which \$149,197,021 were exported. Mexican dollars were formerly sent to Japan in large quantities, chiefly for use in the balance of trade between that country and Korea, where they are still much used, and form the basis of account.

For Indo-China the Paris Mint coins PIASTRES to supersede Mexican dollars. These were formerly the same as the U.S. "trade dollar," viz. 420 grains, 900 fine, but they are now coined only weighing 416.67 grains.

Several attempts have been made to supersede the Mexican dollar in the China trade, but hitherto without success. A British mint was established in Hong Kong in 1864 for this purpose, but it was closed in 1868, partly owing to the expense incurred, but mainly because it was found impossible to overcome the prejudice in favour of the Mexican dollar. In 1895 this last-named coin was, by order in council, made the standard for the colony; but it was at the same time decided to establish a new British silver dollar, to be coined at one of the mints in British India, for use in the Straits Settlements, in Hong Kong, Labuan, and other eastern colonies.

Upon the closing of the Hong Kong mint, the coining plant was bought by Japan, and, in 1871, a new system of coinage was adopted by that country founded upon the YEN, which is practically the same as the Hong Kong dollar, namely, 416 grains of silver 900 fine.

The United States, in 1873, coined a "trade dollar," in the hope of creating a market for the produce of their mines by supplanting the Mexican dollar. With this view the coin was made slightly heavier, viz. 420 grains; but the attempt was unsuccessful, and the coinage was abandoned, as to large quantities, in 1878, and entirely in 1883, up to which time \$35,965,924 had been coined, of which \$28,778,862 had been exported. Those remaining in the States were redeemed and melted under act of 3rd March 1887.

The Austrian Maria Theresa, or Levantine dollar, is heavier than either of the above-mentioned coins, but is much lower in quality, and contains a less amount of pure silver. It is still coined by the Austro-Hungarian mints.

bearing date 1780, but is intended solely for export, being no longer a legal coin within the country. It is used chiefly in Africa—in Zanzibar, and Abyssinia, and other places on the east coast; on the west coast, in the Niger country and other parts; and it also finds its way through Morocco to various countries of North Central Africa. Previous to recent reforms in Egypt, Maria Theresa and Carolus dollars circulated largely there, but this was scarcely as trade coins. They were used, with still larger quantities of British sovereigns, because of the scarcity and badness of the native currency. They have now been almost driven out of the country. In Madagascar the Mexican dollar once circulated largely, but it is now no longer legal there.

The following are the weights and fine contents of the dollars above referred to:—

	Weight.	Fine- ness.	Fine Silver.
	Troy grs.		Troy grs.
Carolus—standard	417·79	902·7	377·17
,, actual	413·7	892·	369·
	to	to	to
	416·	896·	372·7
Mexican . . .	417·79	902·7	377·17
Hong Kong . .	416·	900·	374·4
British . . .	416·	900·	374·4
U.S. "Trade" .	420·	900·	378·
Maria Theresa .	433·09	833·3	360·76

The ancient Dutch guilder was formerly much used throughout the islands and peninsulas of Southern Asia, but is now only used in Java and Sumatra, in which places it is not a trade coin, but the currency of the colony.

GOLD DUCATS (see DUCAT) are also coined in several European countries for use as trade coins. Holland coins trade ducats and double ducats of gold '983 fine; whilst in Russia, up to 1869 at least, "ducats of Holland" were coined of fineness '9791; Russian gold currency and the Russian ducats now coined being only 916·6 fine. Austria coins gold ducats, and double ducats, for use only as trade coins. It appears probable that these coins were originally struck as well for international trade on the continent as to facilitate trade with Africa and the east at a time when the ducats of Venice were widely known.

These coins compare in value as follows:—

	Weight.	Fine- ness.	Fine Gold.
	Troy grs.		Troy grs.
Russian Ducat . .	60·593	916·6	55·543
Russian "Ducats of Holland" . . .	53·853	979·1	52·731
Holland Ducat . .	53·921	938·	53·004
Austrian Ducat . .	53·866	986·1	53·112

(See also art. TOKENS, HISTORY OF.) R. W. B.

TRADE DISPUTES, LAW AS TO. The law as to trade disputes is best stated under two separate heads, viz.: 1. Disputes between

individual employers and individual workmen. 2. Disputes between combinations of workmen and individual employers or combinations of employers. The two classes of disputes are often closely connected together; if, for instance, a workman, by arrangement with other workmen employed in the same trade, leaves his employment, there is a dispute between the individual employer and the individual workman, but it really arises out of the dispute between a class of workmen and a class of employers.

1. Disputes between individual workmen and individual employers are, of course, within the jurisdiction of the ordinary courts, but legislation has created additional tribunals, and provided additional remedies in respect of claims arising out of such disputes. A series of statutes beginning with 20 Geo. II. c. 19, ending with 10 Geo. IV. c. 12, gave the justices of the peace summary jurisdiction in respect of such disputes, and power to order workmen to be imprisoned for breach of contract. The law remained in this state till 1867, when, on the recommendation of a committee of the House of Commons, an act was passed introducing material alterations in favour of the workmen, which act was repealed in 1871 by legislation still more favourable to the interests of workmen. The law on the subject is now regulated by the Conspiracy and Protection of Property Act 1875, and the Employer and Workman's Act 1875. The first act repeals all former enactments, making breaches of contract criminal offences, and imposes criminal punishment for breach of contract in the following cases only: (a) in the case of a workman employed in an undertaking for the supply of gas or water to a town, who has reason to believe that the probable consequences of his breach of contract will be to deprive the inhabitants of their supply of water or gas; (b) in the case of a person wilfully and maliciously breaking a contract of service or hiring, who has reason to believe that the probable consequences of his breach of contract will be to endanger the life or health of any person, or to cause injury to valuable property.

The Employer and Workman's Act of 1875 facilitates the procedure and prevents oppressive proceedings; it gives discretionary powers to county courts with reference to disputes between employers and workmen, which go much beyond their ordinary powers; thus the court may, "if, having regard to all the circumstances of the case, it thinks it just to do so," rescind any contract between employer and workman "upon such terms as it thinks just," and it may also, instead of awarding damages, order performance of the contract of service. In cases involving claims not exceeding £10, a court of summary jurisdiction—that is to say, two justices or one stipendiary magistrate—may adjudge between employer and workman; the proceedings in such a case being held to be civil and not criminal proceedings.

In many continental countries special tribunals, wholly or partly composed of laymen, exist for the decision of disputes between employers and workmen. Thus in France and Belgium, the so-called *Conseils de prud'hommes*, composed of

members of the trade from which disputes are brought to them—half of them being employers, the other half workmen,—exist in many towns, after having been first introduced in Lyons in the year 1806. In Germany a statute, passed in 1890, has introduced trade tribunals (*Gewerbegerichte*), composed of a chairman, a deputy chairman, two employers, and two workmen; they must, in the first instance, try to induce the parties to compromise; and if that attempt fails, adjudge in the dispute in the same manner as an ordinary court of first instance.

2. The legislation as to disputes between combinations of workmen and employers is partly of a repressive, and partly of a conciliating nature; but the repressive legislation has been to a great extent repealed. Its development, together with the development of the doctrine of "conspiracy" in its application to combinations for the purpose of improving the wage of workmen, is admirably described in Stephen's *History of the Criminal Law*, vol. iii. pp. 202-226, and summed up by the same writer as follows: "First, there is no law at all, either written or unwritten. Then a long series of statutes aim at regulating the wages of labour, and end in general provisions, preventing and punishing as far as possible all combinations to raise wages. During the latter part of this period an opinion grows up that to combine for the purpose of raising wages is an indictable conspiracy at common law. In 1825 the statute law is put upon an entirely new basis, and all the old statutes are repealed; but in such a way as to countenance the doctrine about conspiracies in restraint of trade at common law. . . . In 1871 the common law doctrine as to agreements in restraint of trade being criminal conspiracies is repealed by statute. But . . . the doctrine of a conspiracy to coerce or injure is so interpreted as to diminish greatly the protection supposed to be afforded by the act of 1871. Thereupon the act of 1875—being the Conspiracy and Protection of Property Act 1875 quoted above—specifically protects all combinations in contemplation or furtherance of trade disputes . . . and provides positively that no agreement shall be treated as an indictable conspiracy unless the act agreed upon would be criminal if done by a single person."

By the side of the repressive legislation there is already at an early date an attempt to provide machinery for the purpose of conciliation, and in 1824 a consolidation act was passed, repealing the anterior legislation on the subject (5 Geo. IV. c. 96), but this act as well as the Councils of Conciliation Act 1867, and the Arbitration (Masters and Workmen) Act 1872, remained ineffective, and was, together with the last-mentioned statutes, repealed by the Conciliation Act 1896. This act enables the board of trade, in the case of any difference existing between an employer or any class of employers and workmen—(a) to inquire into the circumstances of such differences; (b) to take steps for bringing the parties together; (c) to appoint a person or persons to act as conciliator, or as a board of conciliation; (d) on the application of both parties to appoint an arbitrator. The act also provides for the registration of boards of conciliation and for the furnishing of periodical

returns to the board of trade by such boards, and gives power to the board of trade to aid in the establishment of boards of conciliation for districts or trades, in respect to which adequate means do not exist for having disputes submitted to conciliation.

In France an act for the settlement of trade disputes between whole classes of workmen and employers was passed in 1892. It provides that the justice of the peace of the district shall convene representatives of the contending parties, and appoint an umpire for the settlement of the dispute, unless they can be induced to agree to a friendly arrangement, or in the selection of arbitrators, or of an umpire. In Italy an act was passed on the same subject in 1893. In Germany the act of 1890 (mentioned above) gave power to the trade tribunals (see above) to act as boards of conciliation, but the provisions in question do not seem to have had much practical effect.

[See the statutes referred to above; also Macdonell, *Law of Master and Servant*.—Ramsey, *Handbook for Employers and Employed*.—And see Professor Stieda's articles in Conrad's *Handwörterbuch*, s.v. "Einigungsämter"; "Gewerbegericht," and the same author's article "Einigungsämter" in the supplemental volume (see CONCILIATION, BOARDS OF; CONSEILS DE PRUD'HOMMES; PRUD'HOMMES.) E. S.]

TRADE DOLLAR. See DOLLAR.

TRADE, FOREIGN, REGULATIONS OF (to the time of the Commonwealth). Before the Danish settlement, England had little foreign trade. English merchants travelled to the great continental fairs, and in 796 Charles the Great granted a safe-conduct to subjects of Offa of Mercia, trading in his dominions, on condition that Offa extended the like protection to men of the Empire. English exports consisted of raw produce to be worked up by other nations, and, in order to keep up the price of material on which the foreign market depended, Edgar prohibited the sale of a weigh of wool for less than 120d. on pain of forfeiture of 46s. from both buyer and seller. A minimum price of wool, the chief strength of England, was also fixed by Edward III. Ine, and after him Athelstan, encouraged commerce by making thegn-worthy merchants who had thrice crossed the sea by their own means (see MERCHANTS, HISTORY OF ENGLISH). Ethelred's laws declared that "the men of the Emperor who come in their ships are held as worthy of good laws as we are," and companies of German merchants, of whom the most important were men of Cologne and of the HANSE TOWNS, early founded a colony in London, and obtained extensive privileges from Henry II. and his sons. By the laws of Edward the Confessor, foreign merchants were forbidden to take up work on which natives were employed, and to sell retail or to each other, restrictions reimposed in the fifteenth century, when the citizens complained that alien merchants encroached on their privileges (see FOREIGN TRADERS AND THEIR RIGHTS). By

granting safe-conducts and licences to trade, in return for a fine, the king kept the control of trade in his hands, and prohibition to export wool was a weapon ready to his use in time of dispute with Flanders, the great cloth-making country. Freedom from excessive dues and tolls was promised by the Great Charter, but it was one of the complaints of the barons at the parliament of Oxford 1258, that the king's exactions on merchandise impoverished English merchants and kept away aliens, and the resistance caused by the seizure of the wool in 1297 led to the confirmation of the charters. Edward I. improved the conditions of trading by making it subject to the same laws throughout the kingdom, instead of being regulated only by local custom and authority. The Statute of Merchants enacted in 1283 that debts owing to foreign merchants, and acknowledged in appointed towns before the king's officers, could be distrained for; before this time there was "no speedy law provided for them to have recovery of their debts at the day of payment assigned, and by reason hereof, many merchants have withdrawn to come into this realm with their merchandises." The fixing of the customs in 1275, on wool, woollfells and leather, the chief exports, and on wine, the chief import, was another measure of this reign for the regulation of trade. In 1303, by *Carta Mercatoria*, aliens agreed to pay higher customs in return for permission to stay longer than the usual forty days, to sell spice retail, and other privileges (see IMPORTS AND EXPORTS). To develop cloth-manufacture in England, Edward III., 1337, offered protection to Flemish weavers and prohibited export of wool on pain of death, and import of cloth on pain of forfeiture. These restrictions did not continue in force for long, and in 1353 it was provided that imported cloths under ASSIZE (*q.v.*) were to be allowed for in price, instead of being forfeited, because alien merchants "do withdraw them to come with Cloths into England." The export of wool and import of wine were both regulated in the interests of foreign merchants, the fare between Calais and Dover was fixed, and, in 1353, aliens were placed under the king's protection by the Statute of the Staple, which organised more fully the Company of Merchants of the Staple who exported wool (see STAPLE). A result of the encouragement given to foreign merchants was the large circulation of base money in England (see POLLARDS AND CROCKARDS). In order to check the import of this coin, and also the export of English money, much of which was taken abroad in payments to Rome, it was enacted in 1335 that "no Religious Man or other" carry gold or silver out of England; in 1340, for every sack of wool exported, silver plate of two marks value was to be imported, but the Flemings also forbidding export of bullion,

this act was repealed. The extensive import of finished goods, chiefly brought by the Italians, interfered with the growing industries of the English. In 1435, import of silken goods was forbidden, and in 1463 and 1484 the prohibition was extended to very many small wares, the artificers having "piteously shewed and complained" that they "be greatly impoverished and much hindered and prejudiced of their worldly Increase and daily Living, by the great Multitude" of ready-made goods imported. Side by side with the laws to keep foreign goods out of the kingdom in the interests of manufactures were those to keep gold and silver within it as the measure of the national power. In 1390, aliens were required to spend half the value of their imports (extended, in 1402, to the whole) on exports; at the same time, denizens were forbidden to export wool, and merchant strangers were to be well treated in England "to the Intent that they shall have the greater Courage to repair into the same." In 1478, half the payments for staple wares were required to be in money and bullion, sent in three months to the mint, while export of gold and silver was made a felony; it was not allowed without a licence before 1660, but in 1510 the penalty of felony was repealed. The object of these laws, and also of the Navigation Acts, passed in 1381 and renewed under the Tudors, for the protection of English shipping (see NAVIGATION LAWS), was to increase the national power; while the aim of Edward III. had been to promote the present well-being of the people themselves. The immediate result of his regulation of trade was that foreign luxuries became cheaper and more numerous and trade increased, but it led to the decay of native shipping and the injury of native manufactures. Against these dangers, legislation was directed from the time of the Good Parliament (1360-1377). As commerce became a national matter, commercial treaties took the place of safe-conducts and licences. By the Treaty of Utrecht in 1474, the HANSARDS were confirmed in their privileges in London, but the English were to be free to take part in the Baltic trade which had always been carried on by the Hansards (see HANSEATIC LEAGUE). In 1496 the Great Intercourse (see INTERCURSUS MAGNUS) secured free trade with the Netherlands, to the advantage of the Company of Merchant Adventurers, who exported cloth, and had their mart at Antwerp (see ADVENTURERS, MERCHANTS). The protective policy of the 15th century continued through the 16th. The extensive conversion of arable land into pasture (see ARABLE LAND, CONVERSION TO PASTURE) in the reigns of Henry VII. and Henry VIII. drove a large proportion of the rural population into the towns, and the consequent competition among craftsmen was increased by the number of foreign wares imported, many of them by the

Merchant Adventurers. In 1515 it was forbidden, as it had been in 1336, to those not of high rank to wear foreign cloth. In 1512, import of hats and caps was prohibited as the cause of "great Idelnesse, enpoverysyng and utter undoing of great multitude of the Kyngis naturall subjectis borne wythin this said Realme"; in 1529 they could be imported, but sold only at fixed prices. Statutes of Henry VIII.'s reign prohibited the sale of the best cloth to aliens unless there were no English buyers, the import of tinware, and the buying up of wool for alien merchants. An act was passed 1563, and confirmed 1628, prohibiting import of small wares, such as cutlery and haberdashery, which had been imported so largely as to lead "to the decay of the population of towns and the loss of skill in the like mysteries within the Realm of England." Attempts were made by restricting the import of wine and foreign luxuries, to check the extravagance and "excesse of apparell," which was "at these daies so gorgious that" "godly and necessary lawes, made of our Princes, and oft repeated with the penalties, can [not] bridle this detestable abuse." Velvet hats were forbidden, in 1566, to those below the rank of son of a knight or lord. Elizabeth welcomed Protestant refugees from Flanders and France, who introduced new industries, especially new methods of working up wool into "bayes, sayes, arras," and worsted, as the Flemings, under Edward III.'s protection, had developed English cloth manufacture. Export of live sheep was forbidden in 1566, on pain of forfeiture of goods, a year's imprisonment, and loss of the left hand, a second offence being felony; for nine unwrought cloths exported one was to be exported wrought "for the better employment and Reliefe of greate multitudes of the Queenes Majesties Subjectes using the Arte and Labour of Clothe working." MONOPOLIES (*q.v.*) were granted for manufacture of salt, paper, and other things which before had been imported. The associations formed in the 16th and 17th centuries for trade and exploration, unlike the older trading societies, were joint-stock companies; the monopoly which they enjoyed was an incentive to extend trade. The Muscovy Company (see RUSSIA COMPANY) obtained a charter in 1553, and the following year eastern trade was granted to them on condition that they employed English ships and sailors, and exported only English cloth. Much of the carrying trade with the east had been in the hands of the Venetians, whose "Flanders Galley," instituted in 1317, yearly visited Southampton and Bruges; this trade declined in the 16th century, partly in consequence of the legislation against the import of ready-made goods. In 1588 the Levant Company (see TURKEY COMPANY), founded 1581, undertook the trade of the Venetians, whose last fleet to Southampton was wrecked off the

Needles in 1587. The revenue from feudal dues having decreased, James I., in order to supplement the parliamentary supplies, levied an imposition on imports which was resisted by a merchant named Bate (see BATE'S CASE). The case was tried, and the king was declared to be keeping within his prerogative. Impositions were also exacted during the Commonwealth, though the same party had opposed them when levied by the king. The English, who from being an agricultural were becoming a commercial nation, had formidable rivals in the Dutch, who, in the first half of the 17th century, had control of most of the trade formerly carried on by the Venetians and Hansards. The aim of the Stuart policy, as of the Elizabethan, was to develop trade as a means towards the security and power of the kingdom, rather than to increase its wealth. In 1608, James I. withdrew the charter of the Merchant Adventurers until 1615, with the object of encouraging in England the finishing processes of manufacture, for which cloth was usually sent to the Netherlands. A commission on trade was appointed in 1622 to inquire into the fall in the price of wool, the regulation of merchant companies, the best means of obtaining money payments for exports, and many other matters concerning trade. A trade commission was also appointed by Cromwell in 1655. The EAST INDIA COMPANY (*q.v.*), incorporated in 1600, had many struggles with the Dutch, who themselves founded an East India Company in 1602; the Navigation Act of 1651, prohibiting any import from Dutch fisheries, and imports from the colonies unless brought in English ships, while it caused the price of imports to rise, increased the English carrying-trade at the expense of the Dutch.

TRADE, FREE. See FREE TRADE.

TRADE, LARGE AND SMALL. Many of the considerations raised in the discussion of the relative advantages and drawbacks of production on a large and a small scale (*vide* PRODUCTION) are either identical with, or at

least analogous to, those which present themselves in any estimate of the respective merits and demerits, from an economic point of view, of trade pursued on a large and a small scale. In the sphere of that *commercial* competition, which arises in trading, as contrasted with the *industrial* competition distinguished by CAIRNES as affecting production, the larger competitors enjoy certain advantages of buying and selling, of handling a mass rather than a small quantity of goods; while the smaller competitors are able to pay greater personal attention to the peculiar wants of individual customers. On the one hand, the larger houses can spread their purchases over a wider market, they can employ more competent and experienced buyers, they can offer a better chance of a regular demand, they can afford more easily to risk the loss of having some goods left on their hands. They command more extensive resources than those at the disposal of their smaller competitors. They can also sell on better terms. They can advertise their goods more effectively. They can employ a larger and abler staff of commercial travellers to push their wares. They can acquire more easily a high reputation, which inspires their customers with confidence in their disinclination to cheat or adulterate. They can offer a greater variety of goods to suit different tastes. In the internal management of the business they are able to avail themselves of the economies which attach to organisation on a large scale. They can apply the principle of the division of labour more fully; and it may be noticed that, even where the small producer has an advantage in the personal superintendence of his workmen—in preventing them from wasting time or material—the same advantage is by no means so obvious in the business of the trader, selling to customers the goods which others have produced. There is here hardly so much opportunity for waste, and it is easier to secure the effective superintendence of subordinates. It is conceivable that economic considerations may point in the direction of large trading in goods, which are produced most successfully on a small scale. The qualities required for a competent dealer are perhaps more generally diffused, and more readily tested. On the other hand, in spite of the growth of large establishments in retail trade, which reproduce on a great scale the general shop of the country villages, and offer to customers the convenience of completing their various purchases within one building, it is still true that the personal attention, which a small shopkeeper can give to the personal idiosyncrasies of his customers, has an economic importance which is hardly realised, and with difficulty attained, in a large establishment. Time may, as it seems, be wasted, both by buyer and by seller, but the waste is agreeable to the one and is indirectly

profitable to the other. It is a commonplace of economic treatises that friction is more prevalent in retail trade than in other departments of economic action; and this friction it is which assists the small shopkeeper to hold his own against the larger dealer. Mr. Charles Booth has remarked in his investigations into the conditions of *London Life and Labour* that one of the most characteristic features of London industry is, contrary to a common opinion, the number of small undertakings; and, though the more obvious feature of the times in trade as distinct from industry seems to be the concentration of small businesses, and the extended development of large concerns, this change, which often amounts in reality to a substitution of wholesale for retail trade, may still be accompanied by the constant creation of supplementary and independent shops, where scope is left for the close vigilance and minute attention of the smaller trader. From a social standpoint it may be observed, on the one hand, that individuals unable to become capitalists themselves, may secure tolerable incomes as the salaried agents of large concerns; and on the other, that the suppression of the small traders by immense companies tends to remove a useful element from the life and activities of small towns. In this, as in so many instances, it is easy and tempting to generalise, but the process is not seldom as dangerous as the results are untrustworthy.

[Cp. Arts, on EMPLOYERS AND EMPLOYED, and INDUSTRIES, LARGE AND SMALL.] L. L. P.

**TRADE MARK.** The term "trade mark" denotes a distinctive mark or device showing that the article to which it is affixed is manufactured or sold by a certain house or firm. By recent statutes a trade mark must consist of or contain at least one of the following essential particulars:—

(a) A name of an individual or firm printed, impressed, or woven, in some particular and distinctive manner; (b) a written signature or copy of a written signature of the individual or firm applying for registration thereof as a trade mark; (c) a distinctive device, mark, brand, heading, label, or ticket; (d) an invented word or words; (e) a word or words having no reference to the character or quality of the goods, and not being a geographical name.

The common law recognised the exclusive right of a manufacturer to use a trade mark which had come to be recognised as distinctive of his goods. A register of trade marks was established in 1875, and remodelled in 1883. Anybody wishing to register a trade mark must make application to the comptroller-general of patents, designs, and trade marks. The register contains the names and addresses of proprietors and a record of every change of property in a trade mark. It is necessarily open to public inspection. Registration is

*prima facie* evidence of a right to the exclusive use of a trade mark, and becomes conclusive evidence after the lapse of five years. It must be renewed every fourteen years. No action can be brought for the infringement of an unregistered trade mark. For an ordinary infringement the remedy consists in damages and an injunction; but fraudulent infringement is a criminal offence, punishable with fine and imprisonment, beside forfeiture of the goods in respect of which the offence has been committed. Foreign goods bearing a trade mark in use in the United Kingdom may not be imported unless the trade mark is accompanied with a definite indication of the country in which the goods were produced. As the right to a trade mark is always the exclusive right to use it in connection with a particular class of goods, it can be assigned or transmitted only in connection with the goodwill of the business concerned in making those goods. It is determinable with that goodwill.

[See the *Patents, Designs, and Trade Marks Act 1883* (46 & 47 Vict. c. 57), amended by the *Act 51 & 52 Vict. c. 50*; the rules and orders made in pursuance of the statutes and the cases, *Select Committee on Merchandise Marks, 1887.*]

**TRADE NAME.** See **FIRM.**

**TRADE REVIVAL.** See **REVIVAL, TRADE.**

**TRADER.** A trader is principally distinguished from a merchant in economic phraseology, if such a distinction can be said to exist at all, by the comparative magnitude of their commercial transactions, though there is also a possible implication, approved by convention, that the former is more actively, the latter more passively engaged in trade (see **TRADE**). Similarly a tradesman is differentiated from a trader by being more personally occupied in the actual purchase and sale, and especially the sale of goods, while the trader rather provides them for him. In legal language any person engaged in any kind of mercantile or industrial business is called a trader. Before 1869 only traders were subject to the bankruptcy law, and even now, in the case of married women, a distinction is made between married women "carrying on an independent trade separately from their husbands" and other married women. Bankruptcy proceedings cannot be taken against the latter.

R. W. C. T.

**TRADE UNIONS.** A trade union has been defined as "a continuous association of wage-earners for the purpose of maintaining or improving the conditions of their employment" (Sidney and Beatrice Webb, *History of Trade Unionism*, ch. i. p. 1).

No organisation corresponding exactly to this definition appears to have existed before the beginning of the 18th century, when employers and employed first became permanently differentiated in certain important in-

dustries. The principal object of the original trade unions was to secure the better enforcement of various protective laws, such as the statute of apprentices (5 Eliz. c. 4), which were fast falling into abeyance (see **APPRENTICESHIP, STATUTE OF**). But when the factory system had grown up and caused these laws to be repealed, the function of trade unionism changed. The workers combined no longer to enforce the law, but to maintain restrictions which the law had ceased to countenance. In so doing, they found themselves opposed by the mass of legislation that had gradually grown up against combinations to affect wages and to hamper the free course of trade. These statutes were consolidated and strengthened in 1799, and it was not till after their repeal in 1824 that membership of a trade union ceased to be a statutory criminal offence (see **COMBINATION LAWS**). The legalisation of trade unions, however, was not yet complete. For, in 1867, the Court of Queen's Bench held, in *Hornby v. Close*, that the objects of a trade union, though no longer necessarily criminal, were still so far illegal as being "in restraint of trade" that no contract or trust undertaken in respect of them could be enforced. No action could, therefore, be maintained against a trade-union official for wrongfully withholding a portion of the union funds. It was the agitation provoked by this decision that led to the passing of the Trade Union Act of 1871, which has given trade unions their present legal status. According to this act, every trade union is recognised, whether its objects be "in restraint of trade" or not, as a legitimate object of a trust. Thus, it can hold property, both real and personal, in the name of trustees, who can sue or be sued in respect of such property. But it has no legal personality so as to enable it to sue or be sued directly as a corporate body, nor can its officials be sued on behalf of its members collectively except in order to assert or defend their proprietary rights (see *Temperton v. Russell* (No. 1), 1893, 1 Q. B. 435). It cannot, therefore, either directly or through representatives, enter into collective agreements on behalf of its members, so as to become liable, in case of breach of contract, to be sued for damages payable out of its funds. The Trade Union Act, as amended in 1876, relates to "any temporary or permanent combination for regulating the relations between employers and employed or for imposing restrictive conditions on the conduct of any trade or business," and therefore applies to associations of employers as well as to associations of workmen.

It is pointed out in the 149th paragraph of the report of the royal commission on labour that, where employers and workmen have surrendered the settlement of their mutual contracts to associations which cannot sue or be sued for damages if their members break the

agreements made in their behalf, there is collective action without collective responsibility. Eight of the commissioners, accordingly, reported in favour of an act enabling trade unions "to acquire, by some process of registration, a larger legal personality and corporate character than that which they can at present possess" (see *Fifth and Final Report of the Royal Commission on Labour*, p. 116, par. 10, *Parl. Papers*, c. 7421 of 1894). Most of the labour leaders, however, appear to be opposed to any such change in the law (see *Fifth and Final Report of the Royal Commission on Labour*, p. 146).

According to the latest official statistics contained in the report of the labour department of the board of trade on trade unions in 1896 (*Parl. Papers*, c. 8374 of 1897), the total number of trade unions furnishing returns was 1330, with an aggregate membership of 1,487,562, and an aggregate income of more than £1,675,645, an aggregate expenditure of over £1,239,230, and upwards of £2,168,989 in hand. It is further computed that only about one adult male manual worker in five is a trade unionist. But the great solidarity and complete organisation of the unions, coupled with their unequal distribution among the various trades and districts, give them an influence in the industrial world out of all proportion to their membership (see Webb, *History of Trade Unionism*, pp. 409-430). In recent years, there has been a decided tendency towards the amalgamation of trade unions with one another, the federation of the trade unions connected with the same industry, and the federation of trade unions connected with different industries with a view to exercising greater force in industrial warfare. It has not, however, yet been shown by experience that trades of a totally distinct character from one another can be permanently amalgamated or federated together. For this purpose, a certain natural affinity of occupation would seem to be necessary. At the same time, the annual trade union congresses bring the various associations which take part in them into a certain connection, the chief object of which is to secure common action in matters requiring legislative treatment. In many industrial centres, moreover "trades' councils" exist, composed of the representatives of different and independent trades, and these have a great and, apparently, increasing influence in consolidating for common action the forces of local trades (see *Fifth and Final Report of the Royal Commission on Labour*, p. 32, par. 82).

The constitution of the trade unions varies considerably, but chiefly with regard to the amount of real power vested in their central executive officers. In some cases, as in that of the Durham coal miners, so many references have to be made in the case of general questions to the local "lodges" or branches, to be decided

by ballot, that the central body is little more than a group of delegates, acting under immediate instructions, and having to refer points to their constituents even in the midst of negotiations with employers. In other cases, especially where a trade is scattered in various branches all over the country and through districts differing widely in local circumstances from each other, much power and discretion is frequently left with the district or branch officers, while the central executive possesses full control over the funds, and is thus able to exercise a deciding power in the last resort. The measure of control which is vested in the central executives of some trade unions is remarkably full and complete. The society of the boiler-makers and iron shipbuilders presents an example of the very successful working of a trade union strongly centralised in this manner (see *Fifth and Final Report of the Royal Commission on Labour*, pp. 28 and 29, par. 72).

Trade unions of the normal or "old unionist" type discharge two main functions—protective and benevolent—and their policy varies according to the relative importance which they attach to each. Those that exist primarily for the protection of their members against their employers, aim chiefly at substituting collective for individual bargaining between masters and workmen, and, in their struggle to obtain "recognition" for this purpose, are often ready to resort to the risky expedient of strikes. Those, on the other hand, that make the provision of benefits their main concern, are rather apt to adopt a "peace at any price" policy, for fear of risking in strikes the funds on which there are so many other claims. Many of the so-called "new unionist" leaders profess less anxiety either for obtaining the "recognition" of employers or for the integrity of the trade-union capital than for vesting all employing and capitalist functions in responsible political authorities. But the nature of the relationship subsisting between the old trade unionism and the socialist or "new unionist" movement is a matter of dispute. Some consider it to be one of essential antagonism, and point to the fact that socialism is invariably strongest among those trade unions whose organisation is weakest; while others contend that it is one of close alliance, and point to the resolutions of the trade union congress in which the socialist creed is affirmed.

Whether it be economically possible to raise wages universally by means of combination is a question long disputed. J. S. MILL, whilst he regarded capital as the wage fund, considered attempts to raise wages, except by adding to capital, to be logically absurd, but on his abandonment of this view of the source of wages, his attitude to combination changed. Modern economists, however, holding that wages are paid out of produce, argue that the gross earnings of industry often suffice to aug-

ment wages after the sum originally advanced out of capital has been refunded with interest, and conclude that combination to raise wages may succeed (see also COMBINATION LAWS). If this reasoning be sound, the issue is reduced to a question of fact—whether the net effect of the action of trade unions is to lessen production, or, as it is more often put, to “drive trade out of the country.” The superior importance which they seem to attach to finding employment for all their members rather than to raising the wages of a portion of their number suggests a negative answer. But the point can only be authoritatively decided after a more detailed analysis of their working and its economic results than has yet been attempted.

[See Marshall's *Economics of Industry*, bk. v. chs. ii. and xiii.; Sidgwick's *Pol. Econ.*, bk. ii. ch. x.; Walker's *Pol. Econ.*, pt. iv. ch. v., and pt. vi. ch. v.; and Walker's *Wages Question*.]

Whatever view be held as to the character of the financial advantages gained by “trade union effort,” there is no doubt as to the economic effect of the means adopted in order to obtain them. Although strikes may sometimes enable employers to dispose more easily of their surplus stocks, they are universally admitted to be, on the whole, agencies of pure destruction and wastefulness; and the strength of the economic case against them is often used as an argument against trade unionism generally. It is, accordingly, contended in reply that the connection between trade unionism and strikes is only transitory, and that the organisation that makes a large strike possible is the means of preventing the outbreak of a host of smaller ones, and thus of saving a larger portion of the national wealth than it destroys (see also STRIKES).

The foregoing statements apply only to the United Kingdom, and it is only in the United Kingdom that the higher developments of trade unionism can be studied. In the Australasian colonies, trade-unionism is certainly very strong, but its industrial environment is so imperfect that the recognition by employers of the principle of collective bargaining is hardly even hoped for. For the United States of America trade unions, see TRADES UNIONS, UNITED STATES. In Canada, industrial organisation is still backward. On the continent of Europe, generally, the real or imagined connection of workmen's organisations with the party of political revolution and the consequent alliance between the employers and the all-powerful state bureaucracies, combine to hinder the development of organisation on purely industrial lines. It is in Belgium and Switzerland that industrial organisation most nearly approaches the English type; but, even in these countries, the most important working-class associations are largely mixed up with the machinery of general party politics.

[For detailed information on the subject of the last paragraph, reference may be made to the series of reports on the labour question in foreign countries, published by the royal commission on labour (see *Parl. Papers*, c. 8795, x. of 1892; c. 6795, xi., 7063, vi., 7063, vii., 7063, viii., 7063, ix., 7063, x., and 7063, xii. of 1893-94; and c. 7063, xi., 7063, xiii., and 7063, xiv. of 1894).

In addition to the works already cited, there may be mentioned the following: Brentano, *Hours and Wages in Relation to Production*, London, 1894.—Comte de Paris, *The Trades Unions of England*, London, 1869.—Sir W. Erle, *The Law relating to Trade Unions*, London, 1869.—Howell, *The Conflicts of Capital and Labour*, London, 1890, and *Trade Unionism, Old and New*, London, 1891.—Sir J. F. Stephen, *History of the Criminal Law of England*, London, 1885.—Spyers, *The Labour Question*, London, 1894, being an epitome of the evidence and report of the royal commission on labour, and the “*Labour Gazette*,” the annual reports on trade unions and strikes and other periodical publications of the labour department of the board of trade (LABOUR DEPARTMENT AND STRIKES; VEND, NEWCASTLE).]

#### TRADE UNIONS (UNITED STATES).

Early History, p. 565; Present Size, p. 566; Benefits, p. 567; International Typographical Union, p. 567; Cigar-Makers International Union, p. 567; United Brotherhood of Carpenters and Joiners, p. 568; Knights of Labour, p. 568; Railroad Unions, p. 569; United Green-Glass Workers and National Association of Stationary Engineers, p. 569; The American Federation of Labour, p. 570; State Activity, p. 571; Strikes and Lockouts, p. 572; Objections to Trade Unions, p. 572; Apprentices, p. 572; Labels, p. 573; Labour Papers, p. 573; Labour Leaders, p. 573; Authorities, p. 573.

Nothing is known of labour organisations in America prior to the present century. Records exist of a strike of bakers in New York in 1741, indicating the possibility of a local union at that time, though doubtless only temporary. The strikers were convicted of conspiracy by the courts. There were four successful strikes of a shoemakers' union in Philadelphia, 1792, 1796, 1798, and 1799. Thence till 1821 occasional strikes are recorded, some successful, some unsuccessful, among sailors, cordwainers, printers, and the building trades along the Atlantic seaboard between Boston and Philadelphia, but no important unions existed. During these times the courts almost invariably convicted the strikers, when brought before them, of conspiracy in seeking through an association to raise wages more than the laws of supply and demand would otherwise allow. Such decisions of the courts have been met by statute law, especially since 1850, so that to-day men are free to belong to labour organisations, but courts still sometimes convict, when men strike on railroads or boycott an employer.

The tailors, according to Mr. George E. M'Neill, the historian of the labour movement, organised the first modern trade-union in 1806;

the hatters followed in 1819. Both had previously retained membership in English trades-unions. There was a printers' union in Philadelphia as early as 1802. In 1833 came the first union of various trades of a city—New York,—followed in 1834 by a smaller trade assembly or central trade and labour union of sixteen unions of mechanics in Boston. Prior to 1840 the following trades had local organisations in some of the largest cities; ship-carpenters and joiners, calkers, house-carpenters, printers, roofers, bricklayers, tailors, hatters, saddlers, cordwainers and shoemakers, factory operatives, marble and freestone cutters, coopers, and masons. The panics of 1837 and 1857 interfered with labour organisation, but in 1862 twenty-six trades are said to have had a national organisation. Many, however, were very weak. Through their agitation hours of labour had been reduced to eleven in a large portion of the textile factories, and the ten-hour day secured in government work and most of the building trades. The civil war again interrupted the growth of the unions, many of whose members enlisted in the armies of the north. After the war, organisation was beginning with much success when the severe depression of 1873 to 1877 again forced many of the unions to the wall and endangered nearly all of those remaining.

In 1888 the secretary of the American Federation of Labour reported 53 national and international trade unions in the United States, with a membership of 510,700 in 5247 local unions. He reported in 1893 a membership of 640,000 in 83 national unions having about 8000 local unions. Not all were affiliated with the American Federation of Labour. There were also, at both dates, several hundred unaffiliated local unions. The 12 largest trade unions in the country contained about 230,000 members in 1888. The 12 largest unions at the close of 1896, not necessarily the same as those just referred to, contained about 266,000 members. In the following table there is given the date of organisation and the membership approximately 325,000, of the 20 largest unions, as reported to the writer by their secretaries, or as shown by their representation in the convention, in December 1896, of the American Federation of Labour.

The 20 national unions that were represented at both the 1892 and 1896 conventions of the American Federation of Labour had votes, in the two conventions, indicating a membership in December 1892 of 201,500, and in 1896 of 176,200, a decline of 12·6 per cent; yet this falling off during the severe depression was small compared with the decline in the previous depression of 1873 to 1878, at the close of which it is estimated that there were not over 40,000 members left, who were keeping up their dues in the unions.

Name of Brotherhood.	Date of foundation as a national body.	Membership, 1896.
Brotherhood of Locomotive Engineers	1863	32,000
United Brotherhood of Carpenters and Joiners of America	1881	29,601
International Typographical Union	1850	28,838
Cigar-Makers' International Union of America	1864	28,700
Brotherhood of Railroad Trainmen	1883	24,000
Bricklayers' and Masons' International Union of America	1865	23,254
Brotherhood of Locomotive Firemen	1873	22,461
Iron Moulders' Union of North America	1859	20,000
United Mine Workers of America	1890	15,400
Western Federation of Miners		15,000
International Association of Machinists	1888	14,300
Boot and Shoe Makers' Union	1889	12,000
United Brewery Workmen's National Union	1886	10,000
United Garment Workers of America	1891	10,000
Order of Railway Conductors of America	1868	8,000
Amalgamated Association of Iron and Steel Workers	1876	8,000
Flint Glass Workers' Union of America	1878	7,200
Machine Wood Workers and Amalgamated Furniture Workers	1890	6,500
Brotherhood of Painters and Decorators of America	1887	5,000
Journeymen Tailors' Union of America	1883	5,000
Total	..	325,344

The membership of the unions affiliated with the American Federation of Labour in 1896 was estimated at about 400,000 by the Michigan state bureau of labour statistics. The federation at this time included 54 national unions, 361 independent local unions, and 10 state and 61 city branches, in which were included a large portion of the membership of the national and local unions.

Aside from the American Federation of Labour there were, in 1896, 6 unions connected with the steam railroads, and having a membership of about 95,000; also the Bricklayers' and Masons' International Union of America, containing 25,254 members, and approximately 105,000 members of still other unions in New York state. If to this be added the probably 125,000 members of other unions in other states, the total number of American labour organisations, at the close of 1896, would appear to be about 750,000, although it might vary 10 per cent in either direction.

According to the census of 1890, the number employed in manufacturing and mechanical industries, and upon street and steam railways, in the mines, the quarries, the merchant marine, the telegraph and telephone service, and as stationary engineers and firemen, was 5,404,865 males, ten years of age and upwards. Probably not over 5,000,000 were above the age of 17 in these industries. With the growth of population since 1890, the number

over 17 years of age in these occupations in 1896 could not have exceeded 5,500,000.

Inasmuch as trade unionism in America is almost exclusively confined to male wage-workers in these employments, it would appear that one-seventh to one-eighth of such employees are organised. There is scarcely any organisation among the agricultural labourers, domestic and personal servants, clerks and copyists other than salesmen, classes in which there were 5,300,096 male employees 10 years of age and upwards in 1890. Of 180,231 members of labour organisations in New York state in June 1895, according to the New York state bureau of labour statistics, only 10,102, or 5.6 per cent, were women; and of these, 8728 were engaged in the manufacture of clothing, cigars, and cigarettes. Of the 19,494 members of labour organisations in Michigan in 1896, according to the report of the Michigan state bureau of labour statistics, only 302, or 1.5 per cent, were women.

The best organised of the large trades or occupations are the glass workers, iron moulders, cigar-makers, locomotive engineers and firemen, printers, and the building trades.

Most of the trades unions of Canada are branches of those of the United States. In the province of Ontario in 1892, according to the report of the bureau of industries, there were 3227 knights of labour and 3294 trades unionists. All but about 300 of these were members of organisations having headquarters in the United States. Mr. Wm. B. Prescott, the president since 1891 of the International Typographical Union, was, when elected, a citizen of Toronto, Canada.

Only seven of the existing national unions commenced before 1873, and none earlier than 1850, while only fourteen national unions were organised before 1881.

The census of 1880 recorded only five unions with 13,032 members that then had benefit features for sickness, death, etc. In 1886 there were, according to an investigation then made by the author, and subsequently revised, twenty-six unions with about 135,000 members that had benefit features. In 1893 the number had grown to at least thirty-two national or international unions with about 330,000 members. A brief reference may be made to a few of the most important organisations.

The *International Typographical Union*, in common with the printing trade as a whole, is almost entirely composed of native Americans. Even few English printers migrate to the United States. In 1892 there were 706 women members, but it is harder to secure membership among women than men. The union rules demand equal pay for equal work, and it is noticed that when women join the union they often ask to be relieved from this law, as its enforcement frequently leads to the substitu-

tion of men for women by employers. This union is perhaps the only one in America that has had a historian to write a full statement in book form; this was done by John M. Vickar in 1892. The union also possesses a novel feature in the Childs-Drexel home for invalid, aged, and infirm members, located at a famous health resort, Colorado Springs, Colorado. In aid of it \$10,000 (£2000) was given in 1886 by Mr. George W. Childs, late editor of the *Philadelphia Ledger*, and Anthony J. Drexel, a Philadelphia banker, also now dead. In order to complete the building, which cost \$62,000 (£12,400), and to carry it on since its opening in the summer of 1892, until July 1897, the union has spent over \$190,000 (£38,000). In April 1893, the average number of inmates in the two years ending 30th June 1896 was fifty-two. The distance is too great from most of the printers to tempt a large number to avail themselves of the opportunities offered. Four-fifths of all weekly papers, and nearly all religious papers, are published from so-called open offices, where union and non-union men work together at nearly union wages. Nearly all large offices employ some non-union men, but a large proportion of the important daily papers of the country employ exclusively union men. June 30th 1897, the membership was 28,096 as contrasted with 31,379 three years before. Of the expenses of \$125,162.97 (£25,032) in 1896-97, the Home took \$34,993.70 (£6998), the burial benefit \$23,700 (£4740), trade disputes \$33,676.77 (£6735), and other expenses such as the monthly *Typographical Journal*, the office, etc., \$32,992.50 (£6598).

The *Cigar-makers' International Union of America* has the best developed system of benefits of any union in America, with the possible exception of a small union of German printers, the *Typographia*. It also has the largest reserve fund for each member, which amounted in 1893 to \$18.75 (£3.15s.), but had fallen in 1896 to \$8.25 (£1.13s.) for each member.

The title "International," in this and other American unions, indicates branches in Canada and sometimes in Mexico. The amount spent for benefit features by this union in 1892 to 1895 inclusive was \$2,953,744.91 (£590,749), of which only \$623,151.44 (£124,630), or 21 per cent, went to sustain strikes. The sick benefit took, in these four years, \$894,542.57 (£178,908), the death benefit took \$353,894.90 (£70,778). The travelling benefit, instituted like the two previous in 1881, consumed \$590,414 (£118,080), and the out-of-work benefit, instituted in 1890, took \$491,742 (£98,348). About the same ratio of expense for the different benefits has continued through 1896 and 1897. Travelling benefits not to exceed, in the aggregate, \$20 (£4), and

not over \$8 (£1:12s.) at any one time, are given as loans, so far as necessary to procure transportation to the nearest union in any direction that a member may desire to travel by the nearest route, but after obtaining employment 10 per cent of earnings must be devoted weekly to the repayment of the loan. The out-of-work benefits, after the first week, and not to exceed \$3.50 (14s.) a week, and \$54 (£10:16s.) a year, are given, and sick benefits of \$5 (£1) a week. Funeral benefits of \$50 (£10) are also paid, and, inclusive of the latter, \$200 (£40) to dependent relatives, if the deceased has been a member 5 years, \$350 (£70) if a member 10 years, and \$550 (£110) if for 15 consecutive years. For the first 16 weeks of a strike or lock-out, \$15 (£3) a week is given, and after that \$3 (12s.) a week until the end of the difficulty. The total membership grew from 1016 members in 1877, 12,000 in 1885, and 26,114 in 1893, to 28,700 (in 350 locals) in 1896. In the three years ending 30th June 1896, 7174 members were involved in trade difficulties which did not always lead to strikes. Only 756 of the members lost in their contention, 3558 won, and the remainder secured some compromise, or had not yet settled the difficulty at the end of the third year. The entire weekly cost per member in 1895 was, for benefits, 27 cents (1s. 2d.), and all other expenses, 9 cents (5d.). The average expenses for all purposes, for the 5 years ending 30th June 1895, was 20½ cents (10d.) per week per member. No strike is supported by the national body if involving more than 25 men, unless not only approved by the national executive committee, but by a two-thirds vote of the entire membership voting on the question. This provision was copied in 1890 by the International Brotherhood of Brass-workers.

An interesting feature of the union is that every one must vote on every election of officers, and on questions propounded through the initiative and referendum, which are in full force, or be fined 50 cents (2s.). This has increased threefold the number of voters, and is pronounced a success. Every candidate for high office must write 500 words for publication in the journal relative to the methods and aims of the union.

The *United Brotherhood of Carpenters and Joiners* in America was the largest trade union in America for some years, having 54,124 members in 1893. The paying membership declined to 29,691 in July 1896. From 1883 until July 1894, \$310,583 (£62,116) was spent by the national body on strikes and \$353,520.60 (£70,704) on funeral and disability benefits, while the locals spent \$685,434 (£137,086) for sick benefits. During the next two years the national body spent \$15,015.12 (£3003) on strikes, \$91,002.10 (£18,200) on benefits, and \$33,564.90 (£6713) for publishing the official

organ *The Carpenter*, and other administrative expenses.

During 1889 to 1893 inclusive, the union claims that only 4 per cent of its strikes were lost, 476 were won, and 24 compromised. It also claims to have secured the eight-hour day in 49 cities, nine hours in 399 cities, and a short Saturday in 403 other places, instead of the universal ten hours' day that prevailed in 1891, while wages were also raised fully 50 per cent. There were, in the United States in 1893, 44 locals, and 2750 members of the British Amalgamated Society of Carpenters and Joiners.

*The Knights of Labour*, the most famous of American labour organisations, was designed by its founder, Uriah S. Stevens, to educate its members so that, through co-operation and state activity, the whole wages system might be finally subverted. It was a forerunner of the so-called new trades-unionism of England and America. It was one of the first labour organisations to admit employers, women, unskilled and negro labour. To break down trade exclusiveness, all trades were at first organised in mixed assemblies. This was found, however, to almost inevitably give those unacquainted with the conditions of any industry the right to determine strikes in that industry. To prevent this, and in a spirit possibly of rivalry with the older trades unions, there arose trade districts composed no longer of mixed assemblies, but of those exclusively belonging to a single trade: for example, the district assembly, 300 members, is composed of glass workers. These trade districts seemed to lose sight of the educational idea, and engaged in trade disputes quite recklessly, while a great antagonism with trades unions in the same trades was naturally developed. The organisation of the Knights of Labour did not provide for a thorough control of trade disputes by a national body as in the best of the trades unions. The secrecy of the order led to an exaggerated idea of its importance. Ignorant workers by the thousand were rapidly admitted without such preliminary instruction in the objects of the order as was intended, and to some extent carried out by the founders of the order in its early years. A national organisation was effected 1st January 1878. The membership was 10,000 early in 1879, 71,000 in September 1884, 111,000 in October 1885, while at the October 1886 session of the General Assembly at Richmond, Virginia, the membership was reported as 730,000. It is supposed early in 1887 to have reached 1,000,000 members. The character of the membership led to such reckless indulgence in trade disputes as to produce a very rapid decline, until at the close of 1893 the actual paying membership in good standing is generally estimated by those not in the order to be under

40,000. No official statement of membership has been made for some time. The majority of the leaders, and even a large portion of the rank and file of American trades-unions, have been at one time or another members of the Knights of Labour; and while they believe that its prominent position among organisations of labour is gone for ever, they admit that the trades unions have learned many lessons from the members of the Knights of Labour, one of which is, that an injury to one is the interest of all, and another is the importance of political activity of a non-partisan type. In accordance with the ideas of its founders, the locals of the Knights of Labour were to set aside at every meeting an educational hour for the discussion of questions other than local trade disputes. The result of this, too, has been very marked on the American labour movement (see FARMERS' ORGANISATIONS IN THE UNITED STATES).

*Railroad Unions.*—Of the approximately 1,000,000 men in railroad service in the United States, Canada, and Mexico, over all of which the same unions claim to extend, less than 100,000 are now members in good standing in the unions.

The *Grand International Brotherhood of Locomotive Engineers*, like the *Firemen, Trainmen, and Machinists*, refuses to admit negroes. Three black balls also exclude. About \$1,000,000 (£200,000) in charity have been bestowed by the executive board since the foundation of the union, to say nothing of donations by locals. There is a special insurance department with policies of \$1500 (£300) in case of death or total disability. No one can hold over three policies. Through the insurance department, about \$7,000,000 (£1,400,000) have been paid to beneficiaries. The engineers have incurred the distrust of some other labour organisations by their refusal to federate with them, though occasionally they act in concert with other branches of the railroad service.

The *Brotherhood of Locomotive Firemen*, from 30th June 1880 to 30th June 1896, disbursed for death and disability benefits \$3,836,621.20 (£767,324), and for four great strikes, in 1886, '88, and '93, \$599,545.15 (£119,909). Very little was spent on any other strikes. In the two years ending 30th June 1896 the general expenses amounted to \$141,062.02 (£28,212). There was spent on benefits \$850,400.80 (£112,080), and for the protection of members in dealing with employers, \$11,078.01 (£2215). Even the latter small item does not seem to have been all spent on strikes. The membership of the union 30th June 1896 was 22,461.

The *Brotherhood of Railroad Trainmen*, with about 24,000 members, has a permanent disability and a death benefit of \$400 (£80), \$800 (£160), and \$1200 (£240), according as each person prefers to be assessed. From the

organisation of the brotherhood in 1883 until 1st August 1897, \$3,947,152.86 (£789,430) has been spent in payment of 3818 policies. Very little was spent for strikes—in most years nothing whatever. In 1896 the brotherhood spent nothing for strikes, \$491,942.90 (£98,388) for benefits, and \$73,987.01 (£14,797) for running expenses, of which \$20,292.30 (£4058) was devoted to the monthly journal of the order. Through the influence of the union, the United States government, a few years ago, passed a law in accordance with which the safety appliances upon railroads have been greatly increased.

There are other brotherhoods of smaller size, such as the *Brotherhood of Railway Trainmen*, the *Brotherhood of Railway Shop Employees*, and the *Order of Railroad Telegraphers*—an organisation which, in 1893 (its first year), aimed to absorb all the railway workers, and which did secure a membership of over 25,000, went rapidly to pieces after its defeat in the great railroad strike in 1894. It was formally dissolved in 1897.

The *United Green-Glass Workers* took the initiative in 1884 in organising a universal federation of the window-glass workers of the world. Branches were organised in Belgium, France, Italy, and England, and would have been in Germany but for legal difficulties. At present the American branch pays \$1000 (£200) yearly for the salary of the secretary-organiser, who is stationed in Belgium.

The *American Flint Glass Workers' Union*, with 7200 members, spent on a great strike, from June 1895 to June 1897, \$941,843.50 (£188,368). Although the strike was largely a failure, and the earnings of all those at work, if apportioned equally among all the members of the union, was only equivalent to \$7.97 (£1.12s.) for each week of the two years, while the strike assessments averaged \$1.19 (4s. 6d.) per week in all, the membership was but slightly decreased. Disturbed by the competition of what the union claims are half-trained apprentices, non-union men, and immigrants, the union refuses to work with any non-union men or boys, and refuses to admit to its membership any foreigner, save on payment of \$50 (£10).

The *National Association of Stationary Engineers*, organised in 1882, allows no strikes, differing in this respect from all the other unions which reported on this head. In the year 1892-93, \$2110 (£422) were paid to the sick and disabled, 1610 books were added to the union's library, and 542 lectures were secured. In the prominence of this educational side, also, this union is unique.

In Michigan, 237 local unions of various national bodies, with a membership of 19,494, were investigated in 1896 by the state bureau of labour statistics, and the result is probably

typical of the unions generally throughout the country in the matter of benefit features. It was found that 21 unions paid out, in 1895-96, an average of \$4.01 (16s.) weekly to each one out of work, while 112 made no report; 73 local unions spent, on the average, for each member who was sick, \$5.04 (£1) per week, and 82 made no report; 107 unions spent on the average for strikes \$6.43 (£1: 5s.), and 79 made no report; 93 unions spent an average of \$74.12 (£15) for each death in the order, and 82 made no report. The other unions, in each case, reported no expenses under these heads.

In Indiana, in 1893, according to the report of the state bureau of industrial statistics, 96 unions paid sick benefits aggregating \$8254 (£1651), and 125 paid death benefits aggregating \$16,409 (£3281). The membership of these unions then was 19,081 and the average number of hours per day worked was 9.7, or almost exactly the same as in Michigan.

In New York state, 474 organisations, with 121,925 members, reported to the New York state bureau of labour statistics in 1895, that they expended in benefits, in 1894, \$511,817.59 (£102,363). Of this amount \$89,150.04 (£17,830) was spent for strike benefits, and \$10,676.74 (£2133) was donated to other labour organisations, presumably for strike purposes, or a total under this head of 19.5 per cent of the total benefits. For out-of-work benefits, \$106,801.69 (£21,360) was spent; for sick benefits, \$60,207.98 (£15,041); for death benefits, \$93,437.92 (£18,685); and for other benefits, \$151,543.22 (£30,308). A large part of the latter item seems to have been paid to members who were unable to procure employment. In 67 other labour organisations, 11,660 members reported that they financially aided their members, but failed to state the amount spent. The remaining 319 labour organisations, with 23,612 members, failed to make any report upon this head.

The first successful effort to federate a large number of American trades unions was made in 1866, when the *National Labour Union* was founded, composed of sixty organisations, only part of which, however, were national in extent. Its nomination of a presidential ticket in 1872 divided its membership, and the panic of 1873 completed the ruin of the union.

In 1881 there was organised at Pittsburgh, Pennsylvania, the *Federation of Organised Trades and Labour Unions* of the United States and Canada, whose name was changed in 1886 to its present form of *The American Federation of Labour*. The growth has been steady, until to-day nearly all the important unions having a national organisation, excepting those in railway employment, are affiliated to it. It is impossible to give the number of unionists thus affiliated,

because most of the unions do not pay a *per capita* tax to the federation on all their membership. This tax is three cents (1½d.) per member per year in the case of national unions and twelve cents (6d.) in the case of such locals as have no national organisation. A further difficulty arises from the fact that the same person may be represented in the federation twice, once as a member of his union and again as a member of the central labour body of his city.

At the 17th annual convention of the Federation, held in Cincinnati, Ohio, in December 1896, there were 64 delegates, representing 38 national unions which had paid in a *per capita* tax on 239,600 members. At the same convention 35 delegates represented local unions of perhaps as many hundred members. Three represented the state federations of Illinois, New York, and Massachusetts, and 15 represented the central bodies of Boston and Laurence, Mass.; Baltimore, Md.; Washington, D.C.; Erie, Pa.; Cincinnati, Toledo, Hamilton, and Zanesville, Ohio; Indianapolis, Ind.; Louisville, Ky.; Nashville, Tenn.; St. Louis and Kansas City, Mo.; and Duluth, Minn.

Although in 61 cities the central labour union, or federation of all the unions of the city, affiliate with the American Federation of Labour, New York, New Orleans, Buffalo, and a few other large cities do not affiliate.

The *American Federation*, though hampered by a small revenue and by contests, now growing less in number and bitterness, with the Knights of Labour, has been of value in bringing labour leaders together through correspondence in the annual conventions,—in helping forward the eight-hour movement, and all kinds of labour legislation. Occasional loans and even gifts are also made to trades unions, chiefly to secure proper legal presentation before the courts of what seem likely to be leading cases.

A few comparisons between the British trades union congress and the American convention of labour may be made, based upon an article in the *American Federationist* for December 1896 (published in Washington). Whereas in England the parliamentary committee is the only representative and executive body of the trade unionists between their congresses, a committee whose business it is to ask parliament for legislation, the representative and executive body in America between conventions, is the executive council of the American federation of labour, consisting of the president, four vice-presidents, a secretary, and a treasurer, annually chosen. The president now receives a salary of \$1800 (£360) a year and travelling expenses, and the secretary \$1500 (£300). It may be stated in passing that the salary, aside from travelling expenses,

of the chief of the Cigar-makers' International Union, is \$30 (£6) a week, that of the Firemen \$2500 (£500) a year, of the Railway Trackmen \$1500 (£300), and of the secretary of the Bricklayers and Masons \$1200 (£240).

The executive council of the American Federation concerns itself not only with state and national legislation, but with organisation, strikes, boycotts, grievances, etc. The president presides at all the sessions of the annual conventions, unless temporarily relieved at his own request, and appoints standing committees for the different phases of business considered by the convention, such as legislation, boycotts, labels, *The Federationist*, salaries, organisation, propaganda, grievances, etc. The British congress has no standing deliberative committees, and therefore has little time to consider anything save legislation.

In the American conventions the unit rule is unusual. The convention meets on the second Monday in December, and continues in session until all the business is transacted, usually nine or ten days. Reporters have never been excluded. Government representatives, excepting those for bureaus of statistics, are not seen at the conventions, but a few economists and others are usually in attendance.

The rank and file of American wage-earners in and out of trades unions are not yet committed to any very definite or large schemes of state activity, and are greatly kept back in this matter as compared with English wage-earners by constitutional limitations in national, state, and local government. The doctrine of *laissez-faire*, until lately fostered in America by industrial conditions that opened opportunities for advance to every one, is not at once shaken off. The greatest recent political achievement of labour in America appears to be in the law signed by President Harrison in his last year of office, prohibiting more than eight hours a day of labour on all future contracts for the national government. Another and older law forbids more than eight hours of work by government employes. These two laws are being introduced in the state and city governments. The unions are everywhere the chief supporters of factory and other labour legislation.

The years 1892 and 1893 witnessed a rapid growth of desire for state activity along the line of the so-called "new trades-unionism." The last convention of the federation in 1893 submitted to the consideration of the local unions the demands of the English trades-unionists for compulsory education; direct legislation; a legal eight-hour working day; sanitary inspection of workshops, mines, and homes; liability of employers for injury to health, body, or life; the abolition of the contract system in all public work; the abolition of the sweating system; the municipal ownership of street cars and gas and electric light plants for public distribution of heat, light, and power; the nationalisation of telegraphs, telephones, railroads, and mines; and the collective ownership by the people

of all means of production and distribution. The attempt to commit the federation to this entire platform, including its last plank of pure socialism, by recommending it not only to the consideration but to the "favourable" consideration of the unions, was voted down by the slight majority of 1253 to 1185, and this was only secured by the method of voting in these conventions, which gives trades unions a vote for every 100 members for which *per capita* dues have been paid, but allows only one vote to each of the central bodies of the cities. Of the 15 representatives of the latter 14 voted to retain the word "favourable," and of the 86 delegates from all organisations 54 voted in the same way. Recent restrictions by the courts of strikes on railroads, when in the hands of receivers, as many now are, is increasing the demands by railroad employes for government ownership.

In the convention of 1894, at Denver, the federation struck out the demand for the collective ownership by the people of all means of production and distribution, but passed a vote upon all the other planks, which was interpreted by the convention in New York in 1895, by a large majority, as meaning that these planks should be considered legislative demands of the wage-workers, and not a political platform. In the convention in Cincinnati in 1896 the following resolution was passed:—

"Whereas the influences of corporations, holding, or seeking to obtain, possession of public franchises, are one of the most potent influences antagonistic to reformative measures, and the most active cause of corruption in politics and of mismanagement and extravagance in public administration; therefore, be it

Resolved, that the sixteenth annual convention of the American Federation of Labour urges upon all the members of affiliated bodies that they use every possible effort to assist in the substitution in all public utilities—municipal, state, and national, that are in the nature of monopolies—public ownership for corporate and private control."

The use of injunctions in labour disputes since 1893 has further increased the interest of the wage-earner in such political action as may check this new action of the courts. According to recent decisions, a judge may try without jury, and sentence for contempt for an indefinite period, all violators of some order of court prohibiting, perhaps, the marching on the highways in crowds, or the use of offensive epithets in the neighbourhood of a strike, or the interference in "any manner" as a recent injunction, in 1897, in Pennsylvania declared, "with the plaintiff's employees while they may be passing to and from their work . . . on or near plaintiff's premises."

Labour contests in the strongest organisations are more and more prevented by conciliation and arbitration. Conference committees of employers and employes often make yearly agreements in coal mining, glass, iron and steel making, cigar-making and the building trades. American trades-unionists, outside at least of railroad organisations, have a growing dislike to working with the non-union men, and in very many unions the members refuse to do so. This action finds its apology if not

its defence in the apparent economic success of the policy and in the use of similar methods by many combinations of capitalists, which refuse to deal with competitors who do not join the combination, or with customers who patronise such competitors. When the non-union man, denominated a "scab" by the union, tries to take the place of strikers, violence is often visited upon him by the union, as some years ago in England; but the majority of the unions do not countenance violence.

During the 13½ years from 1st January 1881 to 30th January 1894 there were 14,390 strikes in the United States, involving 69,167 establishments and 3,714,406 employes. In the 10,375 establishments having successful strikes, 1881-86 inclusive, 518,583 employes were involved. In the 3004 establishments in which strikes were partly successful, 143,976 employes were involved, while in the 8910 establishments in which the strikes were failures 660,396 or 49·9 per cent of the employes in all the establishments were thrown out of employment. In the 20,397 establishments having successful strikes from 1st January 1887 to 30th June 1894, 669,992 persons were involved. In the 4775 establishments where strikes were partly successful 318,801 employes were involved, while in the 21,687 establishments in which strikes failed, 1,400,988 persons, or 58·6 per cent, were involved.

The percentage of those failing in strikes during 1887-92 inclusive, prior to the depression, was 55·5 per cent. In the whole 13½ years 32 per cent of those thrown out of employment by strikes won, 12·46 per cent partly succeeded, while 55·5 per cent failed entirely. From the other 0·04 per cent no report has been obtained.

Of the establishments involved, 82·24 per cent, during 1881-86 inclusive, were subjected to strikes by order of labour organisations, and from 1st January 1887 to 30th June 1894, 69·6 per cent. The average duration of the strikes for the 13½ years was 25·4 days. In the first period, 1881-1886, there were 9409 establishments involved in strikes for a rise of wages. In 65·99 per cent of these the men were wholly successful, and in 8·43 per cent were partly so. In the second period 12,041 establishments were involved in strikes for this cause, and in 51·1 per cent the men were successful, and in 10·7 per cent partly so. In the first period there were 4344 establishments concerned in strikes for the reduction of wages, and in 24·29 per cent the men were wholly successful, and in 22·24 per cent partly so. The respective percentages in the 6199 establishments effected during the next period were 56·8 and 1·5. Of the 1734 establishments in which there were strikes against reduction of wages, in the first period the men succeeded in 34·2 per cent, and partly in 9·1 per cent. During the second period the percentages in the 3330 establishments were respectively 16·9 per cent and 25·4 per cent; of the 1314 establishments in which there were strikes for the recognition of the union in the second period, the men failed in 92·7 per cent. Of the 3620 settlements in which there were sympathetic strikes the men failed in the second period in 73·7 per cent.

Much of the opposition to non-union men which prevails among those not wage-earners is due to the comparative newness of unions in America and to the fact that the absorption of free government land, and the growth of manufacturing and mining, have only recently developed the need for labour organisations, a need which a majority of the American-born population reared under different conditions are yet unable to appreciate. The presence in the country of coloured, Chinese, Italian, Bohemian, Hungarian, French, Canadian, German, Irish, and many other nationalities, introduces many complications in labour disputes. These nationalities largely fill up the hard-handed industries which native Americans, perhaps in consequence of this foreign element, are loath to enter. Naturally the foreign-born enter the unions of their trade and give to many the impression that the trades unions are antagonistic to native Americans. Yet the returns of a large number of the unions indicate that the percentage of native Americans is fully as large in most trades unions as in the trade at large, and that the German only is considered to vie with the native American in aptitude for organisation. The absence, until very recently, of technical or trade schools accounts in part for the moderate percentage of Americans in some trades. In some cities every skilled tailor, for example, is of foreign birth, yet outside at least of a few trades in a few cities on the Atlantic coast there is, according to trades-union officials, more prejudice among the unions against than in favour of the immigrant. Nearly all of the trades unions organised prior to 1870 were chiefly composed of native Americans and led by them. A workman trained abroad must pay an initiation fee of \$50 (£10) to enter either the *American Flint-Glass Workers' Union* or the *United Green-Glass Workers' Union of the United States and Canada*, perhaps the most successful of the large unions in keeping up wages and securing a six weeks' summer vacation, and a seven to eight hours' day.

The tableware branch of the *American Flint-Glass Workers' Union* presents the only instance known to the writer of an American union openly restricting the number of pieces its members shall make per day on piece-work.

The attitude of the unions toward apprentices attracts much attention in America. The rapid development of machinery and the dislike of both the boy and the employer for the restrictions of a three or four years' apprenticeship have dealt a fatal blow to this system of trade instruction in most trades. In industries where machinery is not the dominating factor, such as glass-making, iron-moulding, type-setting, brick-laying, and stone-work, plumbing, pattern-making, and a few very small trades like tack-making, knife-grinding, and tile-laying, there is a fairly successful effort by the unions to enforce apprenticeship laws, and even in some places to restrict the ratio of apprentices to journeymen. Even in those cases such statistics as have occasionally been gathered by state bureaus of labour statistics, as in Massachusetts in the census of 1885, indicate that there are usually more young men

in training without any formal apprenticeship, and much fewer apprentices than the trades-union rules would allow. Only about one per cent of American strikes relate to apprenticeship rules, and few of these succeed. Efforts are now being made to create a substitute for the apprenticeship system in manual training in schools.

Many unions have gained concessions from employers by having labels affixed to all goods made by their members. The members of all labour organisations are then urged to buy only such labelled goods, when purchases are made in trades where the label is in use. The secretary of the American federation of labour thus reported at the 1896 convention; "The unions now reporting the union labels are: the cigar-makers, boot and shoe workers, hatters, printers, garment workers, bakers, carriage and waggon makers, sardine packers, salmon fishermen, tobacco workers, tailors, moulders, wood workers, cracker bakers, coopers, flour-mill employés, brewery workers, mattress makers, broom makers, laundry workers, teamsters. The clerks, barbers, and waiters have cards, and the agents a badge. The growth of the union label is steady and sure. It is the backbone of some of our unions, and a great aid to them all. Label leagues are being instituted in many places, both on local and state lines, and are doing good work."

The trades unions of America have never sustained a broad, ably-edited labour paper, but support scores of monthly journals and a few weeklies devoted to the interests of the trade union which publishes such. A few have been excellent of their kind. A new and somewhat hopeful effort to bring out a strong journal has just resulted in the issue of the *Federationist*, a monthly organ of the *American Federation of Labour*.

Among the great organisers and leaders of the American labour movement in the past or present should be mentioned the following, with a word in regard to each. George E. McNeil of Boston, author of an important history of American labour organisations, entitled *The Labour Movement*, and one of the first trade unionists to urge the eight hour day.—Uriah S. Stevens, a garment cutter of Philadelphia, and founder of the *Knights of Labour* in 1869.—Terence V. Powderly of Scranton, Pa., grand master workman of the *Knights of Labour* from 1879 to 1893.—Adolph Strasser, the virtual creator of the *Cigar-Makers' International Union*.—P. J. McGuire of Philadelphia, secretary since 1881 of the *Brotherhood of Carpenters and Joiners*.—Samuel G.ompers of New York, president since 1882 of the *American Federation of Labour*.—P. M. Arthur of Cleveland, O., and chief since 1874 of the *Brotherhood of Locomotive Engineers*.

[Reports, constitutions, and magazines, of the organisations treated, and correspondence with their officials.

TRAFFIC. See COMMUNICATION, MEANS OF.

TRANSFER or "DEED OF TRANSFER" is the name for an instrument by which a mortgage or other debt or a share or debenture is assigned to a purchaser or devisee. Some companies require transfers to be executed in a special form (see FORGED TRANSFER). E. S.

TRANSFER DAYS are the days on which stock registered in the books of the Bank of England may be transferred. All business days except Saturdays are transfer days, and even on Saturdays transfers may be made on payment of a special fee. E. S.

TRANSFERS, TELEGRAPHIC. See TELEGRAPHIC TRANSFERS.

TRANSHUMANCE is the French name given to the periodical migrations of sheep and cattle from certain regions to others, for instance during summer from valleys to highly situated pasture lands in the mountains. Under this form it is still practised in Provence, Piedmont, and Switzerland, though it is falling into disuse in Southern France, where, however, some villages situated in the alpine region derive an income of 0.75 fr. to 1 fr. (say 7d. to 10d.) per head on sheep pastured on their territory. Since the necessity of replanting the slopes of the Alps became recognised, the French law of 1882 has imposed certain conditions and limitations on the passage and right of pasture of these flocks. Experience, moreover, has shown that it is more profitable to bring cows than sheep into these mountainous regions. Some French villages of the *Département des Hautes Alpes* send during the winter their cows to the neighbouring Piedmontese valleys, where the inhabitants feed them and are paid by the milk.

The system of *transhumance* is only appropriate to a low stage of agriculture, as it is apt to cause extensive damage to the fields through

which the flocks pass. In France landowners have always been able to protect themselves by inclosing their holdings, but in Spain, where this right was denied them, they suffered exceedingly (see MESTA).

In Algeria, numerous tribes of nomadic Arabs still regularly migrate every spring with their flocks of sheep from the boundaries of the Sahara, where they spend the winter, to the high table-land known under the name of *Hauts Plateaux*, and forming a broad zone parallel to the Mediterranean between Morocco and Tunis. As long as these bare and scarcely inhabited plains, held by the Arabs under their system of collective ownership, do not attract European colonisation, these migrating flocks, numbering several millions, will be allowed to continue their wanderings twice in the year, but difficulties will begin whenever European cultivation invades these regions.

TRANSIT, TOLLS ON. See INTERNAL CUSTOMS AND TOLLS.

TRANSPORT, COST OF INLAND. The modern organisation of industry could not have been established without improved methods of communication between producers and consumers. The railway and the factory have gone hand in hand in their development and in their economic results. With the means of transportation which existed two hundred years ago, large industries would have been impossible. The substitution of turnpikes for common roads, of canals for turnpikes, and of railways for canals, was as essential a part of industrial progress as was the development of the steam engine or of the factory system. Each of these improvements meant at once an increased investment of capital, a lessened cost of doing the actual work of transportation, and a vastly increased amount of actual carriage of goods. The large capital made it at once necessary and possible to make lower rates for the sake of developing business. The development of business, in turn, made further investments of capital and further reductions of rates possible. When the railway was first invented it was not thought possible to carry goods at less than 1½d. per ton per mile without serious loss. Twenty-five years ago most of the railway systems of the world were carrying goods at about 1d. per ton per mile. To-day the average rate in France is but ¾d.; in Germany, ¾d.; in the United States, less than ¾d. per ton-mile.<sup>1</sup> Nevertheless, so great has been the increase in traffic that the gross receipts per mile of road at these low

<sup>1</sup> The English lines give no figures of ton-mileage.

rates are in many instances much greater than they had been at the higher rates which prevailed previously. The average freight charges on the New York Central and Hudson River Railway are to-day less than half what they were twenty years ago. But the traffic is four times as great.

Yet these figures by no means measure the full effect of railway transportation in abolishing the effect of distance as a limit to the sale of goods. Only a small part of these charges is actually due to differences in distance traversed. The immediate expense of carriage has decreased even faster than the general expenses of railway transportation as a whole. Every improvement in economy has rendered larger train loads possible without corresponding increase in cost, and has thereby reduced the expense of carrying goods as compared with that of loading or unloading them. A few years ago the carrying capacity of a waggon was not much greater than its dead weight. To-day the former can readily be made twice as great as the latter. In other words, two-thirds of a train load may be made paying weight instead of only one-half. Meantime, the weight of the locomotives has been somewhat increased, with a much more than proportionate increase in the carrying capacity. With a track adjusted to the standard of modern train economy and a reasonably level country, it is possible to carry gross train loads of more than nine hundred tons, of which six hundred may be actual goods carried. Omitting terminal charges and internal, the direct expenses of hauling such a train—train-men's wages, fuel, and other supplies, and repairs of rolling-stock—need not be over 2s. per mile run.<sup>2</sup> Or, by simple division, the direct cost of hauling a ton a mile, independent of terminal charges and interest, is not over one twenty-fifth of one penny. Or, to put the matter in another form, an added distance of one hundred miles haul makes but 4d. per ton difference in the cost of carriage. Conditions like these are not frequently realised, but they represent a possible limit of economy on any road of the first rank, and show how thoroughly railways have supplanted other means of inland transportation in efficiency and economy.<sup>3</sup>

While the cost of haul has been constantly reduced, the terminal charge has remained much more nearly constant. In some instances, with the overcrowding of population in large cities, it has actually increased. Such a state of facts makes equal mileage rates impossible. On a waggon road, or even on a canal, it costs nearly twice as much to carry goods two hundred

<sup>2</sup> This is a high estimate. The direct expenses per train-mile on English roads are barely 15d. and on American roads about 20d.

<sup>3</sup> Some of the wheat-carrying roads of the United States realise these conditions on parts of their main line.

miles as to carry them one hundred. On a railway, when once goods have been received, it makes comparatively little difference whether the haul be long or short. In England and America the attempt to base goods rates on a mileage system has been generally discarded. In France and Germany it is still theoretically maintained, but the exceptions are so numerous as to cover much more than half the traffic actually handled.

A more nearly correct arrangement of railway charges is based on a division of expenses into mileage and terminal. Those who would arrange rates on this system hold that the expenses of a railway are roughly divisible into two classes, one connected with the receipt and delivery of goods or passengers, the other with their actual carriage. They believe that fairness requires that each ton of goods should pay a definite terminal, plus a carriage rate proportionate to the distance. Such is the theory on which English railway schedules are arranged. But this system, though much better than the equal mileage plan, does not really meet the facts of the case. A large part of the expenses of a railway are not, properly speaking, either mileage or terminal charges. They do not attach to any particular piece of business, but to the operation of the railway as a whole. Interest on cost of construction remains nearly the same whether the traffic be large or small. Maintenance of way is to be charged by the year rather than by the ton of traffic. All these expenses are indirect, in distinction from the direct expenses of loading and hauling the goods or passengers carried. The consequence is that each railway rate really consists of three parts—a mileage rate for the carriage, a terminal for the expenses at either end, and a tax which the business is made to contribute toward the indirect expenses or fixed charges of the railway as a whole. The amount of such a tax which it is possible to pay depends more upon the value of the goods than upon anything else. Thus we find that all railways, whatever their nominal schedule of charges, actually classify their various shipments, not according to the direct cost of doing the business, but according to the value of the service rendered.

If it were possible to ascertain the cost of doing each piece of business, and to arrange railway schedules accordingly, the regulation of rates would be comparatively simple. But the introduction of this element of taxation complicates the matter almost beyond belief. It is, as Professor Taussig has pointed out (*Quarterly Journ. of Econ.*, v. 438 seq.), a case of "joint cost of production" on the very largest scale; one where the general expenses are so great that the apportionment of such expenses to the different parts of the traffic is a matter of vital importance. This work of apportionment or taxation gives the railway

authorities a power which they are liable to use in an arbitrary manner. They are guided by the general principle of lowering rates where business will thereby be developed; in other words, where the burden of a high proportionate tax is most severely felt. But in the application of this principle they are liable to make mistakes. Nor has any satisfactory way been found of preventing these mistakes. The older systems of regulation proved illusory. Maxima were of little use, because of the right of the railways to produce inequalities by variations within the maximum limit. This power grew wider from year to year as railway economy became more highly developed, because the difference between the legal maximum and the possible minimum rate increased. Much was expected from competition of different carriers upon the same line. But this also proved futile, because of the superior public economy of having the business concentrated in the hands of one company. Nor was competition between different lines of any more avail. Where it existed at all it drove rates down so low that such points contributed almost nothing to the indirect expenses of the railway. The intermediate points were thus burdened with an undue share of the fixed charges. The growth of cities was artificially stimulated at the expense of the country. The business of large shippers was favoured, while that of smaller ones suffered. So great were these evils that contracts to abolish competition at terminal points by the division of traffic were generally regarded as useful to the public as well as the railways.

When competition was finally recognised as unsuccessful, recourse was had to legislative provisions for enforced equality between different shippers. The Railway and Canal Traffic Act of 1854 provided that no preferences should be given; in other words, that all persons shipping the same goods between the same points should be treated alike. The power to tax must not be used as a means of personal discrimination. The commission appointed under the act of 1873 attempted to carry this enforced equality still further, and to say that no greater aggregate charge must be made for a shorter than for a longer distance over the same line; and still later, that the longer distance must as a rule be charged actually more than the shorter one. Of these two principles the first is, as a rule, right; the second is of doubtful utility. Distance is often so unimportant an element as compared with terminal charges that the system of group rates is often the only practical or logical one. The Interstate Commerce Act of the United States provides that no more shall be charged for a shorter than for a longer distance, but does not forbid the roads to charge as much for one as for the other. The whole tendency of good

railway economy seems to be toward the abolition of inequalities rather than toward allowing either the perpetuation of old ones or the creation of new.

There is no doubt that the abuse of the taxing power may be very much diminished by conservative action on the part of the legislatures and courts. But the continental nations have not been satisfied with this degree of control, and have gone far in the direction of state ownership. Theoretically there are strong reasons for putting the taxing power in the hands of the state, but in practice the dangers of state railway management seem to outweigh its advantages. In the conduct of so complicated a business as railway management, the state officials have the same temptations to inequality as those of private corporations. As the Italian commission of 1881 said well—when a state attempts to tax industry it is more omnipotent and less responsible than a private corporation. The standard of efficiency reached by the continental roads is also far from being equal to those of England or the United States. Nor do the state railways of India or Australia furnish an exception to this rule. State railways sometimes give cheaper rates than private ones, but they rarely give anything like the same quantity of service, nor have they developed traffic to the same degree in proportion to the population. On the whole it may be said that government officials have no such stimulus to efficiency and economy as is felt by the representatives of a private business; and as long as this remains true, many advantages claimed for state railways will be found on closer observation to be illusory. Increased publicity of management and more direct responsibility to certain sections of the public will often do more to regulate abuses in railway management than could possibly be done by the transfer of the roads to government officials; while the difficulties and risks of the latter course would be vastly greater than those of the former.

[Within the limits of this article it has only been possible to touch upon a few of the leading points in the history of transportation rates and their regulation. International comparisons have been but sparingly made because of the different methods of keeping statistics in different countries. A large part of Mr. Jeans's book on railway problems is worse than useless on this account. The leading books on the economic side of the railway question are, for England, W. M. Acworth, *The Railways and the Traders*, London, John Murray, 1890; and Cohn, *Englische Eisenbahnpolitik*, Leipzig, 1874-83; for America, A. T. Hadley, *Railway Transportation*, New York, Putnam's, 1885; for the continent of Europe, E. Sax, *Die Eisenbahnen*, Vienna, 1879; and of a somewhat more technical character, Ulrich, *Eisenbahn-*

*tarifwesen*, Berlin, 1886. A. M. Wellington's *Economic Theory of Railway Location*, though written for engineers, contains much that is useful to the student of political economy. The reports of the successive parliamentary committees of investigation, of the United States senate select committee on interstate commerce of 1885-86, and of the Italian commission of 1878-81, may also be consulted to advantage.] A. T. H.

**TRANSPORTATION, THE ECONOMIC EFFECT OF.** In attempting to estimate the economic effect of transportation, two things have to be considered—its effect on the country which transports the convicts, and that on the colony which receives them. To estimate the economic effect on the country which disposes of its convicts in this way is a much simpler task than to estimate the economic effect on the colony. In the latter case so much depends on conditions and methods, many of which have never had a fair trial. Only in England and Russia has the system been carried out with any thoroughness, and in the latter country much is still in the experimental stage. There are two distinct periods into which the history of transportation in England may be divided: (1) from 1619 to 1775, and (2) from 1787 to 1846.

1. In 1619, James I., by sending one hundred dissolute persons out to Virginia, practically converted a law passed by Elizabeth in 1597 for the banishment of rogues and vagabonds into an Act of Transportation. It was not, however, till the reign of George I. that the system came into common operation. The evidence as to the number of convicts transported to the American colonies is conflicting, but Dr. Lang (*An Historical and Statistical Account of New South Wales*) comes to the conclusion that there were in all about fifty thousand. The method used was very simple, and whatever may have been its moral effect, its economic effect would seem to have been beneficial. The English government sold the services of the convicts during their sentences to the captain of the ship which conveyed the convicts to America. He resold them on arrival to the colonists, who employed the convicts to work like slaves under overseers on the plantations. In England, it may be assumed these convicts would have preyed upon the community as thieves or vagabonds, or have been supported by it in prison: in the colonies the conditions of labour were such that no skill was required, while the work could be directed and enforced by an overseer. The fact that the colonists were willing to buy the services of the convicts, and also the fact that they were in the habit of kidnapping free men, shows that such labour was in demand. The resources of a new country made it easy for the convicts to obtain a living when their sentences expired. The evidence as to the extent of the

demand for convict labour is conflicting: in 1692 Maryland prohibited the landing of convicts, but in 1718 mention is made of "the great want of servants in His Majesty's plantations." While a contemporary historian, quoted by Dr. Lang, speaking of the convicts, says "their labour would be more beneficial in an infant settlement than their vices would be pernicious." The inference is that the colonists were glad to have the services of the convicts where no other labour was to be had, but for many reasons slaves, when they became easy to obtain, were more convenient, while it was not considered safe for the latter to see white men working as slaves. If the demand for convicts as labourers had ceased in the colonies, the government would have been obliged to adopt a less simple method of transportation, but the war of independence put an end to the system.

2. Transportation had more influence on the economic development of the Australian colonies. A detachment consisting of six hundred male and two hundred and fifty female convicts founded New South Wales, Van Diemen's Land, and Norfolk Island in 1788. For the first few years the convicts were engaged in clearing the land, making roads and bridges, and building houses. Road-gangs consisting of some of the worst criminals, who were employed in making roads and bridges under the direction of government officials, always remained part of the system. The inevitable hardships of the first few years were greatly increased by the ignorance of the convicts and their dislike of agriculture. In an account of the colony of New South Wales by David Collins, late judge advocate and secretary of the colony, it is stated that "more labour would have been performed in this country by one hundred free people than had at any time been derived from three hundred convicts." In 1795 convicts were, for the first time, assigned to settlers as servants. As this was the most economical way of disposing of the convicts, the government was willing to give large grants of land to any respectable settler who would employ the convicts, but the supply was generally greater than the demand. The great number of capital sentences before the amelioration of the law through the exertions of Sir S. Romilly (commenced 1808), and of consequent commutations into imprisonment for life, *i.e.* life sentences, led to an increased need for disposal of long-sentenced prisoners. There were 1314 sentences to death in 1819 (66 in 1849), and often 2000 to 3000 convicts were sent out in a single year. Gov. Macquarie (1805-1821) considered that the colonists only needed one-eighth of the convicts. This system of assignment has been allowed, even by the opponents of transportation, to have been beneficial from an economic point of view. Owing to the thinness of the soil, flocks were scattered, and shepherds in great request. The isolation of a shepherd, and the fact that his calling required no skill, were conditions favourable to convict labour. In 1849, when for moral, civil, and political reasons the rest of the colony of New South Wales was opposed to the con-

tinuance of transportation, the squatters, in a letter to Charles Buller, M.P., pleaded for its continuance on economical reasons: the cost of a convict, they asserted, was £10 a year less than that of a free labourer. The conditions of labour in towns were not so suited to the employment of convicts. Mechanics and clerks would not use their special skill without the hope of some reward. In this case, the effectiveness of transportation as a means of colonisation was opposed to its effectiveness as a punishment. As soon as free mechanics settled in New South Wales, the class of convict mechanics entirely disappeared. The condition of the emancipated convict was in every way satisfactory from an economic point of view. On his release he was given thirty acres of land, or fifty if married, and ten extra for every child. The large fortunes which were made by the convicts formed one of the chief objections urged by its opponents against transportation as a punishment. The small number of women convicts, however—in 1840 there were only seventeen women to one hundred men—interfered with the efficiency of the system as a means of colonisation. In attempting to sum up the effect of transportation on the Australian colonies, the same terms may be found applicable which were used to express the effect of the system in the American colonies. The labour of the convicts was economically beneficial to the colony, both in founding and developing it, where no better labour was to be had. Where other labour was to be had, there was no longer a demand for the services of the convicts, except as shepherds where the flocks were not valuable. As early as 1838 there was a demand in New South Wales for ten thousand free labourers, and for only three thousand convicts. In England, during this period, two points in connection with the economical effect of the system were the subjects of dispute. It was denied that it had a deterrent effect: it was also declared to be unnecessarily expensive. In the first case it was a serious drawback from the economic point of view, if it led to more citizens becoming chargeable to the community, but there is no sufficient evidence to show that this was the case. The evidence as to the expense is most conflicting. The following statement is taken from the Report on Transportation. From 1786 to 1837, one hundred thousand convicts were transported from this country to the Australian colonies.

Cost of transport . . . . .	£2,729,700
Disbursement for general convict and colonial services . . . . .	4,061,581
Military expenditure . . . . .	1,632,302
Ordnance . . . . .	29,846
Total from 1786 to 31st March 1857 . . . . .	£8,453,519
Deducted for premium on bills, coins, etc. . . . .	507,195
	<hr/> £7,976,324

In 1840 transportation to New South Wales was suspended. It was continued for a short time to Van Diemen's Land. As the result of an inquiry, undertaken in 1857, showed that there was no suitable place to which convicts from England could be transported, no more experiments are likely to be made. Western Australia was a stop-gap for a short period, when the more settled

Australian colonies objected. The Cape Colony successfully resisted a proposal to send there. In 1846 the system came to an end. The Australian objection now extends to the French use of New Caledonia, because of the escape of convicts thence.

At the present time Siberia is the only colony to which convicts are transported, with the exception of some penal settlements belonging to Spain in Africa, and also the French penal settlements in New Caledonia and French Guiana. The latter have been described as "prisons at a long distance from home." The evidence as to the economic condition of the Siberian convicts is scanty and conflicting. According to Mr. de Windt, it is obviously apparent to any one who has studied the Siberian exile system without bias that the object of the government is not so much to punish crime as to colonise Russian Asia. With this purpose in view the convicts are in many cases retained in prison for a very short part of their sentences, and every convict on release is given as much land as he can cultivate. But, according to Dr. Lansdell, this system is not always successful: the peasants will not allow their daughters to marry convicts, and the latter do not as a rule reform. In the island of Sakhalin, however, the case would seem, according to Mr. de Windt, to be somewhat different; the Government, besides granting the convict land, lends him a sum of money, and this money is as a rule returned. As convicts of Russian nationality are never allowed to leave the island, and as escape is almost impossible, the conditions are somewhat different from those on the mainland. The worst feature of the Siberian system would seem to be the want of employment for the convicts; while in prison most of them are quite idle. The silver mines of Nerchinsk are now the only ones in Siberia where convict labour is employed, the rest of the mines are falling into private hands. Even the Nerchinsk mine cannot be said to be productive; three to four thousand prisoners are employed, and in 1893 the output of the entire district did not amount to one ton. Although convicts have been sent to Siberia since the middle of the 17th century, owing to the drawbacks in the climate, the want of civilisation in the natives, the extent of the country, and the want of means of communication, the system would seem not to have achieved at present any definite economic effect, except in the island of Sakhalin, which would seem to be well cultivated by the convicts. The expense of such a system must be very great, and the different reasons for which people are sent to Siberia would make the economic effect of their absence from Russia difficult to determine.

Transportation in itself can hardly be said to have any distinguishing economic effect. Everything depends upon methods and conditions. It is evident from the above sketch of the history of the system that only some of the former have as yet had a fair trial.

[There is no work on the subject, and but little attention seems to have been paid to the economic point of view in books on transportation. The chief authorities are:—J. Hill Burton, *Emigrant's Manual*, 1851-52, esp. N.S.W. p. 17, Tasmania, p. 105.—Dr. Lang, *Transportation and Colonisa-*

## TREASURY.

Treasury, p. 578; Treasury Bill, p. 579; Treasury Bond, p. 579; Treasury Department of the United States, p. 579.

**TREASURY.**—This department of state is generally looked upon as the chief of the departments of the British government, having at its head two great parliamentary officers, the first lord of the treasury, who usually leads the government of the day in the House of Commons, and the chancellor of the exchequer, who is responsible for the national budget and finance. In this department the budget of each financial year is prepared and settled, the estimates, when passed, are administered, and all questions of national finance and currency ultimately considered. Under its general supervision are all the revenue departments, the MINT, the General Post Office, and various minor offices.

The first germs of the present treasury office are to be found in the EXCHEQUER (*q.v.*), to which office the lord treasurer was in early times attached. The treasurer tended to become the most important of the exchequer officers, having duties in both courts—that of account and that of receipt. In early times he was empowered to appoint a vice-treasurer. The chancellor of the exchequer appears to have been originally an officer appointed with a view of controlling the treasurer. The earliest record of such an appointment is in Henry III.'s reign (1234 A.D.); the present functions of the chancellor seem to have taken their rise in Henry VIII.'s reign when he was also appointed under-treasurer.

The office of treasurer was first vested in a board of commissioners by James I. in 1612, and this paved the way for its separation from the office of exchequer, which may be considered to have been completed about 1660.

The exchequer from that time became the subject of considerable attempts at reorganisation by act of parliament, notably in 1688 and again in 1782 (Burke's Act); though the first comprehensive effort of this kind was the act 57 Geo. III. c. 84, which enacted that the duties of the officers of his majesty's exchequer should henceforth be discharged in person, and that the persons so discharging them should be unable to sit in parliament. In 1866 the old exchequer was formally abolished and the new exchequer and audit office arose (see **AUDIT OFFICE**).

The treasury proper, since 1714, has been administered by a board of lords commissioners consisting of the first lord, the chancellor, and two or three junior lords, the exact number not being fixed. The junior lords are nominated by the first lord.

The first lord as a rule takes no part in the general administration of the department: he is concerned chiefly with the patronage of the board and the general business of the government. Nor since 1856 has it been the practice of the board to meet except on quite extraordinary occasions.

The chancellor, who is still also by a separate patent appointed under-treasurer, is for all ordinary business purposes the parliamentary head of the treasury. He is responsible for the annual budget of revenue and expenditure (see BUDGET) and the general finance of the country.

The junior lords may take a certain share of the treasury business from time to time, but their position is mainly political.

More important in practice are the two offices of secretary to the treasury; one that of financial secretary, the other that of the patronage secretary, thus corresponding to the financial and political sides of the department which have been already indicated.

The permanent staff of the treasury, on whom the brunt of the annual work must necessarily fall, whatever ministry may be in power, consists of a permanent secretary, a financial secretary, an auditor of the civil list, four principal clerks, and various senior and junior clerks.

[Madox, *History and Antiquities of the Exchequer*, 1711.—Anson's *Law and Customs of the Constitution*, pt. ii. pp. 164 et seq.] C. A. H.

**TREASURY BILLS.** Part of the FLOATING DEBT (*q.v.*) is raised by the issue of treasury bills pursuant to 40 Vict. c. 2, as amended by 52 Vict. c. 6, § 5. These bills are distinguished from the EXCHEQUER BILL (*q.v.*) by the fact that the maximum period of their currency is twelve months, and that they are as a general rule issued for much shorter periods. They enable the government to borrow money at very low rates of interest, but it would not be advisable to issue a very large amount, as it might be difficult to renew bills falling due at a time of financial pressure or to find means to meet them.

E. S.

**TREASURY BOND** is a term chiefly used in the United States: it answers pretty closely to our EXCHEQUER BOND (*q.v.*), that is to say it is a security issued by the public treasury for moneys lent to the government for a limited period, and not as part of the permanent debt of the nation.

A similar name is sometimes given to securities of certain British colonial governments, which are intended to have a limited currency.

C. A. H.

**TREASURY DEPARTMENT OF THE UNITED**

**STATES.** Between 1776 and 1789—the date of the present constitution of the United States—the treasury business of the government was loosely managed, and, for most of the period, without any real concentration of authority. During the war of independence, financial affairs were first entrusted to two treasurers, then to a standing committee of congress known as the treasury board, and finally, in 1781, to the superintendent of finance. In 1789, by the act of 2nd September, with the new form of government, the treasury department was established with a single head styled secretary of the treasury, not, however, without opposition, on the ground that it was unsafe to trust such important powers in the hands of one man. The secretary of the treasury was authorised to prepare plans for the management of the revenue and the support of the public credit, to report budget estimates, to superintend the collection of the revenue, to decide upon methods of keeping accounts, and to execute laws relating to the sale of public lands. It is to be noted that this secretary, unlike the others, reports directly to congress instead of to the president. It was further provided by the act of 10th May 1800 that the secretary should lay before congress at the beginning of every session a financial report, thus making a series of annual documents which now constitute a record of the financial history of the government. The other officers named in the original act of establishment were a comptroller, auditor, treasurer, and registrar. In brief, the comptroller looks after the propriety of the accounts; the auditor, that they are presented in proper clerical form; the registrar, that the vouchers and bills are preserved; and the treasurer, that no money leaves the vaults save by proper warrants. The treasury department is the settling office of all the accounts of the other departments of the government. In the fundamental principles as thus provided by the act of 1789, and in the methods as initiated by the first secretary, Alexander Hamilton, there has been but little change. The treasury department has grown to large proportions, and now includes a great variety of bureaux, such as the mint, internal revenue, comptroller of the currency in charge of the national banking system, the bureau of engraving and printing, marine hospital service, revenue cutter service, including the patrol of the fur seal fisheries, lighthouse service, life-saving service, steamboat inspection office, coast and geodetic survey, office of supervising architect, and the commissioner of navigation. The number of comptrollers and auditors has varied at times with the increase of business; but by the important act of 31st July 1894 the number of comptrollers was fixed at one, and the auditors at six. In general, each auditor settles the accounts of one department.

None of the principal officials can have any connection with commerce, vessels, public land, or any public property. The treasury department through its various bureaus and divisions of work has its ramifications all over the country. In the customs administration there are over one hundred ports of entry, at each of which there is a collector of customs who is the chief officer of the port. Under his direction is the surveyor or chief out-door officer, and, in addition, the naval officer who verifies and countersigns many of the more important acts of the collector in estimating, levying, and liquidating duties. In 1896 there were 847,203 entries; the average number of persons employed in this branch of service was 5085; and the cost of collecting duties of the country as a whole was 4.28 per cent. In the internal revenue department there were, in 1896, 63 different districts for the collection of duties on tobacco, beer, spirits, oleomargarine, and playing-cards. The percentage of cost of collection in this branch of service was 2.78 per cent. The number of national banks supervised by the comptroller of the currency, 31st October 1896, was 3679, and under this office are examiners constantly engaged in the investigation of the management of these institutions. Upon failure of a bank a receiver is appointed by the comptroller. For the mint bureau, see article MINT, UNITED STATES. The other bureaus referred to are not so closely identified with the economic and financial interests of the country, and further reference is therefore omitted here.

Originally the funds of the government were kept in the First United States Bank, 1791-1811; the Second United States Bank, 1816-36; or in the state banks, known in Jackson's administration as the "pet" banks. By the act of 1846, however, the independent treasury system was established, by which the government takes care of its funds in its own depositories. Such depositories at the present time are the treasury at Washington, and nine sub-treasuries under charge of assistant-treasurers. National banks are also permitted to hold government funds on deposit. For an exhaustive treatment of this branch of administration, see *The Independent Treasury System of the United States*, by David Kinley, New York, 1893. D. R. D.

TREATIES. See COMMERCIAL TREATIES.

TREITSCHKE, HEINRICH VON (1834-96), was the son of a general in the Saxon army. He became privat-dozent in history at Leipzig in 1858, and professor at Freiburg, Baden, in 1864, and in Berlin 1874.

In 1874 his growing dislike of socialism led him into a warm controversy in the *Preussische Jahrbücher*, July and September 1874, with Prof. Gustav Schmoller, who replied in Hildebrand's *Jahrbücher für Nat. Oek. und Statistik* (vols. xxi. xxi. xxi. xxi.). Their discussions grew into two volumes, *Sozialismus und seine Gönner nebst*

*einem Sendschreiben an G. Schmoller*, H. von Treitschke, Berlin, 1875.—*Ueber einige Grundfragen des Rechts- und der Volkswirtschaft, ein offenes Sendschreiben an Herrn Prof. Dr. H. von Treitschke*, Gustav Schmoller, Jena, 1875. Treitschke's brilliant style was undoubtedly in his favour. His merits as a historian are generally recognised. He was intensely patriotic. [See *English Historical Review*, October 1897, "Heinrich von Treitschke," by J. W. Headlam.] J. B.

TRESPASS. A name formerly applied to a variety of torts, i.e. delicts or civil injuries (see TORT). It is now commonly used to denote the wrong which consists in entering upon another man's land without lawful authority. Such entry does not in itself constitute a crime, and the familiar notice "Trespassers will be prosecuted" is therefore absurd; but it will support a claim for damages in a civil action. F. C. M.

TRET. See TARE AND TRET.

TRIAL OF PYX. See PYX, TRIAL OF.

TRIAL PLATE (ASSAY). A thin sheet of gold or silver of the standard fineness, from which portions can be cut to be used as check pieces when conducting assays.

In connection with the assays of coins, such plates have been in use for many centuries; the oldest trial plate of which record exists being a silver one of the reign of Henry III. (reigned 1216-1272). The practice of referring to trial plates of standard metal as reliable guides is however open to objection, because of the difficulty of preparing alloys of a precise standard and of absolute uniformity of composition. The latter quality is practically unattainable in the case of silver of the English standard of 925, owing to the operation of certain molecular changes (known as liquation), which take place while the alloy is cooling, after having been melted and mixed in the due proportions. The preparation of an accurate gold trial plate is not accompanied by any such inherent obstacle; nevertheless many of the old gold trial plates have, on careful examination, proved to vary to some extent from absolute uniformity of composition throughout the entire plate. A standard gold plate, however, which was prepared in the mint in 1873, did not vary from the exact standard to a greater extent than a two ten-thousandth part.

The difficulty in obtaining absolute accuracy in an alloy has led to the adoption in recent years, by the assay department of the royal mint, of test pieces of pure gold and silver, instead of standard metal, and fine gold and silver trial plates were prepared in the mint in the year 1872. Portions of these plates are still in use in the department.

The remains of the old trial plates, formerly kept in the Pyx Chapel Abbey, Westminster Abbey, were transferred to the custody of the mint in the year 1842. F. E. A.

**TRIBAL SYSTEM, THE.** Under this heading is loosely embraced the body of customs by which tribal societies are governed under their tribal chieftains. Each tribe has its own customs, and there are therefore many tribal systems, but they resemble one another in their main features. The more nomad and pastoral a tribe may be, the more primitive, and, in a sense, tribal, are its customs. And as from contact with the outer world, or conquest, or increased population, the stage of settlement and settled agriculture is reached, modifications take place, and often the village form of settlement becomes predominant. In **VILLAGE COMMUNITIES** (*q.v.*) many principles based on older tribal customs survive with modifications. Especially in India the gradual recognition of these tribal elements has been important. One tribe, *e.g.*, conquers another and takes by way of tribute part of the land or a share in the produce. The lordship becomes divided into innumerable shares in course of time, and the necessity for a village accountant arises to divide the tribute, thence under English rule the difficulties of land settlement (see under **ZEMINDAR**). Much information on the general subject, and especially as regards India, is contained in Sir A. C. Lyall's *Asiatic Studies*, Mr. B. H. Baden-Powell's *Indian Village Community*, and Sir H. Maine's *Early History of Institutions*.

As regards British tribal systems, the chief original sources of information are the *Brehon Laws* of Ireland and the *Ancient Codes* of Wales. According to the latter, Cymric tribal society was held together by the bond of blood relationship. The chief unit of organisation was the kindred—embracing descendants of a common ancestor to the ninth degree. And within this larger kindred, under its head chieftain, were smaller inner kindreds and family groups embracing the descendants of a common great grandfather. This inner kindred, called a *gwely* or *wely* (*lectum* or bed), formed the unit *inter alia* for land holding. In the extents made after the final conquest of North Wales, 1283 A.D., Ed. I., these holdings—mainly consisting of rights of grazing of the tribesmen's herds of cattle—are still described as *gwelys* bearing the name of the ancestor—the gwely of so and so—though he may have been long dead; and within this head gwely are described the sub-gwelys or *gavels* of his sons and grandsons and great-grandsons. The head gwely held together, according to the codes, till the great-grandsons divided, they being entitled *per capita*, and not *per stirpes*. At the time of the extents the rights of the tribesmen *inter se* were so fully recognised that a gwely or group of tribesmen with its herds of cattle could be removed from one district to another and possess in the new locality the same rights *inter se* as in the old

one. And according to the ancient codes it would seem that whilst the landed rights were vested in the head of the gwely, his descendants had rights of maintenance under him on attaining a certain age independently of their parents. Under this system strangers in blood or non-tribesmen were grouped together in what were called *taeog-treys*, and held *per capita* in equal shares, but after three generations the descendants of a common ancestor often formed a gwely as in the case of the tribesmen. These groups of non-tribesmen were *adscripti glæbe*, and paid food rents to the chieftain. The free tribesmen also contributed *gwestra* or food gifts. The chieftain and his retinue on his hunting and hawking expeditions were quartered on the tribesmen and non-tribesmen according to fixed tribal custom, but already the substitution of money payments in lieu of tribal dues was becoming usual at the time of the Conquest. These tribal customs were not abolished till the "Statute of Wales" under Henry VIII. And it was not till the lawyers of Queen Elizabeth substituted leases for lives for the confused Welsh tenures that the system finally died out.

Much remains to be done before the descriptions of Cæsar and Tacitus of the tribal systems of the Germans and Gauls are understood, and before the contribution of tribal custom towards mediæval institutions can be fully appreciated.

[See Mr. F. Seebohm's *Tribal System in Wales* (1895), and for the way in which the Tudor lawyers dealt with the confused débris of this system after the "Statute of Wales," see the *Report of the Welsh Land Commission* (1896), pp. 133 *et seq.*; see also Mr. Herbert Lewis's *Ancient Laws of Wales* (1889), and Mr. A. N. Palmer's *History of Ancient Tenures of Land in the Marches of N. Wales*. As regards the Brehon Laws of Ireland, see the prefaces to the vols. already published of the *Ancient Laws of Ireland* and E. O'Curry's *Manners and Customs of the Ancient Irish*, edited by Sullivan (1873). As regards Gaul, see the works of FUSTEL DE COULANGES, and of Jubainville; and as regards Germany, the great work of Meitzen, *Siedelung und Agrarwesen der Westgermanen und Ostgermanen*.

For comparative purposes the following works may be consulted: Kovalewsky's *Droit coutumier Ossétien* (Paris, 1893); H. E. Seebohm's *The Structure of Greek Tribal Society* (1895), and Dr. A. H. Post's *Ueber die Aufgaben einer allgemeinen Rechtswissenschaft* (1891).]

**TRIBUTARIUS.** Under the Roman empire *tributarii* were free husbandmen who paid to their lord a share of the *tributum* due from him to the emperor (*cod. Theodos.*, xi. tit. vii. 2). There is evidence (*v. tit. iv. 3*) that the inhabitants of newly conquered districts were frequently transplanted to serve as free *coloni* or *tributarii*, so that, as Seebohm remarks, the Roman villa under its *villicus* began to wear the aspect of the manor of a later date.

Ammianus Marcellinus (xxvii. 8, § 7) mentions *tributarii* in Kent in 368 A.D. Ducange states that they were bound to servile work. R. H.

TRINODA NECESSITAS. See FYRD.

TRIPLE ASSESSMENT is the name given to Pitt's scheme for raising additional supplies in 1797; it formed the basis of the act 38, Geo. III. c. 16. It was adopted in order to prevent any further accumulation of the FUNDED DEBT. Pitt thought he could, by means of it, draw a considerable contribution from a class both willing and able to pay without pressing upon the labouring classes.

The ASSESSED TAXES at that time were of two sorts—(a) the tax on windows, first imposed in 1696, and the INHABITED HOUSE DUTY, first imposed in 1778, both of which had, from time to time, been rearranged since their first imposition; (b) taxes on coaches and carriages, male-servants, carriage and saddle horses, dogs, watches and clocks, imposed at various times in the second half of the 18th century.

Pitt now divided the assessed taxpayers into two new classes; those who were assessed to the duties on houses, windows, dogs, or clocks, or watches, and persons who were assessed to the duties on male-servants, carriages, or pleasure horses.

Persons of the first of these classes, assessed to an amount less than £1, were to be exempt from any additional duty; but if to that or a greater amount, they were to pay as follows:—

If the existing amount was		
Under £2 . . .	$\frac{1}{4}$	part thereof addl.
If £2 and under £3 . . .	$\frac{1}{2}$	" " "
" 3 " " 5 . . .	$\frac{3}{4}$	" " "
" 5 " " 7:10s. . .	the amt. addl.	"
" 7:10s. " 10 . . .	$1\frac{1}{2}$	times "
" 10 and " 12:10s. . .	2	" "
" 12:10s. " 15 . . .	$2\frac{1}{2}$	" "
" 15 and " 20 . . .	3	" "
" 20 " " 30 . . .	$3\frac{1}{2}$	" "
" 30 " " 40 . . .	$4\frac{1}{2}$	" "
" 40 " " 50 . . .	$4\frac{1}{2}$	" "
" 50 and upwards . . .	5	" "

Persons of the second class were to pay an additional duty on the amount of the last assessment in the proportions following.

If the existing rate were		
Under the amt. of £25 . . .	3	times the amt. addl.
If £25 and under £30 . . .	$3\frac{1}{2}$	" " "
" 30 " " 40 . . .	4	" " "
" 40 " " 50 . . .	$4\frac{1}{2}$	" " "
" 50 and upwards . . .	5	" " "

The fact that the additional amount to be paid by persons of this class was never less than three times the amount of the existing rate, caused the scheme to be named Triple Assessment.

Special provision was made for lodging-house and shop keepers. If they were assessed to an amount less than £3 to the duties on inhabited houses, windows, dogs, and watches, they were

exempted from any additional duty. If the amount were £3 and less than £5, they paid one-tenth part thereof additional; if £5 and less than £7:10s., one-fifth part thereof additional; and so on in a regular scale to those assessed to an amount of £30 and upwards, who paid twice the amount additional.

The additional duties were to be paid in six instalments in the year. To prevent evasion they were based on past and not on future assessments.

Persons whose annual income was less than £60 were exempt from the additional duties; where it amounted to more than £60 they were entitled to abatements according to certain gradations of income. There were twenty-nine grades. The first applied to persons having incomes of £60 and under £65; they might claim such an abatement as would reduce the tax to a 120th part of their income. The 28th applied to persons having an income of £195 and under £200; they might claim a reduction in the duty to an eleventh part of their income. Finally those who had incomes of £200 and upwards could claim to have the tax reduced to a tenth part of their income.

To obtain such exemption or abatement the person claiming had to appeal to commissioners appointed for the purpose and to produce at the same time a signed declaration attested by two witnesses in the form set out in the schedule to the act. The claim was in no case to be allowed unless verified on oath or affirmation. The schedule also contained rules for estimating the incomes of persons appealing against an assessment under the act, and rules setting forth in what cases and on what account any deductions might be made in estimating "fair" income.

The scheme was based on the assumption that the assessed taxes were a true measure of expenditure, and expenditure a true criterion of income. The objection to a direct income-tax seems to have been that it required a disclosure of the pecuniary circumstances of the taxpayer, which, in the language of the protest by Lords Holland and Oxford (*Journals of the House of Lords*, vol. xli. p. 466), "is contrary to the customs and prejudices of Englishmen, and repugnant to the principles of the constitution." But, in spite of this objection, Pitt's legislation required such a disclosure where a taxpayer desired any exemption or abatement.

The method of raising supplies by increasing the assessed taxes was not new. On three occasions an additional tax of 10 per cent had been imposed on the existing assessed taxes. But the system of graduated taxation introduced a new principle into English finance. Triple assessment was a failure; it yielded considerably less than Pitt expected, and was abolished the following year, a direct INCOME-TAX being then substituted.

TRIPLE CONTRACT. See ECK, J.; MAJOR, JOHN.

TRONAGE. The mediæval English term for the charge made upon the compulsory weighing of coarse goods at the public Great Beam (or Tron), as well as the right to demand such a payment.

It would seem that while the small beam was used for weighing certain fine wares, dealt in by the pound, the Great Beam was used for those sold by the way, hundred, quarter, stone, and other heavy weights (see MEASURES AND WEIGHTS). The most important, evidently, was wool for export, and for this there was probably a special beam at all the chief ports, as we know there was in London. The right to maintain such a beam, to compel its use, and to make a charge for the service, belonged to the king, who, of course, could grant it or farm it out to a subject. In London the right was for a long time shared between the city and the Grocers' Company. The name of the beam survives in the Tron Church, built on the site of the Tron of Edinburgh.

[The matter is not free from obscurity, and has not yet been sufficiently investigated. For London a good deal of material will be found in the *Liber Albus*, Stow's *Survey*, and Herbert's *Livery Companies*. For ameracements inflicted upon butchers for selling tallow "without visitation of the tron of our lord the king," see W. Hudson, *Leet Jurisdiction in Norwich* (1892), 52, 60. Other references are given in Ashley, *Economic History*, and Mrs. Green, *Town Life in the Fifteenth Century*, ii. 27, 28. Compare for Germany Maurer, *Geschichte der Städteverfassung*, § 407.] W. J. A.

TROTTER, SIR COURTS, Bart. (1767-1837), for many years a principal partner in Coutts's Bank, began his career in the navy pay office and entered the bank in 1793. He wrote a pamphlet:

*The Principles of Currency and Exchanges applied to the report from the Select Committee of the House of Commons appointed to inquire into the high price of Gold Bullion*, London, 1810, 8vo —"no excess in the paper circulation of the country"; "there is a sufficient check and control in the issues of paper"; "the currency of the country is in no way depreciated by the use of paper"; "the high price of bullion is owing to the present state of the foreign commerce of the country combined with its foreign expenditure"; "our present unfavourable exchanges are in no way caused by our paper currency" (p. 5).

[*Annual Register*, 1837, p. 203.—*Gent. Mag.*, Oct. 1837, p. 423.—*Jordan's Autobiography*, 1852, ii. 214-29.] H. R. T.

TROY POUND. See POUND.

TRUCE OF GOD. The horrors of mediæval warfare produced from time to time strong reactions in favour of peace. One of these gave rise to the famous *Pax Dei* or *Treuga Domini*.

About the end of the 10th century it was

reported in Aquitaine that an angel had brought from heaven to a certain bishop a written command that men should abstain from wars and fightings. The story was generally believed; the clergy everywhere preached peace, and the people received their message with enthusiasm. At the council of Charroux, held in 989, it was agreed that for five years hostilities should cease. The undertaking was to be renewed at the end of every quinquennial period; but it next emerges, not as a solemn covenant to refrain from all war, or even all private war, but as an agreement to keep the peace from the evening of Wednesday till the morning of Monday, these days being sanctified by the institution of the Lord's Supper, His crucifixion, His rest in the grave, and His resurrection. From Aquitaine the truce spread to Burgundy, and from thence to other lands. Popes confirmed it; the church threatened with excommunication those who broke it; and it was enforced by council after council up to and including the third Lateran council of 1179. The period of its general reception is stated to have been the middle of the 11th century. Normandy, which was one of the last countries to adopt it, was convinced in 1042, when the council of Caen decreed that for four days and five nights in each week men and women should abstain from violence against their fellows. However imperfectly the Truce of God was observed, its adoption was a great triumph for Christianity and the Western Church.

## TRUCK.

Truck, p. 583; Truck Acts, p. 584; Fines and Deductions, p. 584; Truck System, p. 586.

Truck (French *Troc*) signifies barter. The existing statutes dealing generally with the "truck system," or the practice of paying wages otherwise than in cash, are the Truck Acts 1831, 1887, and 1896.

According to these acts any contract between employer and workman is illegal, null and void, if it provides for the payment of the workman's wages otherwise than in the current coin of the realm, or contains a stipulation respecting the place where, the manner in which, or the person with whom the wages shall be spent; and an employer entering into a contract declared by the acts to be illegal, is subject to a penalty. A qualified exception, however, is made in the case of agricultural labourers, with whom farmers may still contract to supply them with food, non-intoxicating drink, a cottage, or other allowances or privileges, in addition to money, as part of their wages.

It is further provided that no employer is to be permitted to make deductions from the monetary wages he has contracted to pay merely on the plea of having paid an equivalent in another form. It has been held that this

provision does not prevent him from imposing certain disciplinary fines upon his workmen and deducting the amount from their wages, or from contracting with them for periodical deductions for workroom, gas, firing, the use of machinery, and the like; but the Truck Act 1896 now provides that such deductions shall not be made unless certain stringent rules are observed in connection therewith. Deductions in respect of certain other classes of allowances, such as medicine, horse's fodder, tenancy of a house, and meals eaten on the employer's premises, with the written consent of the workmen, are expressly authorised by the former acts. It is to be observed that, inasmuch as the value of the allowances must be expressed in terms of money before it can be deducted from the monetary wages, the limited sanction which the acts grant to certain deductions is not necessarily inconsistent with their general policy of recognising no form of industrial remuneration but cash. Except in the case of agriculture, workmen's wages must always be estimated, though they need not always be paid, in money. The acts already contain several provisions for securing the fair valuation of the allowances in respect of which deductions are made; but on this point the law is considered by some to be defective.

Provisions analogous to some of those of the truck acts are contained in the Coal Mines Regulation Act 1887, the Hosiery Manufacture (Wages) Act 1874, and the Payment of Wages in Public-Houses Prohibition Act 1883. T. G. S.

**TRUCK ACTS.** *Fines and Deductions* are practically the only forms in which truck survives. For though occasionally a conviction still occurs for payment of wages in goods instead of money, such a case is unusual, and may be regarded only as a survival of an obsolete system. Fines and deductions, however, prevail widely, and are still of considerable importance as affecting the rate of wages in many classes of occupations.

In the case of industries isolated in a remote town or village, even the Tommy-shop sometimes still exists, as in some chain-manufacturing villages in the Chiltern Hills, or small tailoring establishments.

Deductions may be classified as follows:—(1) deductions for things supplied to enable the worker to do his work, as tools, materials, help, or a workroom; (2) deductions for things supplied to the worker as part reward for his labour, as insurance, a house, funeral benefit, etc.; (3) deductions in respect of fines. Deductions of the first class are clearly survivals of the domestic system of industry. The idea that each worker was a manufacturer selling a finished product—and not merely the temporary use of his strength and skill—and himself providing the requisites of production, having lasted on after the introduction of machinery, had resulted in the drawing together of the isolated craftsmen into the factory. As an illustration of this the following "rules" from the "Price and Size List," agreed upon between masters and men in the bolt and nut trade, 17th August 1881, may be given: (i) "where fan blast is used, each hand to pay 1s. 6d. per week; (ii) each hand to pay 4d. per week for having the breeze wheeled to his hearth ready for use; and (iii) for having his hearth cleaned weekly; (iv) all work rejected by the employer or manager as useless to be put on the scrap

heap in presence of the maker, and the value of the spoiled iron and breeze to be then and there assessed and agreed upon, and the same to be deducted from the maker at the first pay-day; the waste to be the property of the workman after he has paid for it." Here, apparently the material is supplied by the firm, except that in the case of spoiled work the worker pays for the material wasted, and becomes the owner of the waste. But the workman pays for the cleaning of his hearth, a modified form of rent for his place in the workroom, and for his share of the common machinery. A nut and bolt is a modified nail, and the Commission on Truck, 1871, gives us a picture of this older trade as still in the "domestic" stage, and consequently here we find the workman bearing all the charges which fall upon the manufacturer. On Saturday or Monday the nailmaker obtains from his employer the bundles of metal which are to be used during the following week, and, with the help of his wife and children, works at them in the little smithy attached to the hovel in which he lives, carrying back his tale of nails at the end of the week. It has everywhere been the endeavour of the workman, having lost the opportunity to earn profits, to rid himself also of the responsibility of the *entrepreneur* and of risks which properly fall on profits; hence his hostility to all forms of deductions. Deductions for materials and tools have frequently been a pretext for fraud on the part of the employer, who attempted to make a profit on the sale of materials to the workman, or on the use of machinery, e.g. the rent of knitting-frames. The Truck Act, 1896, makes it illegal for an employer to make any profit on materials supplied. His only inducement to supply them is therefore such advantage as he may obtain by insuring the use of proper materials in his business.

The second class of deductions—things supplied as part reward of labour—seems to be based upon the idea of the paternal responsibility of the employer. They were at one time numerous, and were very liable to abuse by unscrupulous employers. The pernicious results, for example, of deductions for house-rent are shown in all reports of select committees or commissions on truck. But by the Truck Amendment Act, 1887, all deductions of this class, except those for benefit societies and for schooling, were made illegal. Deductions for school have ceased with the introduction of free elementary education. Deductions for benefit societies of various kinds are now the only deductions of this class which remain, and they are of importance because they have shown a tendency to increase in recent years. All the great railway companies have one or more benefit, accident, or superannuation funds. The practice of establishing such funds has also been taken up by corporations, as well as by some private and many public firms. The sums deducted are not of course, as in the case of other deductions, altogether lost to the workman, but constitute a contingent reward of labour, the real rate of wages being sometimes actually increased by the contributions of employers to such funds. Compulsory deductions for benefit societies are often defended on the ground that expenses of collection and management are thereby saved to the worker, members are protected against the improvidence and carelessness of fellow-members, since arrears are impossible under this system, and the improvident men are coerced for their good. On the other hand, they are objected to because of the hold they give the employer over the worker, and because of the inconvenience arising from change of employment where they exist. Trade union executives and officials have always opposed them. In reference to their influence Mr. Mason, solicitor to the London and North-Western Railway Company, said in his evidence before the select committee on the Employers' Liability Act (1880) Amendment Bill, 1886: "It has been the object of most railway companies to make their service a permanent service for the men, and it is with that object that they have fostered and encouraged their provident societies and pension societies, and, for the higher classes of clerks, superannuation societies."

An important question arises. Are such deductions regarded as deferred payment of wages, or as being the property of the employer? Two illustrations may be given of the confusion which exists on this point. In a strike in 1897 a railway company threatened to forfeit a compulsory benefit fund, thus treating it as their own property and not that of the workmen who had contributed towards it. A form has come into

use which is passed through parliament without question whenever a corporation desires to start a benefit fund. It provides that in case of sickness, death, or dismissal a man or his representatives is entitled to receive from the society the sum total of the moneys contributed by him from week to week, together with the contributions added thereto by the corporation. An exception is, however, made in case of dismissal for fraud or dishonesty, causing actual pecuniary loss to the corporation. By this curious provision an act of parliament claims, under certain circumstances, to dispose of the whole of a man's savings; whereas the most that can suitably be done is to stop so much of them as may be a set-off against the injury sustained by the corporation. Nor is there any justification for stopping the portion contributed by the corporation, for this must be regarded either as deferred payment of wages or as a charitable donation. If it be looked on as wages the corporation obviously has no right to retain it. But if it be looked on as a charity, the corporation would appear to exceed its powers in granting it out of public moneys.

We now come to the third class of deductions—those in respect of fines.

As a rule fines are found wherever a large number of persons of a low degree of intelligence are employed together, or where expensive machinery is thrown out of gear, or many workers are delayed by the irregularity of one. The system implies the existence of a moral censorship in the employer whenever a fine for unpunctuality, breach of discipline, or damage to tools, materials, or work exceeds—as in part it has frequently done—the actual loss to the employer, *i.e.* when it becomes purely punitive. The Truck Act, 1896, has made it illegal for the employer to exact more than compensates for the damage received, by providing that deductions in respect of fines shall not be made unless "the fine imposed under the contract is in respect of some act or omission which causes, or is likely to cause, damage or loss to the employer, or interruption or hindrance to his business; and the amount of the fine is fair and reasonable, having regard to all the circumstances of the case" (see *i. c.* and *d.*) The act also requires that contracts shall be explicit, and provides for their publication.

The case of shop-assistants with regard to fines is interesting. In this occupation the custom of fining is very prevalent, and it is no uncommon thing for an establishment to possess a list of sixty or seventy or even a hundred rules, infringement of all of which is punished by a small fine. The sum total at the end of the week is often a serious reduction of the wage. When the Truck Act, 1896, was under consideration by the standing committee on trade, the home secretary, Sir M. White Ridley, proposed and carried an amendment whereby the first section of the act applied to the case of a shop-assistant in like manner as to that of a workman. By section 1, subsection 2, therefore, shop assistants are now within the scope of truck legislation so far as regards deductions or payments in respect of fines. It appears, however, that though the administration of the Truck Act rests with the home office, so far as concerns factories and workshops, this department has no responsibility regarding retail shops. As no other authority has been entrusted with the duty of enforcing truck legislation, the act of 1896 remains a dead letter as regards shop-assistants, although they were specially included under it.

The occupations in which fines and deductions must be looked for therefore are, first, the less developed industries, where home-work has most recently prevailed, and which are nearest to the stage of domestic industry, such for example as tailoring (especially where this is done for Jewish contractors), many small local industries, many women's occupations, particularly where the work is taken home. They are found also in many employments where trade unionism is weak. For example, fines and deductions are very prevalent and irksome among shop-assistants, omnibus and tram-car servants, waiters, and railway employés. Among waiters especially deductions are made to an extent that can only be described as monstrous. A plausible explanation of the prevalence of the system, and particularly of fines, in these occupations is that in all of them the worker is brought into direct contact with the public, and that a high degree of discipline is necessary to secure public comfort and safety. But it is important to notice that they are also all badly organised or unorganised employments, and that all have come but partially under the

protection of the Truck Acts. Thus waiters are excluded because the "Truck Amendment Act 1887," which extended the benefits of the acts to any persons included under the term "workman" as defined in the "Employers' and Workmen's Act 1875," provided that the term was not to be taken to include, for the purposes of this act, domestic or menial servants. Shop assistants, as before stated, were only included by the act of 1896. With regard to omnibus employés, it was laid down in the case of *Morgan v. General Omnibus Company*, 1884, 13 Q.B.D. 618, that the conductor of an omnibus does not come under the definition "workman," since he does not actually lift passengers in and out of the omnibus. Similarly, with regard to railway employés, it was decided in *Hunt v. Great Northern Railway*, Q.B. vol. 1. 1891, p. 601, that the guard of a goods train does not come under the definition "workman," because the scope of his employment is not primarily manual.

Among miners also deductions have long been common, perhaps because they often form large isolated bodies, not easily reached by the public opinion of other workers. Among the miners of South Wales, for example, the following deductions are found—deductions for a doctor elected by the miners, for sick and accident funds, fatal accident funds, miners' permanent relief society, colliery workers' house-coal and house-rent. In some collieries fines are inflicted in addition for breaches of Mines Acts and special rules, and for loss of tools supplied by the employers.

In consequence of the persistence of fines and deductions in small or undeveloped industries, and among workers who are unorganised or almost unorganised, we should expect to find them much more usual where women are employed than among men. This is, in fact, the case. Where men are employed fines and deductions are rarely found, except in industries not protected by the Truck Acts, *e.g.* waiters, and when the system exists it is oftenest in the form of deductions for benefit societies—this being the least repulsive form in which the principle can clothe itself. Among women, on the contrary, fines and deductions are common—even usual—and punitive fines, or deductions for materials, seem to be the most usual forms. They often materially lower the rate of wages. A case may be given which was quoted at the Conference of the National Union for Women Workers, 1896, in a paper by Mrs. Hicks:—"A woman working for a large city firm, making children's seaside suits at 2s. 9d. per dozen suits, has to pay 1d. in the 1s. for steam power that drives her machine, she has to pay 1d. in the 1s. for light, and she has to buy the cotton with which the suits are made. These suits may be of a special colour and the cotton has to match. A few weeks before I saw her work book, she had three suits to make and the cotton cost 6d.; she did not require that cotton except for those suits. For making these particular suits at the regular rate of pay she ought to have received 8½d., but when the light charge, and the steam charge, and the price of the cotton was calculated, she had 1½d. for making three."

Cases are quoted in the cotton weaving industry where the deductions for faults in the work have exceeded the weekly wage; and though such cases usually prove to be cases where the worker is learning the trade and may perhaps be considered to be compensated by the skill acquired, there are—under a system where fines are assessed by the foreman who may hope to obtain promotion by vigilance in his master's interests—many cases of hardship, and some of great injustice. It is often impossible to ascertain to whose fault the bad work should be attributed, and in such cases, fines are particularly irritating. For example, in the weaving trade the tuner may be in fault, yet the weaver only is fined.

Fines and deductions are far more practically important as lowering wages among women than among men; excepting perhaps in the case of waiters and some other classes unprotected by the acts.

Walker, *The Wages Question*.—Smith’s *Mercantile Law*.] E. M. D.

**TRUCK SYSTEM.** The “truck system” is the barter system introduced between employer and employed, and signifies the practice of paying wages otherwise than in cash. It takes the following forms. First, the gift to the labourer of a portion of that which he produces, whether the commodity be suited to his needs or not; secondly, the gift to the labourer of commodities suited to his needs whether he produces them or not; and, thirdly, the loan to the labourer of the appliances necessary to production. In one or other of these forms, the system is recognised as expedient and even necessary, in certain circumstances; but, in the general case, workmen universally prefer the full payment of their wages in cash, because it tends to place them in a position of greater social and economic independence (see **TRUCK** and **TRUCK ACTS**). The attempt made by employers in many trades in the middle of the century to continue paying their workmen in kind after it had become possible to adopt a system of cash payment was bitterly resented. T. G. S.

### TRUST AND TRUSTEE.

Trust and Trustee, p. 586; Trustee (judicial), p. 586.

**TRUST AND TRUSTEE.** A trust is a contrivance whereby one party holds property, real or personal, for the benefit of another. Such a person is called a trustee, and the person who benefits by the arrangement is called a *cestui que trust*. Trusts were unknown to the common law, and were first enforced by the court of chancery. They are created for a variety of purposes, public and private, but most commonly to make a provision for a family. The trustee has all those powers over the trust property which are essential for its preservation and management, but he is bound to use them solely in the interest of the beneficiaries under the trust. He has a right to be reimbursed his out-of-pocket expenses,

but no right to any remuneration for the performance of his duties, unless the deed creating the trust authorises such remuneration to be paid. He is bound to the utmost diligence and good faith in the discharge of the trust. A trustee is personally liable to replace any loss occurring through non-observance of the provisions of the trust deed (e.g. by unauthorised investments), but a beneficiary at whose request or instigation such a breach of trust was committed was always liable to recoup the trustee, and under a recent statute (Trustee Act 1888, § 6, now reproduced by Trustee Act 1893, § 45) the court may in such a case order the interest of such beneficiary in the trust estate to be impounded by way of indemnity to the trustee, and a more recent enactment (Judicial Trustees Act 1896, § 3) provides that in any case of breach of trust, as to which the court is of opinion that the trustee “has acted honestly and reasonably and ought fairly to be excused for the breach of trust,” the trustee may either wholly or partly be relieved of his personal liability for the same. Formerly no lapse of time barred the trustee’s liability to be sued for breach of trust; but under an act of 1888 it will be barred, in most cases, by the lapse of six years. Fraudulent breach of trust is a crime punishable with penal servitude. The *cestui que trust* has no power to interfere in the administration of the trust, except in so far as it has been expressly reserved to him by the instrument creating the trust. But he has a right to all the benefits arising therefrom, and the fullest redress for misconduct on the part of his trustee. Trusts were known to the later Roman law under the name of *fideicommissa*, but their scope was much narrower in Rome than in England. By a *FIDEICOMMISSUM* the representative of a deceased person was bound to hand over to a party whom the deceased had indicated either the whole inheritance, or a part of it, or some specific object comprised in it.

[Snell, *Principles of Equity*.—Lewin, *Law of Trusts*.—Godefroi, *Law of Trusts*.—*Institutes of Justinian*, ed. Moyle.] F. C. M.

**TRUSTEE (judicial).** By virtue of a recent statute (Judicial Trustees Act, 1896) the high court, and the judge of any county court, to whom jurisdiction has been assigned in that behalf, may, on the application of the creator of a trust, or of any trustee or beneficiary, appoint a “judicial trustee” to act, either jointly with another trustee or alone—in respect of any trust (not being a charitable trust). Any fit or proper person nominated by the applicant may be appointed, and, in the absence of any satisfactory nomination, an official of the court to whom the application is made may be appointed. The court may, within the limits prescribed by the rules issued under

the above-mentioned act, order such remuneration to be paid to a judicial trustee out of the income of the trust property, as shall cover all his work and personal outlay. A judicial trustee, whether an official or not, is subject to the supervision and control of the court by which he was appointed, and his accounts must be audited every year, and reported on to the court. It remains to be seen whether these new provisions, which were adopted on the recommendation of a committee, which had made inquiries on the practice as to "judicial factors" in Scotland, will be much applied in England.

E. S.

**TRUSTS** (in connection with trade combinations). Among the several forms of association which have been chosen by persons wishing to bring the whole of a trade under the control of a particular group of persons or companies, the so-called "trusts"—as established in the United States (see **MONOPOLIES**)—are the most prominent. Of these the Standard Oil Trust, formed in 1882 for the purpose of securing the monopoly of the American petroleum trade, is the prototype, and similar associations exist for other trades. In England and on the continent of Europe the same objects are frequently attained in other ways, e.g. by contractual arrangements between the traders concerned or by the formation of large companies who absorb all the smaller concerns, but the rings of monopolists are not so powerful in Europe as in the United States. In England it was attempted to obtain a declaration from the courts declaring combinations of the nature described to be illegal, but this attempt did not prove successful (*Mogul Steamship Company v. McGregor, Gow, and Co.*). In the United States, on the other hand, the courts have taken a less tolerant view of trusts of this nature, without, however, being able to prevent their continuance. It does not appear that the price of any article was ever permanently raised by trade combinations; and the advantages of a uniform organisation of all operations probably outweigh the evils created by the absence of competition, if the management of the combination is honest and serves no aims outside the proper objects of the combination; but this does not always seem to have been the case.

[See **MONOPOLIES IN THE UNITED STATES**, and the authorities there cited; also Aschrott, "Die amerikanischen Trusts" in *Archiv für sociale Gesetzgebung*, vol. ii. pt. 3, and further the article "Unternehmerverbände (wirtschaftliche)" in Conrad's *Handwörterbuch der Staatswissenschaften*.]

E. S.

**TRUSTS, COMBINATIONS.** See **MONOPOLIES**; **RING**; **SYNDICATE**; **TRUSTS**.

**TRUSTS, CHARITABLE** (Present law as to). Trusts created for one of the numerous purposes summed up under the head of "charitable," including religious and educational as well as

purely eleemosynary objects, are of very frequent occurrence in England, and property of enormous value is devoted to such trusts. It is clear that the public interest requires safeguards to be applied against possible abuses in the administration of the trust property, and also against the possible withdrawal of large areas of land from effective cultivation. Charities have therefore always been—and are now—to a large extent subject to regulations and restrictions imposed on them in the public interest. These may be divided into three heads: (1) the establishment of public authorities specially entrusted with the supervision of charitable institutions; (2) the rules of law under which charities are created and modified; (3) the restrictions in respect of the settlement of property for charitable objects.

(1) Charities are under the supervision of the crown, the courts of law, and the charity commissioners; and parochial charities (not being ecclesiastical charities) are also to a limited extent under the control of the parish councils (see Local Government Act 1894, § 14); but the functions of the charity commissioners are so extensive that they now do by far the most important part of the work which comes under this head. Their powers are derived under a number of acts of parliament, among which the Charitable Trust Acts of 1853, 1855, 1860, 1862, and 1869 are the most important. They are a government department consisting of four commissioners and a number of assistant commissioners and a secretary and assistant secretary, in addition to the commissioners and assistant commissioners who have charge of the endowed schools department. They have extensive powers of inquiry as to the condition and management of all charitable institutions; they are also enabled to authorise and superintend a number of transactions connected with the administration of charitable trusts, for which the trustees alone would not be competent, such as sales, exchanges, leases, repairs, improvements, purchase of sites, etc.; and their powers further extend to the removal and appointment of trustees, and other similar matters. The possibility of applying in respect of all the subjects mentioned to the charity commissioners has removed the necessity of taking proceedings in the courts in many cases, in which previously such proceedings were indispensable—which circumstance not only saves expense but also enables the parties to attain their object in a less formal and more expeditious manner.

(2) The law favours charitable trusts by exempting them from the restrictions of the rule against perpetuities, and it further gives considerable assistance by the application of the equitable doctrine of *cy-pris* (being a rule according to which the donor's intentions, if they cannot be carried out literally, are given effect to in an "approximate" manner). Where a testator manifests a general intention to devote a fund to charity, although no definite purposes are named, or although the objects named are incapable of being effected, that intention is carried into effect, but the particular mode of application is determined by a "scheme" which has to be settled for the purpose, either by the courts or by the charity commissioners. The doctrine of *cy-pris*, whilst thus preserving funds for charitable purposes, which would otherwise have to go to the testator's relations or residuary legatees, supplies the further advantage that it enables the administrators of any charity to disregard the literal directions of the founders, if the changes brought about by time make it desirable to introduce some alteration. In such a case as on the creation of a new charitable trust, a "scheme" may be prepared and settled by the court or by the charity commissioners.

(3) The restrictions imposed upon gifts for charities are divisible into two classes, of which the first is intended to prohibit legacies in favour of any objects which the law, for the time being, considers superstitious; whilst the second deals with gifts of land only, and is intended to resist the mischief which is thought to arise if land becomes the property of a "dead hand."

Gifts to superstitious uses formerly included all gifts for the benefit of religious communities other than the Church of England, but the disabilities of Roman Catholics, Jews, and dissenters were removed by successive statutes; and gifts for the benefit of these communities are now given effect to in the same way as other gifts, subject, however, to the exception that bequests to priests for offering masses for the soul of the dead are void in England. In Ireland such gifts are valid unless they transgress the rule against perpetuities.

The restrictions in respect to gifts of land for charitable purposes are now mainly regulated by the Mortmain and Charitable Uses Acts 1888 and 1891. The present state of the law may be shortly stated as follows:

(a) Gifts of land to corporations are void unless authorised by royal licence, and cause a forfeiture of the land to the crown. This rule is, however, subject to the following exceptions:

A. Gifts of land to a corporation for the purposes of a public park, a schoolhouse, for an elementary school or a public museum, are valid if they are made by a duly enrolled deed executed at least twelve months before the donor's death (M. and C.U.A. 1888, § 6).

B. Gifts of land to a company formed for the purpose of charity, and incorporated under the companies acts, are valid if not exceeding two acres of land, and are valid to any extent if authorised by licence of the board of Trade (Companies Act, 1862, § 21).

C. Gifts of land to a corporation for the purpose of providing dwellings for the working classes in any populous place are valid if made by duly enrolled deed (Working Classes Dwellings Act 1890, §§ 1-2).

(b) Gifts of land by will for the benefit of any charitable use are no longer subject to any restrictions; but any land given by will must, notwithstanding anything contained in the will, as a general rule be sold within twelve months from the testator's death; and personal estate directed to be laid out in the purchase of land for the benefit of any charitable use must not as a general rule be used for the purchase of land. Power is, however, given to the court and also to the charity commissioners:

A. In the case of land given by will, to extend the time for sale; or if satisfied that the land is wanted for actual occupation for the purposes of the charity, and not as an investment, to sanction the retention.

B. In the case of personal estate directed to be laid out in the purchase of land, if satisfied that the land proposed to be purchased is wanted for occupation, etc., to sanction the acquisition (Mortmain and Charitable Uses Act 1891, §§ 5-8).

[Bristow and Cook, *The Law of Charities and Mortmain*, 1889. See also the article "Charities" in the *Encyclopedia of the Laws of England*.] E. S.

TUCKER, GEORGE (1775-1861). Born in Bermuda; died in Virginia. In early life he was a lawyer and in public life. He retired from congress in 1825; was professor of moral philosophy and political economy in the university of Virginia for twenty years.

He wrote *Laws of Wages, Profits, and Rent Investigated*, Philadelphia, 1837, pp. v., 189, in which he criticises the Ricardian theory of distribution of wealth; *Theory of Money and Banks Investigated*, Boston, 1839; *Progress of the United States in Population and Wealth in Fifty Years*, New York, 1843. The edition of 1855 contains *Appendix*, p. 68, on the census of 1850. This is a valuable study in social statistics, dealing with sex proportions, race elements, age, maladies, progress of slavery, and annual increase of the population; *Correspondence with Alexander H. Everett on Political Economy*, 1845; and *Banks or No Banks*, New York, 1857. In this the unrestricted banking of the early period of the first third of the century is severely criticised. D. R. D.

TUCKER, JOSIAH (1712-99), son of a small Welsh farmer-squire, curate and rector at Bristol under Bishop Butler, and dean of

Gloucester (1758-99); laid in his *Elements of Commerce* (1755) those four foundation-stones of political economy, the discovery of which is attributed by Zeyss (1889) and Hasbach (1891) to A. SMITH (1776).

(1) He regards political economy as a science, for commerce means with him, as with D. HUME (1752), any means whereby wealth is got; and his "elements," which deal with men's animal and social "wants," and are non-national and "universal," yield, but for "human impediments," an order like that of the stars in their courses (p. 8). HEGEL, too, called political economy a theory of wants, and compared its laws to those of astronomy (J. Bonar, *Phil. and Pol. Ec.*, p. 310). (2) In supplying wants, "self-love," SAY's word, or "self-interest," A. Smith's word, is "the great mover"; "the strongest principle," far mightier than "benevolence," and destined to drive out "tyrant custom" from its last stronghold in the open field, and to turn proud "Gothic barons" and cringing "vassals." Hume's phrases, 1752, into "commercial" farmers bent on gain. He looks on commercial man as swayed solely by self-interest. (3) Self-interest, if untrammelled, almost always "coincides" with public interest in populous countries, for it is competition which produces this result; and in thinly-peopled countries competition is inconceivable. With competition, the producer will sell as cheap as he can, without competition as dear as he can; and in the former case "the public" or "consumer" will gain, and "the maker" will not lose. Further, industrious foreigners should be naturalised in order that wages may be beat down and labourers' "combinations" broken; and "though individuals may suffer," prices will be cheaper or wares better and the "public is a gainer" (MCULLOCH, *Collection of Scarce Tracts on Commerce*, 1859, p. 343). He is therefore an advocate of competitive distribution as well as competitive production. His point of view is so absolutely that of the consumer that he calls monopolies and bounties "taxes on the community," and says "abolish every tax and remove all impediments whatever which might prevent self-love—the grand mover—from operating for the public good" (*E. of C.*, p. 169). "One-half at least of . . . the statutes . . . might be made a bonfire of" (p. 158), including privileged companies, parish settlements, apprenticeships, laws as to labourers' hire, hours, wages, and combinations, and as to price and quality of goods. "Remove disorders which a bad habit or a wrong treatment hath brought upon the constitution, and then leave the rest to nature, who can best do her own work"; when healed, "it would be as wrong to multiply laws relating to commerce as it would be to be for ever prescribing physic" (p. 79). He called industrial freedom a "natural right" (pp. 124, 155), echoing—not LOCKE, whom and whose disciples he abhorred (*Treatise concerning Civil Government* (1781); *Sequel to Sir W. Jones* (1784)); but Sir E. Sandys (*Journals of H. of C.*, (1602), vol. i. p. 218). At this date the PHYSIOCRATS had written nothing, and Hume still called the economic sense "avarice" (*Works*, ed. Green and Grose, vol. iii. p. 295); possibly A. Smith

was, in 1755, moving in the same direction (J. Rae, *Life of A. Smith*, p. 203); but if not, Tucker's voice was the voice of one crying in the wilderness. (4) There were a few cases in which self-interest, even when exposed to competition, does not promote public interests: (a) profit may be too remote, as in reclaiming bogs, growing timber, and infant industries, where temporary bounties and remissions of taxes were allowable (*E. of C.*, pp. 73, 74); (b) cheapness may involve vice, as in ale-houses, which should be limited; (c) learned professions live on the labour of others, and therefore their members should be few (p. 92); (d) bad doctoring is too dangerous, therefore doctors must be selected beforehand by examination (p. 91); (e) in production on a large scale self-interest, by ranging masters and men into hostile camps, leads to mutual suicide, and therefore production on a small scale will alone survive.

He made politics tributary to economics, and wished the colonies to separate from England because trade laws were the only link, and that link was rotten. Burke upheld the trade laws and reviled "the profane herd of those vulgar and mechanical politicians . . . who think that nothing exists but what is gross and material" (*Speeches on Am. Tax. etc.*, ed. Selby, pp. 99, 131). Tucker replied with an audacity worthy of COBDEN, that he was proud to belong to the latter class. So too his denunciation of trade wars, and the jealousy of trade (Hume's phrase, 1758), is enlivened by a sentence worthy of Cobden. "A shopkeeper will never get the more custom by beating his customers, and what is true of a shopkeeper is true of a shopkeeping nation" (*Four Tracts and two Sermons* (1774), p. 132; cp. A. Young, *Tour in Ireland*, ed. 1892, vol. ii. p. 219). Like A. YOUNG and Mr. Goldwin Smith, he combined colonial separatism with Irish unionism, and prophesied in 1785 that the latter event would come to pass in ten or fifteen years (*Reflections*, p. 33). He knew that slave-labour was costly (*Instructions for Travellers*, p. 20), and deemed political the handmaid of industrial freedom, but scorned votes, and thought that the levelling disciples of Locke in France were harbingers of revolution (*Cui Bono*, 1781).

Why, then, is Tucker almost unknown? First, he held the views about population which prevailed from FORTREY and Sir W. TEMPLE down to R. PRICE and WALES; and asked, "What is a market but a collection of inhabitants"? wished to refasten some of the old trade fetters on bachelors, and though a champion of strict indoor relief, wished to grant out-relief to large families. His preference for small estates, like BACON and HARRINGTON, small farms and allotments, like PRICE, and his appreciation of the division of labour, are like gleams of sunshine across this gloom. Secondly, his idea that "industry and labour are the only real riches," that "commerce" is "the exchange of labour" (*Sermon*, i. p. 13), and that money is "a certificate of labour" (*E. of C.*, p. 99), is a crude version of PERRY's ideas which Hume and A. Smith refined, but which reappear yet more crudely in R. OWEN, KARL MARX, and the LABOUR EXCHANGE of this century. True, it enabled him to defend machines, and to see clearly what no

mercantilist saw quite clearly, that domestic and foreign trade are on the same footing with regard to wealth, and that all trade benefits both buyer and seller (ROSCHER, *Zur Geschichte der englischen Volkswirtschaftslehre*, p. 39), but it proved that his mind was a blank on problems of cost and value. Thirdly, his panacea of taxing luxuries shows that he had not thought out taxation from his new point of view. He was only a "ways and means" man. Fourthly, his *Brief Essay on the Advantages and Disadvantages which respectively attend France and England with regard to Trade* (1748), reprinted by M'Culloch (*loc. cit.*), misrepresents the writer's mature opinions (*Cui Bono*, 3rd ed. p. xiii.); it is but a stepping-stone from Richardson's (?) mercantilist *Essay* (1744), also reprinted by M'Culloch (*loc. cit.*) to Tucker's great work, *Elements of Commerce and Theory of Taxes* (1755); continued in *Instructions for Travellers* (1757), and second *Tract* (v. i.). And this work is the merest fragment, thrown aside for want of money. Indeed, the *Elements* have only been privately printed, and the *Instructions* restate the best portion of his *Brief Essay*. His other economic works are with a few exceptions pamphlets on questions of the hour; e.g. on naturalisation (*Reflections*, pt. i. (1751); pt. ii. (1752); *Two Letters* (1753)); on limiting public-houses (*Inquiry into . . . Low-priced spirituous Liquors* (1751)); on opening the Turkey trade (*Reflections* (1753)); on trade wars and colonial separation (*Tract*, ii. (1763); iii. (1766); iv. (1774), and v. (1775); *Letter to E. Burke* (1775); *Humble Address* (1776); *Series of Answers* (1776); *Dispassionate Thoughts* (1780); *Cui Bono . . . Letters to Necker* (1781); *Plan for a General Pacification* (1782); on Ireland (*Tract* v. (v.s.); *Reflections* (1785); and extracts in *Arguments for and against an Union* (1798), and T. B. Clarke, *Union or Separation* (1799)). TURGOT translated two of these pamphlets, *Reflections*, pt. ii., and *Tract* ii.; but they are too polemical to live. The exceptions fall into two classes. (a) Those of passing interest are—*Reflections on the . . . Low Price of Coarse Wools* (1782) (allotments); *Manifold Causes of the Increase . . . of the Poor* (1760); *Bath Soc. for . . . Agriculture*, vol. vi. p. 252 (proposes unions, benefit clubs, etc.); to which M'Culloch adds the anonymous *Causes of the Dearness of Provisions* (1766) (?) (b) His *Tract* i. (1758), which arose out of a correspondence with Hume, and *Two Sermons* (1774) go to first principles. Hume wrote (1752) that a rich nation must lose its riches, because a poor nation can work more cheaply owing to low wages (*Essay* iii. in *Works*, vol. iii. p. 310). Tucker answered that if the nation was idle, its riches would "melt like snow in summer"; if the nation had been and was industrious, its fixed and circulating capital—he enumerates the different species, but does not use these words (*Tract* ii. p. 22)—its skill, division of labour, and the fact that profits must be higher in the poor country, gave the rich country an incalculable advantage, except in unskilled industries like timber-growing. Hume's reference to "the advantage of superior stocks and correspondence" in his sixth *Essay* (1758), (*loc. cit.* p. 348), was perhaps inspired by Tucker.

The argument about high profits was put better in the *Brief Essay* (ed. McCulloch, p. 339), but is similar to that on which J. S. MILL relies (*Pol. Ec.*, bk. iii. ch. xxv.). He also adds that in advocating naturalisation he did not wish to attract moneyed idlers, who only impoverish a nation; and this was the true answer to MANDEVILLE'S paradox, which D. HUME (*q.v.*) had failed to answer (cp. T. B. Clarke, *Survey of the Strength and Opulence of Great Britain*, 1801, p. 38).

Tucker was one of those who grow with astonishing rapidity up to a certain point, which they never pass. As Bristol and the influences of Butler and Hume undoubtedly stimulated, so perhaps Gloucester stunted his spirit.

[For philosophic doctrine of self-interest, in Butler, see Hume's *Works*, ed. Green and Grose, introduction to vol. ii.; in recent writers, see M. Block, *Les Progrès de la Science Économique depuis A. Smith* (1897), ch. vii.—For Tucker's political ideas, see Leslie Stephen, *Hist. of English Thought in the Eighteenth Century*.] J. D. R.

**TUNNAGE AND POUNDAGE.** See **Tonnage and Poundage**.

**TURBOLI**, GIAN DONATO (17th century), a Neapolitan writer and merchant and director of the mint at Naples. He discussed money and exchange in several speeches published in different years between 1616 and 1629. All these, except the first, were eventually published in Custodi's collection. Turboli, like many other writers of the day, investigates the causes of the want of specie in the kingdom of Naples, and gives interesting notes on the difficulties of coining in that kingdom.

He especially studies exchange, to which many proposed to fix a legal maximum limit, believing this to be a means of preventing money from leaving the country. Turboli, however, combats these measures, observing that if the rate of exchange was high in Naples, insuperable reasons caused it to be so; and if the rate of exchange was high against the kingdom, and this had deprived it of all coins, this evil was irremediable, as he who owes largely cannot have much ready money, because he is obliged to pay. Turboli's chief merit is his persistent opposition to the suggestions of a legal regulation of the rate of exchange; but his treatment of the subject is far inferior to that of *SERRA (q.v.)*.

*Discorso sopra le monete del regno di Napoli, ec., con diverse relazioni e copie d'altri discorsi, ec.*, 1629 [see Fornari, *Delle teorie economiche nelle provincie napoletane*, 1882.—Gobbi, *L'economia politica, ec.*, 1889]. U. R.

**TURGOT**, ANNE ROBERT JACQUES TURGOT, BARON DE L'AULNE (1727-1781), one of the noblest and purest figures in history, occupies an important place on the roll of great economists. Endowed with a fine intelligence, nourished and fortified by unwearying assiduity, he became early in life a distinguished scholar, and was elected prior of the Sorbonne in 1749. In that capacity he delivered in 1750 an address on *The benefits which Christianity has procured for Humanity*, and the same year an

account of *The Progress of the Human Mind*, in the course of which he predicted as inevitable the separation of the American colonies from the mother-country:—"Les colonies sont comme des fruits qui ne tiennent à l'arbre que jusqu'à leur maturité: devenues suffisantes à elles-mêmes, elles firent ce que fit depuis Carthage, ce que fera un jour l'Amérique" (*Œuvres*, ii. 66). He translated from the Greek, Latin, Hebrew, German, and Italian, and notably, from the English, some of the economic writings of D. HUME and J. TUCKER. He composed French and Latin verse with elegance and facility. His epigram on FRANKLIN has rested famous: *Eripuit coelo fulmen sceptrumque tyrannis*. The letter on paper money which he addressed to the Abbé de Cicé in 1749, criticising the system of Law, is his first excursion into economic reasoning. In 1750 he wrote an essay against the metaphysics of BERKELEY, and subsequently worked up for the *Encyclopédie*, and published under the title "Existence." A criticism of Maupertuis's theory of languages similarly formed the basis of an article "Étymologie" in the same collection. In 1751 he quitted the Sorbonne. Conscientious scruples decided him to abandon the ecclesiastical career upon which his family and friends desired to see him enter; and in 1752 he embraced the profession of the magistracy, commencing as *conseiller-substitut* of the *procureur-général*. The same year he became *conseiller au parlement*, and in 1753 *maître des requêtes*. In 1756 he followed up his articles in the *Encyclopédie* with three others, "Expansibilité," "Foires," and "Fondations," the last two of economic interest. He opposes exclusive privileges of fairs and markets, and pleads for liberty for commerce to find its own channels, supporting his views by reference to GOURNAY, "to whom France will perhaps some day owe the destruction of obstacles which have been imposed upon the progress of trade in the vain hope of encouraging it." To the argument that fairs facilitate the collection of taxes upon articles sold for export, he replies that it would be wiser to exempt such goods from taxes altogether, and points out that a reduction of duties by stimulating trade and consumption, and reducing the cost of collection, may result in a larger net revenue. His criticisms of "foundations," are, though much fuller and deeper, in many respects similar to those to which twenty years later ADAM SMITH gave utterance. The vanity of founders, their want of foresight, the social dangers of ill-advised charity, the degeneration of worthy objects, are vividly brought out. Self-help, and freedom to exercise one's own faculties, are conditions of a healthy society. But none the less, voluntary effort, individual or combined, in relief of suffering, is a duty incumbent upon all citizens. The poor have incontestable claims upon the abundance of the rich. Religion and

humanity call upon us to succour our fellows in distress. But in all things public utility is the supreme law, and ought not to be held in check by superstitious respect for the "intentions of founders." "If there were a tomb for every man who has lived, it would be necessary, in order to find land for cultivation, to sweep away these barren monuments and stir the ashes of the dead to provide subsistence for the living" (*Euvres*, iii. 255). The order for the suppression of the *Encyclopédie* and its partisan reputation for agnosticism induced Turgot to abandon his intention of contributing further articles to the great dictionary, which was continued clandestinely. His translations of English writings upon trade deepened his intimacy with Trudaine and Gournay. In 1755 and 1756 he accompanied Gournay, then *intendant* of commerce, upon his official travels throughout the country, and was made to see the ramified mischief wrought by excessive and ill-judged state regulation, often inspired by interested motives, and "putting the poor still more at the mercy of the rich." In 1759 Gournay was cut off by death, and Turgot wrote his *Éloge de M. de Gournay*, a memoir struck out in a few days to assist Marmontel to deliver an official oration at the academy. This tract furnishes almost the only account we at present possess of that eminent precursor of the French school. It sets forth with conviction the eagerness of Gournay for a LAISSEZ-FAIRE policy, and warmly praises his large views and clear principles of freedom of enterprise.

In 1761 Turgot was nominated *intendant* for the generality of Limoges. Confronted by obstacles almost insurmountable, he applied himself with equal vigour and intelligence to the solution of the most difficult problems of administration. The district was poor. Its finances were in a state of chaos. The *intendant's* duty was to raise from his generality a certain sum, fixed annually, for the royal treasury, and to apportion the amount between the several localities. Part of the district had been surveyed in 1738; but such of these records as had been preserved were faulty or out of date. Estimates of wealth were framed upon different principles—gross revenue being sometimes reckoned as net income—and as regards the unsurveyed portion of the generality, the declarations of owners approximated to the truth with widely varying degrees of accuracy. No record was kept of changes of ownership, or other essential circumstances. To remove the glaring anomalies which resulted, and to eliminate as far as possible the arbitrary element from future apportionments, Turgot undertook the immense task of a complete survey. Another of his first steps (1762-1764) was to abolish the CORVÉE, and to replace it by the milder and more convenient burden of a highway rate based upon the TAILLE. So great

was the mistrust entertained towards the government, that it would have been difficult to raise such a rate directly, for the peasants could feel no confidence that the money would not be diverted to some other purpose, and the roads left unattended. He ingeniously proposed that the parishes should have the work executed by contractors, and the cost deducted from the quota of contribution due from the parishes to the treasury. This bold reform, which Turgot executed by an *ordonnance* transgressing the strict limits of legality, was an unqualified success, and paved the way for the confidence and popularity which he subsequently enjoyed throughout his district.

In 1770-71 he found his generality menaced by famine. Rigorously enforcing the unlettered movement of corn within the district, he trusted with confidence to an influx of corn and to its commercial distribution where it was most required, as evidenced by the height of prices. At the same time he borrowed 20,000 francs, and, adding to these from his own resources, and from government subventions, he undertook public works to provide the poor with employment, and the means wherewith to purchase food. At this period he addressed to Terray, then controller-general, seven letters on the corn trade, of which three are lost. In these letters he examined the ill effects of legal restrictions upon the free circulation of corn throughout the country, and strenuously pleaded for free trade. The success which attended his abolition of the *Corvée* for repairs of the roads encouraged him next to abolish the *corvée* for the forced transport of troops and war material. The peasants, employing large numbers of slow oxen and small chariots in this service at times when their harvests urgently required them at home, were greatly benefited by a change which allowed them to pay in money a contractor who conducted the transport by horses at a quarter of the old charges. A similar reform was executed with regard to billeting. He successfully resisted the attempt to impose upon his district a new *corvée*—the hauling of boats laden with admiralty timber along the Charente. His enquiries into the wealth of his generality enabled him also to claim with success a diminution in its quota of national taxation. His unwearied efforts to promote the welfare of the people rendered him truly popular. He established veterinary schools; encouraged the society of agriculture of which he was president; introduced the potato, clover, and artificial grasses; stimulated new industries or new processes in the manufacture of paper and in tanning; and by his active and enlightened administration greatly contributed to the prosperity of his district. Particular occasions upon which it became necessary for the government to consult him drew from his able pen reports in which the

great lines of important economic principles were boldly laid down. Such are his memoir on mines and quarries (the economic and legal aspects of free mining) and his study of the laws of interest (a defence of free trade in capital). He suggested to the society of agriculture that it should offer a prize for an essay upon the advantages of employing horses as compared with oxen, and upon the effects of indirect taxes on the revenue of landowners. The latter of these offers drew forth the works of SAINT PÉRAY and GRASLIN.

Two young Chinamen, who had been brought to France and educated by Jesuits, were sent back to Canton with a royal annuity, to maintain a correspondence upon the state of literature and science in China. Turgot wrote for them in 1766 a little treatise on political economy, which was published in the *ÉPHÉMÉRIDES* (Nov. 1769 to Jan. 1770) under the title of *Réflexions sur la Formation et la Distribution des Richesses*—his most considerable work in economic speculation. In 1774, to the great regret of his district, which he had thrice refused to leave for promotion to other generalities, he was called to the court of the new king (Louis XVI.), and made secretary of state for the navy, a post which he held for only five weeks before being appointed controller-general and minister of finance (24th August). DUPONT DE NEMOURS, giving a striking account of Turgot's maritime programme and of his enlightened views upon colonial policy, thinks it perhaps regrettable for France that Turgot had not remained in the less political office of the admiralty, to carry out the extensive proposals which his fertile brain had already framed. Entering upon his new duties, he stated the principles by which he intended to be guided in the most difficult of offices, and summarised them in a striking letter to the king in which he lays down three cardinal propositions, *point de banqueroute*, *point d'augmentation d'impôts*, *point d'emprunts*; expenses are to be kept below receipts and debts reduced, or the first cannon shot will force the state to financial ruin. The king is urged to favour economy, and to be firm against the clamour of those who resist it, for the good of his people must be his primary consideration; and those who wish to dip their hands into the treasury must remember that the revenues of the state are provided with difficulty by the humblest subjects, and that the king has no right to deprive these of subsistence to gratify even his dearest dependents. This bold appeal is as remarkable for its foresight as for its courage. Turgot clearly saw that those who profited by laxity and abuse would make a desperate fight against reform, and he endeavoured to strengthen the king's good intentions by timely warning and advice. The royal expenses for 1775 were estimated to exceed the revenue by over 22,000,000

livres, and upwards of 78,000,000 livres had been expended in anticipation. Pensions were three or four years in arrear, and each department was heavily in debt. Nevertheless Turgot did not hesitate to abolish or diminish various onerous charges upon the public, and to devote a sum of 15,000,000 towards the immediate payment of arrears due from the state. He purified the financial administration, checked the growth of parasitic *croupiers* who drew a kind of royal pension from the FARMERS-GENERAL, himself refused from them the customary commission of 100,000 crowns on a new lease and 50,000 a year, and thus secured for the state better terms than his predecessors—at once increasing the revenue and diminishing the expenditure. On the 25th September 1774 he issued a decree permitting free trade in corn within the country, but not its export. The bad harvest of the following autumn assisted Turgot's enemies in their efforts to foment corn riots throughout the country, as a protest against the new policy; but the disturbances were firmly quelled, and the government showed its spirit and reassured commerce by promptly paying 50,000 francs to a merchant for a cargo of corn which had been thrown overboard by the mob. Du Pont asserts that the really serious result of this disorder was not merely the loss of money (610,000 francs) spent in repressing it, but especially the waste of valuable time which prevented Turgot from putting into execution his matured plans for an extensive reform of local government, decentralising a large measure of power and responsibility into the hands of local elected authorities. The riots delayed the prosecution of this scheme for six weeks, and made it impossible to carry through the necessary preliminary stages by October, when the finances of the year were regulated. This compelled the plan to be delayed a whole year, and Turgot was not destined to have another opportunity for carrying it out. The abundant details which we possess of his administration illustrate the clearness, courage, consistency, and integrity of his views. Unfettered liberty, unspotted honesty, were to him the ideal requirements for promoting the financial and social welfare of the nation, and he revised with much shrewdness, to the great profit of the treasury, the financial bargains concluded with farmers-general and others by his less scrupulous or less enlightened predecessors. The credit of the state revived. The rate of interest on loans to government fell in twelve months from 5½ to 4 per cent, and a large measure of conversion by aid of a loan from Holland, was in preparation by Turgot when he fell, and a great programme of many and far-reaching measures, calculated to promote the greatest benefits to the country, came to an untimely end.

The reforming zeal of Turgot had stirred up

an active band of enemies at court. Courtiers, who were aided to live in the giddy and costly society of Versailles by more or less thinly veiled grants from the treasury, in the shape of perquisites, sinecures, and royal gifts, saw with rancour and alarm the financial severity of the new controller-general. In almost the same words as Sully had employed to Henri IV., he pointed out to the king that his money was collected from his poorest subjects; and like Sully he successfully invoked the king's fairness and clemency towards the great mass of the labouring people as a check upon uncalled-for and unearned generosity at their expense. The financial interests, unable to advance their own profits by the corruption of the minister, and compelled even to disgorge some of their unjust gains, shared to some extent the same feeling. Most of Turgot's colleagues in the ministry had an uneasy conviction that he was going too fast and too far. Finally the queen herself held him in high disfavour by reason of the limitations which he imposed upon her extravagance. These elements of discontent came to a head when the famous Six Edicts were presented to the king by Turgot in the beginning of 1776. These proposed, 1st, to abolish the *corvées* throughout the kingdom; 2nd, 3rd, 5th, and 6th, to suppress various taxes and tolls upon corn, cattle, etc., in Paris; and 4th to suppress the JURANDES or guilds. Differences arose among ministers with regard to these measures, but the king decided in favour of their acceptance; and, after being passed by the council, they required to be registered by the parliament. That reactionary body objected to register them with the exception of one of the least importance. The king was obliged to call a *lit de justice* to compel their submission. The infuriated parliament commenced to clamour against Turgot, and ordered the burning of a treatise *Sur les inconvénients des droits féodaux*, written by his friend and subordinate BONCERR. Intrigues were set on foot in every quarter. The king, who had shortly before declared his opinion that only he and Turgot really loved the people, was worked upon and wearied by Turgot's enemies. A memoir, said to have been prepared by NECKER, was privately submitted to him pointing out some arithmetical inaccuracies in Turgot's draft budget, and suggesting that he was incapable to deal with the accounts of the nation. Du Pont alleges that damaging letters, with the forged signature of Turgot, were brought to the king from the *cabinet noir*. A coldness sprang up on the king's side. An open breach occurred over the proposed appointment or a successor to Malesherbes, Turgot's chief friend in the ministry, who had resigned his office. The queen's party proposed Amelot, an antagonist to all Turgot's ideas. Turgot remonstrated. The

king vacillated. Turgot wrote him four letters, in the tones of vigorous and almost patronising exhortation which he had employed when accepting office. One of these letters remains to enable us to judge of the rest. "Do not forget, sire," he says in one place, "that it was weakness that brought the head of Charles I. to the block." . . . "You, sire, have been sometimes believed to be weak, but I have seen you in trying circumstances show real courage. You have said it yourself, sire, that you want experience, that you have need of a guide." To none of these letters did the king send a reply. It cannot have surprised Turgot to receive his dismissal, 12th May 1776.

Du Pont has summarised Turgot's ministry. He abolished twenty-three taxes onerous to industry and commerce. At a cost of 10,000,000 livres a year he got rid of the scourge of the *corvée* on the roads, which cost the country four times as much, and abolished other forms of forced labour. He arrested a devastating plague, stifled a sedition, lightened the collection of taxes, freed trade and labour from many shackles, paid four years' arrears of pensions, defrayed the extraordinary charges arising out of the coronation, a royal marriage, and a royal birth, paid off 74,000,000 of debt and 58,000,000 of advances, leaving only 10,000,000 of anticipated income to be repaid by his successor, and left behind him a surplus of 3,500,000 as compared with a deficit of 19,000,000 when he assumed office. All this and much more in a ministry of twenty months, during seven of which he was incapacitated by gout. He betook himself to a calm retreat, and to the study of literature and science, and died less than five years after his dismissal (18th March 1781). Men so different as VOLTAIRE and Adam Smith, who met him in Paris in 1766, esteemed him highly. There have been greater economists and more tactful statesmen; but no minister has ever surpassed him in combined courage, probity, patriotism, and intellectual attainments.

Some more extended account is required of Turgot's chief economic work, the *Réflexions sur la formation et la distribution des richesses*. It is divided into 100 sections, occupying 180 pages of Du Pont's edition. He traces the existence of commerce to (i) the unequal distribution of land; (ii) the diversity of the soil in fitness for production; (iii) the multiplicity of human needs; (iv) the advantages of the division of labour, which he illustrates by examples. The agricultural labourer is pre-eminent over the artisans, not in honour or dignity, but in physical necessity, for he might do without them, but they cannot do without him. In fact, what his labour produces from the soil is the only WAGES FUND (*l'unique fonds des salaires*), and the commodities which he buys are the exact equivalent of the produce which he gives in exchange. Competition forces artisans' wages down to subsistence level (the doctrine of neces-

sary wages). But the agricultural labourer produces more than this, for nature does not higgie with him for a subsistence wage, and he is thus the only producer of wealth. The extractive classes, then, are productive; the artisan classes salaried (*l'une productive, l'autre stipendiée*). As society progresses and lands are all taken up, the owner becomes distinct from the labourer, the new-comers may as well earn wages on the land as in manufactures. The product is now divided into two parts—the wages of labourers and the surplus which goes to the landlord as his revenue; the landlord becomes available for social needs like war and justice, either by personal service or by deputies whom he pays. He may therefore be assigned to a third class (*classe disponible*), an available reserve. The evolution of labour on the land is traced from (i) labourers to (ii) slaves, (iii) serfs, (iv) metayers, (v) farmers. He proceeds to examine the mechanism of exchange, and describes the stage of barter and the origin and nature of money in terms reminiscent of CANTILLON, and suggestive of comparison with Adam Smith. The accumulation and social utility of capital is next sketched, and its functions in aid of production are described. It is argued that interest for the use of capital is as legitimate, and should be as free as the sum paid for the use of land or any other object of commerce, and depends, in either case, upon supply and demand. The annual net produce of the land of a country capitalised, plus the movable wealth in the country, gives the sum of the national wealth, excluding loans, for they would otherwise count twice over. The capitalist, who lends at interest, does not form part of the *classe disponible*, and his income is not available for the state, for it is not a *produit net*, but the result of a buying and selling like the profit of other merchants. It should no more be taxed than the manure which fertilises the land. "C'est toujours la terre qui est la première et l'unique source de toute richesse . . . Il n'y a de revenu que le produit net des terres." It will be seen that these conclusions are in harmony with those of the PHYSIOCRATS; but, though a friend of QUESNAY, Turgot's repugnance to all "sects" kept him aloof from the inner circle of that school.

[A complete bibliography of Turgot would be very extensive. It will suffice to mention Du Pont's edition of his works, referred to above as *Œuvres*, 9 vols., Svo, Paris, 1809-1811, prefaced by a life of Turgot which first appeared in 1782, 2 vols. Svo, Philadelphia.—*Œuvres de Turgot*, rearranged, with additions by DAIRE and DUSSARD, 2 vols. Svo, Paris, 1844.—*Vie de M. Turgot*, Svo, Londres, 1786 (by Condorcet).—Dupuy, *Éloge de Turgot (Mémoires de l'Académie des inscriptions et belles lettres*, vol. xiv.).—Baudrillart, *Éloge de Turgot*, Paris, 1846.—Foucin, *Essai sur le ministère de Turgot*, Paris, 1877.—Batbie, *Biographie de Turgot*.—Batbie, *Turgot Philosophe, Économiste et Administrateur*, Paris, 1861.—L. [Since this article was written Monsieur G. Schelle has published a volume on Gournay, and Prof. W. J. Ashley has edited a new translation of *The Reflections on the Formation and Distribution of Wealth*.]

TURKEY COMPANY, or as it was also called the Levant Company, was a fellowship or corporation of merchants who in 1605 obtained a charter from James I. licensing the persons therein named to be "one Fellowship and Body Corporate and Politic by the name of Governor and Company of Merchants of England, trading to the Levant Seas."

Unlike the French and Italians, the English had not until the late 16th century made a speciality of eastern traffic. They had been content to receive their oriental wares and spices at second hand from the Venetian merchants who, from a very early time, annually despatched a richly laden fleet to Flanders which touched at our shores. But a quarrel with the rough Southampton seamen early in the 14th century caused the offended Venetians to avoid England, and it was not till the opening of the 15th century that their trade with England was renewed. One of their argosies was, however, wrecked off the Isle of Wight, and for the second time the Venetians declined to continue the traffic. Henceforth the English were compelled to go in search of these commodities for themselves.

In 1550 Captain Bodenham (ANDERSON, vol. ii. p. 87) was the first Englishman who proceeded as far as the Grecian Isles. In 1553 Anthony Jenkinson visited Aleppo, and here paid for certain trade privileges which were made the basis of all future stipulations with the Turks. But the terrible cruelties practised by the African pirates who infested the Mediterranean very much indisposed the English merchants for the Levant trade; and it was not till 1581 that the first commercial treaty was drawn up between the queen of England (Elizabeth) and the Ottoman Porte. In accordance with this, a charter or licence for trade to the Grand Seigneur's dominions was granted for five years to certain persons forming a fellowship of merchants. The licence was subsequently renewed for twelve years, and Sir Edward Barton was sent out as first resident ambassador at Constantinople. He died in 1597.

In 1605 these terminable licences were replaced by the perpetual charter mentioned above; and Sir Thomas Glover was sent out as ambassador. In 1643 some ambiguity having arisen from the terms of the charter, an ordinance was passed explaining and extending their privileges. At the Restoration Charles II. renewed their charter.

By these instruments the company was invested with power to fine and imprison members and subordinates who disobeyed its orders. No one might send ships to the parts designated by their charter but such as were free brothers of the corporation, or otherwise licensed by them, who were to pay £20 for admission. Their commerce extended to all parts of the Grand Seigneur's dominions, in Asia, Africa, and Europe, on the shores of the Mediterranean, the Archipelago, Levant, and adjoining seas and bays as far as Constantinople, to Venice on the one side, and to Ragusa on the other, excepting, however, the coasts of Italy, France, of Spain on the Mediterranean, with Malta, Sicily, Corsica, and other islands in that sea.

The company imported silk and other oriental goods in return for English woollen cloth taken out.

The extensive powers granted to the company, justified as they were by the despotic nature of the government with which the company had to deal, excited much jealousy at home.

The company, however, had never been an exclusive or oppressive monopoly such as the EAST INDIA or the GREENLAND COMPANY was, but on the contrary was based on the assertion of the inestimable liberty of trade. Every merchant who could pay the required entrance fee was of right admitted a member, and was then entitled to trade on his own account. The trade was similarly prohibited to all who were not members of its fellowship.

The trade, however, languished, and in 1753 the case of the Governor and Company of Merchants trading to the Levant Seas having come before parliament, it was sought to freshen it up, by opening it to all comers. In 1754 was passed "An Act for enlarging and regulating the trade into the Levant seas" (26 Geo. II.) by which the company was opened to all English merchants paying £20 for admission to its rights and privileges.

In 1803 a most important change was effected with regard to the Turkey Company; government assumed the payment and appointment of the ambassador and his secretaries, with some additional consuls. In 1821 a second step was taken: it was decided that the whole of the company's establishment should be in the hands of government. This being announced to the company, by Mr. Secretary CANNING, with the assurance that "it resulted solely from considerations of public

expediency, and in no degree from any disrespect, or disposition to impute any blame to their past administration," the Directors called a special court, who accorded to the propriety of the government's proposal. They also saw that their existence as a body, however useful for the protection and extension of commerce on their first establishment, was now no longer so; they therefore proposed to surrender their charter also, "as an offering to the enlarged and liberal spirit of commerce, which now distinguished England." Thus was dissolved as an "antiquated anomaly" a body which had existed with distinction for a period of 244 years, during which time, the appellation of Turkey merchant was one of the most honourable that could be acquired.

**TURNPIKE TRUSTS.** Throughout the mediæval period the maintenance of roads in England appears to have been left to private benevolence. In the reign of Philip and Mary an act was passed to compel every parish to maintain the roads within its limits, and to appoint a parish surveyor for that purpose. But great highways traversing many parishes could not be kept in proper condition by the disjointed efforts of parochial authorities. Some parishes were unable, and most parishes were unwilling, to discharge their statutory duty. The most important roads remained in an execrable condition till the early part of the 18th century, when the extraordinary growth of commerce and manufactures compelled reform. It then appeared most convenient and equitable to make those who used the roads pay for their improvement. Turnpikes were erected and tolls exacted on the principal highways. These turnpike roads were regulated each by a separate act renewed from time to time. The execution of the acts was confided to bodies of trustees or commissioners. At one time the turnpike trusts numbered several thousands. But the inconvenience of levying tolls has led to the gradual suppression of turnpikes, and to other arrangements for keeping highways in proper condition. The

turnpike trusts began to diminish rapidly after 1850, and probably all have now disappeared.

[See Cunningham, *Growth of English Industry and Commerce*, vol. ii., and authorities therein cited.—Wright and Hobhouse, *Local Government and Local Taxation*.] F. C. M.

TURTON, THOMAS (1764-1844) of Starborough Castle, Surrey, barrister, baronet (since 1796), and M.P. for Southwark (1806-12), wrote *Address to the Good Sense and Candour of the People in behalf of the Dealers in Corn* (1st and 2nd eds. 1800), in which he advocated free trade in corn, ascribed the dear corn, like A. YOUNG, to scarcity, and deprecated the convictions of some four hundred corn dealers, etc., and especially Rusby (T. Peake, *Additional Cases in Nisi Prius*, p. 189), for regrating, etc. He denied that rings could keep up prices; as that would require "the eyes of Argus, the hands of Briareus, and the purse of Ceresus."

Turton's opposition to the "Report of the Bullion Committee" (*Hansard*, vol. xix. p. 1051, vol. xx. p. 937) was based on the usual fallacies.

J. D. R.

TUSSER, THOMAS (c. 1525-1580), the one English poet of agriculture, and one of the very earliest writers on the subject in the vernacular, was the author of a collection of metrical prescriptions and comments, the *Five Hundred Points of Good Husbandry*, which enjoyed a great vogue in the 16th and 17th centuries, and is now a valuable source of information concerning the agriculture of the Elizabethan period.

[Tusser's *A hundreth good pointes of husbandrie*, composed of a hundred four-line stanzas, appeared in 1557. There were probably three or four editions of this, before, in 1573, Tusser issued his much larger and almost entirely new work, *Five hundreth pointes of good husbandry united to as many of good huswifery*. Two later editions were prepared by the author in 1577 and 1580, with numerous small changes. Between 1530 and 1638 there were as many as eleven editions; and the book was several times reprinted subsequently. The reprint (1878) by the English Dialect Society, edited by W. Payne and S. J. Herrtage, collates the edition of 1580 with those of 1573 and 1577, gives a list of all the recorded editions, provides a valuable comment both philological and historical, and reprints the *Hundred Points*. Perhaps the most interesting section of the work is that entitled *A comparison betwene champion countrie and severall* (see CHAMPION AND SEVERALTY). An account of Tudor farming as described by Tusser is given in R. M. Garnier, *History of the English Landed Interest* (1892), i. 318 et seq. See also R. Prothero, *Pioneers and Progress of English Farming* (1888), p. 30.] W. J. A.

TWELVE TABLES, ROMAN LAW. See ROMAN LAW.

TWISS, SIR TRAVERS (1809-1897), the son of a Denbighshire clergyman, was educated at University College, Oxford, where in 1830 he obtained a first-class in mathematics and a

second in classics. He became a fellow and tutor of his college, and successively public examiner in classics and in mathematics at Oxford, Drummond professor of political economy, professor of international law at King's College, London, and Regius professor of civil law at Oxford, which post he held from 1855 to 1870. But his scholarship and energy soon won distinction for him on wider fields than those of academic work. He joined the legal profession and was attracted to that now almost extinct branch of it which is concerned with Roman, ecclesiastical, and admiralty law. He became an advocate of Doctors' Commons, and rapidly attained high professional advancement. One after another the offices of vicar-general of the Archbishop of Canterbury, chancellor of the diocese of London, advocate-general of the admiralty, and queen's advocate-general fell into his hands. Soon after his appointment in 1867 to this last post, now abolished, the honour of knighthood was conferred on him.

The catastrophe which put an end to his official career in 1872 left him more leisure for literary work. From early manhood he had been a prolific writer, and the multiplicity of the subjects he dealt with is not more remarkable than the learning displayed in one and all of them. He ranged from the pure scholarship of an edition of Livy to the practical politics of a constitution for the Congo Free State, drawn up by him in 1884 at the request of the king of the Belgians. Though he will be chiefly remembered by his writings on INTERNATIONAL LAW, he made a notable contribution to economics when he published in 1847 his *View of the Progress of Political Economy in Europe since the 16th Century*. In this, as in his other works, he showed the historical bent of his mind. His wide reading supplied him with numerous precedents, and he was happier in applying them to new cases than in harmonising accepted principles or striking out fresh lines of thought. His great work on the *Law of Nations considered as Independent Political Communities*, published in 1861, is a monument of deep erudition and patient historical research. But it must not be supposed that he was merely a scholar. He was also a skilled jurist and an able man of affairs. He served the country on several royal commissions, notably those on neutrality and naturalisation, the labours of which resulted in important modifications of our laws respecting the subjects with which they were concerned. He was also legal adviser to the British plenipotentiaries at the West African conference of 1884-85. His reputation as a publicist extended over the civilised world. He was a member and vice-president of the *Institut de Droit International* and a member of the Society for the codification and reform of the law of nations. T. J. L.

*The View of the Progress of Political Economy in Europe since the 16th Century*, published by Travers Twiss, 1847, was the outcome of the course of lectures delivered by him as professor of political economy at Oxford in 1846 and 1847. *Habent sua fata libelli*. It is certainly difficult to account, when reading this brilliant sketch of the early course of economic science—even remembering

that the book appeared at the low water period which intervened between the times of Malthus and Mill—for the total oblivion into which it has fallen. The earlier lectures commence with a very complete account of 16th century English, Italian, and French writers, and trace the gradual development of doctrine in this country, particularly exemplified in the theory of VALUE as shown in the opinions of our early writers from Thomas Mun to Sir W. Petty and Sir Dudley North. Considerable space is given to the works of the school of French economists, and their place in the development of the science is shown. An explanation follows of Law's great financial experiment in France, with the reaction against the principles of Colbert and his encouragement of manufactures and commerce. The later lectures contain an analysis of the chief doctrines of Adam Smith, with some remarks on his relation to those writers on economics who had preceded him, and discuss the subject of population in reference more particularly to Godwin and Malthus. Then follows a complete analysis of Say's remarks on commercial outlets and liberty of trade, with a commendation of Say's "beautiful theory" that "nations can only pay for produce with produce, and that prohibitions against buying are obstacles to selling" (p. 239). The advantages of freedom of commerce are very ingeniously put, that protected labour is labour disadvantageously employed (p. 253). The last lecture traces the history of currency questions in Europe during the preceding century; the issue of assignats in France, the suspension of specie payments in England, closing with a sketch of the Bank Act of 1844, then a recent measure.

The sentence in the preface in which Twiss explains the object that he had in view was "to exhibit political economy by example, and so to show that its leading doctrines are the conclusions of an enlarged experience, and are not, as many persons suppose, mere deductions from arbitrary premises skillfully assumed," vividly places before us not only the object which Twiss had

before him, but the position of the study at the time when he wrote.

Travers Twiss also wrote *On Certain Tests of a Thriving Population*, four lectures delivered before the University of Oxford in Lent term 1845.

## TWO-FIELD SYSTEM. See THREE-FIELD SYSTEM.

TYDEMAN, HENDRIK WILLEM (1778-1863), was a professor of law at the university of Leyden.

He wrote several prize essays. Among these should be mentioned *Over den voor- en nadeeligen invloed van het invoeren der werktuigen in de plaats van menschenhanden in de fabrieken van ons vaderland* (On the favourable and unfavourable influence of the substitution of machinery for manual labour in Dutch manufacture), Haarlem, 1819.—*Over de Gilden of Corporations van neeringen en ambachten* (On guilds and crafts), 1821. From 1817 to 1822, he was on the staff of the *Magazyn voor het armenwezen in het Koninkrijk der Nederlanden* (Magazine for studies on the question of destitution in the kingdom of the Netherlands).—As announced on the title page, his *Grondbeginselen van Staatshoudwiskunde*—Elements of political economy—follow the doctrine of N. W. SENIOR, as stated in the lectures delivered by Count ARRIVABENE (q.v.) at Brussels.

[*Biographisch Woordenboek*, pt. xviii., Haarlem, 1874.] E. ca.

UDAL TENURE. Land is still held in Orkney and Shetland by this tenure, which has been decided by the Scotch law courts to be allodial possession (see ALOD). It is a relic of Danish rule: the land is simply held by natural right, and is transferred by giving possession on the ground by a stone or other symbol without any writing, but in the presence of the neighbouring inhabitants. Udal lands descend to all the children of the udallers in equal shares. Sometimes a tribute called *scat* (see SCEATTA) is paid to the crown.

[Erskine, *Institute of the Laws of Scotland*, ed. 1838.—Sir Walter Scott, *The Pirate*, ch. i.—S. Laing, *Norway*, cap. 5.] E. H.

ULLOA, BERNARDO DE (dates of birth and death unknown). He was first a magistrate in Seville and afterwards in Madrid under the earlier kings of the Bourbon family.

Ulloa published in 1740 his *Restablecimiento de las Fábricas y Comercio Español* (Madrid, 2 vols.) He mainly follows the great work of UZTÁRIZ (q.v.), which had been published sixteen years before, but lays stress exclusively on the baneful influence of former Spanish systems of taxation. Though often quoted, Ulloa does not supply such copious and extensive information on the state of Spain as UZTÁRIZ; both belong to the mercantile school. Ulloa is very bitter (vol. ii. ch. iv.) on the famous ASSIENTO TREATY with England.

A French translation, said to be made by DANGEUL (better known under his *nom de plume* Chevalier NICHOLLS, q.v.), appeared in Amsterdam

and Paris in 1753 under the title of *Rétablissement des fabriques et du commerce d'Espagne*.

[Winninghaus, *Zwei Spanische Merkantillisten Uztáriz und Ulloa*, Jena, 1886.] E. ca.

ULSTER TENANT RIGHT. The body of usages generally comprised under this heading is of somewhat obscure origin. It seems to have arisen from the peculiar circumstances connected with the planting of several Ulster counties with English and Scotch settlers in the 17th century. In order to retain these colonists the proprietors found it expedient to tacitly recognise the interests for which their improvements supplied a basis. Thus the tenant-right system developed by degrees without attracting observation. Even so acute an enquirer as Arthur YOUNG failed to notice it. Before the middle of the present century, however, it was firmly established, as the evidence taken by the Devon commission (1844) amply proves. The essence of the custom consists in (1) the right to undisturbed possession so long as the rent is paid, and (2) the right "to sell his interest . . . in his holding . . . to any solvent tenant to whom the landlord shall not make reasonable objection." The tenant under the custom therefore possesses in modified form "fixity of tenure" and "free sale." The further condition that the landlord shall not by undue increase of rent encroach on the tenant right was also vaguely recognised, but was naturally much more disputable.

From the very fact that it was merely customary, the Ulster tenant right varied much in the different parts of the province, and even on neighbouring estates. It is more accurate to speak of customs than of a single uniform usage. Some landlords sought to limit the amounts paid by the incoming to the outgoing tenant, and in rare cases to destroy the system altogether. But any infringement of the tenants' privilege was resisted, and led to outrages similar to those in other parts of Ireland.

By Mr. Gladstone's first Land Act 1870 (33 & 34 Vict. c. 46, § 1), the Ulster tenant right was "declared to be legal" and was at a stroke transmuted from "custom" into "law." The necessary result, in accordance with Maine's view, has been a greater rigidity in the system. A large number of legal decisions have dealt with many of the doubtful points, while the later legislation of the act of 1881 and its successors has superimposed the general system of judicial tenancies on the custom. Nevertheless a tenant under the custom still enjoys certain advantages. A breach of statutory conditions does not deprive him of the benefit of the custom, and he is not affected by the decisions (notably that in *Dunseath v. Adams*) limiting the compensation grant for improvements. Further it is at present in debate whether the Ulster custom does not confer a right to have the rent fixed at a lower amount than in the case of an ordinary tenant.

There has been a good deal of controversy as to the principle on which this custom is based. One view is that it is the result of the improvements made by successive tenants which come in time to form the source of a "profit rent" justly due to its producers. Another regarded the right as based on insurance against outrage which followed disturbance of a tenant without payment for his tenant right, and probably both elements were in operation. But the strongest reason for its growth was the advantage to both landlord and tenant. The former was secured against loss of rent in arrear, which was the first charge on the payment for tenant right; he obtained a tenant who had proved his solvency; and he was relieved from expenditure for improvements. The latter obtained security in his occupancy, he could deal more confidently with the land, and he was not exposed to the reckless competition of persons without capital which proved so injurious in other parts of Ireland. Such a custom, moreover, implied a large amount of sympathy between landlords and tenants, and in some degree tended to develop it. These advantages were manifested in the prosperous condition of Ulster.

The strongest objections urged against the Ulster custom were (1) the division of ownership that the system required; and (2) the unnecessary expenditure of capital by an incoming tenant which hampered him in working his

farm. Both, it may be said, lose their force if account be taken of the peculiar circumstances of Ireland with its sharp division of classes and the insecurity of agricultural investments by the tenants.

Analogous usages existed in some other parts of Ireland, such as the custom on the Portsmouth estate, and were likewise legalised by the Land Act of 1870 (see art. F's, THE THREE).

[See the *Report of the Devon commission* (1845), also that by the Bessborough commission 1880 (C. 2779).—W. N. Hancock, *The Tenant Right of Ulster considered economically*, Dublin, 1845.—M. Longfield, "The Tenure of Land in Ireland," ch. vi. in *Cobden Club Essays*, 1870.—W. O'Connor Morris, *The Land Question of Ireland*, chs. xxiv. xxv. 1870.—R. R. Cherry, *The Irish Land Acts*, pp. 14 and 18, 2nd ed. Dublin, 1893.] C. F. B.

**ULTRA VIRES.** The doctrine of "ultra vires" is of importance in the case of corporations and companies, which being always created for specific purposes only, have only a limited range of powers. Any act transgressing these powers is said to be "ultra vires." In the case of a company incorporated under the Companies' Acts, an act may be "ultra vires" of the company or "ultra vires" of the directors. If the act is done for an object not covered by the object clause in the memorandum of association, it is "ultra vires" of the company and is void for all purposes, but if the act is authorised by the memorandum and merely transgresses the powers given to the directors by the articles, it may be ratified by a general meeting of the shareholders, and thereby is rendered valid. (*Grant v. United Switchback Company* 40, Ch. D. 135.) Directors using the funds of the company for unauthorised purposes are personally liable to replace them. E. S.

**UNDERTAKERS.** See EMPLOYERS AND EMPLOYED; ENTREPRENEUR.

**UNDERWRITER.** The term applied to the insurer of ships and their cargoes from the custom of writing his name and the amount of risk he undertakes at the foot of the policy.

[Arnould, *Marine Insurance*, London, 1887 (see art. INSURANCE, MARINE).] J. E. C. M.

**UNDERWRITING.** The members of the association of insurers of ships known as Lloyds sign their names individually at the foot of the policy, and opposite thereto the sum insured by each in figures, and also in words, with the date of so doing. This is called underwriting the policy for so much, and each thereby makes a separate contract, in the terms of the instrument, with the assured, of the particular amount set opposite to his name.

[Arnould, *Marine Insurance*, London, 1887.]

J. E. C. M.

**UNEARNED INCREMENT.** See INCREMENT, THE UNEARNED.

**UNFUNDED DEBT.** See DEBTS, PUBLIC.

**UNION, POOR LAW.** Unions are unions of parishes. Their formation has affected rating, settlement, and removal, and the general administration of poor relief.

By 43 Eliz. c. 2, the parish was made the local unit for administration and rating, with as its officers the churchwardens and overseers of the poor. Later, parishes were incorporated under local acts (e.g. Bristol, 7 & 8 Will. III.; Exeter, etc.), or joined for the provision of common work or poorhouses under 9 Geo. I. c. 7 (1722), or they might be combined by justices under Gilbert's act 1782 (22 Geo. III. c. 83). In this case guardians were appointed for each parish with the authority of overseers, except in the making and collection of rates. In 1834 there were 364 parishes incorporated under local acts, and 283 under Gilbert's act. Under the Poor-Law Amendment Act of 1834 the poor-law commissioners formed groups of parishes into unions, and by degrees recast the Gilbert and other incorporations. In each union was created a board of guardians representative of the parishes included within it, with a common administration and a common fund. The guardians formed a union assessment committee, and the overseers of each parish made out for them a valuation list of its rateable hereditaments (for forms, etc., see Archbold's *Poor-Law*, by Cunningham Glen, 1885). On the approval of these lists by the committee, the overseers and churchwardens made a poor rate according to the rateable value of the parish with the consent of two or more justices. The overseers then paid over to the guardians the sums chargeable to their parish. Later, by the Union Chargeability Act (28 & 29 Vict. c. 79) 1865, separate parochial chargeability of the poor in the union came to an end, and the overseers now pay over to the guardians such sums as they require according to the annual rateable value of each parish. From being the administrative unit the parish thus became the fiscal unit for valuation and the collection of the poor rate, and is now defined (29 & 30 Vict. c. 113) as a place for which a separate poor rate is or can be collected, and for which a separate overseer is or can be appointed. For the metropolis there are special rating arrangements.

After the act of 1865 there was no longer any object in overseers pressing for the removal of paupers from one parish to another within the union, in order to avoid their acquiring a settlement and becoming chargeable, for all parishes in the union now shared alike according to rateable value. Questions of settlement and removal thus became practically union questions.

As to general administration (*Report of Poor-Law Commissioners*, 1834, and *The Union and the Parish*, 1839), the unions were formed in order to establish union workhouses (see **WORKHOUSES**) for the relief of able-bodied pauperism and its prevention, to neutralise local and parochial influences by the adoption of a larger area, to introduce a system of paid relieving and other officers in the place of the annually elected unpaid overseers, and to establish a simpler and better regulated administration acting under the orders of a central board. On all these points the reform was fully justified.

The Local Government Act of 1894 (56 & 57 Vict. 73) provides for an alteration of boundaries of unions, and changes the qualifications of the local elector and of the guardian, but it does not alter the union system (cp. *The Local Government Act*, Macmorran and Dill, 1894).

(See also **ALLOWANCE SYSTEM**; **GILBERT'S ACT**; **POOR LAW, ADMINISTRATION OF**; **POOR LAW, HISTORY**.)

C. S. L.

**UNIONS, MONETARY.** See **LATIN UNION**.

**UNIT OF ACCOUNT.** The unit of account is usually, but not always, a coin. Thus in Great Britain the sovereign, in France and the countries allied in the monetary way the franc, in the United States the dollar, in Holland the guilder, are respectively the units in which accounts are reckoned. The unit of account and its subdivisions are frequently of conventional importance, through being the amounts usually paid on certain occasions or for certain services. Thus in England the entrance charge to many exhibitions is 1s. while in France it is the franc. The guilder also under some circumstances takes the place filled by the two last named coins. The unit of account is therefore not without considerable influence in mercantile transactions and in social life, though, while as in France accounts are rendered in its name, the coin itself is never used for large payments.

**UNIT OF VALUE** indicates "something by comparison with which we may ascertain what is the value of any other thing" (Mill, "Of a measure of Value," *Pol. Econ.*, bk. iii. ch. xv.). This ideal measure need not be a material object (Sidgwick, *Pol. Econ.*, bk. i. ch. iii. § 1, note). It should be, according to modern analysis, equivalent to a unit of marginal utility or disutility. Prof. Irving Fisher, in his *Mathematical Investigation*, conceives a unit of the former sort which he professes to call a "util." The last hour of the working day—or rather the last which a person is induced to work, which might be the earliest—measures marginal disutility (Jevons, *Theory of Political Economy*, ch. v. J. B. Clark, *Quarterly Journal of Economics*, vol. v. p. 296). But the quantity of labour which Adam Smith considered as a measure of value was not the *marginal* hour; but rather "one day's ordinary muscular exertion of one man" (Mill, *loc. cit.*).

These distinctions have a bearing on the problem of correcting the value of money by **INDEX-NUMBERS**. If, as in fact during recent years, the productivity of labour and the abundance of products per head of population have increased, ought the standard of deferred payments to represent a constant quantity of goods, or a constant quantity of labour? Against the first it is argued that the same quantity of goods no longer represents the same marginal utility. It is replied that,

as the goods restored would not all be employed at the margin of expenditure, the increase in the quantity of goods payable by the debtor should not be measured by the decrease in marginal utility. It may be rejoined that the labour standard, in the only form in which it could be practically applied—securing that the money value of the produce per head should be constant, —would not be a measure of marginal disutility.

[See the authorities referred to in the memorandum on "Recent Writings on Index-Numbers" in the *Economic Journal* for March 1894; and arts. INDEX-NUMBERS; TABULAR STANDARD.]

#### UNPRODUCTIVE CONSUMPTION.

Adam Smith, while dwelling repeatedly on the distinction between productive and unproductive labour, nowhere uses the term unproductive consumption, nor would it have occurred to him to do so. He saw, and saw rightly, that all consumption, all employment of wealth as revenue, is essentially the destruction of wealth, not its production, and that consequently, to speak of productive consumption, which seems necessarily implied as the counterpart of unproductive consumption, would amount indeed to a contradiction in terms. Mr. Mill, in his *Principles of Political Economy*, was the first English writer to make use of the phrase, and to emphasise the distinction. At the close of his well-known chapter, bk. i. ch. iii. on *Unproductive Labour*, he writes as follows, p. 64. "The distinction of productive and unproductive is applicable to consumption as well as to labour. All members of the community are not labourers, but all are consumers, and consume either unproductively or productively. Whoever contributes nothing directly or indirectly to production is an unproductive consumer. That alone is productive consumption which goes to maintain and increase the productive powers of the community; either those residing in its soil, in its materials, in the number and efficiency of its instruments of production, or in its people. We see, however, by this that there is a distinction more important to the wealth of a community than even that between productive and unproductive labour, the distinction, namely, between labour for the supply of productive, and the supply of unproductive consumption; between labour employed in keeping up or in adding to the productive resources of the country, and that which is employed otherwise." A glance, however, at Mill's own illustrations and the slightest reflection upon them will be sufficient to show how impossible it would be in practice to hold consistently to the distinction here insisted on, and how little is consequently gained by it. Mr. Fawcett, as was too often the case, follows somewhat blindly in this matter in the footsteps of Mill. In bk. i. ch. iii. of his

*Manual*, pp. 15, 16, he gives an abstract or summary of the views already expressed by Mill. F. Walker, in his *Political Economy*, pt. v. ch. iii., approaches the question from a more hopeful side. While admitting that it is impossible to draw any very sharp line between productive and unproductive consumption, since much of what is spent on what might be called luxuries, and in an earlier age and state of civilisation would certainly have been so called, really tends to give increased productive efficiency to the labourer, he yet notes—what is indeed obvious—that various kinds of consumption have varying effects on a nation's productive powers, and he deprecates the want of any treatise which discusses consumption from this purely economic point of view. "We need," he says, § 406, "a new Adam Smith or another Hume to write the economies of consumption in which would be found the real dynamics of wealth, to trace to their effects upon production the forces which are set in motion by the uses made of wealth. When this has been done, but certainly not till then, shall we be able to place upon the terms productive and unproductive consumption something like an intelligible sense." W. A. ST.

UNPRODUCTIVE LABOUR. See PRODUCTIVE AND UNPRODUCTIVE LABOUR.

UNSKILLED LABOUR. See LABOUR.

USANCE. This word is sometimes used to denote the time for payment fixed by custom for bills of exchange. This customary time varies according to the situation of the place of issue and of the place of payment. Thus the customary time for bills drawn on London from South America is ninety days' sight, whilst the customary time for bills drawn in London from Indian ports is three months' sight. In most places, however, fixed customs have ceased to exist, and the time for payment depends on the particular circumstances of each case and the arrangements between the parties.

In some countries the bills of exchange codes have stereotyped the usances by fixing once for all the time which the word "usance" implies when found in a bill of exchange, and in such countries bills may be drawn at one or more usances after date or after sight.

The following is a list of usances fixed in this manner by law:—

France	} Thirty days reckoned from the day following the date of issue, or thirty days from acceptance.
Holland	
Belgium	
Spain	Sixty days in the case of bills drawn from Spain, Portugal, France, England, Holland, and Germany; ninety days in the case of other bills.

In the United Kingdom, Germany, Austria-Hungary, Switzerland, and a number of other countries, documents payable at one or more usances from date or from sight are not recognised as bills of exchange unless they are drawn in one of the countries the codes of which have recognised usances in the above-mentioned manner. E. S.

USE, VALUE IN. See UTILITY; VALUE.

USES, CHARITABLE (History of Law as to). Certain restraints have been imposed by English law on gifts to charitable uses. By statute 43 Eliz. c. 4, charitable uses were defined to include the relief of aged, impotent, and poor people, the maintenance of sick and maimed soldiers and mariners; schools of learning, free schools, scholars in universities; repair of bridges, ports, havens, causeways, sea-banks, and highways; education and preferment of orphans; relief stock, or maintenance for houses of correction; marriages of poor maids; support, aid, and help of young tradesmen, handicraftsmen, and persons decayed; relief or redemption of prisoners and captives; for aid or ease of any poor inhabitants concerning payment of FIFTEENTHS AND TENTHS; setting out of soldiers; and other taxes. This definition of charitable uses has been somewhat enlarged by judicial decisions, but it apparently remains authoritative in spite of the repeal of the act of Elizabeth by the Mortmain and Charitable Uses Act of 1888 (see MORTMAIN). Gifts of personalty to charitable uses have never been put under legal restriction. But, for different reasons at different periods, the law has prohibited gifts of land to corporate bodies. And even when a charity is not incorporated it has been thought advisable to forbid testamentary gifts of land to it, as such gifts may be made by dying men under solicitation and to the prejudice of their families. Hence two distinct forms of restraint on gifts of land to charitable uses:—(1) Under the law of mortmain, properly so-called, which rests on the statute *De Viris Religiosis* (7 Ed. I. c. 13) all gifts of land to corporations are void unless made with the licence of the crown. Charitable institutions which have been incorporated are therefore incapable of taking gifts of land, except with the sanction of the crown. (2) Under the Mortmain Act, improperly so-called (9 Geo. II. c. 36), a gift to any charity, of land or of money to be invested in land, had to be made by deed executed at least twelve months before the death of the donor, and enrolled in the court of chancery within six months of execution. Such gifts therefore could not be made by will. The Mortmain and Charitable Uses Act 1888 consolidates the law of mortmain in both senses of that term. There are certain statutory exceptions to the rule laid down in 9 Geo. II. c. 36, and re-enacted in the act of 1888. [As to these exceptions and as to the change in the law brought about by the Mortmain and Charitable Uses Act 1891, see TRUSTS, CHARITABLE.]

F. C. M.

USSELINX, WILLIAM (living early 17th century), inhabitant of Holland, wrote on the peace between Holland and Spain in 1608, which prevented the erection of the Dutch West India Company.

*Vertoogh, hoe nootwendigh het sy voor de Nederlanden te behouden de Vrijheyt van te handelen op West Indien*, 4to, 1608. This work suggested the Dutch West India Company, and is the original of the *Excellent Discourse*, printed in the English edition of Jacques Le Hermitte's *Relation*, 1625.—*Memorie van de gerichtige redenen* (Relation of the important Reasons which should persuade the States General not to abandon the Commerce and Navigation to the (East and West) Indies), 4to, 1608.—*Bedenckingen over den Staet* (Considerations on the State of the Netherlands, their Navigation, Commerce and general Trade), 4to, 1608.—*Vaerder Bedruckingen over de zeevaert* (Further Considerations on the Navigation, Commerce, and Trade of the Netherlands), 4to, 1608.—*Discours by Forme van Remonstrantye* (Discourse in the form of a Remonstrance, by which the Netherlands will secure as great advantage in her navigation round the Cape as through the Straits of Magellan, etc.), 4to, 1608).—*Onpartydich Discours op te handelinge van de Indien* (Impartial Discourse on the Commerce with (the East and West) Indies), 4to, 1608.

Usselinx was engaged in the formation of the proposed Swedish South Company of 1626. Great efforts were made to find the capital for this undertaking, which was fostered by Gustavus Adolphus (reigned 1611-1633). Preparations were made to send ships to "New Sweden," the proposed Swedish settlement on the Delaware. The connection of Sweden with the Thirty Years' War put an end to the enterprise. [*Handwörterbuch der Staatswissenschaften* (s.r.) Südseegesellschaften.]

(See EAST INDIA COMPANY.)

USTARIZ, JERONIMO DE. See UZTÁRIZ.

USUCAPIO. Ownership by quiet possession. By the early Roman law if a man had purchased *bonâ fide*, or had obtained by other legal means, a thing from a person whom he believed to be the owner but who really was not, he might acquire it by use (*usucapiat*) for one year if a movable, or for two years if an immovable which was in the *solum Italicum*. The mere *possessio* was turned into *usucapio* by time. Justinian altered the necessary time for movables to three years; and for immovables in any place, if holder and claimant lived in the same province, to ten years. If they were in different provinces twenty years were required.

[*Institutes of Justinian*, bk. ii. tit. 6.] R. H.

USURY, USURY LAWS. See CANON LAW; DRY EXCHANGE; INTEREST AND USURY.

USUS signifies (1) a mode of acquiring marital power (*manus*) over a wife by living with her continuously for a year which was recognised by the law of the Twelve Tables. (2) A personal servitude by which one person is entitled to take the fruits or produce of

another's property simply for his own use, not for the purpose of letting or selling.

E. A. W.

**UTI POSSIDETIS.** This interdict is the procedure by which a person in possession of land or building is protected from arbitrary interference on the part of any one, its object being to maintain a person in the possession he has acquired. The possessor at the time the interdict is granted has the benefit of this protection, provided that he has not acquired possession from the opposite party in the proceeding, either by violence (*vi*), or furtively (*clam*), or by his leave or licence (*precario*).

E. A. W.

**UTILITY** is the power of giving satisfaction (cp. Marshall, *Principles of Economics*, p. 78, 3rd ed.). "Political economy has nothing to do with the comparative estimation of different uses in the judgment of a philosopher or of a moralist" (J. S. Mill, *Pol. Econ.*, bk. iii. ch. i. § 2). "The use contemplated is the simple power of ministering to a purpose, though that purpose were the most absurd, wicked, or destructive to the user" (De Quincey, *Logic of Political Economy*, § vi.). For an object to have utility it must be desired, it need not be desirable. Even the immediate pleasure aimed at is possibly not proportioned to the utility as measured by the sacrifice made in order to satisfy a desire (Marshall, *loc. cit.*, Sidgwick, *Pol. Econ.*, bk. i. ch. ii. § 2, and *Methods of Ethics*, on "Nonhedonistic desire").

The relation of utility to value, which exercised the older economists, is thus simply explained by the mathematical school. The value in use of a certain quantity of commodity corresponds to its total utility; the value in exchange to its marginal utility (multiplied by the quantity). The former is greater than the latter; since the utility of the final increment of commodity is less than that of every other increment (see FINAL DEGREE OF UTILITY; MARGIN; VALUE.)

[The subject is treated by almost all economists; particularly well by those above mentioned.]

F. Y. E.

### UTOPIAS

Utopias, p. 602; Utopias and Modern Socialism, p. 604.

**UTOPIAS, HISTORY OF.** Utopias are social romances, or "ideologies" which have appeared at certain epochs of history, especially in the presence of some social crises which turned the eyes of men away from depressing actualities to some imaginary "Nowhere land," where the social ideal might be realised. Such was the *Republic* of PLATO, and the *New Atlantis* of Lord Bacon. Such, too, was the *Utopia* of Sir Thomas More, with its numerous imitations since. These utopias, however, are often only fancy-woven dreams of poetical and philosophical thinkers, but they are also critical

transcripts of the social ideas of the time expressive of views on what is, in comparison of what might be. They are pictures of a perfect society having for their background the dark state of existing society as it appears to the mind of the writer; in short they are suggestions in myth, suggesting by a story social reform—plans which the writers could not, or dared not, state in plain terms. Thus Plato sketched an ideal commonwealth based on justice, in which the opposite dangers of despotism and democracy would disappear, and where in circumscribing the power of accumulating private property, and the "intemperate craving after wealth," the danger to the capitalist class enriched then by colonial enterprise, arising from the envy and cupidity of Demos, could be avoided. Living as he did in an atmosphere of political and social fermentation, Plato wrote the *Republic* in the hope of raising the social level by counteracting the greed of egotism. For this reason he recommended a communistic state and the abolition of private property; "if they will follow their rules," he says of the moneyed aristocracy, from whom the change is to emanate, "they will be safe themselves and the saviours of the city" (bks. ii. and viii.). With the return to classical ideals which accompanied the Renaissance these speculations of the social innovator of antiquity were revived and enriched by an accretion of Christian sentiment. The millennial hopes of Christianity placed the golden age in the future, with love of the brethren, or the enthusiasm of humanity for its moving cause. In More's *Utopia* we have this coalescence of Hellenism and Hebraistic Christianity, in the conception of an economic ideal. Appearing as it did in the reign of Henry VIII. (1516), its criticism is of necessity veiled, though it suggests a sad picture of the social condition of the times—luxurious idleness and grinding poverty breeding crime and vagabondage and other evils arising from the abrogation of peasant proprietorship, the secularisation of church property, the conversion of arable land into pasture, royal monopolies, and over-taxation. *Utopia* by way of contrast is described as a "Commonwealth of Equals," its government is democratic and elective. The reduction of the hours of labour to six encourages cultured refinement and the enjoyment of the product of liberal arts. Yet productivity is heightened, since all alike in the community would have to work; wealth is held in contempt, the wearing of gold being a badge of slavery; only limited, not absolute ownership is permitted; voluntary ascetics perform the meanest offices; variety of pursuits, and rational means of enjoyment, add to the interests and relish of life. In the fragment of Bacon's *New Atlantis* (1624, published 1629), we notice the influence of the age of new discoveries and the

romance of travel, giving "the certainty of a new unexplored kingdom of knowledge within the reach and grasp of man." A similar prediction is found in the *City of the Sun* (1637), the utopia of CAMPANELLA, a Calabrian monk, a friend of Galileo, and one of the "Novi homines" in Italy. Here the hours of labour are reduced to four, all are to have a share in it, and under the rule of the "chief metaphysician" and his spiritual subordinates, a new social order of enlightened equality is to rise out of the old. The *Oceana* of Harrington (1656), dedicated to Cromwell, addresses itself chiefly to the problems of government, which, however, he makes to depend on the "balance of property." The *Idea of a Perfect Commonwealth*, by D. Hume (1752), is purely political. The most remarkable utopias of the 17th century which serve as links between the social schemes of the Reformation and the Revolution, are Vairasse's *La République des Sévérames* (1677),—*Le testament de Jean Mezier* (1690), and the *Voyage en Salente* in Fénelon's *Télémaque*. They have been aptly described as "state-romances," as they are the products of an age of state absolutism. Mezier's *Testament*, as abridged by Voltaire, strikes the first note of the revolution. It alludes to "the abuses and errors in the conduct of governments" and demands autonomy of the commune. Next in order comes MORELLY's *Basiliade*, conceived in the spirit of the 18th century, and giving a sketch of society framed on the principles of the *Code de la Nature* by the same author. It speaks of private property as the "author of all crimes," and of private interest as the "universal pest" of society. It proposes a commonwealth where all have a share in the work done according to their capacity, and all are rewarded out of the common fund where inequalities are discouraged, the strong supplementing the requirements of the weak. Through MABLY, Sylvain Maréchal, and Marat, their ideas found their way into the convention. But the revolution, in proclaiming the principle of natural liberty and *laissez-faire*, by establishing free competition and contract, entirely dispelled these dreams of a "republic of equals" in its diametrical opposition to centralised government under "social authorities." The utopias of the 19th century, therefore, are pictures of a state of society in which the centrifugal forces of individualism, set free by the revolution, are restrained by organisation, association, and a "centralised industrialism," where liberty and the principles of liberty and law, authority and the sovereignty of the people, are alike recognised. Such was the picture of social fraternity drawn by Etienne CABET in his *Voyage en Icarie* (1840), the utopia of the modern proletariat. Here there is neither property nor money, buying nor selling. All

alike work for the community which provides for their needs. Manufactures and industries are public property, and the executive regulates the production and consumption of commodities. The principal meal is taken in common halls, and at the age of sixty-five no man, at that of fifty no woman, is required to work any more. An elaborate scheme is propounded to bring about without revolution a gradual transition from the old to the new order of things. This is the last of the pre-scientific utopias. The economic value of utopias is partly historical in furnishing the data for the historian of social evolution who sees reflected here the social tendencies, as well as those economic conditions which give rise to the conception of the social ideals of the age. They may also supply instruction. From the partial realisation of former utopias we may infer possibilities of economic progress in those now in vogue, and discover a clue to the conditions of success. Some of the achievements of social improvement may be traced to the influence of those idealised conceptions of a more perfect society which have succeeded in drawing attention to social wants, and in kindling enthusiasm for social reforms in quarters which purely scientific works would not have reached. To some degree, too, they could not fail in affecting the speculations of the economist or the political consideration of the statesman. They may also serve as object-lesson teaching ardent philanthropists and others the limited range of possibilities in social amelioration, and that it is only by patient work and hope that in the slow and steady progress of our race the fanciful conceptions of a perfect state of society become eventually translated into something approaching to reality. The disappointments to which they have given rise must be attributed to the exaggerated idea of human perfectibility on which they are founded. If all men were good and perfect, social commonwealths would be feasible, but this, as Sir Thomas More says in the *Utopia*, "will not be yet for these many years."

[*Ideal Commonwealths*, with an introduction by Henry Morley, forming No. 23 of his "Universal Library," 4th ed. 1889.—A. Gehrke, *Communistische Idealstaaten*, 1878.—*Social Utopias* in Chambers's *Papers for the People*, a very able and succinct account from the pen of Thomas Frost (date unknown).—R. Mohl, "Die Staatsromane" in *Zeitschrift für das gesammte Staatswesen*, 1845, vol. i.—M. Kaufmann, *Utopias, or schemes of Social Improvement*, 1879.—Fr. Kleinwächter, *Die Staatsromane*, 1891.—J. dans le passé" and "Les précurseurs du socialisme moderne" in *La Revue Socialiste* for December 1889 and January 1890.—E. de Laveleye's article in *Contemporary Review* for January 1890, on "Two New Utopias," also Eugen Richter's *Sozialdemokratische Zukunftsbilder*, trans. by H. Wright, 1894, a satirical brochure on the most recent forms of socialism (see COMMUNISM).]

M. K.

UTOPIAS AND MODERN SOCIALISM.—Recent Utopias illustrate the triumph of natural science (E. Bulwer Lytton, *Coming Race*, 1871), of a moral paradox (S. Butler, *Erewhon*, 1872), or of socialism based on contract (G. Rossi, *Un Comune Socialista*, 1884), or on the state (E. Bellamy, *Looking Backward*, 1889; which merely throws Utopian drapery around Lytton Gronlund's *Co-operative Commonwealth*, 1884; Bebel's *Woman*, 1893, 1st German ed., 1883), or of anarchical communism (W. Morris, *News from Nowhere*, 1890; joy in beautiful work is the only motive which holds men together; this is the finest Utopia since More's), or of anarchical individualism (W. Bode, *Individu*, 1892), or of individualistic co-operation *plus* a free use of land and productive capital, which is practically communism (Hertzka, *Freeland*, 1891; *Visit to Freeland*, 1894; *Entrückt in die Zukunft*, 1895; C. Secrétan, *Mon Utopie*, 1892; M. Flürscheim, *Money Island*, 1896). These recent Utopias are very similar: thus there is but a narrow line between Morris's and Bode's anarchy and between Flürscheim's co-operative societies, which cover the whole state and own land and capital, and Bellamy's state. Socialists who repudiate Utopianism include under that name any set complete scheme (F. Engels, *Socialism, Utopian and Scientific*, 1892; A. Bebel, *Zukunftstaat*, 1893). J. D. R.

UTTER OR CIRCULATE. See BANKING; BANK NOTE.

UZTÁRIZ, JERÓNIMO DE (born in 1689); under King Philip V. (reigned 1712-1746), he was a member of the council of trade, and of the council of the Indies.

His *Teórica y práctica de Comercio y de Marina . . . para su pronta restauración*, appeared, Madrid, 1724; two other editions, "corrected and enlarged by the author," followed 1742 and 1757.

In his preface, Uztáriz states that he has consulted all available sources of information and travelled over France, Italy, England, Flanders, Holland, and the western part of Germany, "correcting in the large ports and emporiums of trade what is always defective and doubtful in purely speculative intelligence." His book is a rich mine of information on the population of Spain, its system of taxation and of colonial government and its commercial policy; many interesting documents of the time of Isabella (reigned 1468-1504) are either given in full or in analysis. He was the earliest to point out that the Spanish official census of population generally

erred on the side of under-estimating the actual numbers; made for fiscal purposes, account was only taken of the numbers of *vecinos* or householders.

Uztáriz starts from the fundamental proposition that Spain could only be restored to its former power "by a strong military force, a powerful navy, and a well-regulated and still better protected trade" (p. 4, ed. 1724) after the model established in France by COLBERT. The rules he proposes are (1) free admission or with trifling duties of raw materials; (2) high import duties on foreign manufactures; (3) free exports of national manufactures; (4) exemptions or alleviations on such inland taxes as the *ALCAVALA* (*q.v.*), the *Cientos*, etc., granted to the national manufacturers. A trade established on these lines is a *comercio útil*, or useful; on any other, it is a *comercio dañoso*, or hurtful. It signifies little whether the customs yield a good revenue; the balance of trade must be the leading aim of the statesmen and monarch. In order to have a useful trade, "we must strive with untiring zeal . . . to sell to foreign countries more produce and articles than we receive from them" (p. 10). Trade ought not to be passive, but active, namely in the hands of the *naturales* (native born subjects). However, he allows advantages to be granted to foreign Roman Catholic manufacturers and operatives in order to induce them to settle in Spain (p. 26); still he considers that the native population of Spain is quite sufficient to uphold an active industry; its numbers have been reduced, not as a consequence of the occupation of America, but of "the poverty which resulted from the destruction of trade and manufactures . . . and the excessive weight of taxation increased by fraudulent and extortionate practices in its levy" (p. 30).

Uztáriz remonstrates against most of the existing abuses: the excessive number of convents, the monopoly granted to Cadiz for the American trade, the crushing export duties levied on manufactures shipped for America, etc. It should be noticed that though anxious that exemptions or alterations of taxation should be granted to manufacturers, he is adverse to "exclusive privileges" and monopolies; thus he objects to the state monopoly of alcohol, though he admits it for tobacco.

Whatever may be our opinion about his theories, Uztáriz was a conscientious, painstaking, and well informed official, honestly striving to raise his country from the dejection into which it had been sunk by the frightful misgovernment of the Austrian dynasty.

The *Teórica* was translated into English by Kippax, *The Theory and Practice of Commerce and Maritime Affairs* (2 vols. 8vo, London, 1751), and into French by Forbonnais, *Théorie et Pratique du Commerce et de la Marine* (1 vol. 4to, Paris, 1753).

[Wirminghaus, *Zwei Spanische Merkantilisten*, Jena, 1886.] E. C.

VACANTIA BONA signifies the inheritance of a deceased person which is without an owner, because there is no one who is able and willing to enter upon it. The Fiscus (*g.v.*) was entitled to appropriate property in this condition.

VAGRANCY. From the point of view of the poor-law the vagrant is a destitute casual pauper; from that of the criminal law (Vagrant Act, 5 Geo. IV. c. 83), he is an "idle and disorderly" person, or a "rogue and vagabond" if he commits certain offences, such as wandering about to beg or gather alms, sleeping out, and so on.

Public provision for the casual poor and the repression of vagrancy are considered to be supplementary to one another, but, except on grounds of social expediency, repression by the state does not involve the obligation of state maintenance.

The number of vagrants relieved on 1st January 1896 by the poor-law guardians in England and Wales was 12,239, but a night count on that 1st January showed the actual number of vagrants to be only 7859 (Local Government Board, *A Report*, 1896, p. 419). Thus, as locomotion is easy, the number appeared to be nearly twice as large as it really was. Other night counts of vagrants in casual wards, common lodging-houses, and shelters, confirm this result (cp. for instances, *Charity Organisation Paper No. 7*; report of committee of that society on the *Homeless Poor of London*, 1891; Appendix lxxxii. to the *Report of the Scotch Departmental Committee on Vagrants, Inebriates, etc.*, 1895; and *West Midland Poor-Law Conference*, May 1894). It seems probable that in England and Wales the total number of the migratory poor, including strangers in common lodging-houses and vagrants in receipt of poor-law relief, does not much exceed 30,000. The number of prosecutions for offences under the Vagrant Act in 1895 were for begging, 15,679, for sleeping out, 8159.

The history of the individual vagrant is usually one of personal degradation or incompetency, but economic disturbance increases vagrancy. The less capable morally or intellectually drift into it. The kind of degradation that vagrancy implies is fairly constant and well understood.

The methods of dealing with vagrancy are—(1) punishment and restriction to place of abode or settlement; (2) "correction" with or without employment; (3) employment; (4) restrictive toleration. Burn's *History of the Poor-Laws* (1764) contains a good statement of penal measures, including instances of (1). In the same spirit, though not probably with the same purpose, is 14 Car. II. c. 12, that originated the present law of "settlement" (Glen's ed. of Archbold's *Poor-Law*, 1885). Of (2) "correction with employment," Bridewell, founded by Edward VI., where chastisement

was administered with compulsory labour "to the overthrow of the vicious life of idleness," is an instance. By 18 Eliz. c. 5, houses of correction were substituted for jail for the committal of vagrants. Eden (iii. p. 186) gives the rules of the Bury (Suffolk) House, 1588. The adult reformatories now suggested by some are in principle the same as these houses. The Vagrant Act, 5 Geo. IV., now covers the penal side of vagrancy. Of (3) employment as a remedy, the German and other so-called colony systems are instances (see INDUSTRIAL COLONIES). Restrictive toleration (4) fairly defines the English system from the poor-law side. Every destitute casual pauper is entitled to food and lodging in exchange for work. The casual pauper is not removable. His treatment is regulated by the Casual Poor Act 1882 (44 & 45 Vict. c. 36) and subsequent poor-law orders (Macmorran and Lushington, 1890). Casual wards are now usually built on the separate cell or room system. The pauper, on admission, has to take a bath and his clothes are disinfected. He has to do a task of work, and, subject to a large discretionary power in the hands of the authorities, cannot discharge himself till the morning, second day after admission. There is a fixed dietary.

There is need of greater uniformity in the detailed enforcement of the English system. Otherwise it meets fairly the demand for considerate treatment, though coupled with irksome conditions. It does not aim at being remedial though it is restrictive. Remedial measures it leaves to other agencies or to economic change, and it is a fact that only in very few cases of vagrants are remedial measures practicable. On the other hand, if carried out with uniformity it does not foster vagrancy, while in particular cases it allows ample discretion. The history of vagrancy appears to justify it.

VALERIANI, LUIGI MOLINARI (1758-1828). Born at Imola, near Bologna. A learned man, and well acquainted with the classical languages; he studied poetry, physics, law, and economics. He was appointed in 1797 a member of the legislative body in Milan, and in 1801 professor of public economy at the university of Bologna where Pellegrino Rossi was his pupil.

In his day Valeriani was widely known; he wrote many works, some of which were never published. Though diffuse and obscure in style, his writings deserve attention from the learning they display and a certain originality of conception. Trained both as a lawyer and an economist, his writings bear especially on the relation between economics

and law. He devoted himself with assiduity to the theory of value, and wrote a book on the subject. He maintains that the law of value depends rigidly on supply and demand, supporting this theory with a geometrical illustration from the relative quantities of both; he combats the theory of cost of production and engaged in a controversy on this question with Melchiorre Gioja. In illustrating the theory of value he employs mathematical formulæ. These are, however, not employed as a means of investigating the phenomena of prices, but are only symbols employed to express in mathematical language economic laws already known—as MONTANARI justly said.

Molinari Valeriani's principal works are:—*Del prezzo delle cose tutte mercantili*, 1806.—*Trattato sulle misure* 1807.—*Discorsi*, 1809.—*Trattato dei cambi*, 1823.—*Saggio di erotemi di quella parte del gius delle genti e pubblico che dicesi pubblica economia*, 1827. [A. Cavazzoni Pederzini,—*Intorno alla vita, opere e dottrine di L. Molinari Valeriani*, 1859.—Montanari A., *La Matematica applicata all' economia politica da Cesare Beccaria, Guglielmo Silio, Luigi Molinari Valeriani, ed Antonio Scialoja* (always omitted), 1892.—Cossa, *Introduction to the Study of Political Economy*, 1893.] U. R.

**VALES REALES.** In 1780, in order to meet the debt resulting from the war between England and Spain, a loan of 148,500,000 *reales* (say £1,485,000) was contracted in Spain under the form of state notes issued under that name, bearing interest at 4 per cent per annum, redeemable within twenty years, and which were to be legal tender at all public offices. Under the pressure of circumstances their total emission attained, in 1788, the amount of 548,905,500 *reales* (£5,489,055); they were favourably received at first, but they soon lost about 22 per cent of their nominal value. The *Banco de San Carlos*, which was founded in 1782, with a capital of 300,000,000 *reales*, having redeemed a certain number of these *vales*, they rose to a slight premium. However, at the death of King Charles III. (1789), only 15,000,000 *reales* of *vales* had been withdrawn from the circulation.

[Piernas Hurtado, *Tratado de la Hacienda Pública*, vol. ii. pp. 97 and 98 (4th ed., Madrid, 1891).] E. CA.

**VALUABLE CONSIDERATION.** A mere promise is not enough in English law to create a contractual obligation. In order to form a contract the promise must either be expressed in a deed under seal, or have been made for valuable consideration. Consideration has been judicially defined as either "some right, interest, profit, or benefit accruing to one party, or some forbearance, detriment, loss, or responsibility given, suffered, or undertaken by the other." It is, in fact, a *quid pro quo*. Consideration may be either a promise or an act. It must move from, i.e. it must be given by, the promisee. It must be of value in the eye of

the law. Thus a promise to do what I am already bound in law to perform is not consideration for a promise made to me. But the value of the consideration may not admit of precise statement in money. F. C. M.

## VALUE.

Value and Utility, p. 606; Total Utility, p. 606; Monopoly, p. 607; Competition, p. 607; Cost, p. 608; Value in use, p. 608; Value, Normal, p. 609; Value, Origin of, p. 609; Value, Stability of, p. 609; Value, Standard of, p. 609; Value, Subjective and Objective, p. 609; Value, Intrinsic, p. 610; Value, Feeling of, p. 610; Value, Surplus, p. 610.

**VALUE.** The satisfaction of the desires of human beings is conditional, in general, on the possession and use of material objects. At any rate it is convenient, for the sake of brevity, to use phrases referring in the first place to material objects, though it must be understood that the conceptions dealt with apply equally to immaterial sources of satisfaction. In virtue of the dependence of the satisfaction on the object, this object possesses value, in one of the senses in which that word is commonly used, but which may be more conveniently denominated by the word *UTILITY* (*q.v.*). When there is in question a class of objects possessing the quality of utility to an individual, it may happen that this individual has at his disposal so large a supply of this class of objects that no one of his desires capable of satisfaction by the use of these objects need go unsatisfied. In such a case, though deprivation of the whole supply would perhaps leave unsatisfied desires of a very urgent nature, the loss of a single one of the class of objects in question would compel, at the worst, the non-satisfaction of a desire of small, perhaps of extremely trifling, urgency; while, if the supply exceeded what the individual were inclined to utilise, the loss of any part or the whole of such excess would not involve any restriction of satisfaction. While the class of objects, viewed as a whole, would possess value, perhaps a very great value, one single object would have a very small value, or even no value at all. It is owing to the application of the same words to such different cases as here indicated, that the apparently paradoxical statement is possible that such indispensable commodities as water are devoid of value.

The relation of the two conceptions covered by the same word is not difficult to appreciate. It is expressed by saying that in the one case what is referred to is the *TOTAL UTILITY* of his supply of a commodity to the consumer, in the other case the marginal utility of that supply. When value is conceived of as the power of acquiring other commodities in exchange, a comparison of utilities is involved, in general of marginal utilities, namely the utility of the commodity parted with and that of the commodity acquired in exchange for it. As it is

obvious that a person parting with a portion of his supply of a given class of objects would seek to leave undisturbed the satisfaction of the more urgent of the desires whose satisfaction is dependent on the use of these objects, any restriction in his use of the objects would apply to the less urgent of the needs to which they had been, or might have been, applied. If the commodities acquired by the exchange are estimated to possess a greater utility than those parted with, there are motives urging to further exchange. When equilibrium is attained, the commodity parted with possesses less utility than that obtained in exchange, while to part with a further portion would be to sacrifice a greater utility than was gained by the acquisition of the exchange-equivalent. Thus, in the case of the exchange of goods, the marginal utilities sacrificed and acquired tend to be equalised, which is expressed by saying that the value-in-exchange of a commodity tends to equality with its marginal utility to its possessor. It is to *value-in-exchange* that reference is usually made in economic discussions when the term *value* is used without qualification. In virtue of the empirical law (see DEMAND; LAW OF DIMINISHING UTILITY) that the marginal utility of a commodity decreases as the supply increases, the level to which the value of a commodity attains will depend on the available supply. Given the amount of the supply and the demand schedule for the commodity, the position of the marginal use and the amount of the marginal utility at once follow. But the amount of the supply is itself not independent of the value-in-exchange, since production takes place very largely for the purpose of acquiring value by means of exchange rather than of acquiring utilities for direct enjoyment. Even if an isolated individual were considered, his supplies of enjoyable commodities would be limited by the productive energy he was capable of exerting, and he would naturally distribute his efforts so as not to waste effort in realising a small satisfaction which might have been applied to better purpose. There would emerge a relation between the amount of effort applied in any given direction and the marginal utility thereby realised. So also in a developed state of society is there a relation between COST OF PRODUCTION (*q.v.*) and the value realised as the reward for incurring such cost. The most suitable mode for expressing the relation between value and cost of production will vary with the conditions of supply.

If the supply be conditioned by the existence of a MONOPOLY (*q.v.*) the exchange-value will not be necessarily in close approximation to the cost. The monopolist will seek to establish such a value-in-exchange as to give the greatest possible net excess over the cost of production. Consumers will adjust their consumption so that to each the marginal utility is brought as

close as possible to that of the equivalent given in exchange, but the difference between the cost of production and the value will only be limited by the consideration that a moderate profit on a considerable turnover may be preferable to a large profit with a very small sale; that in fact the desirable point is not a large profit on each unit of commodity unless this coincide with the largest possible profit on the whole supply.

When we pass from commodities subject to monopoly conditions to those where commercial and industrial competition modify the problem of value, the profits of producers are subjected to limiting influences. There are three cases to be considered according to the different possible conditions of supply.

(a) If the conditions of supply are such that the cost of production per unit is the same whatever the scale of production, the value tends constantly to the level of cost of production. These costs are to be taken so as to include cost of labour, of hire and wear and tear of capital, and of hire of business ability—in fact, all the outlay necessary that the production may be carried on continuously, without undue losses which would tend to cause production to be restricted, or such large gains as would tempt producers to expand their businesses and tempt those in other occupations to transfer their skill and capital to the one under consideration. If the value should exceed the cost as thus estimated—or as preferably it might be expressed,—if the price exceed the expenses of production, the profits of producers will be so increased that with competition free, supply will be increased, and the marginal utility being lowered with increased supply, value diminishes towards cost of production. If, on the other hand, the value fall short of the cost of production, a tendency to restrict the amount produced results, and with restricted supply, the conditions for increased marginal utility and increased value are established. If, then, competition be free and active, cost of production will measure value.

(b) If the supply conform to the Law of DIMINISHING RETURNS (*q.v.*) the condition for the maintenance of the supply is that the value should be sufficient to recoup the expenses of production of that part of the supply produced at the greatest expense; the marginal cost of production becomes the measure of exchange value, the reasoning under (a) applying with increased force in this case in regard to the tendency of competition to bring about this result. If the demand suffice to carry off, not merely such supplies as are produced under advantageous circumstances, but also supplies produced under less favourable conditions, the control of the more favourable conditions may produce a RENT (*q.v.*) but the cost of production under these conditions does not provide the measure of exchange value.

(c) If the supply conform to the law of increasing returns (see INCREASING RETURNS), the relation of cost of production to value is obtained by the consideration of a *Representative Firm* (cp. Professor Marshall's *Principles of Economics*, bk. v.), a consideration useful in every case, indispensable in this. The expenses of such a firm serve as a type of the expenses necessary to be incurred in order to obtain the usual supply of the commodity. The value of its product must suffice and just suffice to cover its expenses, or changes in the volume of production will be stimulated, the consideration of which lie outside the scope of the present account of the determination of value, changes which would set up new conditions of supply and hence new determinants of value.

In all cases, then, of commodities freely and continuously produced under a *régime* of competition, the effect of competition is constantly to stimulate a rearrangement of productive effort when the value of products diverges from the standard given by cost of production. In cost of production must be included profits. The assumption of the existence of commercial competition (see COMPETITION and CUSTOM) means that capital and organising power seek always to obtain the highest reward open to them, thus tending to produce something like a uniform level of interest and of earnings of organising ability of any given grade. By assuming the existence of industrial competition, we assume that labour also seeks to find the most profitable employment open to it, and that thus there is a tendency to equality of remuneration for labour of any given degree of skill and intensity, while differences of reward are proportioned to differences in the exertion or skill demanded. By making these assumptions, it becomes possible to attach some definite meaning to the comparison of costs of production of commodities demanding widely different combinations of labour and capital and widely different qualities in the agents employed. In the case of products obtained by the members of one industrial group by exchange of their products for those of another group, when competition between the groups does not exist, whether what is lacking be one form of competition only or both varieties, the proportionality of cost of production and value has no longer the same causes in operation to maintain it. The principles in accordance with which relative values are determined in this case of non-competing groups are precisely those applicable to the case of values in INTERNATIONAL TRADE (*q.v.*). Within the limits fixed by comparative cost (see COST, COMPARATIVE AND RELATIVE) the play of reciprocal demand of the non-competing groups for one another's products determines the proportions between the values of the products produced within such a group and the values of those obtained from without by exchange. In all

cases of the determination of value, the use of SUPPLY CURVES and DEMAND CURVES (*q.v.*) is a great assistance in the clear appreciation of the points involved.

The relation between cost of production and value is of such fundamental importance that it will be worth while to add a little to the above brief and slight sketch of the theory of value in order to indicate the relation of these to one another in the theory of those modern writers, among which the Austrian School occupy the most important place, who adopt the point of view made familiar in this country by JEVONS (*q.v.*) that value is dependent entirely upon utility. With this school, the value of all goods ready for consumption is given by the utility they present to consumers. The values of instrumental goods and of labour are derived from the utilities of the products in which they may be expected to result. The writers of this school thus set themselves in direct opposition to those who derive value from the labour expended in production. With the Austrians the labour has value because it can give rise to useful goods, and has value just in the proportion of its contribution towards the production of such goods. There is a sense, however, in which the value of the product is derived from the value of the means of production even in their scheme, which ordinarily inverts this order of dependence. If we suppose a case of such an instrumental good as, say, iron, which contributes to an almost endless variety of products, we may see most easily the line of thought followed. In some uses a given quantity of iron could contribute to a larger utility than in others. If its supply be so great that it exceeds what can be so used as to produce a marginal utility of, say, forty per unit, it will push its way into uses where the marginal utility realised is less, say, thirty-six per unit. What then will happen? Under free competition there cannot remain two different values for the same object, and different units of iron are perfectly capable of mutual replacement before the elaborative process begins. If the larger supply and the lower grade of usefulness are permanent phenomena, iron in its former uses cannot retain a higher level of value, and the products to which it formerly contributed a value forty will obtain a lower value, lower precisely to the extent to which the cost-good, iron, has decreased in value. In the marginal use the value of the product determines the value of the instrument; in all but the marginal use, the product derives value from the instrument value measured by the instrument's value in its marginal use. The consideration of this view is instructive, and aids in understanding the mutual relationship of marginal utility, value in exchange, and cost of production.

*Value in use* is what is ordinarily designated

by *Utility*, and is sufficiently defined above and under that head (cp. *UTILITY*).

*Value, Normal.*—By this term is meant the value which tends to be established under the conditions of demand and supply existing in the case to which the term is applied. It is such as might, under those conditions, be maintained unaltered, and which would, if attained under those conditions, require some external influence to operate before deviation would result.

*Value, Origin of.*—The question of the origin of value has been keenly disputed. There is no doubt in any reasonable mind that value cannot exist without utility. Further, utility alone is not sufficient unless *Scarcity* or *Difficulty of Attainment*, two ways of indicating the same thing, be superadded. In the cases which are most frequent of occurrence, and most interesting to investigate as a result, such scarcity is limited by the available productive powers of the person or society concerned. The investigation of the causes of relative scarcity or abundance of commodities becomes an investigation of the conditions and cost of their production. As value exists in virtue not merely of the utility but also of the scarcity of the valuable object, to assign the origin of value entirely to one or the other of these alone is to give an insufficient account of such origin. Neither utility without scarcity nor scarcity without utility is sufficient to endow an object with value, but the two in combination. Scarcity here means merely such a degree of scarcity as leaves unsatisfied some wants to which objects like the valuable object which is in question could minister. These wants, which remain without satisfaction, may or may not be urgent. The existence of some such, which, with a larger supply of the commodity at the disposal of the person feeling the want, might be satisfied, is all that is implied by saying that there is scarcity.

*Value, Stability of.*—The value of a commodity is, as the preceding discussion shows, a relative term. It is great or small according to the relation existing between the wants which the said commodity could satisfy and the means available for satisfying such wants in addition to the commodity itself. In the sense of value-in-exchange, the value of the commodity is equally relative to the extent of want and the extent of the available means of satisfaction. The wants in question are now conceived of, not as those which can be directly satisfied by the consumption or use of the commodity, but such as might be satisfied by any of the indefinitely numerous kinds of commodity which might be obtained in exchange for it, in such quantity as its value enables them to be procured.

The value of the commodity may be said to be stable if, either by itself or by what can be procured in exchange for it, it can afford a utility which remains the same from one time to

another. Stability of value, in the sense of stability of exchange-value, is generally meant to imply merely the capacity for procuring in exchange equal quantities of some one other commodity, or of other commodities in general. This last expression acquires definiteness through the calculation of INDEX-NUMBERS which are devised to procure a measure of the stability of value of money and hence of any commodity whose money-value is ascertained.

*Value, Standard of.*—In comparing the values of different commodities, recourse is generally had to the expression of the value of each in terms of some one commodity chosen as a "standard of reference." This one commodity serves as a value-measurer, the value of any particular commodity being expressed by stating the quantity of the "standard" whose value is equal to that of some definite amount of the particular commodity; as when wheat is quoted at 45s. per quarter, the value of one quarter of wheat is stated as equal to the value of 45s. If we regard money simply as an instrument of exchange, this means an equality in value with whatever commodities 45s. will purchase. This reference of all values to one standard is especially convenient, and not only so, but necessary, when the values in question are values to different persons. These, though in themselves incommensurable, are brought to a possibility of comparison by the expression of each value in terms of the value of a definite quantity of the standard. The various quantities of the standard which serve as measures of the values of many commodities to many persons are directly comparable, and thus a comparison of wants which is indispensable to enable trade to be developed is rendered not only possible but easy. It is very obvious that stability of value is a highly desirable quality in the standard. The precious metals possess many qualities rendering them suitable for use as standards of value, including a very considerable degree of stability of value. For particular purposes various writers have proposed to use corn or labour as a standard, and a composite standard arrived at by determining the average changes in money-value of numerous representative commodities is presented in various index-numbers. These may enable far better comparisons of values to be made over considerable periods of time than is possible by the simple comparison of money-values, and are constantly so used. The introduction of such a standard for common commercial use is, however, beset with many difficulties in addition to those which attend a satisfactory determination for historical purposes (see also *STANDARD OF VALUE*).

*Value, Subjective and Objective.*—The subjective value of a commodity is the importance which the commodity is considered to possess with reference to the satisfaction of desires

felt by a person; also called *personal value*. The objective value of a commodity is its capacity for producing some objective effect. The most important kind of objective value is objective exchange value, or the power a commodity possesses to procure some other commodity or commodities in exchange for itself.

*Value, Intrinsic.*—There is a constant tendency to use the term value as if it implied some inherent property of the object to which it is applied. Bread, for instance, is supposed by some to possess an intrinsic value in virtue of its power to satisfy hunger. Such power, however, presupposes that the hunger exists. In view of the constant recurrence of hunger this seems a reasonable supposition, but if the supply of bread were renewed as frequently as hunger recurred, and in quantity more than sufficient to satisfy the hunger, some part of such supply would possess but slight, if any, value. The illustration may serve to indicate that value is not inherent in an object, but depends on the relation of the object to unsatisfied needs. This phrase 'intrinsic value' is also used sometimes to indicate such a distinction as that between the face value of a token coin and the value of the metal of which it is made, the latter being referred to as the intrinsic value of the coin. In these cases the desired distinction can probably be made more clearly by the use of other phrases (see also INTRINSIC VALUE).

*Value, Feeling of.*—An expression related to the conception of personal or subjective value.

*Value, Surplus.*—Karl MARX (*q.v.*) in his theory of value adopts the view that value is wholly caused by cost of production, and that the necessary labour expended in that production is the only element which can impart value to the product. He asserts that, the value being determined by the amount of such necessary labour, the capitalist employer compels extra labour to be performed by the labourer while not increasing the recompense paid to the labourer. The extra product thus obtained is conceived of as being valued at the same rate as the other portion of the produce, and its value is denominated "surplus value." From such "surplus value" the payment of interest and profits is conceived to be made.

[All systematic treatises on economics contain of necessity a discussion of so fundamental a part of economic theory as the doctrine of value. No special reference need therefore be made, except to the exponents of the Austrian views. Menger, *Grundsätze der Volkswirtschaftslehre*.—Böhm-Bawerk, *Grundzüge der Theorie des wirtschaftlichen Güterwerths* in Conrad's *Jahrbücher*, 1886; comp. the same author's *Karl Marx and the close of his system*, translated. Fisher Unwin, 1898.—Wieser, *Der natürliche Werth*, besides other works referred to in an article in the *Economic Journal*, No. 1, March 1891, by Professor Wieser.—See also AUSTRIAN SCHOOL; PROGRESS, INFLUENCE OF, ON VALUE.]

VALUE, MEASURE OF. See VALUE, STANDARD OF.

VALUES, OFFICIAL. See OFFICIAL VALUES.

VAN HALL, FLORIS ADRIAN (1791-1866), an able Dutch statesman and financier, who distinguished himself principally by his action as minister of finance in re-establishing the disturbed credit of the state on a firm basis. As, in consequence of reckless and wasteful administration of the finances, the bankruptcy of the state was imminent, Van Hall carried, in 1841, notwithstanding a very sharp opposition, an act of the legislature for a voluntary loan of about £10,500,000, or, as an alternative if that loan were not fully subscribed, an extraordinary property and income tax of nearly £3,000,000. Fortunately the loan was subscribed, and the conversion of the 4½ and 5 per cent debt into a 4 per cent loan followed, causing an economy of about £300,000 a year. These measures, together with the very considerable contributions of the Dutch Indian possessions, re-established the equilibrium of the finances.

To bring the monetary system of the kingdom into accordance with that of most civilised countries, who at that time employed the single silver standard, or at least used silver only, Van Hall put an end to the free coinage of gold, and replaced the double standard in 1847 by the single silver standard. He also promoted a revision of the tariff and navigation acts, and took, after his resignation, an active part in parliament as leader of the conservative party in the revision of the constitution, 1848.

Van Hall was again minister of finance in 1858, and carried a railway act prescribing the construction by the state of railways on a rather large scale; he then retired from public life.

Van Hall wrote: *Lofrede op Johann de Witt* (1819).—*Onpartijdige beschouwing van den toestand des koophandels binnen de Vereenigde Nederlanden* (1820).—*Lettre d'un Hollandais indépendant à Lord Grey* (1833).—*Proeve van een onderzoek omtrent de schuld van het Koninkrijk der Nederlanden* (1840).

C. A. V. S.

VANDELEUR, J. S. See CO-OPERATIVE FARMING, AND OWEN, ROBERT.

VANDERLINT, JACOB, a Dutch merchant.

Author of a notable work published in London, 1734, under the title: *Money answers all things: An Essay to make Money sufficiently plentiful amongst all Ranks of People and increase our foreign and domestick Trade, fill the empty house with inhabitants, encourage the Marriage State, lessen the number of Haukers and Pedlars, and in a great measure prevent giving long Credit and making bad debts in trade; Likewise showing the Absurdity of going to war about trade, and the most likely Method to prevent the clandestine exportation of our Wool, and also to reduce the National Debt and ease Taxes*. Influenced by LOCKE, he in his turn was studied by the PHYSIOCRATS, and may be said to have initiated scientific socialism in England. The head title of his book

(*v. Ecclesiastes*, x. 19) is no doubt suggested by Locke's use of it in *Some Considerations . . . [on] . . . Interest*. The little work pretends, in addition to its lengthy titular programme, to give "an evident and clear account of the foundations of the trade of the world." Its actual contents are mainly suggestions in outline, having little to do with currency, but making for a better distribution of property and the amelioration of the lower and middle classes. Vanderlint has, it is true, a "quantity" theory (*Prin.* iv.) and faith in the favourable effect of plenty of money on trade (*Prin.* viii.), but he quickly passes on to his main topics:—the desirability of increase in the national output of raw produce, and of increased and more widely diffused consumption. To effect this more land should be enclosed, with due regard to common rights, and more cultivators attracted to it. The latter would multiply if all taxes on commodities were removed. There would then be more consumption, more raw material produced, more demand for land. By the rise in rents that would ensue the landowner might be made the sole tax-payer. Increase of consumption would give luxury its "natural and proper bounds," luxury being the effect of decay of trade and not its cause. For, decay of trade leaving the comparative few in ever greater affluence, the relatively poor majority run to over-extravagance, *i.e.* luxury, in emulating their "magnificent living."

Trade, he held, should be "unrestrained," all prohibitions cutting off so much employment. Nations should develop the production of "commodities peculiar to them" as "a foundation of commerce, and by the quantity and quality of such produce be able to defy rival imports without protective legislation. Yet "every nation ought to keep trade on such foot as always on the whole to have the balance in their favour." Further points of interest are Vanderlint's theory of wages as determined by the price of necessaries, of population, and of the duty of collective afforestation.

Vanderlint's anticipations of socialism may be sought in his conviction that the hardships of the poor were unnecessary and remediable by wise and just measures, in his advocating the theory of the natural right of every man to sufficient land to enable him to live and support a family, and in his recommendation that new enclosures should be made and owned by communal authority, not by individuals. As if anticipating Rousseau, he held that, whereas a state of civil government with wealth adequately diffused was far preferable to a state of nature, yet "if the bulk of mankind be made miserable by the oppression of the rest, as they undoubtedly are . . . such an unhappy state . . . is worse than a state of nature itself."

[See Cossa, *Introduct. to Pol. Ec.*, Eng. trans., Macmillan, 1893, p. 245, as to Vanderlint's views on the SINGLE TAX.] C. A. F.

VANDERMONDE, ALEXANDRE THÉOPHILE (1735-1796), was born and died at Paris. A very distinguished geometrician, he was admitted to the *Académie des Sciences* in 1771, and from the date of the institution of the *Conservatoire des arts et métiers*, he was appointed director by the decree of 10th October 1794.

When the normal school was established by the convention, under the decree of 30th October 1794, its scholars being 1500 young men, aged at least twenty-one, drawn from all parts of France, Vandermonde was appointed to teach political economy. This mathematician performed his task with remarkable skill, especially considering his date.

The closing of the school, 19th May 1795—it had been only opened 20th January of the same year—unfortunately only allowed Vandermonde to give eight lectures; these have been published under the title of *Séances des écoles normales recueillies par des sténographes et revues par les professeurs*, 1<sup>re</sup> partie (5 vols. 8vo). These lectures bear evidence of a mind singularly well adapted to the study of economic science.

In the *Journal des économistes*, December 1873, M. Henri Baudrillard supplied a critical epitome of the lectures in which he expressed his regret at their curtailment and the premature death of the professor. The chair of political economy he held was the earliest established in France. A. C. F.

VANSITTART, NICHOLAS, LORD BEXLEY (1766-1851), son of Henry Vansittart, sometime governor of Bengal, took his M.A. degree at Oxford in 1791, and was called to the bar at Lincoln's Inn, where he became a bencher in 1812. He was M.P. for Hastings in 1796, and in 1801 was sent as minister plenipotentiary with Parker and Nelson to Copenhagen to endeavour to detach Denmark from the Northern Alliance. In April 1801 he was appointed joint-secretary to the treasury by Addington.

Between 1802 and 1812 he sat for Old Sarum, and afterwards for Harwich. In 1804 he was a lord of the treasury in Ireland and in the following year secretary to the lord lieutenant. He was reappointed joint-secretary to the treasury, 1806-7, under Grenville's administration; and in 1812 became a cabinet minister, succeeding Perceval as chancellor of the exchequer. He held this office during Lord Liverpool's administration until January 1823, when he retired, and was raised to the peerage. He remained in the cabinet as chancellor of the duchy of Lancaster until 1828. He died 8th February 1851, in his 85th year.

Vansittart was a poor debater, with feeble voice and indistinct utterance, but he at one time had a certain financial reputation, and his gentle manners and benevolent character secured the attention which his natural abilities were unable to command. The eleven years during which he was chancellor of the exchequer were from a financial point of view perhaps the most critical England ever saw, but Vansittart never showed dexterity either in imposing or in remitting taxation. He introduced no measure of first importance. He was not responsible for the repeal of the income tax in 1816, the surrendering of the war malt tax, nor the return to cash payments. His resolutions on the report of the BULLION COMMITTEE have not added to his fame, and a praiseworthy scheme for

converting the navy five per cents to four per cents in 1822 was coupled with an objectionable proposal to farm the pensions known as the "dead weight annuity." He introduced alterations into the SINKING FUND (*q.v.*) far from successful. He was simply an honest and industrious clerk, finally dismissed from his office with little ceremony.

*Reflections on the Propriety of an Immediate Conclusion of Peace*, London, 1793, 8vo (well-written defence of the war as regards its effects upon public prosperity).—*A reply to the Letter addressed to Mr. Pitt by Jasper Wilson*, 1794, 8vo.—*Letter to Mr. Pitt on the conduct of the Bank Directors*, 1796, 8vo.—*Inquiry into the state of the Finances of Great Britain in answer to Mr. Morgan's facts*, 1796, 8vo (the last three are in defence of Pitt).—*Substance of two Speeches, 7th and 13th May 1811, in Committee of the Whole House on the Bullion Committee Report*, 1811, 8vo.—*Outlines of a plan of Finance proposed to be submitted to Parliament*, 1813, 8vo (the "Sinking Fund"; repr. in the *Pamphleteer*, i. 255; discussed by F. Silver, *ib.* ii. 313-321).—*Substance of Speech comprising the Finance Resolutions for 1819*, 1819, 8vo (*ib.* xv. pp. 15-26).

VARRO, M. TERENTIUS (B.C. 116-28). He fought in the wars against Mithridates and afterwards under Pompeius. After Pharsalia he was pardoned by Cæsar and employed by him in collecting a library for public use. He was reputed the most learned of the Romans, and was the author of 490 books. Except mere fragments, his treatises *De Lingua Latina* (imperfect) and *De Re Rustica* alone remain. The latter is a work of a very practical nature, giving directions for farming which are so clear and comprehensive as to show that Varro wrote from actual experience. In the first book he deals with the art of cultivation; its instruments and methods; the proper seasons for operations; the culture of vines, olives, and other crops; and the slave or animal labour employed. In the second book he treats of the peasantry (*c. x.*) and of the larger animals, of wool and other produce. Of the third book the chief subjects are fowls, pigeons, peacocks, fish-ponds, and game.

[The text is given in a convenient form by H. Keil's edition, Leipzig (B. G. Teubner), 1889.—C. T. Cruttwell, *Hist. of Roman Lit.*] R. H.

VASCO, GIOVAN BATTISTA (1733-1796), born at Turin, was a priest and doctor of law; he taught theology at the university of Cagliari for some time, and also cultivated natural science and political economy. He was continuously persecuted for his liberal ideas, and died in great poverty. He left several works on economic subjects, the most important being one on corporations and another on begging.

In the first, written for the prize competition at the Academy of Verona (see MARACHIO), Vasco

advocates the utmost economic liberty and the dissolution of trade-gilds, quoting TURGOT and A. SMITH. Vasco studies, from a liberal-minded point of view, the evils arising from the regulation of occupations, and shows that governments can, even without the existence of trade-gilds, prevent certain disadvantages which may arise from freedom in these matters; he advocates absolute liberty in agriculture, manufacture, and trade. The writings of Vasco are profound and clear, and, though he adheres to the doctrines of the well-known economists of his day, his observations have a practical basis.

Vasco's book on mendicants is also noteworthy considering when it was written. In it he studies the causes of begging, and makes practical suggestions for simplifying the relief system for those incapable of work, and eliminating the causes which leave capable men unemployed and a burden on public charities. The remedies Vasco proposes, though they have the merit of simplicity, were not adequate even for his own time, far less so for the present day.

[*Delle università di arti e mestieri*, 1793.—*Mémoire sur les causes de la mendicité et sur les moyens de la supprimer*, 1790 (in Custodi's collection). [Alberti, *Le corporazioni d'arti e mestieri*, etc., 1888.—Balletti, *L'abate Giuseppe Ferrari Bonini e le riforme civili della beneficenza nel secolo XVIII.*, 1886].] U. R.

VAUBAN, SEBASTIAN LE PRESTRE, Seigneur de, Maréchal de France (1633-1707). One would hardly expect a distinguished general to rank among the economists of his time. Such, however, is the place in history of Vauban, the celebrated marshal of France, who, after besieging fifty fortified places and receiving eight wounds, found leisure to write *La Dîme Royale* (1707), an erudite economic work much in advance of his time, and distinguished both by accuracy of method and breadth of view.

Though the book was published anonymously, and only a few copies issued, Vauban had to submit to the mortification of seeing it "pilloried" by the parliament, while he himself incurred the displeasure of the king. A few weeks later he died. The book contained no subversive doctrines. It is only a plan for financial reform, and aims at substituting for every other impost a proportional tax on every description of income:—on income derived from landed property (which should be levied on the raw produce, as was the case of ecclesiastical tithes), on income from house property, profits arising from manufactures and business, salaries and pensions of officials, government stocks, and also the wages of artisans and labourers,—in short, a kind of income tax. The amount to be raised by this tax, like the income tax, should vary according to the requirements of the treasury. Vauban considered that 10 per cent should be the maximum, never to be exceeded, and proposed 6·66 per cent as a normal rate. On the wages of artisans and labourers he would only demand, on account of the frequency of slack seasons against which they find it difficult to bear up, a rate of 3·33 per cent—"subject to being doubled in case of great necessity of the state."

To this tax Vauban added others which bore rather on expenditure than on income (though the distinction never seems to have been clear in his mind), for instance, on luxuries, servants, "exaggerated magnificence in furniture, gilded carriages, large and ridiculous perruques," and even "on swords worn by those who were neither nobles nor soldiers." He also proposed a tax on each hogshead of wine drunk at a tavern, though not on wine drunk at home, so as a little to check the expenses of the peasants who on Sundays and fête-days spend their time in taverns, and "to oblige the more steady of them to stay at home."

All this, according to the estimate of the author, who calculated each category of taxes with all the accuracy possible at the time when he lived, should supply 116,822,500 livres (French), a revenue sufficient, he thought, for public requirements, while in time of war it might at a moment's notice be raised by 2 or 3 tenths.

The value of Vauban's book lies not so much in his plans of financial reform—though, considering his period, they are remarkable—as in the mass of facts, figures, and observations of all kinds. These, as he said himself, are the outcome "not of imaginary observations and guess-work, but of exact investigation and careful statistical enquiry," which render the book a document essential to understanding the economic history of France. In it abuses of all kinds are denounced with a boldness which sufficiently explains the anger it excited among all those who benefited by these abuses. Passages such as the following would obviously not find favour with a king like Louis XIV.:—"If the people were not oppressed so severely they would marry more freely; they would be better clothed and better fed; they would work with more vigour and heart if they saw that they retained the main part of their gains. No better service can be done to monarchs than to remind them continually of this truth."

To Vauban's honour, he was one of those few at the court of Louis XIV. who protested against the revocation of the Edict of Nantes. He did this by a memorandum in which, with remarkable clearness, he called attention to the economic effects which would result from this measure to the injury of France and to the advantage of foreign countries. c. g.

VAUGHAN, RICE (17th century), son of Henry Vaughan of Machenlleth, Montgomeryshire, barrister since 1638 of Gray's Inn, registrar of the sequestration commission which sat 1643-60, prothonotary (1653), and judge-assistant (1659) in North Wales, and imprisoned for high treason "without pen and ink" 1665 *et seq.*—wrote (1635?) *A Discourse of Coin and Coinage*, pub. 1675, posthumously, by Henry Vaughan (the poet?), and reprinted by McCulloch (1856) in *A Select Collection of Tracts on Money*, which is the first historical monograph in English on money. He knows that money means general purchasing power, it is "a pledge," "it serves actually to no use almost—potentially to all uses," and is the medium of

exchange and measure of value, "either the thing is exchanged for money or if it be exchanged for another thing, the measure of that exchange is how much money either of the things exchanged is conceived to be worth," and should be of value, not common, easily stamped, and divisible, durable, and generally acceptable (he should have added portable). As for value "Use and delight, or the opinion of them, are the true causes why all things have a value" (value in use), "but the proportion of that value . . . is wholly governed by "rarity and abundance" (value in exchange) and therefore "must needs differ in several times and places," and he defines the "intrinsic" value of coin as its "proportion to other things valued by them." Doubtless he should, like W. POTTER (1650), have added after "abundance," "mobility"; and HOBBS's (1651) definition of the function of money is more clearly expressed; and his arguments against "raising" the denomination of "money," and against the par of exchange, came from MISSELDEN (1622); but he avoided the error which tainted even Misselden and MUN (1621), that raising money attracted the precious metals (pp. 77-86), substituting the truth that raising silver without raising gold money will attract silver (p. 88). He does not discuss companies, banks, usury, nor those physiological metaphors about money which Hobbes derived from MILLES, Misselden, etc.

The book on coin was written while Charles I., Louis XIII., and Ferdinand II. (p. 118) reigned, and before certain Dutch and French proclamations (p. 19) were repealed; *i.e.* between 1625 and 1636. In *Plea for the Common Laws* (1651), he opposed Hugh Peters's plan of law reform, and in *Certain Proposals* (1652), made unimportant counter-proposals; his *Practica Walliae*, published (1672) posthumously by T. M. (Manley?), is merely professional; and his *Manner of the Proceedings in the Courts of Great Sessions in . . . North Wales* (1653) is the first chapter of it. J. D. R.

VAUGHAN, ROBERT, D.D. (1795-1868), congregationalist minister at Worcester, 1819, and Kensington, 1825-43, historical professor of University College, London, 1830-43, principal and theological professor of the Lancashire Independent College, 1843-57, founder and editor of the *British Quarterly*, 1845-66:

Wrote several English histories of fair merit in which he usually set apart chapters on "Social history," which he called "a species of science." His one work on social philosophy, *The Age of Great Cities: or Modern Society viewed in its Relation to Intelligence, Morals, and Religion* (1843), illustrates the thesis that politics, science, and literature are derived from "the state of society" in any epoch, and that our society is essentially civic, with happy quotations from Samuel LAING and Harriet MARTINEAU, with an able argument that the dangers of town life are often exaggerated, and always outweighed by its superior opportunities for good; and with the following epigram in answer

to those who condemned factory labour as making men's work less skilled and their minds less intelligent. "Education," he wrote, "comes not from the structure of a loom but from the texture of society." This thesis is also the hypothesis of moral statisticians, to whom, however, Vaughan does not refer. The self-educated man reveals himself in his exaggeration of the effects of town life, an exaggeration which sometimes leads to a confusion of commercial, civic, and social influences, sometimes to such an assertion as this, that the eddas and sagas "hardly deserve a place in the history of literature" (p. 137).

[Landon mentions his eloquence—*Imag. Conv.*, ed. Crump, vol. vi. p. 397; Coleridge his *Wycliffe—Table Talk*, ed. Bohn, p. 223; McCulloch his *Age of Great Cities—Lit. of Pol. Ec.*, p. 356. In the last century R. PRICE had attacked towns as the "graves of mankind," and YOUNG defended them as an "Euthanasia." Vaughan's book was a *coup de grace* to these writers.] J. D. R.

VAUVENARGUES, LUC DE CLAPIERS, Marquis de (1715-1747), was compelled, through bad health, to leave the army in 1744, and lingered on a few years, bearing this trial with equanimity, and finding a solace in the composition of his works.

He has been called a modern stoic, and was a critical and refined moralist, opposed equally to extreme austerity and self-indulgence. Those writings of his which require notice here are his *Discours sur l'inégalité des Richesses*; this inequality arises, as he shows, from natural causes. In ch. xliii. (*Du Bien et du Mal Moral*) of his *Introduction à la Connaissance de l'Esprit Humain* he demonstrates that vices never tend to the public good, refuting thus Mandeville's *Fable of the Bees*, which, however, he does not appear to have known. His often-quoted maxim (No. 310 of the collection), *Le Commerce est l'école de la tromperie*, shows a curious coincidence of opinion between a highly polished gentleman of the 18th century and the ascetic ecclesiastics of the middle ages, who held that *Contrahentibus naturale est se invicem decipere* (in bargains people naturally deceive each other).

E. ca.

VAVASSEUR. SERFDOM became extinct very early in Normandy, and from the 11th century onwards the rural population was divided between freemen (*franci*) and peasants (*rustici*). Many of the freemen were called *Vavassores*; they held land of a lord to whom they paid a rent and RELIEF on entry into possession; they were obliged to be present at his pleas, had to plough a portion of his lands, and to provide him with a horse for his cartage. But in many respects their position was distinguished. Thus in the 13th century they sometimes presented the parson of the parish; in certain fiefs (see MANOR) they were entitled to take wood or feed their cattle in the lord's forests. The *vavasseurs* of the bishop of Bayeux owed military service on horseback, armed with a lance, a shield, and a sword; elsewhere we hear of *vavassores pedites*. In old texts a *vavassorium* is carefully distinguished

from a tenure in villenage and a *bordagium*. Still being a non-noble tenure, it could be divided between a great number of owners, but the lord was supposed to deal only with one of them, who collected the rents and was responsible for the rest. This tenant, being supposed to be the eldest of the various sons of one former owner, was called *l'ainé*: hence the name of *ainesses* also given to these holdings (see SERVICES, PREDIAL AND MILITARY).

[Léopold Delisle, *Études sur la Condition de la classe agricole en Normandie au Moyen Age*, Evreux, 1851, pp. 6-7 and 32.] E. ca.

VECTIGALES AGRI signifies land let out by a municipality for a long or indefinite period, subject to the payment of a yearly rent (*vectigal*). The lessee of such land, as long as he paid his rent, had the rights of an owner over it, though the municipality was considered in law to be the owner. An analogous tenure arose in respect of waste lands of the imperial demesne, which were let out on long lease for the purpose of being planted (*agri emphyteuticarii*). From this latter custom the term *emphyteusis* (in-planting) was used to signify a long or perpetual lease, by which the tenant (*emphyteuta*), who fulfilled its conditions, was in the position of a freeholder. Under Constantine and his successors *agri vectigales* disappeared, becoming in most cases imperial or ecclesiastical property, hence they are not mentioned in the Theodosian code, or in the *Corpus Juris* of Justinian.

E. A. W.

VELLON. In the old Spanish monetary system this word is used very much in the same way as our "sterling," to denote the standard money of the day. It was attached either to the word "plata" or to "real," i.e. *plata da vellon* or *real da vellon*. Which of these came first in time it is difficult to say. Barcia defines it as "ordinary copper money." The expression is thought to be derived either from *villon* or *villis*, base; or from the sheep (*vellon*, fleece) which was stamped on certain old Roman coins. Barcia, with much probability, refers it to the same root as French "BILLON," Ital. "biglione," Eng. "BULLION," with derivation from "bulla," a round piece and so a coin.

[Barcia's *Diccionario de la lengua Española*.—Zarolo's *Dicc. Encycl. de la lengua Castellana*, s.v. *Real-Vellon*. For the use of the term in currency, see Kelly's *Cambist*, p. 317.] C. A. H.

VEND, NEWCASTLE (1602-1844). The received view that "there is no direct or indirect connection between the ancient and modern forms of trade combination" is contradicted by this "vend," which was once the attribute of a gild (see GILDS), then of a cross between gild and RING, then of a ring; which afterwards inspired simultaneous attempts to renovate the gild and invent TRUSTS, and which now influences the policy of TRADE UNIONS. The history of this missing link is in its earliest

stages difficult, and has not been told; it will therefore be told at length.

*Preface.*—In 1600 the Newcastle hostmen were formally incorporated as a gild of exclusive coal-fitters for the north of England; "fitting" was defined by the charter (Brand, *Hist. of Newcastle*, ii. 623-627, 659) as "loading and unloading," but was universally construed as "selling for export" (21 Jac. c. 3, § 12; *Col. State Papers, Dom. Ser.*, 1655-56, p. 280). But "hostmen" and "coal-fitters" were not synonymous; thus we read in 1633 of "hostmen's fitters," and in 1700 of hostmen regulating fitters' charges (M. A. Richardson, *Newcastle Reprints, Historical*, vol. iii. *Conservatorship of the Tyne*, p. 81; Brand, ii. 302 n.). A double process was going on. On the one hand, hostmen were expanding (1600-1750) until they embraced nearly all free burgesses, and their significance evaporated; on the other hand, a nucleus of hostmen, described by foes as eighteen or twenty, and by friends as over thirty, and five of whose names have survived (Record Office, *State Papers, Domestic, Elizabeth*, vol. 263, No. 72; par. 3), were accused in 1590 and 1597 of having converted to their private use collieries leased to the hostmen at large, and of engrossing "all other collieries" (*ib.* Brand, ii. 269), and, in 1653, of making efforts to retain their monopoly of "leases of the coal-pits" (*Conservatorship*, p. 26). The fact that certain hostmen were lessees of the Gateshead and Whickham (1590?-1681), and of valuable Newcastle collieries (*ib.* pp. 59, 85; *New. Rep., Miscellaneous, Certain Matters*, pp. 9, 10), and that sometimes coal-owners (1610), sometimes hostmen, were accused of raising the price of London coal, lends colour to the charge. But the matter does not rest here. These owner-fitters have told us themselves how from the first they usurped the power and, probably, the property of the fitters' gild.

*First Period of its History (1602-1768).*—The hostmen's guildbook for 1602 contains an "order and agreement of partnership for the vente of coals" by twenty-nine or (counting joint-owners as one) twenty-four hostmen. Their names include the five mentioned in 1597; and they were a majority and commanded the gild, which in 1600 numbered forty-eight. The twenty-four are ranged in four groups; each member of each group may only separately sell so many "tens" of coal, the highest exceeding the lowest quantity, as nine to one. This compromise between partnership and severalty suggests the COST-BOOK company, a tenure which still exists among mining adventurers. Moreover it was usual in the next century for Northumbrian mining adventurers to club together like one of these groups, ear-marking and apportioning to each member such and such quantities of coal when sold by their fitter-agent each week (J. Bell, *Collieries and Coal Trade*, vol. i., a MS. in the Royal Geological Museum, see esp. "Washington Colliery"). Further, people only spoke of "tens" in reference to their own mine, for the "ten" was a private measure varying in each mine. We infer then that the hostmen (or some of them) owned twenty-four collieries, and resolved that they should be worked for "fitting" purposes as one company, by this same nucleus, each for his private

use if his "fitting" did not exceed his allotted share. The second document is an agreement of two terms made in 1665 "at a meeting of the several principle traders in coals"—so that the gild is there, but unofficially. The first term, signed by twenty-one coal-owners—six of whose names figured in the document of 1602—and by one agent for one of the twenty-one, bound the signatory to close his colliery until the end of the third quarter or thereabouts; one quarter-group must have held aloof from this term. The second term signed by seventeen out of the twenty-one, and by eight others, bound the signatory to raise the price of his coal. Briefly, the twenty-nine coal-owning hostmen of 1602 have been transformed into twenty-nine coal-owners, many of them hostmen. A fluctuating body, held together by what was then thought the frail thread of self-interest, has been substituted for the organic cohesion of the gild. The third document, dated 1768, states the "intended" annual vend of twenty-four collieries for seven years to come, and was perhaps a response to the fitters' lists required by the Septennial Act of 1766 for regulating the Newcastle coal trade. Words of agreement are avoided, as such an agreement would be a crime under 9 Anne c. 28. The ratios of the quantities allotted vary as widely as ten to one. Gild hostmen and fitters, who were then mere agents, have all finally vanished. The singular similarity between these three shreds of evidence seems to prove that a sub-gild—if it may be so called—of coal-owners had detached itself from the doomed and decadent parent gild of owner-fitters, and exercised until 1768 such functions of its parent as concerned coal-owners. If this view is true, those functions—in other words, the vend—comprised the following features, some of which were expressed, and others implied:—

(1) It was a partnership composed of members, who, if they traded beyond a certain point traded as partners, but if they traded up to that point, they traded as though they were private traders and not partners; for this purpose (2) it limited the annual output (3) which it distributed among the collieries in certain proportions. Briefly, it was what 17th century writers called a *STINT*. Stints were usually annual, and were meant to secure (4) fixed prices. Prices were also directly fixed by the vend of 1665, and before then by the gild (*Col. State Papers, Dom. Ser.*, 1655-56, p. 280) or by its "pricers" (*Conservatorship*, pp. 32, 65; cp. *Surtees Society, Newcastle Merchant Adventurers*, i. 52); and the act of 1766 assumed that the sellers fixed the "usual prices" of coal; and the coal (5) was put (in 1602) into three classes. So much for the express features; the implied features were as follows: (6) it was a condition of the charter of 1600 that the hostmen should sell direct to shipowners (R. Gardiner, *England's Grievance*, 1655, ch. ix.), and the act of 1766 assumed that the latter had a right of purchase on tendering "the usual price." (7) Labourers were at that date called "servants," and were hired gild fashion, *i.e.* by the year and by indenture, providing for payment by piecework and during suspension of work, for exclusive service, and for penalties which the magistrates enforced (5 Eliz. c. 4, § 7;

J. Bell, *l.c.*). However much the gild ministered to the interests of a class of capitalists, it was true to its ideal of organising industry all round. (8) Nor could it legislate for capitalists or producers as such, but only in so far as they were urban traders of a special kind. Therefore this stint being invented by fitters for fitters could not affect inland trade nor coals consumed at Newcastle. And further the hostmen granted, as the consideration for their charter, a duty on coal exported from the Tyne "to the free people of England," and "spente within this realm and not transported" (R. Gardiner, *l.c.*; Brand, ii. 658); probably, therefore, the grant to them was from the first construed as co-extensive with the grant by them, and they did not regulate "transported" coal. (9) The usual remedies of the decadent gild were fines, boycotting, and warnings.

These features must have characterised the vend of 1602. Their co-existence in the vend of 1768, and persistence during the intermediate period, is inferred from the fact that they were all present when the vend was put under the microscope in the second period of its history. Granted that the second, third, fourth, and ninth features might have often died and been born again, and that the fifth and seventh might have lived on in isolation, it is inconceivable that the first, sixth, and eighth could have existed by themselves, or could have been revived if they had been once suffered to lapse for any length of time at any date after the great rebellion. The theory of survival gives the only possible solution; and survival means an uninterrupted existence from the time when the things surviving had a meaning—namely, from the first half of the 17th century. But we are anticipating.

The second period of its history (1771-1844) is a replica of the first period; each of these nine features recur, but with differences due to an age of movement. London had tapped new sources of supply, and the margin within which the northern coal-owners could dictate terms grew narrower day by day. And there were foes from within. Thus Sunderland, which used Newcastle as its port in 1704 (Brand, ii. 677), soon became independent, but federated with Newcastle in 1771; and the railway of 1825 gave a new outlet to the Tees-side collieries, only some of which joined the confederacy in 1834. Again, the Tyneside collieries, which were of the traditional number (twenty-four) in 1768, were twenty-nine in 1787 (Brand, ii. 688), and forty-two in 1829 (*Rep.* (1830), vol. viii. p. 316), and although their respective quantities and prices were assigned to each colliery every year 1786-1833, and the "rules" and "agreement" of 1833-34 were elastic as well as permanent, and admitted readjustments from time to time, there were always one or two dissenters. Again, for some years before 1786, and afterwards for parts of years, corporate trading broke down and competition came romping in. It was an age of intermittent individualism. Ideas had also moved, and the coal-owners forgot their origin in the gild, and passed themselves off as a ring. This gild-ring—if it may be called so—was investigated by at least five committees in 1800, 1830 (*bis*), 1836, 1837-38, yet the word

gild was never whispered by one committeeman nor by one witness; all accepted as history the legend that before 1771 there was competition, and then for the first time the coal-owners combined in order to defeat the rings on the London market—yet the coal-owners revived these very rings after their abolition in 1831! Truly, the industrial revolution had, in twenty-nine years (1771-1800), swept men's memories clean, and turned their minds topsy-turvy. Lastly, these dupes of a legend invented apologies which are of unique interest as made by men to whom economic history before 1771 was a blank.

As to (2) and (3), the apologists said that the agreement did not create a MONOPOLY (*Rep.* (1836), p. 12, and that the appointed annual totals exceeded the demand, and therefore were hypothetical figures for calculating proportions, and giving the weak a chance of sharing with the strong; yet many of the collieries worked half (*Rep.* (1830), pp. 267, 301) or one-third (*Rep.* (1836), vol. xi. pp. xv., 80) power under the vend, and the so-called weak often fared best when the vend was off (*Rep.* (1836), pp. 11, 24). Even thus Wheeler (1601) wrote of the stint, that it was not a monopoly, and that it was double of the supply (he was defending traders against producers, not producers against consumers), and therefore operated only as an "economical apportioning among the brethren of the companie of the . . . benefits of the same, so that the wealthier sort . . . are kept from engrossing the whole trade." As for (4), "regulation" or "order" kept prices stable (this was disproved in *Rep.* (1871), vol. xviii.; *Rep. E., App.*, p. 208), and was more "economical" than the "open" or "fighting" system which produced the same result at the cost of "confused" and "wasteful" alternations between over-cheapness and over-dearness (*Rep.* (1800), vol. xxvi. pp. 30, 31; (1830), pp. 295, 304). This language is natural to men who dread competition as an unknown power, and recurs on almost every page of 17th century opponents of "free trade" (individualism). As for (6), the plea that working coal is incompatible with freighting and sending coal to market (*ib.* pp. 415, 472)—although these incompatibles were habitually combined when the vend was off—is redolent of the middle ages, which separated trades as we do professions. As for (7), annual wages, they said, necessitated an annual price-list (*ib.* p. 422; (1836), p. 81)—the converse would have been equally near the mark, for most gild arrangements are annual. (8) The exclusion from the vend of coal sent inland, abroad, to the Orkneys, and to Ireland (*Rep.* (1830), pp. 433, 463) and, (5) the absurd trichotomy (*ib.* 469, 470; (1800), 14, 100), were noted but not explained; so was the partnership scheme (1), under which each paid calls proportionate to his appointed share in the sales (*Rep.* (1836), p. 18), and each took in severally what he sold within the prescribed limit, but accounted as partner to the other coal-owners for any excess (*Rep.* (1800), pp. 19, 20, 98); indeed, a continuous history from the time when one company owned every mine furnished the only possible key. As for (9), fines were, under the constitution of 1833, secured by

deposit, but warnings (*Rep.* (1837-38), vol. xv. p. 91) and boycottings (*ib.* 89, 90, 265; (1836), p. 22) were the usual penalties.

The spirit, as well as the institutions, of the gild dominated this ring, though much was inexplicable when they proclaimed "self-interest their *primum mobile*" (*Rep.* (1836), p. 92). Industry was in a semi-conscious customary stage, and men only expected to justify part of what they did; and justified that part by repeating, as faithfully and unconsciously as parrots, all the old sophisms forged by the founders of the system—for it was a system every part of which cohered until the last. When one prop was removed, the entire edifice collapsed.

*Its Death* (1844-45).—Between 1837 and 1843 two collieries were worked by joint-stock companies, to which gild methods would be *ultra vires*. After 1834 the London Gas Company defied the sixth rule, and treated with the producer direct (*ib.* pp. 37, 42, 193-203). The competition of certain Tees-side collieries, which would not join the vend, sent prices down and production up, and induced the masters to snap what looked like the least essential link in the chain—the seventh—and to dictate a monthly in lieu of the old annual bond. The Tyneside, Wearside, and Tees-side miners struck against the new bond (*Rep.* (1873), vol. x. p. 304; Fynes, *Miners of Northumberland and Durham*, pp. 62, 77, 104) and lost. But the spell was broken, and the masters never even proposed to resuscitate what they had renounced, but only such parts of it as appealed to their class interest.

*Its Successors: a Modernised Gild* (1844).—Mr. Lambert writes, in *Two Thousand Years of Gild Life* (p. 368), that if in some national trade masters and men combined to regulate output prices, profits, and wages, this would be the nearest conceivable reproduction of the gild as it was 300 years ago. He seems unaware that a proposal to regulate the English coal trade on this basis was made by the miners, and rejected by the masters in 1844 (Fynes, p. 50).

*The Trust* (1845).—The leaders of the gild-ring tried, and only just failed, to erect on its ruins a joint-stock company composed of north of England coal-owners, and with the object of reviving the second, third, and fourth features of the vend (*Rep.* (1873), pp. 297 *et seq.*).

*The Trades Union*.—In 1836 both masters and miners wished to restrict output (*Rep.* (1836), p. xv. n.), and this policy has since then been often put into practice by the miners with the avowed object of raising prices (*Rep.* (1873), p. 10); indeed this policy and object were the *raison d'être* of the coal strike of 1893. The proposal of 1844, and the strike of 1844-45, were bids for the succession to the traditions of the vend; and when in 1845 the gild-ring tried to pass on its diminished torch to a trust, the miners snatched it from their hand.

D. R.

**VENDOR AND PURCHASER.** The normal sale of land is in English law a process with three stages.

(1) First there is the formation of the contract for sale. The vendor usually embodies his offer in two documents: (a) particulars of sale which specify the locality and size of the estate, and must state if it is anything less than an estate in fee simple in possession free from incumbrances; (b) conditions of sale which state the time and mode in which details belonging to the second and third stages shall take effect. The acceptance of the vendor's offer must be signed by the purchaser and must refer to the parties, subject matter, and price. If verbal, it is unenforceable unless the parties have acted on it to an irrevocable extent. (2) The effect of the first stage is to introduce a stage intermediate between contract and conveyance; or in technical language, the ownership has passed in equity but not in law from vendor to purchaser. During this stage, which remotely resembles an action conducted without (until 1874) an oral hearing, the vendor may not damage nor alter the character of the property in possession of which he still remains but as constructive trustee; and he must prove his title in the method prescribed by rules which have grown up in the courts of equity, and are contained but not codified in the *Vendor and Purchaser Act* 1874, and *The Conveyancing Acts* 1881, pt. ii. and 1882, or by the conditions agreed on in the contract for sale, or more often by a mixture of these public rules and private conditions. If or in so far as there are no conditions, the contract is called an "open contract," and the rules prevail; but the conditions, unless expressed ambiguously or in a manner calculated to mislead, modify or replace the rules. If the contract is "open" the vendor must produce an abstract of all documents and events material to his title, and must produce originals of deeds, marriage and death certificates, etc., for verification with the abstract, and the abstract so verified must prove that he has power to sell the property in the way in which he has offered to sell it. The proof need only go back forty years, and must be as strict as in an action, but facts recited in documents twenty years old prove themselves; and purchasers of leaseholds cannot call for the freehold title. There are few titles which can pass unscathed through this ordeal; but the purchaser must point out flaws to the vendor within reasonable time, or else it will be assumed that he has waived them. Conditions of sale are usually framed preventing the purchaser from making these objections, or enabling the vendor to meet them by statutory declarations, by compensation, or by some answer which would not, in the absence of such conditions, be binding. If there are no flaws of title or all flaws are waived, adjusted, or removed, the vendor's case against the purchaser is complete, and the purchaser completes his case against the vendor by tendering to him the price and a deed of conveyance which is in accordance with and, if properly drawn, supersedes the preliminary contract and negotiations. Disputes on these matters or on any isolated points which do not affect the validity of the contract as a whole are, since 1874, settled by summary oral procedure in the chancery division. (3) With the execution of the conveyance and payment of the price, which until payment is a lien on the property, the relation of vendor and purchaser ceases, and the estate which the vendor had power to convey, vests in the purchaser. Up to that date they have been united by numerous reciprocal duties. The most important duty is not to mislead; and the vendor, and in rare cases the purchaser, have the additional duty to disclose "latent" defects which the other

party has no means of discovering for himself. Breaches of duty by one party, unless condoned or written off against breaches of duty by the other party, disentitle him to equitable relief. Equitable relief is now administered by the chancery division, and consists of the following ascending scale of remedies: (1) the court remains neutral; (2) or grants damage in lieu of specific performance; (3) or specific performance (a) of the contract (b) plus a new term, or (c) plus compensation making good any breach of duty; (4) rescinds the contract, and if purchaser is plaintiff, may order his deposit (if any) to be returned with interest, and may charge the property therewith; (5) orders the contract to be delivered up and cancelled. If equitable relief is not asked for an action for damages for breach of contract or for TORT (*Law Reports*, 1891, 2 Q.B. 456) or for money had and received, may be brought in the Queen's Bench division, or in minor cases in the county court.

*Exceptional Cases.* Where land is sold by forced sale to a public body under the Lands' Clauses' Act 1845, parties under disability may contract to sell and sell, the purchaser may enter into possession after paying a deposit and on giving a bond, conveyance vests in the purchaser, all estates which have been paid for, and outstanding estates when they are paid for, and if the vendor will not convey the purchaser may dispense with it. Briefly (1) the capacity to contract is enlarged; (2) the completion of the contract takes effect as an out-and-out sale in certain cases. Otherwise the process is as above.

The provisions for registration in the Land Transfer Acts 1875 and 1897 alter the whole process described in the above. The purchaser of registered land acquires no property by the conveyance, but acquires the entire ownership by entry on the registry; and no investigation of title takes place in the case of an absolute title.

In so far as the title is registered as less than absolute the ordinary rules prevail. The act of 1897 is the first to contain compulsory provisions; which, however, do not come into force in any district unless adopted by the county council.

[E. Sugden, *Vendors and Purchasers of Estates*, 1805, 1892.—J. H. Dart, *Vendors and Purchasers of Real Estate*, 1888.] J. D. R.

VENTURI, GIAMBATTISTA (1746-1822). Born at Bibbiano (Reggio Emilia). He was an abbé and a man of great and varied attainments, he studied mathematics and physics, literature and history. He occupied himself greatly with economic and financial questions on these subjects, wrote and held discussions with able economists. He held many public offices in the duchy of Modena, was professor of geometry and physics at the university, state engineer, and assayer of the mint. Later on he held offices in the government of the Cisalpine republic.

Among his works of interest to economists is a report illustrating the advantages of the decimal system, his *Pareri di finanza*, preserved in manuscript in the archives of Modena. MONTANARI attributed to Venturi an anonymous article published in the *Nuovo giornale dei letterati d'Italia*, printed in Modena in 1773; in this work the author reviews the *Meditazioni sull'economia politica* by VERRI, he mainly discusses the theory of value, and fiercely criticises the mathematical method applied to political economy, used by Frisi, who edited Verri, in a series of notes on his work—*Rapporto della commissione di commercio, etc., sopra il sistema da adottarsi nelle nuove misure, monete e pesi della repubblica*, 1798.—*Pareri di finanza* (manuscript). [De Brignoli, *Memoria biografica del cavalier abate Giambattista Venturi*, 1835.—Montanari, *La teoria matematica del valore ed uno scrittore emiliano del secolo scorso*, 1891.] U. R.

VENUSTI, M. ANTONIO MARIA (16th

century), was the author of two works on commerce, one containing a defence of trade, particularly of wholesale trade; the other a development of a theory on value, which, though unoriginal and obviously inspired by the doctrines of ARISTOTLE and S. THOMAS AQUINAS, merits mention for the fluency of its explanations.

Venusti examines into the elements of a just price (see JUSTUM PRETIUM) which he considers to be the one prevailing at the time and place of a contract—the circumstances of selling and buying, the quantity of goods and money, the number of buyers and sellers, and the convenience and usefulness of the bargain, according to the judgment of upright men incapable of dishonesty.

Venusti makes a minute analysis of these elements, illustrating them by the theory of SUPPLY AND DEMAND, and to some extent opposing this by the theory of cost of production, asserting that *giusto prezzo* springs from abundance or scarcity of goods, and of merchants and money, not from cost, labour, or risk.

*Discorso d'intorno alla mercantia.—Istituzione dei mercanti*: both published in one volume entitled *Compendio utilissimo di quelle cose le quali a nobili e cristiani mercanti appartengono*, 1591.

[Gobbi, *L'economia politica negli scrittori italiani del secolo XVI.-XVII.*, 1889.—Montanari, *Contributo alla storia della teoria del valore*, 1889.] U. R.

VERDERERS. See FORESTS, MEDIEVAL.

VERGANI, PAOLO (18th century). The author of an important work on the customs-houses of the papal states, containing many facts and intelligent opinions. Vergani studies the principles of customs regulations, and in particular the tariff of customs duties established by Pius VI., at the same time he explains the ideas of the day on customs duties in the most civilised states.

He advocates moderate and temporary protection; criticises the PHYSIOCRATS, and explains the point of view they started from in order to support absolute freedom in trade; he combats the theory that agriculture, and above all things the cultivation of cereals, constitutes the only true wealth of a nation; he would establish a new financial system in the papal states promoting manufacture. Vergani starts from the principle of protection for national industries, with a corresponding system of taxation, at least until other states adopt a similar taxation, and until the industries have reached a certain degree of development. He admits, like VERRI, that if all nations agreed to abolish the taxation of goods, then universal and unlimited freedom would not be injurious to the arts. He also studies the details of customs duties and advises the transformation of duties *ad valorem* into specific duties, thus showing his perception of the most correct system of technical taxation.

Vergani treats the subject of customs duties with great breadth, and his book may be regarded as a complete treatise on the subject—its breadth of ideas, wide technical observation and clear

expositions, placing him among the first financial theorists of his day.

*Dell' importanza e dei pregi del nuovo sistema di finanza dello stato pontificio*, 1794.

[Ricca Salerno, *Storia delle dottrine finanziarie in Italia*, 1881.—Gobbi, *La concorrenza estera e gli antichi economisti italiani*, 1884.—Graziani, *Le idee economiche degli economisti emiliani e romagnoli*, 1893.] U. R.

VERRI, PIETRO (1728-1796) was born at Milan, of a noble family; he first entered the army and fought at Soran in the Austro-Prussian war.

At Vienna he commenced the study of economics, and wrote the *Elementi di commercio*; he continued these studies in other publications after his return to Italy. In 1765 he was made a member of the supreme council of economics, and then privy councillor of state. He played an important part in the financial reforms of the Milanese states, especially in the reform of the customs duties tariff, which was entrusted to him. In 1786 he retired into private life and devoted himself to his studies; later on, he again took office at Milan, after the entry of the French.

Verri's principal work is the *Meditazioni sull' economia politica* several times reprinted, also in the Custodi collection and in the *Biblioteca dell' economista serie I<sup>a</sup>*: the *Meditazioni* were translated three times into French, twice into German, and once into Dutch; they form the best summary of political economy published in Italy in the last century, and one of the best in any country.

Verri, in this work, makes a minute analysis of production, and examines the different causes which allow a country to gain wealth or prevent it from enriching itself by an excess of production over consumption, thus obtaining a maximum produce on which the increase of population depends.

Verri is not content with abstract theory, but studies the actual conditions of different countries, observing the causes which render changes necessary in legislative regulations.

He is, therefore, eclectic; this is chiefly noticeable in the question of international trade, which he examines with great width of view. Without altogether abandoning the principle of the balance of trade, Verri severely criticises it; at the same time he combats the PHYSIOCRATS, showing the productiveness of manufactories. He advocates free trade internally, and the free export of corn, at the same time he allows taxation on the export of raw materials, and on the import of foreign manufactured goods; he would protect national industries, observing that the abolition of customs duties would be prudent if simultaneously adopted by all nations, but injurious to any one nation doing so if the others continued these duties.

Verri combats an unequal division of wealth and excessive concentration of great properties. He displays sound ideas on value, though he does not attain to the conception of normal value (see VALUE), and endeavours to reduce the laws of value solely to the principle of DEMAND and SUPPLY.

Verri's *Meditazioni* contain also a perfected and in some part original theory on taxation. He considers taxation to be a payment made by a person to the public exchequer of a portion of his possessions in order that he may in safety enjoy the remainder, its necessary limit being fixed by the amount of public expenditure incurred for the good of the community. This becomes injurious when it exceeds the economic resources of a country, and is not proportional to the general wealth, or unequally imposed among private individuals. Every tax tends naturally to level itself uniformly on each citizen in proportion to that which each consumes. The most equitable tax is that which falls directly on the largest consumers, owners of land, buildings, and goods, on whom in any case all taxes would fall.

Verri, therefore, proposes a tax on land to reach land-owners, customs duties to touch merchants and those engaged in trade—maintaining that eventually these taxes would reach all consumers.

It is easy from the point of view of to-day to criticise Verri's system of taxation, but this does not prevent it from being the best plan which could then have been designed, and in principle it is the basis of the systems elaborated later.

Some of Verri's other writings are of great importance. In his philosophic discourses, *Discorsi di argomento filosofico*, he takes broad views of social economy, discussing the national inclination of man to happiness, the "calculus of pains and pleasures," and the favourable influence of the severer climates on economic development over the more relaxing southern countries of the world. His *Memorie storiche*, published after his death, on the history of trade in the Milanese states, are amongst the most noteworthy works on Italian economic and financial history.

*Elementi del commercio*, 1765.—*Memorie sull' economia pubblica dello stato di Milano*, 1768.—*Meditazioni sull' economia politica*, 1771.—*Riflessioni sulle leggi vincolanti principalmente nel commercio dei grani*, 1796.—*Discorsi*, etc., 1781.

VERT. "Bonnet Vert" or "green cap," in old French law meant a bankrupt who had satisfied the courts. In Scotland, where something like the French practice was adopted, the cleared bankrupt went about in a yellow cap (cp. WHITE BONNET).

[See Burton, *History of Scotland*, vol. viii. p. 70 (ch. lxxxv.).] J. B.

VETHAKE, HENRY (1792-1866), was born in British Guiana and died in Philadelphia, where he had been connected with the university of Pennsylvania in various capacities for thirty years. He took his first degree at Columbia College (New York) in 1808, and taught mathematics and allied subjects in the same institution (1813), in Queen's College, now Rutgers's (1813-1817), in Princeton College

(1817-1821), in Dickinson College, Carlisle, Pennsylvania (1821-1829), and in the university of the city of New York (1832-1835). In 1835 he became president of Washington College (Lexington, Virginia), and in the following year professor of mathematics in the university of Pennsylvania. Ten years later he was chosen vice-provost, and in 1854 provost. Shortly after becoming provost he exchanged his chair of mathematics for that of intellectual and moral philosophy. After resigning the provostship, he remained emeritus professor in the university, while engaged in teaching higher mathematics in the Philadelphia Polytechnic College.

Although never nominally an instructor in political economy, he probably taught that subject in at least four of the schools with which he was connected, since his *Principles of Political Economy* (Philadelphia, 1838), published two years after he became a professor in the university of Pennsylvania, is dedicated "to the numerous young men who at different periods during the last sixteen years have attended his lectures on political economy." This work is a systematic exposition of the principles of the science as then generally held in England and France. It avoids all reference to writers whose views differ from his own. He attempts a few innovations, prominent among them, the extension of the definition of wealth and of capital to include immaterial or intellectual products, which the author himself calls a *bold* innovation, though he might have discovered precedent for it among classical writers.

Of greater practical value was his American edition of J. R. M'Culloch's (*q.v.*) *Dictionary of Commerce and Commercial Navigation* (Philadelphia, 1847). He added many valuable articles, e.g. "A Historical Account of Banking in the United States" (36 pp.), and short supplementary notes on such subjects as *American Coinage*; *Aliens in the United States*, etc. E. T. D.

**VICESIMA HAEREDITATUM.** A tax upon successions to property, usually said to have been established by the Emperor Augustus. In the Roman republic direct taxation of citizens had never been more than occasional, and had become obsolete with the growth of the provincial revenues. The reorganisation of the state by Augustus involved a great increase in the ordinary expenditure, and it became necessary that Italy should, as well as the provinces, contribute regularly to the public expenditure. As it was not convenient to subject Italian soil to the land tax levied on the provinces, an equivalent was taken on this tax on successions. As the name shows, it was fixed at the rate of 5 per cent. Exemptions were granted in favour of direct heirs and of persons taking legacies or inheritances below a fixed minimum. The Emperor Caracalla extended this tax to the whole empire by conferring the citizenship of Rome on all its inhabitants other than slaves. He is also said

to have raised it to 10 per cent. Soon after his death it was reduced to its old figure. It disappeared in the later times of the empire.

F. C. M.

**VICO, GIAMBATTISTA** (1668-1744), was born at Naples, the son of a bookseller, studied philosophy under the Jesuits, and adopted the profession of advocate, which, however, he soon renounced. The patronage of the bishop of Ischia procured for him employment as teacher of his nephews, the sons of the Marquis Domenico Rocca; this office he held for nine years, during which he earnestly pursued his studies. He was appointed professor of rhetoric in the university of Naples, which office he filled during forty years, not having obtained the great object of his ambition—the chair of jurisprudence in that university. In 1744, the year in which he died, he was nominated historiographer to the king of Naples.

Vico was undoubtedly a great and original genius. Professor Flint is justified in the opinion that it is impossible to read him "without feeling oneself in contact with a singularly profound and powerful intelligence." The work on which his reputation rests is *Principii di una Scienza Nuova d'intorno alla commune natura delle nazioni, per li quali si ritrovano altri principii del diritto naturale delle genti* (1st ed., 1725; 2nd ed. much altered, 1730). This book, on its publication, made an impression in Italy, especially among learned circles at Venice, but was scarcely noticed at all in other European countries before the 19th century. Herder and Wolf referred to it; Salis called the attention of the French public to it; and Michelet published, in 1835, *Œuvres choisies de Vico*, containing a paraphrase of the *Scienza Nuova*, with an introduction on the life and writings of the author. Vico's object was to construct "an ideal and eternal history," whose phases should serve as types of the actual revolutions of all ages, within which all the histories of particular nations should take their places in the order of their birth, progress, maturity, decline, and end. From the common nature of nations comes amongst all peoples a "constant and universal knowledge of things human and divine," and thus is discovered, as a principal corollary of the *Scienza Nuova*, a system of natural law—an "eternal ideal law, which is in force in the universal city, a city founded in the thought of God, and in the form of which are instituted the cities of all times and countries." His ideas are habitually clothed in theological and metaphysical forms; but many of them admit of a scientific interpretation and correspond to doctrines of positive sociology.

The threefold basis common to all societies is, in his view, religion, the institution of marriage, and respect for the tomb; every community passes through three stages—a divine, a heroic, and a human age—with successive systems of law, political constitution, morality, respectively corresponding to and characterising these. But he does not go beyond this movement of each society, which he regards as indefinitely recurrent; he does not study, or apparently recognise, the con-

tinuous life of humanity—represented, not by a series of cycles, but by a rectilinear progression, only modified by frequent oscillations. He failed to create the philosophy of history; but he gave a strong impulse to the study, supplying many hints towards solving its special problems. For the Cartesian criterion of individual feeling he substitutes the *sensus communis* of the race, the spontaneous impression of the mass—of a whole people—of mankind; considering that most writers make too much of the “inexplicable superiority of a few great men,” as explaining historical facts; such men he regards as products of their age; they are, as is now said, organs of humanity.

Vico was not specially an economist; but his ideas on the nature and life of political communities are valuable to the economist, who cannot correctly understand the phenomena with which he is primarily concerned, if he does not view them in relation to the general structure and development of society.

There is a complete edition of Vico's works by Giuseppe Ferrari, in 6 vols. (Milan, 1844). The *Scienza Nuova* has been literally translated into French by the Princess Belgiojoso (1844). There is no English translation.

[Introduction to Michelet's *Œuvres de Vico*.—Professor Flint's *Vico in Blackwood's Philosophical Classics for English Readers*.] J. K. I.

**VICTUAL BRETHREN.** These were a privateering organisation formed under the patronage of the HANSEATIC LEAGUE in their wars with Waldemar of Denmark. On the restoration of peace the freebooters turned their hand against every one, and though as a federation they soon ceased to exist, the North Sea and Baltic were in a state approaching anarchy until nearly the end of the 15th century. From this disturbed state of affairs England reaped much good. For the HANSARDS claimed the commercial monopoly of the Baltic, and Denmark of Iceland, and just as their power began to wane, the attacks of the Victual Brethren gave the English an excuse for reprisals. The coasts of England were continually ravaged by the North Sea pirates; Scarborough, Sandwich, and Southampton were pillaged and burned; London and Norwich had to defend themselves. Many English ships were captured by freebooters and the inhabitants of the coast lived in fear of kidnappers. Of course reprisals were made, and now and again a payment settled the claims of England and some HANSE TOWNS upon each other. However the outcome of all this anarchy was in favour of England. Through the quarrel of Denmark and the Hansards she had gained a foothold in the Baltic, and the EASTLAND COMPANY was formed to trade with the Teutonic Knights. Regardless of INTERNATIONAL LAW, English ships carried on a clandestine trade with Iceland in furs and fish, and, in spite of reprisals, persisted in it. Moreover the need of combination forced England to realise the

necessity of a navy. Convoys of ships began to be formed, and in 1406 the merchants were authorised to take dues on staple exports and 3s. on every cask of imported wine to defray the expenses of two admirals, appointed by the king, to defend the north and south coasts. In a few years this system broke down, but in 1453 the earls Salisbury, Shrewsbury, Worcester, and Wiltshire, and Lord Sturton, were empowered to collect TONNAGE AND POUNDAGE, and to raise money on the security of these taxes, in payment for the defence of the coasts. Though this arrangement also speedily failed, a precedent had been set that in the end prevailed.

L. R. H.

VIDAL, FRANÇOIS (b. 1812), marked the transition in France from the utopian socialism of ST. SIMON and FOURIER to collectivist socialism.

In his works, as in those of his contemporary POCQUEUR—both now nearly forgotten—the principal doctrines of collectivism are clearly expressed and reduced to formulas; among these are the so-called “iron-law” of wages, the theory that wealth is the produce of the work “of others” (*d'autrui*), and that economic evolution leads infallibly to the socialisation of the land and of capital.

Vidal, however, does not go so far as this in his conclusions. He contents himself with co-operation for producers, profit-sharing for labourers, and a minimum wage fixed by law.

His principal works are *De la répartition des richesses et de la justice distributive* (1846), a critical explanation of the doctrines of the liberal school and those of the principal French socialists, interesting even at the present day; and *Vivre en travaillant* (1848).

C. G.

VIGANO, FRANCESCO (1807-1891), was born at Cigognola (Como); died at Milan. In 1828 he was exiled by the Austrian government and travelled abroad for many years. While in Paris he joined the Saint Simonians (see SAINT SIMON); later on he supported Mazzini, and conspired with him in Italy. For thirty years Vigano taught commercial science at the technical high school in Milan.

After 1843 he devoted himself entirely to promoting international peace and the extension of co-operative societies, devoting himself to the cause enthusiastically and untiringly until his death, not only by words, but by giving up his fortune and by writing numerous works on the subject—many were translated into different languages.

The two most important are: *La fratellanza umana*, 1873 (translated into French).—*Le banche popolari*, 2nd ed., 1875.

U. R.

**VILLAGE COMMUNITIES.** In theory “an organised self-acting group of . . . families exercising a common proprietorship over a definite tract of land (*Maine*)”; but setting aside for the moment this and other *dicta*, and not stopping to discuss side-issues respecting the MANOR

(*q.v.*); it may be said that a village community of the kind met with in England in the 11th century consisted of a body of men of various degrees of personal freedom, cultivating, by co-operative industry, open fields which chiefly belonged to a lord. Some were free and owned the acre strips they ploughed; some were in a modified state of bondage, and held their land by the render of agricultural services (see SERVICES, PREDIAL AND MILITARY); and a small and fast-diminishing number of others were in absolute slavery to a lord who owned both them and the bulk of the land his group of peasants were cultivating (see VILLANUS and SERVUS). The village was a cluster of cottages, often gathered closely round a church, and contained not only the cultivators and their REEVE (*q.v.*), but the smiths, carpenters, tilers, and others whose labour was essential towards rendering the village completely self-sufficing in an economic sense, and whose work at forge or bench was repaid by a settled share of the results of cultivation.

A walk through the flat country westward of Bruges, or a railway journey between Aix-la-Chapelle and Cologne, will show the lineal representatives of similar village clusters in the midst of hedgeless, houseless, stretches of open country which the present inhabitants of each cluster are tilling. Sight will not make us too readily aware of the exchange of produce for money which now goes on, or of the irrevocable change in personal status which has taken place in the course of centuries, but we may accept the assistance of external forms and realise from them what a true village community must once have been.

In races which tend towards improvement, blood-relationships and the social instincts of man would suffice to congregate the humbler elements of a population engaged in field labour into such village communities as those described; but external forces might have the same result, and thus many questions arise on the history of these groups.

Were village communities really primitive institutions? Did they start as free or unfree? If the manorial system was superinduced so as to form an external shell to the village community, when and how did it happen? What was the relation of the village community to the tribal system with its constant redistributions of land? Is it true that "joint-ownership, and not separate ownership, is the really archaic institution"? But the answers as yet given to these and other queries do not resolve all doubts.

Setting aside writers like G. L. Gomme, who draws evidence from the Russian MIR (*q.v.*) and the customs of Fiji, F. Seebohm's *English Village Community* deserves early and careful attention.

With respect to England, Seebohm states his conclusion that there have always been two rural systems, the tribal community in the west, and the village community in the east, each connected with its own special form of open-field cultivation. Both he believes to have been pre-Roman. The village community in eastern England was connected with a settled agriculture which was apparently improved during the Roman occupation, and was

carried on under the THREE-FIELD form of the open-field system, which became the shell of the village community. The quality of the holdings, and the succession of a single tenant which preserved it, were signs, not of an original allodial allotment on the German MARK SYSTEM, but of a settled SERFDOM under a lordship, each tenant having but the user of the land at the will of the lord. This serfdom, Seebohm thinks, was to the masses of the population not a degradation, but a rise from a once more general slavery. In western England he sees the tribal community, of a pastoral rather than an agricultural type, bound together by ties of blood-relationship and further distinguished by the redistribution of lands (see TRIBAL SYSTEM).

The manorial system, however, was not, Seebohm thinks, a mere development from the German tribal system described by Tacitus. There was a Roman element in it, derived from the *villa* with its *coloni*, *tributarii*, and slaves working under the *villicus*, and the manorial estate became the predominant form of land ownership in what had once been Roman provinces on the continent. Thus the German successors of Roman lords of villas became in turn manorial lords, whilst the *coloni* and others remaining on the land apparently became, "with scarcely a visible change, a community of serfs." He thinks that Pliny's words (*Nat. Hist.*, xvii. 4) as to Belgic Britain indicate a one-field system, and that the three-course rotation of crops was introduced by the Roman conquerors, so that the open fields round the *villa* of the Roman lord, cultivated by his *coloni*, *tributarii*, *liti*, and slaves, may have been at once arranged on the three-field system. Indeed he quotes from Sículus Flaccus (Lachmann, p. 152) the case of *possessores* who do not own *continuas terras*, sed *particulas quasdam in diversis locis, intervenientibus complurium possessionibus*, "words which amount to a partial description of the open-field system."

Like many other students of history, Seebohm disbelieves in the total obliteration of the Romanised Briton, and thinks that, taking England as a whole, the continuity between the Roman and English system of land management was not really broken, and that the earlier "*hams*" and "*tuns*" of Ethelbert's laws were undoubtedly manors.

The theories included under the mark system of the Germanists have been vigorously attacked by FUSTEL DE COULANGES, who considered that he had swept away all historical basis from them, leaving primitive communism as an unproved possibility. Certainly he has shown that the word *marca* in early German law does not mean an area of land held in common, but primarily a boundary or frontier, and, in a derivative sense, the private property which it surrounds. He has shown furthermore that a blunder with respect to a word in an ancient deed, *anales* for *ariales*, led Maurer to believe in the periodical redistribution of village lands. To this writer's *Origin of Property in Land*, Professor Ashley has prefixed a valuable chapter on the English manor in which he argues from Cæsar (*Bell. Gall.*, v. 14) that the village community did not exist among the Britons, as "most of those in the interior sow no corn, but live on flesh and milk." Further than this, in Ireland, Scotland, and Wales the early population

was mainly pastoral, and there is no trace of the village community among them. On the other hand it appears from Tacitus (*Agricola*, xix.) that Britain had become a corn-growing country, and later, from Zosimus, that in A.D. 360 Julian fetched corn from thence in 800 vessels. We know too from the Theodosian code (xi. tit. vii. 2) and Ammianus, xxvii. 8. 7, that there were *coloni* and *tributarii* in England in A.D. 319-368. In other words the very classes of free, or imperfectly free, cultivators which were characteristic of the Roman *villa* were actually working in Britain under their Roman designations, and the existing traces of Roman occupation in rural districts are eloquent as to all that remains to be proved as regards the presence of the true *villa* and its personnel. These cultivators were reinforced by imported bodies of conquered barbarians who, as De Coulanges shows (*Recherches sur quelques problèmes d'histoire*, p. 43), became not PEASANT PROPRIETORS but tenants bound to the soil. The manor of continental Europe was the continuation of the *villa* of the Roman domination, and the features of the English manor run so closely parallel to those of manors across the sea that it is scarcely possible to doubt that in the English mediæval manor we have the Roman *villa* slightly modified by the Teutonic invasion.

Vinogradoff's important work on *Villainage in England* presents us with very cautious views. "The communal organisation of the peasantry," he says, "is more ancient and more deeply laid than the manorial order." He argues that the open-field system is so strange and inconvenient when viewed from the standpoint of private ownership, and so natural and convenient when regarded as a communal system, that it must be of the latter character. But apparently against this conclusion there stands the fact that there are three main sizes of holding, the VIRGATE, bovate, and cotland, and the further fact that these holdings are indivisible and are not varied according to the size of the families that have to subsist on them. These he interprets as signs that the institution is in a state of transition, and is distorted from its original shape. This distortion is due to the manor. The rigidity of the holdings would, from a communal point of view, be unjust, but from a manorial standpoint extremely convenient for keeping intact the working units of service. And yet the holdings are not formed for manorial purposes, for they depend upon another element. The virgate is one quarter of a hide because two oxen, the normal equipment of the *virgatus*, form one fourth of the great plough-team of eight oxen. The land was thus parcelled out in units of oxen, and could not be divided because the ox could not. So we have in the scattered acre strips a trace of communal allotment, though no such redistribution of the arable any longer occurs. In the treatment of meadow and waste we see, however, the former annually redistributed by lot, and the latter measured out by limitations of the number of animals that may be sent into it; and these are obviously communal methods of procedure.

The manor Vinogradoff regards as consisting of two elements, the peasant village and the demesne cultivated by its help, and he views the manor as

of gradual growth and comparatively recent origin. He cites the PRESTATION—fowls, cheese, etc., sent to the lord, often at a distance—and the *firma unius noctis*, paid by a village to the king's household, as traces of something preceding the manorial system,—signs, indeed, of a former great over-lord exacting tribute from a village community, rather than a lesser lord close at hand cultivating land by the help of his peasantry. Another sign of the same he sees in those cases in which the DEMESNE consists of acre strips scattered among the rest in such a way that all is cultivated at one operation, and the villagers are not called up to the demesne farm to work on stated days. This he interprets as something intermediate between the tribute paid to a great over-lord by a practically self-dependent community, and the full manorial system. As a further sign of transition he cites the fact that in the earlier records few manorial officers appear, but in the later a large class of "sergeants." In early days the gathering of tribute for an over-lord and the supervision of a few manorial services did not need so great a staff of intermediaries. A further point against those who argue for an original servile community is the constant presence of freeholders (see FREEHOLD, HISTORICAL) who only do slight services, but yet are full members of the village group; and the manorial court furnishes another argument for their presence and effective influence, for servile suitors could never by themselves have acquired the position of judges in litigation. Furthermore the transfer of land is effected by an appeal to communal testimony (see COMMUNE), and custom and self-government prevail over attempts at capricious change. Everywhere, even during the feudal period, Vinogradoff finds traces remaining of a peasant class which formerly lived and worked in self-dependent communities, paying tribute to and owning the general authority of a great over-lord, "whose claims may be political and affect the semblance of ownership, but do not give rise to the manorial connection between estate and village."

These cautious words do not exclude the idea that the manor is due to the Roman occupation, and they permit the view that the early village community was a mixture of free and unfree elements.

The above are the theories which appear to have the best claim to public attention at present. The older notions, which are generally discarded, are amply set forth under MARK SYSTEM. Unbiased study of the results of the Teutonic conquest on the Romano-British population may lead to settled ideas as regards England. Too great stress is undoubtedly laid by such writers as Freeman on extreme expressions used by the chroniclers. The city of Bath, to take an entirely unnoticed example, was captured from the Britons by Ceawlin in 577, and was "destroyed" by the Normans in 1088, and yet the *Gesta Stephani* (Rolls ed., 37, 38) describe the "arched chambers" of the Roman baths as the resort of invalids and loungers in the year 1138. It is clear that the heathen Saxons who would spare Roman baths might attach some value to Roman agriculture, and might retain, at least as slaves, communities of cultivators who could grow corn in plenty for their use (see SERVUS).

And two passages from Bede (*Engl. Hist. Soc.*, ed. ii. 62, 234) are significant on this point. Referring to a date before 705, he writes of the *Britones qui Occidentalibus Saxonibus subditi erant*, Britons living in subjection in Wessex, and then, under date 681, he states that there were 250 *servi* on 87 hides at Selsey. But there were 7000 hides of cultivable land in the South Saxon kingdom (see *HIDE*), which included Selsey, so that without for a moment insisting on strict proportion, which would give 20,000 slaves, we get figures which cannot at so early a date represent Saxons reduced to bondage, but must indicate a Romano-British population spared to act as labourers.

[All the books in the list appended to *MARK SYSTEM*, bear, like the article itself, directly upon village communities. To them may be added the following:—G. L. Gomme, *The Village Community*, 1890.—*The Nineteenth Century*, Jan. 1896, pp. 69-86.—F. W. Maitland, *Domesday Book and Beyond*.—Baden-Powell, *The Indian Village Community*, 1896.]

R. H.

VILLANO, FILIPPO (18th century), was a Neapolitan jurist.

In his *Discorsi economico-politici* he follows the mercantile system, but would protect not only manufactures but also agriculture. He studied the condition of the kingdom of Naples and proposed the re-organisation of the taxation, particularly as to taxes on consumption, which he prefers to direct taxes.

On the other hand he quite fails to understand the question of the population, which he desired to see increased.

To combat usury, as it is injurious to agriculture, Villano proposes establishing a public bank to receive agricultural products to be sold at a reasonable profit, or to advance money on them to the agriculturists.

*L'ozio autunnale; ovvero discorsi economico-politici*, 1768-70.

### VILLANUS.

Villanus, p. 624; Villein Tenure, p. 626; Villenage, p. 626.

VILLANUS. Strictly a man of servile condition holding usually one virgate of land, that is the fourth part of a hide, in the common fields of a manor by base services; but the term is sometimes applied to one of free status who holds land by servile tenure. There were also villeins not settled on the soil who paid *CHEVAGE* (*q.v.*) for living outside the manor as artificers, and there must have been, as well, the sons of villeins acting as labourers, like the *homines qui serviunt extra domos patrum suorum* mentioned in the Peterborough *Liber Niger* (p. 163). The word *villanus*, the feminine of which is *nativa*, is in an economic sense opposed to *libere tenens*, while the corresponding terms *nativus* or *rusticus* denote unfree status as contrasted with the condition of a

*liber homo* (see *LIBERE TENENTES*). Before the conquest it was the equivalent of *eorl* or *gebur*, as in the *Rectitudines* (Thorpe, *Ancient Laws*, p. 185) and the body of 108,407 *villani* of Domesday no doubt included these classes, and probably, too, many free men holding in villeinage, for it must be remembered that Domesday treats of units of taxation and units of service, and was a census of responsibility and geldability, not of men and their status.

The *eorls* had at an earlier date been personally free and could become thegn-worthy. Some were probably free at the time of the conquest; but the manorial system under the Anglo-Saxon kings had tended to reduce the peasantry to dependence, and Domesday Book shows, perhaps, their lowest depression. Later records, such as the Domesday of St. Paul's, show an upward development by which some became *libere tenentes*, while the term *customarius* applied to the others, notably in the *Botenla Manerii* (4 Ed. I.), marks a position in which, though they were still in legal theory subject to the absolute will of the lord of the manor, that will moved in practice on the lines of custom, and left undisturbed the man who duly performed his services. The *villanus* could not quit the manor, and of course could not sell his holding; he was tallaged at the will of the lord; he paid *MERCET* (*q.v.*) on the marriage of his daughter, and a fine on the sale of cattle; his son could not be ordained without the lord's leave; he was liable to serve as *REEVE*, and his minor offences were punished at the *halimote*. Legally he was viewed as annexed to the freehold, and so, through a technicality, could not be devised by will: but he could be sold, and deeds of sale of villeins are extant. His lands could be confiscated, but this probably seldom happened. Maitland (p. 45) gives a case in which a villein is ousted for denying that he is *nativus*, but is put back on confessing his servile status. On his death his holding passed to his youngest son (*Ramsay Cartul.*, i. 372), who paid a relief, and the widow paid a *HERIOT* for her life interest. To prevent claims of freedom, genealogies of villeins were carefully kept, for if a *villanus* could not be shown to be *nativus*, unfree by birth, the law would declare him free in status. If a lord treated his villein as a free man, granting, for instance, land to him and his *heirs*, the act operated as a manumission. A villein could not maintain an action against his lord except for bodily injury or deprivation of *WAYNAGE* (*q.v.*); but he could do so against any other person, for he was free in respect to all men except his lord. It has been asserted that villeins could not serve as jurors, but manorial records (Maitland, *Manorial Courts*, p. 94; and *Select Civil Pleas*, case 123) show that they did so in the *halimote*. They formed part of the juries which made the Domesday returns, and villeins habitually went with their

reeves to the courts of the hundred and the shire. Villeins, too, came under the system of FRANK-PLEDGE, and were thus free men as regards the criminal law. These facts would alone show that they were far removed from slavery.

A villein's normal holding, a virgate, commonly of about thirty acres, with rights of grazing cattle on the waste, and with grass rights as well, was in Anglo-Saxon times usually stocked by the lord with two oxen—that is a fourth part of the great plough team of eight oxen, a unit of labour which determined in a practical way the unit of assessment, the hide, of which a virgate was one quarter, and a bovate an eighth part. In addition, as appears from the *Rectitudines*, he had a cow and six sheep, and was provided with farming and household implements. In return he or his substitute worked, as a rule, for three or four days in the week from Michaelmas to 1st August on the lord's demesne lands at ploughing, harrowing, and other field labour. Often, too, he was bound to provide seed. At harvest time he worked still harder, and brought all his family, except his wife and grown-up daughters, with him into the field. There were the ploughing PRECARIE (*q.v.*) at other times in addition (see SERVICES, PREDIAL AND MILITARY). Usually he paid a small annual sum of money as well, and rendered at specified dates a fixed number of chickens and other produce. In some manors an ell of cloth was required, an exaction which points to weaving as a common home industry. The annual value of this labour varied very much. From 5s. to 8s. is a common reckoning, though there is an entry in the TESTA DE NEVILL, p. 186, c. 2, which values the annual services of a villein (probably after extensive commutations) at 8½d.; but those of a *nativus operarius*, an agricultural labourer, at 8s. 4½d. It is clear, however, that on the average the *villani* had a good margin of profit from their holdings.

Occasionally, even in early times, a villein commuted his services for money payments, and these commutations frequently led to successful assertions of freedom. The villeins on land in ancient demesne were chiefly villein SOCMEN, men free in status holding land in villenage. In all manors the lord would tend to view the mechanism as a whole, and if his demesne lands were well cultivated by the united teams of his peasantry, and if the stipulated produce was duly offered, he would have no inducement to disturb the working of a profitable co-operative organisation; while the early rolls of manorial courts show that there was in fact little wanton interference on his part. Occasionally the body of servile tenants appears to have been treated as a community, exchanging or adjusting claims with their lord, to whom they were often personally bound

by an oath of fealty (Maitland, *Select Pleas, Manorial*, p. 172). In fact, throughout manorial records there is an inconsistency between the legal view of the *villanus* and his visibly sustained rights and privileges.

The early practice of commuting services for fixed money payments, the steady influence of the church, and the tendency of judicial decisions in favour of freedom, prepared the way for the breakdown of the manorial system which was to follow in the 14th and 15th centuries.

The gradual rise from the position of villein to that of copyholder began very early; but its first definite stage is marked by the Year Book of 42 Ed. III., which, in stating that if a customary tenant does not perform his services his land may be seized, shows that on due performance his holding was then legally secure (see COPYHOLD). This alone would show that the system of cultivation by a servile tenantry was breaking down. Many became free labourers, and the BLACK DEATH of 1348, by causing a dearth of cultivators, led to the statute of labourers, 23 Ed. III. c. i., by which hired service was made compulsory on all who had no definite means of living, and an artificial restriction was placed on the rates of hiring of the important class of free cultivators and workmen (see LABOUR STATUTES).

The statutes 1 Ric. II. c. 6, and 2 Ric. II. c. 7, show the smouldering of the rebellion among the peasantry which broke into flame in 1381, when the villeins extorted the charters of freedom which were annulled by 5 Ric. II. c. 7. Court rolls and other records of servitude were destroyed to an extent which necessitated the special provisions of 5 Ric. II. c. 9. Other methods by which the villeins were seeking enfranchisement were met by futile statutes, some of which restricted the power of apprenticing children of the peasant class. These appear in the 9th and 12th years of Richard II. and the 4th and 7th of Henry IV., and mark a late stage in the ruin of the system. It lingered, however, for many years, and Fitzherbert (*Surveying*, c. xiii. ed. 1539, p. 31) wrote of bondmen continuing in some places, while in 1536 their existence was publicly recognised by an abortive bill for their manumission. Mr. Hubert Hall has found a case in Elizabeth's reign in which predial services were exacted by a lord of a manor at Gimmingham in Norfolk. But the queen exerted herself in favour of the villeins, and in 1574 issued a commission for the enfranchisement of those on certain royal manors (*Fœdera*, ed. 1713, xv. 731). Law cases in which villenage was pleaded appear as late as 1617, and relics of serfdom seem to have existed considerably later.

The case of the Scotch colliers who, it is stated in the act 39 Geo. III. c. 56, were "in

a state of bondage" in 1799 is, however, probably not one of hereditary serfdom, but of entanglement in legal difficulties.

[Vinogradoff, *Villainage in England*.—Cunningham, *Growth of English Industry and Commerce*, 1890.—F. W. Maitland, *Select Pleas in Manorial Courts and Select Civil Pleas* (Selden Soc.).—*Ramsay Cartulary*, Rolls Series.—*Peterborough Chronicle*, Camden Soc.—Seeböhm, *Village Communities*.—Howell's *State Trials*, xx. 35-49.]

R. H.

VILLEIN TENURE, or tenure at the will of the lord of the manor by the render of base services (see SERVICES, PRELIAL; VILLANUS; and WEEK-WORK).

R. H.

VILLENAGE. The servile condition in which the bulk of the English peasantry are found in the 11th century, and in which they continued down to about the middle of the 14th. From that time the villein class lasted in decreasing numbers and in improving conditions until, by the beginning of the 17th century, villenage had practically disappeared from England (see VILLANUS).

In old records the word *villanagium*, however, often means the part of a manor allocated to the villeins, or rather the sum of the scattered acre strips held by them. In the *Ramsay Cartulary*, for instance (ii. 37), we read "*de villanagio sunt ibi quinque hyde.*"

VILLEIN. SEE VILLANUS.

VILLEINAGE. SEE VILLENAGE.

VILLENEUVE-BARGEMONT, VICOMTE ALBAN DE (1784-1850), born at the Chateau of St. Alban (Var.), became a prefect under the empire and the restoration, and a deputy during the monarchy of 1830. He was perhaps the earliest to describe his economic tenets as "Christian," thus subordinating the science to the teaching of the Bible and the doctrines of the Roman Catholic church.

Of his two works, the first, *Économie politique chrétienne ou recherches sur la nature et les causes du paupérisme en France et en Europe et sur les moyens de le soulager et de le prévenir* (3 vols. 8vo, 1834), as the sub-title shows us, only discusses indigence, charity, and benevolence.

He seeks to found political economy on new principles in opposition to those which the economists—especially in England—with whom he couples J. B. SAY, have taken as the bases of their works. He pities France for having undergone "the great catastrophe of the revolution of 1789," which he attributed to the anti-religious and anti-monarchical spirit diffused through that country, and he foretells for England "a catastrophe inevitable, more or less near, and without doubt terrible." Besides these faults, resulting from the spirit of the system which inspired their author, there is a great deal well said in his work, and which clashes, though unconsciously, with his expressed views. He made an exception among his countrymen, which should be noticed, in favour of MALTHUS, declaring that this author "proclaimed sorrowful though striking and serious truths."

Villeneuve-Bargemont's second book—*Histoire de l'Économie politique, ou Études historiques, philosophiques et religieuses sur l'Économie politique des peuples anciens et modernes* (2 vols. 8vo, 1841), is—even more than Blanqui's work with a nearly similar title—rather a history of facts than of ideas.

The economic literature referred to in this work shows wide reading compared to that of Blanqui, and is on this account interesting to study; unfortunately the author cannot persuade himself to break with his religious beliefs, and he too readily subordinates to these the principles of his science. Thus he reproaches the author of the *Theory of Moral Sentiments* for having omitted any consideration of moral and religious ideas in his *Wealth of Nations*. "Thus it is that modern political economy arose"—in it products are no longer made for man, but man for products. In a word, though sentiment, according to Villeneuve-Bargemont, should prevail, cold reason is the rule. But the author had happier inspirations than these. Preferring, from the religious and moral point of view, agriculture to manufactures, he assisted in founding, in 1822, the celebrated model farm at Roville (Vosges), which was directed by Mathieu de DOMBASLE until his death in 1843.

A. C. f.

VILLERMÉ, LOUIS RENÉ (1782-1863), born and died at Paris. Patient and industrious, an acute observer, an able theorist, striving to reconcile, as far as possible, the requirements of the present with economic principle, Villermé had a large share in introducing the law of 12th March 1841 into France, amended 19th May 1874 and 2nd November 1892. This law aimed at the protection of children employed in factories, and to bring about similar good results to those produced in England by the acts of 1833, 1844, and 1878 (see FACTORY ACTS).

Having been directed by the Institute (*Académie des Sciences morales et politiques*), of which he had been a member since 1832, to enquire into the condition of factory workers, he visited the principal industrial centres of France, and brought out, in 1840, his *Tableau de l'état physique et moral des ouvriers employés dans les manufactures de coton, de laine et de soie* (2 vols. 8vo). This work contained the results of enquiries made on the spot, and supplied information collected with the most commendable and conscientious impartiality. His conclusions were against invoking state intervention in favour of adults. Like Charles Dunoyer, whose liberal principles he adopted, he maintained that "nothing more can be done for workmen who rely on their own unaided efforts, and always keep their expenses within their means, and steadily lay by"; but he invokes the protection of the law for the children, those poor irresponsible beings whose sufferings he sympathetically describes, sometimes breaking into fierce indignation.<sup>1</sup>

The work quoted above is not the only book by Villermé deserving notice. He was also the

<sup>1</sup> At the present time this work is interesting from a historical point of view, as a description of the condition of the factory hands some half century since.

author of many reports on prisons, the movement of population, workmen's associations, *Cités Ouvrières*, accidents caused by machinery, etc.

A doctor by profession, he early ceased to practise, and devoted himself to questions of public hygiene. During the 1832 epidemic of cholera in France, he resumed medical work, and courageously laboured among the sufferers, only ceasing his efforts when the scourge disappeared. A. C. F.

**VILLES FRANCHES AND CHARTERED TOWNS.** In the 13th century the kings of England frequently granted charters to English towns, which after receiving a charter usually became known as boroughs; but that word also applies to towns that were so called at the time of the Domesday survey, as Totnes and Barnstaple. The charters conferred many and various privileges; some were much wider and more extensive than others. Sometimes they were only granted by reference; thus the charter to Hartlepool (1201) conferred on the burgesses there the same liberties and franchises as were enjoyed by the burgesses of Newcastle-on-Tyne. In France such chartered towns were known as *Villes Franches*.

The privileges enjoyed by burgesses have been classified by Sir F. Pollock and Professor Maitland as follows: (1) Privileges of jurisdiction, such as the right of not being impleaded except in the courts of the Borough; or the franchise of the return of writs, which were executed by the bailiffs or other officers of the borough instead of by the sheriff of the county. (2) Privileges of tenure, such as the right of disposing of land by will. (3) Mercantile privileges, such as freedom from toll outside the borough. (4) Power to farm the borough—that is, to take the borough tolls, to receive the profits of the borough courts, and the rents which before the grant were paid to the king. (5) Power to elect officers such as coroners and bailiffs, or a mayor; but it should be noticed that a MAYOR was not an essential officer of a borough. (6) Power to make bye-laws, though these were usually of narrow application. (7) Certain limited powers of self-taxation. (8) Power to form guilds merchant to maintain the mercantile privileges granted by the charter.

These privileges were not always enjoyed together; they were often granted by different charters. Nor did the grant necessarily make a borough; many manors enjoyed most of the usual privileges, but not the title of a borough.

During the 13th century, and especially during the reign of Edward I., many new boroughs were created, but afterwards this happened less frequently. As government became more centralised and the incidents of the feudal system less grievous, there were fewer advantages to be gained by these privileges. It has been stated that Edward I. granted charters as part of a settled policy; he certainly

granted a large number to small but rising towns, such as Melcombe Regis in Dorsetshire. But his charters were of the same form as those of earlier kings; the one granted to Melcombe Regis (1280), for instance, was little wider than the one which King John granted to Northampton (1200). They, no doubt, did much to develop trade and industry; but it is probable that a charter was usually granted for pecuniary rather than political reasons; the king sold and the burgesses bought privileges (see GILDS).

[Pollock and Maitland, *History of English Law*, Cambridge, 1885, 8vo.—Maitland, *Domesday Book and Beyond*, Cambridge, 1897, 8vo.—Maitland, *Township and Borough*, Cambridge, 1898, 8vo. G. I. F.

**VILLES NEUVES.** In the 13th century a large number of towns were built in the south of France upon a certain definite plan; they are called *Villes Neuves*. Their principal streets all ran in the same direction, and were connected with one another by narrower lanes at right angles to them, so that the houses stood upon rectangular plots. There was usually a large square in the centre of the town for a market-place, but in one corner of it there was a church and graveyard. The two principal streets did not run through the square, but passed along two sides of it. Montpazier in the department of Dordogne is an excellent example of such a town. They were built to encourage commerce and were free from the jurisdiction of the neighbouring feudal lords, who looked upon their growth with much jealousy. They also enjoyed other extensive liberties and privileges. Most of them were built by Edward I. in Aquitaine; but similar towns had been founded in France before his time. Some towns of this nature were also built in England, of these Winchester and Kingston-upon-Hull are good instances.—Turner, *Domestic Architecture in England*, Oxford, 1851, 8vo. G. I. F.

**VILLIAUMÉ, NICOLAS** (1818-1877). This economist deserves notice as an early disseminator of the doctrines of State Socialism, at that time hardly recognised in France.

He published several historical works, as *Histoire de la Révolution de 1789*, and the *Nouveau traité d'Economie politique*, 2 vols. 1857, which passed through two editions. He maintained in this work the arguments in favour of government interference, progressive taxation, the suppression of the power of bequest to collateral relations, and the limitation of the rate of interest. These views, though scarcely heretical, drew upon him a severe admonition from Monsieur Hippolyte Passy in a report to the *Institut* (see *Journal des Économistes*, 15th August 1857), and a very flattering letter from John Stuart Mill. C. G.

**VINCENT, J. C. M. DE.** See GOURNAY.

**VINGTIÈME.** One of the most obvious defects of French finance before the revolution was the exemption of the privileged classes

from direct taxation. The injustice of the system was strikingly depicted by VAUBAN in the *DIME ROYALE*, in which he advocated the substitution of one universal tax on income in place of the existing imposts. The book was burned and the author disgraced, but the government did not forget the lesson which it so bitterly resented. In 1710 DESMARETS, the controller-general, reduced to great financial straits by the war of the Spanish Succession, induced the king and council to impose a *Dixième* based on the proposal of Vauban, not instead of, but in addition to, all the existing taxes. By the edict of 10th October all incomes, whatever their origin, and whatever the rank of the holder, were to pay the tax; the assessment was to be based on the returns of the tax-payers; all disputes were to be decided by the intendants, subject to an appeal to the royal council. No such blow had yet been struck at the edifice of privilege in France, and a cry of indignation was raised by nobles, clergy, and the official classes. As usual their agitation was successful. The clergy soon induced the pious king to grant them a formal exemption. One after another most of the powerful corporations, the *pays d'états*, and many of the larger towns, arranged to pay a commutation in place of a direct assessment.

The *dixième* was abolished in 1717, but as soon as war began its revival was at once considered necessary. Thus it was reimposed from 1733-1736 for the war of the Polish Succession, and again from 1741-1749 for the war of the Austrian Succession. The expenditure in this latter war was enormous; and though the military expenses were reduced after the peace of Aix-la-Chapelle, the burden of interest on loans had so enormously increased that MACHAULT, the controller-general, found it impossible to conduct the government without some other direct tax in addition to the *TAILLE* and the *CAPITATION*. But the *dixième* was still detested by the privileged orders. It had always been regarded as peculiarly a war tax, and the king had formally promised its abolition on the termination of hostilities. In these circumstances Machault determined to get rid of the name *dixième*, but to keep the tax itself while reducing the nominal charge by a half. He reckoned that if the exemptions and commutations were abolished the *vingtième* would bring in almost as much as its predecessor, and that its collection in time of peace would render possible the gradual reduction of the public debt.

Accordingly in May 1749, a royal edict substituted the *vingtième* for the *dixième*, and ordered its imposition upon all classes, privileged and non-privileged. On the outbreak of the Seven Years' War in 1756 a second *vingtième* was imposed, and in the later years of the war a third, but this was abolished in 1764. The

*vingtièmes*, though always unpopular, were undoubtedly the fairest of the direct taxes in France. ADAM SMITH (bk. v. ch. ii.), in discussing the reform of French finance, suggests the abolition of the *TAILLE* and the *CAPITATION* and the collection of an equivalent revenue by increasing the *vingtièmes*. Undoubtedly such a measure would have remedied some of the chief grievances of the lower classes. But it would be a mistake to suppose that the equality of incidence prescribed by the edict of 1749 was carried out in actual administration. The clergy were successful in maintaining the exemption they had enjoyed from the *dixième*, and the *pays d'états* and many corporations succeeded, after a lengthy struggle, in securing their right to compound, and their composition was far below their real obligations.

The only incomes which were at all regularly taxed were those derived from real property, and Adam Smith compares the *vingtièmes*, which should have been an INCOME TAX, to the English LAND TAX as settled under William and Mary. But perhaps the worst abuse arose from the private negotiations by which the nobles secured very advantageous terms from the royal officers. CALONNE admitted that the tax would have brought in twice as much but for the favour accorded to the nobles. The letter from a noble to the intendant of his district has been frequently quoted: "Your sensitive heart will never allow a father of my rank to be strictly taxed for his twentieths like one of the common people." Thus the principle of inequality, which in France seemed to be irresistible, succeeded in affecting a tax which had been originally imposed with the greatest parade of equality.

[Clamagérac, *Histoire de l'impôt en France*, tome III.—Gasquet, *Précis des Institutions de l'Ancienne France*.—Adam Smith, *Wealth of Nations*, bk. v. ch. ii.] R. L.

VIOLET, THOMAS (fl. 1635-1662), was a 17th century free trader. The *Advancement of Merchandise* (1651), republished as *Mysteries and Secrets of Trade Affairs* (1653), was, like Potter's *Humble Proposals* (1651), dedicated to the council of trade whose deliberations he had, since the 20th August 1650, been ordered to assist. The cardinal principles of his book—"Let every man come in to trade according to their skill,"—"Let no man have a greater privilege than another"—were aimed at the privileged trading companies whose privileges, he said, raised imports and exports some 30 per cent in price, and thereby impoverished "the general" (consumer) "for the benefit of the few" (producers), and enabled foreigners to undersell English producers.

The reasoning was inspired by Sir E. Sandys (1604) (*Journal of House of Commons*, i. 218), who was director of monopolising companies most of his life, and by MISSELDEN who denied that

exclusive privileges meant monopoly (*Free Trade*, 1622); I. R.'s *The Trades Increase* (1615), p. 51, and Brent's *Discourse* (1645), anticipated Violet's conclusions. Three extensions of these principles were more or less original: (1) the abolition of "alien customs"—a device tried in 1539 (Schanz, *Englische Handelspolitik*, vol. i. pp. 86, 372); (2) the plantation of foreign capitalists and artificers, and their NATURALIZATION (*q.v.*), with power to buy land—this scheme was inspired, not by Francis Bacon, whose suggestions were dictated by an old-world contempt for traders (*Works*, ed. Spedding, vi. 449), but by those twin panegyrics on trade, H. ROBINSON'S *England's Safety in Trades Encrease* (p. 18) and L. ROBERTS' *Treasure of Traffike* (p. 14); (3) his policy of "free ports," whence imports could be re-exported without duty, had been anticipated by James I.'s and Charles I.'s dispensations (*Misselden's Circle of Commerce*, pp. 121, 127; 16 Car. I. c. 25, 29, 31), and by Robinson's *Briefe Considerations* (1649), and MUN's not yet published *English Treasure by Foreign Trade* (p. 21), and was endorsed by B. W.'s *Free Ports* (1652), the author of *The Merchants' Remonstrance* (1659), and in a tentative way by the legislature in 1656 (Scobell's *Parliament Acts*, p. 388) and 1662 (14 Car. II. c. 11, §§ 25, 27). MADDISON (1655), like Robinson in his earlier works, also urged free ports, but not for aliens. The object of this policy was to divert the carrying trade from Holland.

In advocating the prohibition of or high duties on imported luxuries, a political lent, a bank, and mercantile courts, he followed ROBINSON (*q.v.*), but his scheme for the latter is more matured than those of Robinson, Roberts (1641), Philopatris (1651), LAMBE (1657), the author of *The Merchants' Remonstrance* (1659), or CRADOCKE (1660), and may be compared with CHILD'S scheme.

He also wrote pamphlets, *e.g.* *Humble Declaration* (1643), *Proposals* (1656), *True Discovery* (1659), *Appeal to Caesar* (1660), in support of the most reactionary bullionism; and in these he often borrows the language of MALYNES. Not that he did not know better (Cal. of State Papers, Dom. Ser., 1651-52, p. 25), but penal laws against melting down and exporting bullion had been meat and drink to him. Persecutor by taste—whether of Jews or the East India Company—and goldsmith by trade, he had smuggled bullion (*ib.* 1661, p. 13), then prosecuted his fellow-smugglers in the Star Chamber (1635-43), and had played these same tricks under the protectorate (*ib.* 1659, p. 273), and his sinister advocacy of bullionism—including royal dispensations and Star Chamber prosecutions—in his *Appeal to Caesar* (1660) doubtless contributed to the anti-bullionist reaction of 1663. Like other bullionists of that date he wished also to penalise the export of corn, wool, leather, munitions of war, etc. His resistance to milled coin, *Answer to Libels of Blondeau*, 1653, and his advocacy of royal exchangers (see EXCHANGER ROYAL), and private coinages of copper, were merely interested.

[SNELLING, *View of Silver Coin*, pp. 43, 44. *View of Copper Coin*, p. 35.] J. D. R.

VIRGA. The steward of a MANOR, when

admitting a new customary tenant, usually handed to him a rod (*virga*), received from the out-going tenant, as a symbol of the transfer of rights, and an entry being then made in the court roll, the transaction was complete. This custom has descended to modern times. R. H.

VIRGATE. One-fourth of a HIDE, which was the Domesday unit of assessment. The hide cannot be viewed as a measure of surface of land, for it really expressed the value as regards taxation of that portion of 120 acres which was in cultivation during the current year. This would vary according to the mode of working the land. Under the two-field system it may be regarded as the tax value of sixty acres. Under the THREE-FIELD SYSTEM (*q.v.*) it would be the equivalent on eighty acres. The share of pasture land annexed to each holding is thus not reckoned in the acreage. An average virgate was therefore about thirty acres scattered in strips over the common fields of a manor; but there were great variations in some places. It was the usual holding of a VILLEIN. From fifteen to twenty acres of it would be ploughed each year, and a proportion of the pasture land and waste would be held with it. R. H.

VIRGILIO, JACOPO (1824-1891). Virgilio taught for many years at the technical high school of Genoa, and founded and directed the higher school of commerce in that city.

Virgilio left several economic works—chiefly practical in nature; of these the principal is on emigration; he advocates spontaneous and individual emigration, which he considers very advantageous, and he shows the objections to the steps taken by governments to prevent emigration. In another work on the fundamental conception of economics, he combines a dissertation on the theory with the modern scientific train of thought, giving especial importance to the inductive method.

Virgilio in his other works discusses the merchant navy, railways, and the history of trade with much ability.

*Delle migrazioni transatlantiche degli italiani*, 1868.—*La questione dell' emigrazione*, 1874.—*Principii di economia politica*, 1865-66.—*Concetti fondamentali della scienza economica*, 1882.—*Storia del commercio*, 1891. U. R.

VIRGINIA COMPANY, THE. This company took its origin from a charter granted by Queen Elizabeth to Walter RALEGH, in 1584. The charter authorised him "to discover such remote heathen and barbarous lands, not actually possessed by any Christian prince nor inhabited by Christian people, as to him . . . shall seem good," with licence to remain there and to fortify them, notwithstanding the statutes against subjects departing the realm. Full licence was given "to take or lead such of our subjects as shall willingly accompany him," and to employ such shipping, etc., as might be necessary. Enjoyment was granted to Raleigh and his heirs of "all the soil of such lands or towns in the same," the fifth part of the gold

and silver obtained being reserved to the crown. The land was to be held by homage. The conception of "Greater Britain" was involved in the clause conceding to the settlers and their children "all the privileges of free denizens and persons native of England." The widest legal jurisdiction over life and property was granted to Raleigh and his heirs. In a word, a tributary kingdom was created. Armed with these prerogatives Raleigh despatched two vessels on a voyage of discovery in the spring of 1584. They took possession of the island of Roanoke, five miles from the coast of North Carolina, and returned in September with a glowing account of their acquisition. Raleigh thereupon equipped an expedition consisting of "a fleet of seven sailes with one hundred householders and many things necessary to begin a new state," which left Plymouth in April 1585 under the celebrated Sir Richard Grenville. The territory to be colonised was already designated by the name of Virginia, as a compliment to the queen. The settlers disembarked at Roanoke, and explored the coast of the mainland, but scarcity of provisions and the hostility of the natives caused them to re-embark for England with Sir Francis Drake, who at the head of an English fleet anchored at the island in June 1586. In 1587 Raleigh made an effort to retrieve this disaster. He granted a charter of incorporation to thirty-two persons, nineteen of them merchants of London, under the style of "Governor and Assistants of the city of Raleigh in Virginia." His purpose was to establish a colony at Chesapeake bay, and 150 settlers were despatched on board three ships. They returned to Roanoke, intending to pick up some men who had been left there by Sir R. Grenville, and with them to proceed to Chesapeake Bay. The men were not to be found, and after a sojourn at Roanoke of more than a year this colony was massacred by the Indians. Thus ended the Virginia Company. Its work was afterwards taken up with more success by the London Adventurers' Company, called also the South Virginia Company, which received a charter from James I. in 1606. The rest of Virginia—at this time the name assigned to the vast territory between the thirty-fourth and forty-fifth degrees of north latitude—was assigned to another chartered company called the PLYMOUTH ADVENTURERS. The modern Maryland, Virginia, and Carolina fell to the first—Pennsylvania, New Jersey, New York, and New England to the second company.

Keane, *The early Chartered Companies*, London, 1896.] I. S. L.

**VIRICULTURE.** Under this name M. de Molinari proposes the foundation of a new branch of science to be based on data provided both by moral sciences such as economics, and by natural sciences such as biology. This word has scarcely yet hitherto been used in French; it is formed on the model of such words as *apiculture*, *apiculture*, *viticulture*, etc., which are often met with in French literature.

Premising that we now witness a phenomenon exactly opposite to that which excited the fears of MALTHUS, namely the stationary or even decreasing tendency of population in several nations of Europe, accompanied by a parallel tendency towards the physical and moral deterioration of the race, M. de Molinari suggests that the threefold object of this new science of the cultivation of man ought to be the investigation and study of the means by which—(1) the numbers of population might be adjusted to its means of subsistence, without legally interfering with liberty of marriage and of sexual intercourse; (2) the progress of human deterioration might be arrested, and the standard of the moral and physical qualities of mankind might be raised; and (3) prostitution might be suppressed, or at least circumscribed within the narrowest possible limits.

[G. de Molinari, *La Viriculture*, Paris, 1897.]

E. CA.

**VISA.** The financial expedient known as the *visa* was only brought into operation after the downfall of John Law. It was a violent reaction from his policy. The decree which established it appeared 26th January 1721; PÂRIS DUVERNEY was entrusted with its execution. He had, the year before, in 1720, sought to undermine the *SYSTEME*, and to compete with it by establishing the *anti-système*, but, by an arbitrary act, Law had absorbed this to the advantage of the *système*. Hence the natural animosity of Pâris Duverney to Law can be understood, though he could not show this till the removal of Law from France left him a free field.

The *visa* consisted in making an inventory of every description of the property of those who, either directly or indirectly, had shared in the profits of the *système*. It was needful to trace their right of possession back to its source, and to classify the property according to this complicated investigation.

It was spoliation legally organised, rigorously carried out, or rather, what was worse, under cover of protection and favouritism.

The decree of 26th January 1721 ordered that all the contracts for income from the state—both perpetual and life annuities—the shares of the India Company, all the certificates of bank accounts, accounts of deposits, all the bonds, contracts for annuities, as well as the notes of the royal bank, in fine, all the proofs of personal property created by the *système*, should,

within two months, a time which might be extended to the 30th June, be presented before a commission to be appointed by the king. The accounts which were rendered from the 1st to the 15th of July were, as a commencement, to be reduced by a third; those which were rendered from the 16th to the 31st of July by two-thirds. If not presented before the last date mentioned they lost all value.

Every one was obliged to declare by what title they had acquired the securities, and what value they had given in exchange for them. As may be supposed, a severe drop in prices followed immediately. The shares of the India Company, which, in 1720, had been worth 27,000 livres, fell to 30 livres, and even, it is said, to six livres, the nominal value being 750 livres. Still Pâris Duverney was not satisfied.

The *Hommes Nouveaux* (les *Mississippiens*) might escape by concealing their wealth.

The notaries were obliged, within a month, to produce copies of all contracts passed since 1st July 1720. As gold and silver retained their value, what was held thus could only escape by being carried out of the country. Denouncements were frequent, and the property was often confiscated before crossing the frontier.

This was to the advantage of the countries north and east of France, where many people prudently sought a refuge for themselves and their property. Law and his *système* met, as may be seen, their match in Pâris Duverney.

The depositions before the commission actually reached 511,009 in number, and in value, 3,060,474,441 livres, of which amount 2,233,786,719 was in Paris. According to their character they were divided into five categories, each of which was further divisible into fifteen classes, according to the manner in which the property had been acquired.

All, more or less, were submitted to reduction according to a scale—small sums less than large, not so much out of consideration for small properties, but because the large were easier to get at, and brought more profit to the operation of the *visa*.

Finally, the above-mentioned sum was reduced to 1,613,911,481 livres, the final amount. But the reductions were far from being proportionate. The figures varied from the absolute admission to the absolute rejection of the claim.

To crown the work of Pâris Duverney, and to reach those who had hitherto been able to escape, the council of state, on 15th September 1722, issued a decree enforcing an additional poll-tax, namely the levy of a fine on all immovable property belonging to the *hommes nouveaux*, which produced 187,893,661 livres. The expenses of the *visa*, another loss to the country, were 9,045,874 livres.

[Du Hautchamps, *Histoire du système des finances sous Louis XV.*, 6 vols. 12mo, 1739, The Hague.—Du Hautchamps, *Histoire générale et particulière du visa*, etc., 9 vols. 12mo, 1743, The Hague.—A. Thiers, *Histoire de Law*, Paris, 1858 (last edition); 18mo.—Alph. Courtois, *Hist. des banques en France*, 2nd ed., Paris, 1881 (pt. i.).] A. C. F.

VISA (as to a passport). Some countries (e.g. Russia) require that passports for the use of travellers wishing to enter their territory should be certified by their minister or consul. The minister or consul's certificate on the passport is called the "visa." E. S.

VISSERING, SIMON (1818-1888), born at Amsterdam, studied law and philology at Amsterdam and Leyden (1835-42); for some time practised as a lawyer, was editor of a newspaper (1847-48), and in 1850 was appointed professor at the university of Leyden; during two years, 1879-81, he stood at the head of the department of finances.

His first economical work was a series of articles on the anti-corn-law movement in England, which he thoroughly approved; when the reform was accomplished he wrote its history.

His principal work is *Handboek voor praktische staathuishoudkunde* (Manual for Practical Economy), Amsterdam, van Kampen en zoon, 1860-65, 1872, and 1878. In this and his other writings he shows himself an adherent of the school of Bastiat, whose theories we meet with as well in the speech which Vissering delivered in 1850 on "Liberty in Economy," as in his last article "Prosopographia socialistica," combating modern state-socialism. A. F. V. L.

VIVANT DE MÉZAGUES. See MÉZAGUES.

VIVES, JUAN LUIS (1492-1540), one of the most notable humanists (see HUMANISM) of the 16th century, deserves a place in the history of economic thought for his treatise *De subventionem pauperum*, written in 1524 and printed in 1532.

In this tractate, addressed to the magistrates of Bruges, who had consulted him on the subject, he proposed a complete reform of the existing methods of poor relief. The destitute should be properly registered and classified; those unable to work should be provided for in well-administered hospitals and almshouses; those able to work should be found employment; and mendicancy should be prohibited. The work is significant of the new current of thought on the subject of the relief of the poor which was making its way in western Europe, and itself contributed to still further stimulate the work of reform.

The dedicatory letter is dated 6th January 1526 (i.e. 1525). The *De subventionem pauperum libri duo*, was printed at Lyons in 1532. It will be found in both the collected editions of Vives' *Opera*, that in 2 vols., Basel, 1555 (ii. 889-922), and that in 7 vols., Valencia, 1782-1790 (iv. 420-494). It was translated into French, Italian, and Spanish: a modern reprint of the Spanish version

is given in *Biblioteca de autores españoles*, vol. lxxv. (1873).

[Of modern writers, the first to call attention to Vives' tractate was Franz Ehrle, in his *Beiträge zur Geschichte u. s. v. der Armenpflege* (Freiburg, i. B. 1881), who is followed by Ashley, *Economic History*, i. pt. ii. 343. The best biography of Vives is that by Rudolf Heine, prefixed to *Vives: Ausgewählte pädagogische Schriften* (Pädagogische Bibliothek, xvi., Leipzig, 1882). The traditional account of Vives' residence in England is there subjected to a necessary criticism]. W. J. A.

VIVORIO, AGOSTINO (1744-1822). An abbé, born at Vicenza. He studied mathematics, philosophy, and economics, and was secretary of the Italian scientific society called *Dei Quaranta*.

Vivorio was the author of numerous pamphlets on various subjects, among others one on corporations, written for the prize competition at the academy of Verona (see MARACHIO). In this Vivorio briefly and clearly discusses the evils of corporations; he recognises their merits in the past, and the good side they still preserved, observing, however, that this was entirely destroyed in his day by abuses and disadvantages. He concludes by advocating the absolute abolition of all corporations, and granting the greatest freedom in the pursuit of all industries.

Although this work is far inferior to that of VASCO, it deserves notice for its clearness and fluent explanations.

*Sopra i corpi delle arti*—risposta ad un quesito accademico, 1792 [Alberti, *Le corporazioni d'arti e mestieri*, etc., 1888]. U. R.

VOLTAIRE, FRANÇOIS MARIE AROUET DE (1694-1778). In his long and active literary career Voltaire, whose life is too well known to require narration here, often touched on topics connected with economics. He had never studied them, however, systematically, and simply expressed the superficial common-sense views of his times, upholding with the same sparkling wit both truth and fallacy. Writing under the impulse of the moment, he frequently contradicted his former assertions. Thus we find him upholding the theory of the balance of trade and of the necessity of preventing the export of money, though at other times he remonstrated against trammels imposed on the corn trade. He saw no great harm in alterations of the currency, and only insisted that they ought to be gradual, as a nation which is its own creditor does not, according to his views, impoverish itself. Heavy debts, as well as a free spending of public and private money, are incentives to industry. The two thousand millions of debts bequeathed by Louis XIV. to France, the ruin of many families, the resulting bankruptcies, and the excessive taxation, were simply the "misfortunes of a happy nation" (*Observations sur Law, Melon, Dutot, le Commerce, le Luxe, les Monnaies et les Impôts*). At other times he sneered at the enthusiastic promoters of population. "The principal point

is not to have an excess of men, but to make those we have as little unhappy as possible" (article "Population" in the *Dictionnaire Philosophique*). With his strong sense of equity in administration, he consistently claimed an equitable apportionment of taxation, and became, towards the end of his life, a warm and sincere admirer of Turgot: see in the *Correspondance* the letter addressed to the Abbé BAUDEAU in 1775, and in his poem, the *Épître à un Homme*, addressed to Turgot after his fall.

Only a few years before, in 1772, in a note appended to his satire *Les Cabales*, he had been very bitter against the ÉCONOMISTES (q.v.), calling them "people who, being bankrupt themselves, teach the art of becoming rich through trade, travel round the world without leaving their closet, and, never having owned a plough, fill our granaries with corn." It is also against them that, almost a quarter of a century before, he had composed his celebrated tale, *L'Homme aux quarante écus*; in fact, the only one of his publications on a distinctly economic subject. The dogmatic and often pompous and heavy style of the PHYSIOCRATS had probably bored him, as well as their abstract and subtle mode of reasoning. *L'Homme aux quarante écus*, directed against MERCIER DE LA RIVIERE'S (q.v.) *Ordre naturel et essentiel des sociétés*, is the history of the owner of a small estate yielding a net income of forty crowns a year, who has been frightened by the appearance of several edicts promulgated "by a few gentlemen who, having some leisure, have undertaken to govern the kingdom from their firesides." In the preamble they stated that the government "being by divine and birth-right co-proprietor of his land, he at least owes it one-half of his income," and that "as all wealth proceeds from land, land is to bear the whole burden of taxation." Overflowing with wit and sarcasm, the book consists of conversations between the man with the forty crowns and the most motley succession of people, and, with the author's usual unfairness, is not free from misrepresentations and gross exaggerations of Mercier's real meaning.

In various passages of the *Dictionnaire Philosophique* (article on *Natural Law*), Voltaire, in the insulting controversial tone which he frequently adopted, rails at ROUSSEAU'S theories on the illegitimacy of private ownership in land. How little of an optimist he was may be gathered from his *Candide ou l'Optimisme*.

[On Voltaire's social and economic opinions see the article Voltaire in the *Nouveau Dict. d'Econ. Politique* (Paris, 1892), and on his *Idées Générales*, Faguet's *Études littéraires sur le dix-huitième siècle* (pp. 219-239).] E. CA.

VOLUME OF MONEY. See MONEY.

VOLUNTARY DEED. In English law a promise not made for valuable consideration is said to be voluntary. Such a promise is not

legally binding unless couched in the form of a deed under seal. Even then it is not binding if made in restraint of trade. English courts do not enforce specific performance of a voluntary promise under seal, but the person claiming under such a promise has a remedy in damages.

F. C. M.

In case of the insolvency of the estate of a deceased debtor, persons claiming under voluntary deeds are postponed to creditors whose claims are supported by valuable consideration, but they are preferred to legatees.

A voluntary disposition of property, whether by deed or otherwise, may be declared invalid under the statute of 13 Elizabeth, if it was made with the intention of "delaying, hindering, or defrauding creditors." And under the Bankruptcy Act 1883, a voluntary settlement may be declared void: (a) if the settlor be adjudged bankrupt within two years from the date of the settlement; (b) if he be adjudged bankrupt within ten years from such date, unless he or his representative can prove that at the time of making the settlement he was able to pay all his debts without the aid of the property comprised in the settlement. Another statute of Elizabeth was, prior to 1893, interpreted as meaning that a voluntary conveyance was defeated by the subsequent conveyance of the same property to a purchaser for valuable consideration, but the Voluntary Conveyances Act 1893 has repealed this interpretation; a voluntary conveyance of land effected with a fraudulent intent may, however, still be defeated under the same statute. A deed by which property is conveyed or settled in contemplation of marriage is deemed to be made for valuable consideration.

E. S.

VON BIELFELD, JAKOB FRIEDRICH (1717-1770), belonged to a family of Hamburg merchants, and filled his sphere in a practical public life. As a young man he travelled through Holland, England, and France, and stayed at universities in these countries. In 1739 he received some notice from Frederick the Great, at that time crown prince, who shared his taste for the French language and literature, and was drawn by him into the circle of friends at Rheinsberg. Later he was employed by the king as a diplomatist, and in this capacity spent some time in London. In 1747 he was appointed curator of all the universities of Prussia by Frederick II.

In 1758 he withdrew to his country seat at Treben in the duchy of Altenburg, to devote himself quietly to literary work. The result of this was the publication, in French, of his *Institutions politiques*, 2 vols., 1760, a German translation of which appeared a year after, under the title, *Des Freiherrn von Bielfeld Lehrbegriff der Staatskunst*, 1761. This work is dedicated to the brother of the king, Prince August Ferdinand, whom Bielfeld had been summoned to teach. The author explained that he aimed at giving instruction to statesmen concerning the objects of their vocation, not only in the art of government, but in all things connected with political economy.

The subject of this clearly-written book was *Politische Oekonomie*, which expression appeared here for the first time in German literature (after the French *Economie politique*). It dealt almost exclusively with French authors, as VAUBAN, ST. PIERRE, MELOX, MONTESQUIEU, FOMBONNAIS, DUTOT, NICHOLS (DANGEUL), etc. The practical details were drawn from the *Dictionnaire du commerce* of SAVARY. COLBERT was described as the "greatest financier in history." The predominating idea in the work appears in the following passage imbued with the theories of the MERCANTILE SYSTEM (*q.v.*). "The political system of Europe at the present day is such that one state can only raise itself at the expense of some other, either by conquest or by trade." In these matters German authors did not appear to Bielfeld to have any part. In the chapter on *Political Arithmetic* (see ARITHMETIC, POLITICAL), the ENGLISH SCHOOL is applauded for their labours in this science; particularly GRAUNT, PETTY, HALLEY, DAVENANT, HUME, etc. In this chapter two Germans are also mentioned, SÜSSMILCH and KUNDMANN. The *Institutions politiques*, soon translated into Russian and Italian, was an epoch-making work for German CAMERALISTIC SCIENCE, in so far as it drew this out of its national isolation and under the influence of foreign thought. The professor of cameralistic science at Frankfurt on the Oder, J. G. DARJES, wrote a preface to the second German edition of the work 1764. In a later edition, after his death, a third section on practical politics was added. He had foreshadowed the appearance of this in a concluding note to the second volume.

Bielfeld later published, *Lettres familières et autres*, 1763, and towards the end of his life issued a weekly periodical in German, entitled *Der Eremit*, Leipzig, 1767-1769.

["Éloge de Bielfeld," in *Nouv. Mémoires de l'Académie royale des sciences et belles-lettres*, année 1770, Berlin, 1772. — Roscher, *Geschichte der Nationalökonomie in Deutschland*, München, 1874. — *Allgemeine deutsche Biographie*, ii. 1875.]

VOUCHER. See RECEIPT.

VUITRY, ADOLPHE (1803-1883), born at Sens, died at St. Donnin (Seine-et-Marne). He studied engineering first 1834, and afterwards changed his profession, graduating as doctor of laws 1838. He then entered the government employ, became governor of the bank of France 1863, president of the council of state 1864, chairman of the Paris, Lyons, and Mediterranean Railway 1871.

He retired from public life in 1870, and devoted his leisure to writing the historical works on the finance of France mentioned below, *Études sur le régime financier de la France avant la Révolution de 1789*, 3 vols. 8vo, 1876-1883, ending with the death of Charles V. (1380), he was not able to carry this to the accession of Louis XI. (1462) as he had planned. *Le désordre des finances et les excès de la spéculation à la fin du règne de Louis XIV. et du commencement du règne de Louis XV.*, 18mo, 1885. A selection from his numerous reports and speeches was published in 1887.

1846), and taxation was increased to meet the ruinous cost of the great French war, wages were not allowed to rise; accordingly, the lot of workers was most deplorable. Magistrates took a merciful and charitable view of their powers, and published scales of relief. The allowance system was very general from about 1795 to 1834, until the enactment of the new poor law. The economic influence of the ALLOWANCE SYSTEM (*q.v.*), intended to assist the industrious poor, was very injurious to them. Wages actually paid able-bodied men were frequently only five or six shillings a week, but relief to the extent of four, five, six, or seven shillings, according to the size of a family, would be given out of rates. The wages quoted are not pauperised wages.

Wages in the woollen and worsted trades are quoted at length, because, together with agriculture, before the industrial revolution they employed three-fourths of the productive classes; their history affords a fair comparison of wages in the days of domestic production with those now ruling under the factory system.

It is not possible in a statement of this description, carried over a period now approaching two centuries, necessarily by different hands, following perhaps different methods, to speak with absolute certainty, but every effort has been made by personal inquiry and by the use of official sources, to obtain accurate information.

INDUSTRY. (1) Before the industrial revolution, in the days of domestic industry (1720-1780). (1800-1845). (3) The modern epoch of free trade and factory production (1845-1898).

A Production by power-loom is about 110 yards cloth, by hand-loom it was about 50 yards.

B Production by power-loom, for woman minding two looms, will now be about six times more than by hand-loom. The high wages of weavers from 1800 to 1830 were occasioned because the new spinning machinery had increased supply of yarn at much greater rate than weavers could weave it, hence the enhanced demand for weavers, and increased value of their labour.

C It is difficult to estimate the increased production of machinery as compared with the primitive single wheel of 180 years ago. The number of spindles per frame or mule is being constantly increased, so also is speed. Nine shillings paid in wages will now produce at least sixty times more yarn than could be spun for same

amount of wages 100 years ago. Children 100 years ago would work 10 hours a day for 4s. to 5s. 6d. a week, now they work 5 hours a day for 4s. to 4s. Production will be forty times greater for shorter hours than it was 100 years ago for longer hours.

D Wool-sorting is, and always must be, a manual operation. Wages fluctuate very little.

E As in spinning, it is difficult to estimate increased production of machine wool combs. Sixteen shillings paid in wages will now produce sixty times more than the same amount of wages produced some fifty years ago. Machinery has reduced woolcombing from a skilled to an unskilled industry. Wages have fallen accordingly.

F Boot and shoe manufacture is now a "factory" industry. Before use of machinery a workman would

WAGES FUND. The theory of a wages fund, was during fifty years, 1820-1870, the accepted doctrine of English economists. The prevalence of this doctrine during this period contributed to a great extent to render the doctrines of political economy unpopular with the working classes; for, if the teaching of political economy on the subject of wages were true, any attempts which the working-class might make to gain better terms from their employers by means of trade-unions, or otherwise, were either fore-doomed to failure, or, if successful, did but benefit one particular class

or section of the labouring classes at the expense of all the rest. The doctrine, as originally stated by MALTHUS, took the following form: "It may at first appear strange, but I believe it to be true, that I cannot by means of money raise the condition of a poor man, and enable him to live much better than he did before without proportionately depressing others in the same class. . . . But if I only give him money, supposing the produce of the country to remain the same, I give him a title to a larger share of that produce than formerly, which shows he cannot receive without diminishing the share of

produce about 450 pairs a year, now the average is 1800 pairs.

G Net earnings, West Yorkshire.

H The agricultural labourer was better off, because of common right, allotments, and other privileges, 100 years ago, with a third less wages than he gets to-day.

I The price of fowls has risen accordingly: 100 years ago the price of a fowl was 9d. to 12d., now it is 3s. to 8s. 6d., for table use, poulterers' prices.

K In trades where, since the repeal of the combination and conspiracy laws and alteration in the law of settlement, workmen have combined, wages have perceptibly risen. Carpenters, masons, tailors, and colliers are examples of such rises; wages have also risen since in

other industries. The combination laws were repealed in 1825.

L The minimum may be taken as summer, and the maximum as winter prices.

M It is difficult to give a table for vegetables and market garden produce. Before the industrial revolution workmen mostly grew their own supplies; retail prices are now, however, fully 200 per cent higher than consumers could buy at in the open market, direct from the grower, 100 years ago.

N Wages in all cases stated are per week. The rates of wages quoted are mainly those prevailing in the North of England, principally in West Yorkshire and Lancashire.

O Rent of good farms in corn growing districts (1893).

others" (*Essay on Population*, bk. iii. ch. v. pp. 333, 334). The assumptions which Malthus here makes—(1) that a certain fixed proportion, and no more, of the total food produce of the country will go to the labouring classes; and (2) that that total food produce is practically a fixed amount, so that any increase in the demand for it will simply raise prices without calling out any fresh supply, grew out of and were justified by, the exceptional circumstances of Malthus's own time, but had by no means universal validity. It is further to be observed that Malthus restricted his reasonings

to the food-supply of the wage-earning classes, and makes no attempt to explain the principles by which the proportion of food that fell to the wage-earning classes was determined. From Malthus the doctrine was taken over by James MILL, who, however, adopts it with two important modifications—(1) he substitutes capital for food in the reasonings which he borrows: and (2) he assumes that it is the amount of capital, meaning by this food, raw material, and instruments or machinery, devoted to productive purposes, which determines the share of the national wealth the labouring classes have to

divide. His doctrine takes thus the following form:—"Universally, then, we may affirm, other things remaining the same, that, if the ratio which capital and population bear to one another remains the same, wages will remain the same; if the ratio which capital bears to population increases, wages will rise; if the ratio which population bears to capital increases wages will fall" (*Elements of Pol. Econ.*, ch. 2, § 2). In a later section he gives a proof that "Capital has a less tendency than population to increase rapidly." J. S. MILL, in his *Principles of Political Economy*, adopts, but with further modifications, his father's doctrine, and gives its final shape to the wage fund theory. He lays it down (1)—bk. 1, ch. 5, §§ 1, 2, 3—"that industry is limited by capital, but does not always come up to that limit, while the increase of capital gives increased employment to labour without assignable bonds." (2) "It is not, however, all capital, *i.e.* all wealth saved and appropriated to reproductive employment, which constitutes the wages fund of a country, but that part only which is circulating as distinct from fixed, *i.e.* that part only which is destined for the direct purchase of labour"—bk. ii. ch. xi. § 1. (3) This being so, "wages depend mainly upon the demand and supply of labour; or as it is often expressed, on the proportion between population and capital. With these limitations of the terms, wages not only depend upon the relative amount of capital and population, but cannot, under the rule of competition, be affected by anything else. Wages, meaning of course the general rate, cannot rise but by an increase of the aggregate funds employed in hiring labourers, or a diminution in the number of competitors for hire; nor fall, except either by a diminution of the funds devoted to paying labour, or by an increase in the number of labourers to be paid" (*Principles of Political Economy*, bk. ii. ch. xi. § 1, 6th edition). These same principles furnish the basis of Fawcett's doctrine of wages both in his *Manual of Political Economy* (see especially bk. ii. ch. iv., where he discusses some of the objections which had been brought against the doctrine of a wages fund) and also in his *Lectures on the Economic Position of the British Labourer*. The first writer by whom the doctrine was attacked was Mr. F. D. Longe, who in a pamphlet entitled, *A refutation of the Wage Fund Theory of Modern Political Economy as enunciated by Mr. Mill, M.P., and Mr. Fawcett, M.P.*, pp. 9, 10 (Longmans, 1866), attempts to establish the following positions: (1) that wages do not depend on any merely mechanical cause, but that there is a "natural wage," and that wages may properly be described as "just or unjust," "fair or unfair," "reasonable or unreasonable"; and (2) pp. 22-48, that the theory of a wage fund is untenable because (a) the capital or wealth applicable to the payment of the wages

of labour in a country, at any time or during any period, does not consist of a definite fund which is distinct from the produce of labour; (b) because the dependent or labouring population in a country at any time, or during any period, does not constitute a supply of labour, or body of labourers, among whom the average wage fund or capital of a country could be distributed by competition; (c) because the supposition that such wage fund would be all distributed among the labourers of a country by the competition of the buyers and sellers of labour, if allowed free operation, involves an erroneous notion of the demand and supply principle. Mill did not himself reply to Mr. Longe's attack, but in reviewing for the *Nightly Review*, May 1869, Thornton's work on *Labour and its Claims* (where much the same arguments as those advanced by Longe were promulgated and enforced, only with more illustration and in more detail), acknowledged himself convinced and prepared to surrender the position he had previously taken up. "Is there such a thing," he writes (*Dissertations and Discussions*, vol. iv. p. 44), "as a wages fund in the sense here implied? Exists there any fixed amount which, and neither more nor less than which, is destined to be expended in wages? Of course there is an impassable limit to the amount which can be so expended; it cannot exceed the aggregate means of the employing classes. It cannot even come up to those means; for the employers have also to maintain themselves and their families. But short of this limit it is not, in any sense of the word, a fixed amount."

The conflict was, however, by no means brought to an end by Mill's surrender. The cudgels were taken up in behalf of the wages fund by Professor CAIRNES in his work *Some leading Principles of Political Economy*. He in pt. ii. c. i. attempts to reply to the arguments of Longe and Thornton, maintaining against the former the possibility of a general or average rate of wages determined by the relation of population to capital, and against the latter the real existence of a natural wages fund destined to be expended on labour, though he concedes the essential point which Mill's theory seems to imply, that this fund can ever have the character of being of a determinate or fixed amount. These reasonings of Cairnes were adopted and reinforced by Fawcett in the later editions of his *Manual*, who answers in addition certain objections urged by Professor Sidgwick in his *Principles of Political Economy*, bk. ii. ch. viii.

The controversy entered on a new phase after the publication in 1876 of Professor F. A. Walker's treatise on the *Wages Question*. Professor Walker attacked the theory from a wholly new point of view. He maintains that wages stand in no necessary relation to capital at

all, that it is only for convenience sake that they are advanced out of capital, that their amount is in no sense determined by the proportion of population to capital, "rather that wages are in a philosophic view of the subject paid out of the product of present industry, and hence that production furnishes the true measure of wages" (F. A. Walker, *The Wages Question*, pt. i. chs. viii. and ix.). The same writer, in his *Political Economy*, pt. iv. ch. v. § 826, describes the labourer as the "residual claimant to the product of industry," holding that after the deduction of rent, interest, and profit, the whole remaining body of wealth, daily or annually created, is the property of the labouring class, their wages, or the remuneration of their services. Most modern writers have at least so far adopted these views as to admit the untenableness of the doctrine of a wages fund, and to consider the proportion of population to capital as one at most, though a really important one, among a number of causes by which the average or the actual rate of wages in any country will be determined.

WAGES, NOMINAL AND REAL. In the term *nominal* wages is included the present value of all money wages, regular or occasional, and perquisites and expectations, reckoned over a given period, say one year, in the currency of a given time and place. The ordinary weekly wage, whether time or piece; a fair estimate of special earnings, from overtime or occasional work, as harvesting; the money value of all payments in kind, whether in the shape of actual receipts, or of reduced rent, or of facilities for cheap purchase of goods; a suitable estimate for residence, board, or clothing; and interest on the capital present value of the

expectation of deferred pay or pensions—all these must certainly be included, while the expenses of getting to work and the annual cost of necessary implements must be subtracted. It is doubtful whether allowance should be made for lost time, when not seasonal; whether taxes direct or indirect should be subtracted; whether facilities for subsidiary earnings, indoors or out, by any member of the family, ought to be estimated; and whether account should be taken of the average number of years' work out of a lifetime that can be spent at the trade in question, this number varying very much according to the dangers or sanitary conditions of the trade, and determining the number of non-workers that must be supported by each worker (Engel, *Wesen und Preis der Arbeit*, and *Die Selbstkosten der Arbeit*, 1872; Walker, *The Wages Question*, p. 12 seq.). Thus by consideration of such circumstances the average *nominal* annual earnings of the English agricultural labourer in 1891 were found to be £39 ("Labour Commission," *The Agricultural Labourer*, vol. v. pt. i. pp. 57-87). By *real* wages are meant the purchasing power of nominal wages measured by a constant standard. According to Prof. Walker (*loc. cit.*) "*real* wages are the remuneration of the hired labourer as reduced to the necessities, comforts, or luxuries of life," and differ from nominal by reason of (i) variations in the purchase power of money; (ii) variations in form of payment; (iii) opportunities for extra earnings; (iv) greater or less regularity of employment; (v) longer or shorter duration of the labour power. Of these (ii) is best corrected as described above, while the advantage of including (iii) (iv) or (v) in practical comparisons is doubtful. (For the whole definition compare Marshall, *Principles of Economics*, ed. 1895, pp. 629-635.)

When comparisons are made between the economic conditions of groups of different countries, districts, trades, or periods, it is useless to regard simply the *nominal* wages. This is most evident when a great interval of time is taken; thus a hind's annual (nominal) earnings in the 13th century were valued at 35s. 8d. (Thorold ROGERS, *Six Centuries of Work and Wages*, p. 170); now those of an agricultural labourer may be taken as about £40; and it is difficult to suppose that this ratio, 1 : 22, in any way measures their relative well-being. Hence comparison of nominal wages is, at any rate in extreme cases, futile.

A more recent example may be obtained from the divergence of currency from gold during 1861-78 in the United States. The following figures are compiled from the Senate report on wholesale prices, wages, and transportation, 1893, and the table is in the main the same as that given by Mr. Edward Atkinson in his pamphlet *The Battle of Standards and the Fall of Prices*.

In each case 100 represents the quantity in 1860.

Years . . . . .	1845	1850	1855	1860	1865	1870	1875	1880	1885	1890
Average wage in currency . . . . .	86	91	97.5	100	149	167	158	143	156	168
"    "    gold . . . . .	86	91	97.5	100	69	137	140	143	156	168
Average price of commodities in currency . . . . .	103	102	118	100	217	142	128	107	93	92
Value of paper currency in gold . . . . .	100	100	100	100	46	82	89	100	100	100
Purchasing power of wages . . . . .	84	89	87	100	69	117	124	137	168	183

This shows that the course of *nominal* wages, measured in currency, is entirely different in the period 1860-80 from that of *real* wages, measured by purchasing power—so different that no change in the method of computation could make them similar. Even when wages are measured in gold, the courses of nominal and real wages possess only a rough similarity. A third example may be found in the earnings of gold-diggers. When gold is plentiful and provisions are scarce, an immense *nominal* wage is necessary for a bare subsistence. It may be noticed in passing that the cycle of commercial inflation and depression affects *nominal* more than *real* wages; for in time of inflation prices rise and wages follow, and in depression prices fall, and wages are, at any rate, hindered from rising if they do not actually fall. Thus wages measured by purchasing power fluctuate less violently than wages measured in currency. We have then to determine the best method of comparing purchasing power at different times or places. For different times the obvious method is to use index-numbers (see INDEX-NUMBERS; TABULAR STANDARD). Those formed on a consumption basis and dealing with retail prices (p. 385, col. 2 b), are theoretically the best, but in practice cannot be accurately evaluated. For approximation index-numbers like Sauerbeck's can be used, but the theoretical objections stated in the article referred to have their greatest weight when dealing with retail purchases by a special class. Numbers representing the ratio of the purchasing powers of money in different places at the same time could be compiled by similar methods, but since we should then be measuring accidental variations due to the peculiarities of a single place, and not a general movement of price due to general changes, we could no longer expect our number to be independent of the errors of weighting. The mere rate of exchange of currency between two countries is of course determined by quite other considerations than that of purchasing power (see EXCHANGE, FOREIGN). For times separated by long intervals writers are generally contented with a rough statement of the following nature:

*Purchase value of the Sovereign.*

Year.	Flour.	Beef.	Butter.
	lbs.	lbs.	lbs.
1820	113	70	25
1880	173	89	21

Levi, *Wages and Earnings*, 2nd ed. pp. 148, 150.

*Number of days' work necessary to purchase  
1 qr. of Wheat.*

Year . . . . .	1880	1910	1950
Artisan . . . . .	12	30	32
Labourer . . . . .	18	44	44

Thorold Rogers, *op. cit.* p. 427.

(Compare also table on pp. 634-637, *Wages and Prices*, and see Cunningham, *Growth of English Industry*, vol. ii., app.). If we attempt to combine such statements we are confronted with the difficulty of weighting the numbers representing the different commodities; this is usually done by means of budgets (see WORKMEN'S BUDGETS), the following being the most important methods.

(i) A standard budget, having no close relation to any time or place, is formed (a) of the commodities generally purchased by the working classes, corresponding to a LIVING WAGE (*q.v.*), or (b) of the minimum necessary for subsistence (Atkinson, *Distribution of Products*, p. 158 *seq.*, Carnegie, *Contemporary Review*, 1894). This standard budget is priced for any two places or times. The ratio of the two prices is inversely proportional to the two purchasing powers. The ratio of the *nominal* wages, multiplied by the ratio of the purchasing powers, gives the ratio of the *real* wages.

(ii) A similar method is to make a typical budget for one place or time, and value the budget at the prices of the place or time with which comparison is to be made. Then procedure is as in (i) (Toynbee, *Industrial Revolution*, pp. 139, 140; Leone Levi, *Wages and Earnings*, 2nd ed. p. 34; Purdy, *Stat. Soc. Journal*, 1861, and many others, *v. infra*; Porter, *Progress of the Nation*, 1851, esp. p. 583). The objections to (i) are that the standard both of living and minimum wages varies immensely from country to country (*e.g.* China and U.S.A.), and rapidly even in the same country.

The grave objection to (ii) is that the proportion of income spent on different commodities changes, and depends to a great extent on the cost of those commodities. Thus a comparison between budgets of agricultural labourers in 1800 and 1890 would be most misleading, whichever budget was taken to be priced at the other period.

M. de Foville (*Journal de la société de statistique*,

1888, p. 333) discusses a paper by M. Guyot—*Essai sur l'aisance relative du paysan lorrain*, Nancy, 1889. M. Guyot's method at first was to assume that the same proportion of income was always spent on the same commodities, giving impossible figures. M. de Foville applies method (ii) with better results (*v. infra*). The word "aisance" used by Guyot (*loc. cit.*) represents well the quantity we wish to measure. (iii) The best method theoretically for measuring "aisance relative" appears to be as follows: calculate the quantity by method (ii) twice, taking first a budget typical of the earlier, then of the later year, valuing them at the prices of both years and obtaining two ratios. The average (possibly the geometric rather than the arithmetic) of these ratios measures the relative "aisance."

Let  $a_1, a_2, \dots, a_n$  units of  $n$  commodities be bought at prices  $p_1, p_2, \dots, p_n$  at one date, and  $b_1, b_2, \dots, b_n$  units at prices  $q_1, q_2, \dots, q_n$  at another, where any of the  $a$ 's or  $b$ 's may be zero. Then the

"aisance relative" by method two is  $\frac{\sum ap}{\sum bq}$  or  $\frac{\sum bp}{\sum aq}$ .

By the method suggested it is  $\frac{1}{2} \left( \frac{\sum ap}{\sum aq} + \frac{\sum bp}{\sum bq} \right)$  or

$$\sqrt{\left( \frac{\sum ap}{\sum aq} \times \frac{\sum bp}{\sum bq} \right)}.$$

If  $c_1, c_2, \dots, c_n$  are units in standard budget (1),

"relative aisance" is  $\frac{\sum cp}{\sum cq}$ .

M. Guyot's method was:—if  $r_1 I_1, r_2 I_2$  are parts of income,  $I_1$  spent on different commodities.

Let  $r_1 I_1$  buy  $a_1$  goods in one year, and  $r_1 I_2$  ( $I_2$  other income) buy  $\beta_1$  similar goods in another.

Then  $\Sigma \left( \frac{\beta}{a} r \right)$  measures "relative aisance."

A. L. B.

WAGES, PURCHASING POWER OF. In comparing records of wages paid in various occupa-

tions in the past, especially in the distant past, all sense of the proportion between the degree of well-being procured by the wages of labour at different epochs is lost, if the variations in the prices of the commodities entering into the labourer's daily consumption are not brought into the comparison. But the modes of expenditure of wages change considerably from period to period, and are by no means similar for the majority of individuals in any given class of labourers at any one time. The variations in the general purchasing power of money cannot be appropriately applied to determine the variations in the purchasing power of money wages whose varying amounts are known. Satisfactory records of prices are, from the nature of the case, records of wholesale prices, while the labourer's expenditure is a retail expenditure. Only in so far as we can assume that the variations of wholesale and of retail prices are the same in direction and similar in amount, can we regard with satisfaction any judgment on the course of the purchasing power of wages based on comparisons of wholesale prices. We cannot, therefore, pretend to any precision in the measurement of changes in the purchasing power of wages. Retail prices vary in very arbitrary fashion, and no two families will purchase the same commodities even if their incomes be the same. Even taken in large groups, no great degree of regularity in the apportionment of expenditure under different heads manifests itself in WORKMEN'S BUDGETS (*q.v.*). Recognising that it is better to know part of the facts, than to ignore them entirely on the ground that a degree of knowledge which is satisfactory is not to be attained, estimates have been framed to indicate the changes in real wages which are bound up in recorded changes of nominal wages. So long as we recognise the limits of the applicability of the conclusions, it will be a gain to have partial knowledge; were we to ignore the fact that the limits exist and are rather narrow, such partial knowledge would perhaps be worse than ignorance. In the articles PRICES, HISTORY OF, and WAGES AND PRICES OF COMMODITIES, a certain amount of material is presented which permits the variations of prices of leading commodities to be compared with those of wages. So far as England is concerned, we proceed to make some more detailed comparisons. The investigations of Thorold ROGERS supply us with the most abundant material, and the modes of comparison adopted by Rogers may be abbreviated for the purpose of summary view of the results. The amount of food necessary for the support of a family of four persons for a year is, in some of Rogers' comparisons, given at 3 quarters of wheat, 3 quarters of malt, and 2 of oatmeal (*cp. Six Centuries of Work and Wages*, ch. xiv.), while in others a provision of 4 quarters of wheat, 2 quarters of malt, and 800 lbs. of

meat (cp. *History of Agriculture and Prices*, vol. i. ch. xxix.) is considered suitable for purposes of estimating the relation of wages to necessities of life. Referring to these as "grain diet" and "meat diet" respectively, we obtain the following comparative table:—

	1261-1350	1351-1400	1401-1540	1541-1582	1583-1642	1643-1702
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
Cost of grain diet . . .	43 10	47 0	53 6	135 6	285 8	360 0
Cost of meat diet . . .	48 0	53 6	65 5	166 9	327 7	409 8
Yearly wages of carpenter	73 5	108 8	138 1	235 0	292 9	480 9
Yearly wages of labourer	61 8	91 1	94 0	176 3	227 2	300 7
Number of weeks' labour yearly needed to procure grain diet by						
(a) Carpenter . . .	28	20	18	27	46	34
(b) Labourer . . .	33	24	27	42	59	55
Number of weeks' labour yearly needed to procure meat diet by						
(a) Carpenter . . .	31	23	22	33	53	40
(b) Labourer . . .	37	28	33	51	68	64

*Note.*—In calculating the cost of malt, the prices for the first quality have been taken. Rogers takes second quality, but his tables do not give continuous records for second quality from which to form the above averages. For meat, in the first three periods the cost is based on Rogers' estimates, the prices being quoted for whole animals. In the last three periods the price per 14 lbs. is taken as basis. As in the article on *Prices, History of*, the wages for a labourer before 1400 are those of a thatcher, which are somewhat higher than those of common agricultural labour, the wages of which are quoted after 1400. Hence the relative change in the labourer's position is not truly shown, the actual position being less favourable in the first two periods than is here represented. Fractions of pence and fractions of weeks have been ignored in the table. The yearly wages have been calculated at the rate of 47 weeks in the year at the daily or weekly rates given in the article *Prices, History of*.

The fact is clear that at some periods the amount available for clothing, etc., and other purposes was adequate, while at others the provision was necessarily more stinted than that which has formed the basis of these calculations. To carry on the comparison, we may take advantage of the results stated by Rogers so far as concerns the relative position in the time of Arthur Young and at various periods during preceding centuries. Compared with the fourth of the above periods for example, the case is stated (Rogers, *History of Agriculture and Prices*, vol. iv. p. 758) thus: the necessities of life had become three to four times as dear, while the wages of labour were not much more than double. The purchasing power of wages had therefore decreased from 33 to 50 per cent. The course of the relation of wages to prices during the 18th century is shown in the table quoted from Arthur Young in the article to which reference has already been made several times (see *Prices, History of*). It there appears that agricultural wages during the 18th century did not advance as rapidly as prices. Comparing the first two-thirds of the 18th century with the first decade of the 19th, wages were doubled in the

interval, while prices were increased to two and a half times their old level or more. The purchasing power of wages, therefore, fell about 20 per cent, and the fall took place in the period 1767-89, but little further loss of wages relative to prices coming later according to

Young's records. The first half of the 18th century was a time when the purchasing power of wages rose to a higher level than that of the preceding century. By the beginning of the 19th century, the movement had been so unfavourable to the labourer that his command over commodities was probably not greater than in the worst period (1583-1642) of

those shown in the preceding table. It may be added that the necessities of life in the matter of clothing and shelter were much dearer, and needed certainly as large a share of the wages to be devoted to them as in the 16th or 17th centuries, probably more. The table in *WAGES AND PRICES OF COMMODITIES* shows the amounts of wages and the cost of a working man's board at short intervals from 1720 till recent times, and affords more than as much information on the relation of wages to the cost of living for these later times as the tables of this article afford for earlier times.

Mr. Bowley, in a paper read before the Royal Statistical Society in 1895, adopted an ingenious method of making comparisons of wage-levels at different periods. Comparing these with the movements of prices shown by Mr. Sauerbeck's Index Number, Mr. Bowley points out the resultant changes in average real wages, that is, in the purchasing power of average wages, in the following scheme:—

Date.	Real Average Wages.	Date.	Real Average Wages.
1860	100	1877 }	159
1866	110	1880 }	
1870	116	1883	157
1874	134	1886	180
		1891	192

Reasons for not relying implicitly on the indications of INDEX NUMBERS as to the average movements of the prices of the articles entering into the workman's expenditure, have been given above. These and other facts already alluded to, such as changes in the nature of working-class expenditure which must derange any comparisons with past centuries which pretend to precision, deter us from placing here a table showing, for the whole period covered, by a single series of numbers, the movements

of real wages. The facts adduced will, however, show the leading upward and downward movements of real wages, and no real loss is caused by their presentation in such a form as not to permit of a ready comparison of the position to-day with that at any given epoch of the past. Such comparison cannot be precise, cannot be made without taking into account many circumstances of the life of the people not mentioned here, and to offer an appearance of precision would be delusive (see *WAGES, NOMINAL AND REAL; WORKMEN'S BUDGETS*; and the works referred to in the bibliographies attached to those articles). A. W. F.

*WAGES, STANDARD RATE OF.* See *STANDARD RATE OF WAGES.*

*WAGES STATISTICS.* From figures collected and tested by the labour department of the board of trade, it appears that the normal rates of wages, plus the estimated value of allowances, such as free homes, etc., paid to the workers in thirty-eight selected occupations during 1886, were 24s. 7d. per week, or £64 per annum, for men; 12s. 8d. per week or £32.10s. per annum, for women; 9s. 2d. per week, or £23.8s. per annum, in the case of lads and boys; and 7s. per week, or £18.4s. per annum in the case of girls. Of the men employed in these occupations, 0.2 per cent were receiving less than 10s. per week; 2.5 per cent, from 10s. to 15s.; 20.9 per cent, from 15s. to 20s.; 35.4 per cent, from 20s. to 25s.; 23.6 per cent, from 25s. to 30s.; 11.2 per cent, from 30s. to 35s.; 4.4 per cent, from 35s. to 40s.; and 1.8 per cent, above 40s. That is to say, nearly 60 per cent were receiving from 20s. to 30s. per week, or about the average rate; and of the remainder, about 25 per cent were receiving less than 20s.; and 17 per cent, more than 30s. If to these thirty-eight occupations there be added the other important industries, as railways, building trades, etc., which it was not found possible to treat in the same way, the average annual earnings of adult males may, according to Sir R. Giffen, be approximately estimated at a little over £60; of women at £40; of lads and boys at £23.8s.; and of girls at £23. According to the census returns for 1881, the total adult male working population, excluding the residuum, chiefly to be found in the large towns, of persons whose employment is permanently irregular, was, in round numbers, 7,330,000; of adult female workers there were 2,900,000; of lads and boys, 1,700,000; and of girls, 1,260,000; making a total working population of 13,190,000. The aggregate earnings of the men may, therefore, be placed at £440,000,000; of the women, at £118,000,000; of the lads and boys, at £46,000,000; and of the girls, at £29,000,000; making a total annual income for the manual labourers of £633,000,000.

[See Minutes of Evidence taken before the

Royal Commission on Labour, sitting as a whole, questions 6873-7165, and 8086-8381, Parl. Papers, c. 7063-i. of 1893, and Appendix to ditto, No. 124, Parl. Papers, c. 7063-iiia of 1894]. T. G. S.

*WAGES, STATISTICS OF (IN THE UNITED STATES OF AMERICA).* The statistics of wages for the United States labour under peculiar difficulties. Any historical account of wages encounters the enormous change that has come over a country developing from an agricultural colony into a great industrial state. The United States has participated with Europe in the development from hand-labour to the factory system, only the change has been in some respects even more abrupt, radical, and complete. Comparison of wages for successive periods is, therefore, difficult, because occupations have changed often in name and almost always in character. Such comparisons must be limited to a few common occupations. They cannot be carried very far back because of the lack of data, and because in early agricultural communities employments are scarcely differentiated. Particularly in the United States is this true, where originally every man owned his farm, and agricultural day labourers as a class were unknown. A second difficulty is that even at the present day there are very striking differences between different sections of the country, so that any statistics of wages applicable to the whole country is almost, if not altogether impracticable. The eastern states are industrial, with large cities and factory towns, and the population has many of the characteristics of the English factory and mining districts. Owing to immigration, there are, however, many contrasting bodies of working men, from the highly skilled American artisan down to the French Canadian factory hand, the Italian day labourer and the Russian-Hebrew sweated tailor and garment-maker. In the north-central states of the Mississippi valley we have a community still largely agricultural, with farmers owning the land—peasant proprietors on a large scale. In the extreme west we have some of the characteristics of newly-settled countries, i.e. scarcity of certain kinds of labour and a high range of wages. Finally, in the south we have the great mass of negroes, formerly slaves, unskilled, ignorant, and representing labour of a low degree of efficiency. An average wage even in the same employment for all these different sections is an impossibility. At least it means nothing. For historical and comparative purposes it is necessary to confine ourselves to one section.

Systematic attempts to collect wage statistics are of very recent date in the United States, in fact scarcely twenty years old, and are confined for the most part to the eastern states.

*History of Wages.*—There are scarcely any records of wages in the 18th century. The Massachusetts bureau of labour statistics has

gathered up what there are from old pay-rolls, private account books, and other documents, and presented the results in the following table (*Report*, 1885, p. 454):—

2. *Wages (Daily). By Periods of Years (Massachusetts) 1800 to 1883.*

The second great investigation of wages was that conducted by the department of labour at Washington, for the senate committee on wholesale prices, wages, and transportation (Aldrich Committee), and published in 1891. There are in this Report 61 series of wage returns which begin as early as 1840, and as many as 543 distinct series which cover the period from 1860 to 1891. The returns are actual wages, from manufacturers' pay-rolls, and quotations are given for January and July of each year.

*Index Wages.*—The chief object of the Aldrich Report was to determine whether wages had increased or decreased during the last fifty years. For this purpose the familiar method of the index number was used, the year 1860 being taken as the base, 100, and two methods being used, one a simple average, and the other a weighted average according to the relative number of persons engaged in each occupation. The result on a

gold basis is shown by the following table, *Rept.*, pt. i. p. 14:—

*Relative Wages by Years 1840-1891*

Year.	Simple Average.	Average According to Importance.	Year.	Simple Average.	Average According to Importance.
1840	87.7	82.5	1866	108.8	111.1
1841	88.0	79.9	1867	117.1	121.8
1842	87.1	84.1	1868	114.9	119.1
1843	86.6	83.0	1869	119.5	123.5
1844	86.5	83.2	1870	122.7	126.9
1845	86.8	83.7	1871	147.8	150.3
1846	89.3	89.1	1872	152.2	153.2
1847	90.8	91.3	1873	148.3	147.4
1848	91.4	91.6	1874	145.0	145.9
1849	92.5	90.5	1875	140.8	140.4
1850	92.7	90.9	1876	135.2	134.2
1851	90.4	91.1	1877	136.4	135.4
1852	90.8	91.8	1878	140.5	139.0
1853	91.3	92.2	1879	139.9	139.4
1854	95.8	95.8	1880	141.5	143.0
1855	98.0	97.5	1881	146.5	150.7
1856	99.2	98.0	1882	149.9	152.9
1857	99.9	99.2	1883	152.7	159.2
1858	98.5	97.9	1884	152.7	155.1
1859	99.1	99.7	1885	150.7	155.9
1860	100.0	100.0	1886	150.9	155.8
1861	100.8	100.7	1887	153.7	156.6
1862	100.4	101.2	1888	155.4	157.9
1863	76.2	81.9	1889	156.7	162.9
1864	80.8	86.2	1890	158.9	168.2
1865	66.2	68.7	1891	160.7	168.6

From a consideration of this table, it becomes evident that there was a gradual advance in wages from 1840 to 1860; since that date the advance

has been less regular, but more rapid. The depressing effect of the premium on gold is seen during the years 1863-66. Comparison with a table of prices would show that the purchasing power of wages has increased to an even greater extent than money wages.

The increase in wages has not been the same in

*Relative Wages in 1891, compared with 1860  
by Industries.*

Industry.	Number of Quotations.	Relative Wages.
Agricultural implements . . . . .	5	137·9
Ale, beer, and porter . . . . .	5	224·7

White lead . . . . .	3	140·6
Woollen goods . . . . .	58	167·8
Total . . . . .	542	160·7

all industries. This is shown by the preceding table, which gives the increase from 1860 to 1891 by industries. The number of quotations is also given, so that it is possible to judge of the basis upon which the index number rests. Each quotation represents a series of wages, *Rept.*, pt. i. p. 12.

*Comparative Wages.*—

An attempt is sometimes made to compare wages in the United States with wages in Europe. Wages are undoubtedly higher in the United States, but how much higher it is impossible to say, because of the differences in occupations and in the purchasing power of money. The most elaborate comparison of this sort was made by the Massachusetts bureau of labour statistics in 1884. The average weekly wages in twenty-four industries were as follows:—

	Massachusetts.	Great Britain.
	\$	\$
Men . . .	11.85	8.26
Women . . .	6.09	3.37
Young persons . . .	5.10	2.40
Children . . .	2.81	.79
All employes . . .	10.31	5.86

The Massachusetts Report for 1895 gives actual wages in the United States and in foreign countries, but no attempt has been made to average them for purpose of comparison.

*Average and Classified Wages.*—Average wages are, as a rule, very unsatisfactory. There are so many differences in skill, age, sex, hand or machine labour, that an average may be mathematically correct and yet give a false impression. So, too, the inclusion of the high wages of a foreman or superintendent would raise the whole average above what the ordinary workman gets. It has been proposed, therefore, to classify wages rather than to average them, *i.e.* to give the number of men receiving between \$5·00 and \$6·00 per week, between \$6·00 and \$7·00, and so on. We are thus able to judge somewhat of the real income of the greater number of wage earners, which is the important question in wage statistics.

The eleventh census has proceeded upon this plan, and some of the results are published in the volume on manufacturing industries. For the sake of illustrating the method as well as giving wages for two important industries, the following table is given showing the number of males above sixteen years of age in the iron and steel manufacture, and in the cotton manufacture, at different rates of wages.

The advantage of such a table is that it shows the economic position of the great mass of working men in any industry. In the two industries con-

Weekly rates of Wages.		Iron and Steel Manufacture.	Cotton Manufacture.	Percentages.	
				Iron and Steel.	Cotton.
Under \$5.	1,643	15,164	$\frac{57}{100}$ 97	$\frac{77}{100}$ 14	
5 and over, but under \$6.	3,424	9,924	2 03	11 32	
6 " " "	10,198	15,491	6 03	17 51	
7 " " "	20,265	10,485	12 00	11 85	
8 " " "	25,041	9,120	14 82	10 20	
9 " " "	23,727	8,712	14 04	9 84	
10 " " "	24,516	8,409	14 51	9 50	
11 " " "	24,458	5,427	14 47	6 13	
12 " " "	17,974	3,027	10 63	3 42	
13 " " "	10,502	1,291	6 21	1 46	
14 " " "	7,195	1,417	4 25	1 80	
Total	168,943	68,467	100 00	100 00	

trasted here, it will be seen at a glance that the men in the iron and steel industry are paid much higher wages than the men in the cotton manufacture. More than one-half (57.7 per cent) of the men in the cotton industry receive less than \$8.00 per week, while only 21 per cent of the men in the iron and steel industry receive less than \$8.00 per week. For the question of income, such a classified wage is more interesting than an average wage.<sup>1</sup>

For complete wage statistics it would be necessary to add some facts in regard to the cost of living and the question of employment and unemployment. These things vary, however, so

<sup>1</sup> There is one slight discrepancy in this comparison, viz. officers and foremen are included in the cotton industry but not in the iron and steel.

much from time to time, and in different industries, that it is impossible to enter into the subject here. Some references will be found in the bibliography.

*Critical Bibliography.*—The chief sources of information for wage statistics in the United States are the reports of the bureaus of labour statistics of the several states, the investigations of the department of labour at Washington, and the tenth and eleventh censuses of the United States.

Of the state labour bureaus, by far the most important is that of Massachusetts. The report for 1874 gave "Comparative Rates of Wages and Hours of Labour in Massachusetts and Foreign Countries"; also "Prices of Provisions, etc. in Massachusetts and Europe." The report for 1876 contained 71,389 wage returns. The report for 1879 contained a comparison of "Wages and Prices, 1860, 1872, and 1878." The result of this investigation showed an increase in 1878 as compared with 1860 of 24·4 per cent in wages, and 14·50 per cent in cost of living. The report for 1882 was entitled "Wages, Prices, and Profits." The report for 1883 gave statistics of wages of 207,793 employes. The report for 1884 was a very extensive investigation, comparing wages in Massachusetts and Great Britain for several years, ranging from 1860 to 1883; this report is the best piece of work of this sort ever accomplished in America. The chief results are shown in the table above. The report for 1885 contained a condensation of the report for 1884, and in addition an "Historical Review of Wages and Prices, 1752-1860." It is from this report that the first table above is taken. The report for 1889 was devoted to "Classified Weekly Wages"; it contained classified wages for 248,200 employes. Finally, the report for 1895 commences the publication of 489,600 wage returns, gathered from all sources, and 166,400 price quotations. It will be several years before all of these returns are published; they are arranged by occupations, and wages are divided into five classes: high, medium high, medium, medium low, and low. The utility of this enormous undertaking may be doubted. Other state bureaus have collected statistics of wages, notably New Jersey in 1884, and Michigan in 1885, but none of them is comparable with the Massachusetts report of 1884.

The department of labour at Washington published extensive figures of actual wages in its sixth and seventh annual reports entitled "Cost of Production in Iron, Steel, Coal, Textiles, and Glass Industries"; it also investigated the cost of living of families in these industries, and compared cost of living with income (see WORKMEN'S BUDGETS). The department of labour also collected the figures of wages for the Aldrich report mentioned in the text.

The tenth census of the United States published various returns of statistics of wages. Those of manufactures are contained in vol. ii.; they are of little value, because the average wage is calculated by dividing the total amount paid in wages in an industry by the total number of employes; such an average confuses the wages of men,

women, and children, of skilled and unskilled workmen, and differences due to locality, so that the average represents nothing at all. Volume xx. of the tenth census is devoted entirely to the statistics of wages. No effort was made to classify this enormous collection of figures, so that it has remained practically useless.

The eleventh census of the United States collected statistics of wages in manufacturing industries, classified as described in the text, and published chiefly in the three volumes on manufacturing industries. In these returns a distinction is drawn between males, females, and children, between piece workers and time workers, and between officers, firm members, and clerks, as contrasted with operatives, skilled and unskilled. A summary of average annual earnings per employe in different industries and in different states will be found in Part I., and detailed wage statistics for textile industries, chemicals, glass, coke, petroleum, glue, iron and steel manufactures, locomotives, clay products, shipbuilding, forest industries, etc. in Part III. In all these industries wages are classified as illustrated in the text. The volume on transportation business also contains statistics of wages, but in a crude form. The report on mineral industries contains statistics of wages of miners, classified as foremen and overseers, miners, labourers, and boys under sixteen years, giving also the average number of days' work.

[For criticism of American wage statistics see "American Labour Statistics," in *Political Science Quarterly*, March 1886, and "Wage Statistics and the next Census of the United States," in the *Quarterly Journal of Economics*, July 1888. For criticisms of the Aldrich report see Bowley, "Wages in the United States and in Great Britain," 1860-1891, *The Economic Journal*, vol. v. (1895) p. 369].

R. M.-S.

**WAGES OF WOMEN.** The most striking fact about the wages of women is, as Mill said, that they are generally lower, and very much lower, than those of men. Roughly speaking they are about half. This has been usually accounted for by the inferiority of women as workers. But the explanation seems to weigh the labour of the two sexes in very unequal balances. It would certainly be hard to prove that two woman weavers, minding three or four looms for 10s. a week, are "worth" only one able-bodied navvy earning 20s. A better explanation is that women generally occupy non-competing groups relative to men; the fact being that, when women enter a trade, they generally monopolise it before long. In this case the natural and sex disabilities which prevent them combining tend to bring down the wage—however high it was when the men occupied the industry—to a level at or even below subsistence. Where women combine in the same trade union with men, as, for instance, in the Lancashire weaving, their wages keep up to the men's rates. The specific difficulty of the problem is that, while women must share

with men in the one portion of the national dividend that falls to labour as against the other factors, the great majority of them, either as living with parents or as married, are not independent units. The woman's wage is part of a "family wage." That is to say, while the demand for and the supply of "labour" regulates the wages of labour, these wages are divided among the sexes according to other than purely economic considerations.

[*Econ. Jour.* vol. i. p. 635 (S. Webb), vol. ii. p. 173 (Mrs. Fawcett).—*Studies in Econ.* (Smart), p. 105; FEMALES AND CHILDREN, EARNINGS OF.]

W. S.

WAIF. The earliest mention of this word is probably contained in a charter (*Ch. Roll, No. 42*) of 1247, by which Hen. III. granted to the hospital of Ospringe that animals called "Weyf," found in the fee of the hospital, should belong to its brethren, unless any one should sue for them who would and could prove that they were his, and unless they should be demanded and sued for within a certain term, according to the custom of the country. Subsequently the term "Estray" was used to designate such animals, and waif came to be used in a different sense; for Sir Ed. Coke states that "waif is where the felon in pursuit waives the goods, or when the felon, for fear of being apprehended, thinking that pursuit was made, having them with him in his possession, flies and waives the goods." If seized on behalf of the king they were forfeited to him unless the owner had made "fresh suit" to recover them. In the 13th century this meant that the owner had forthwith to raise the hue and cry to the four nearest townships; and after announcing his loss to the bailiffs and coroners, to appeal the thief at the next county court, and so on from court to court until attainted. Later, however, this law was considerably modified.

[Coke, *Reports*, ed. 1826. London, 8vo, part v. p. 221.] G. I. T.

WAINAGE. See AMERCEMENTS; WAYNAGE.  
WAKEFIELD, DANIEL (1776-1846),  
chancery barrister, and, after 1835, Q.C.:

Wrote *An Essay upon Political Economy, being an inquiry into the truth of the two positions of the French Economists that labour employed in manufactures is unproductive, and that all taxes ultimately fall upon or settle in the surplus produce of land*, 1st ed. 1799; 2nd, 1804, was a follower of Sir J. STEUART: but his comparison of rent and interest as "the surplus values" of land and capital § 20, his distinctions of positive and relative cost and use value § 39, of "physical" or necessary and "surplus" or monopoly wages § 49—are clear and correct. In § 43 n. he shows himself a protectionist. In *An Investigation of Mr. Morgan's Comparative View of the Public Finances*, 1801, he praises Dr. PRICE, his SINKING FUND, and W. PITT.

He also wrote *A letter to Thomas Paine in reply*

to his *Decline and Fall of the English System of Finance*, 1796?—*Observations on the Credit and Finances of Great Britain*, 1797; also *Facts of Importance relative to the Present State of Great Britain*.

[W. Roscher, *Principles of Pol. Econ.*, transl. Lalor, vol. i. pp. 177, 268. J. D. R.]

WAKEFIELD, EDWARD (1774-1854), elder brother of Daniel and father of E. G. WAKEFIELD:

Wrote one book only, *An Account of Ireland Statistical and Political*, 1812, pp. 1600, 4to. He was examined as an expert Essex farmer and general landjobber and valuer by a "committee on the distillation of sugar and molasses," *Reports from Committees of the House*, 1808, iv. 109, and by a "committee on agricultural depression," *ib.*, 1821, ix. 206, and as an expert on Irish money by a "select committee on the high price of gold bullion," *ib.* 1810, iii. 133. His book was written at the instance of J. L. FOSTER, chairman of "the committee for enquiry into the state of Ireland as to its circulating paper, etc. and coin," 1804; and the Irish secretary, W. W. Pole, supplied him with statistics. In addition to these qualifications for his task, he had spent two years on tour in Ireland, travelling like so many of his contemporaries in politics, and weaving his journals into what the 17th century called "political anatomy," the 18th statistics, and the 19th "public economy." His economic bias classes him with such Irish political tourists as T. Campbell (1777) and A. Young (1780), rather than with Bush (1764), Derrick (1767), Twiss (1776), and Luckombe (1780); and like Young he aims at completeness. But there the resemblance to Young, his great exemplar, ceases. No writer has a more personal note, or is more quotable, than Young. Most of the quotable sayings in Wakefield's book are themselves quotations—e.g. Vasco's "a large population, if proportionate to the wealth of a country, is advantageous, otherwise it is harmful" 1788 (also quoted by A. Young, *Travels in France*, ed. 1794, vol. i. p. 485), an anonymous writer's "a poorhouse was the cradle of the cotton trade of Ireland," A. Young's "the penal laws are not against the Catholic religion but against the industry and property of whoever professes that religion,"—cp. Campbell, *Philos. Survey*, p. 251. His advocacy of large farms is a reminiscence of A. Young; his views on Irish money (see IRISH CURRENCY), which he wishes to assimilate to English money, are based on SIMON's work; his discussion of various estimates of the Irish population only confirms NEWENHAM, and his unionism is the unionism of PETTY, CHILD, Molyneux, Maxwell, DOBBS, Madden, DECKER, TUCKER, POSTLETHWYAT, FRANKLIN, BREWSTER, YOUNG, and A. SMITH. True, he has read the latest and best books, including those of MALTHUS, whose postulates appeared to him, as they did to Hallam and Hazlitt, as true "as that the earth turns round on its own axis," ii. 723, and Lecky has rescued at least one bright specimen of original observation, *Hist. of Ireland*, i. 286. His bookishness, while it makes him dull when compared with A. Young, makes him interesting when compared with the authors of the *Statistical Surveys of Irish Counties* which the

Dublin society initiated in 1801, partly at the instance of S. CRUMPE, *Essay*, 1793, p. 157, partly in imitation of the SINGLAIR Reports for Great Britain, 1793 *et seq.* Wakefield's culture and access to statistical information and to Sir J. Banks's famous library are the chief reasons why his work is valuable to economic historians of Ireland.

[*Biogr. Dict. of Living Authors*, 1816, p. 366.—McCulloch, *Liter. of Pol. Econ.*, p. 218, and A. Young, *Autobiography*, p. 75, praised the book.—Graham Wallas, *Life of F. Place* (1898), ch. iv., describes his work as an educationalist and reformer. Comp. R. Garnett, *Life of E. G. Wakefield* (1898).] J. D. R.

WAKEFIELD, EDWARD GIBBON (1795-1862), coloniser, the son of Edward WAKEFIELD, was educated as a land-surveyor. In 1826 he was concerned in an extraordinary case of abduction, for which he was tried and sentenced to three years' imprisonment. During this term he studied with effect the English penal system, and on his release in 1831 he proceeded to Australia, to study the convict system in the colonies. This led him to the study of the improvident system, up to that time in vogue, of parting with the crown lands in these colonies, and of the question of the proper means of proportioning the number of settlers to the areas taken up. The result of this study was his formulation of the principle on which he afterwards always insisted, viz. that the unoccupied lands of a new colony should not be granted promiscuously, but portioned out and sold on a regular system at an adequate price, and that the proceeds of such sales should be made a fund for assisting further immigration to the colony. The chief difficulty incident to this system was that of fixing the "sufficient" price in each case (see *Parl. Paper*, H. of C., 512, 1836, pp. 66 *et seq.*; *View of Art of Colonisation*, pp. 331 *et seq.*; Mill's *Principles*, v. xi. § 14).

In 1833 Wakefield published his *England and America*, and immediately attracted the notice of the political chiefs in England.

In 1835 Henry George Ward obtained a committee of the House of Commons, "to inquire into the disposal of colonial lands." He obtained Wakefield's assistance as secretary, and the result of the evidence taken was the initiation of the company for the colonisation of South Australia of which Col. TORRENS (*q.v.*) was a leading spirit. Wakefield then addressed himself to arouse the public mind and obtain a parliamentary inquiry into the system of convict transportation, which thus received its death-blow. In 1837 Wakefield became a director of the New Zealand Association, intended for colonising New Zealand. But before he could take up any active work in that direction he went out to Canada as Lord Durham's private secretary in 1838 and remained there till 1845. His health soon afterwards broke down; he went first to the south of France, then to New Zealand, where he died.

Wakefield will always be best known by his system of colonisation above described. He was content to work through others rather than embody his views in any great work. The few writings he left behind served the requirements of the moment, and are obsolete for practical purposes, though Mill quotes him with approval (*Principles*, bk. iv. ch. iv. § 2). The chief of them are *Plan of a Company to be established for the purpose of founding a colony in South Australia*, 1831.—*A Commentary on Adam Smith's Wealth of Nations* (London, 1835).—*A View of the Art of Colonisation in letters between a Statesman and a Colonist* (London, 1849).

WALES, WILLIAM (d. 1798). Captain Cook's travelling astronomer 1772-79—Master of the Royal Mathematical School at Christ's Hospital 1780-98, and F.R.S. 1777-98:

Made but one incursion into political arithmetic in his *Inquiry into the present State of Population in England and Wales*, 1781. Dr. PRICE's calculations that England was dwindling were based on the HEARTH TAX returns of 1690 and window tax returns (see TAXATION) of 1759 and 1777. A. YOUNG, *Pol. Ar.*, 1774, pp. 84, 88, 322; and Eden, *Letters to Lord Carlisle*, 1780, App. 6, pointed out that in the former "houses" meant "families" (Dr. Price's was also DAVENANT's and MALTHUS's mistake), *Essay*, ed. Bettany, p. 232, and in the latter untaxed cottages were filled in by guess-work. WALES and then HOWLETT repeated these criticisms, not always so well—compare *Inquiry*, p. 13, and *Pol. Ar.*, p. 327 n.; and added estimates of their own which relied too much on Yorkshire statistics in which Dr. Price admitted an increase—Anon., *Uncertainty of the present population of the Kingdom* 1781; Dr. Price, *Observations on Reversionary Payments*, 4th ed. 1783, ii. 275 *et seq.* Dr. Price ignored A. YOUNG, traversed EDEN and HOWLETT, but adopted some of Wales's figures—*ib.* i. 245, 251, 260, etc. Price, Wales, and Howlett assumed that numbers meant strength, and Wales followed Sir W. TEMPLE, SHORT, Sir M. DECKER, and J. MASSIE in suggesting the adjustment of taxation, etc., so as to promote marriage.

WALKER, AMASA, LL.D. (1799-1875). As economist and statesman, the Hon. Amasa Walker exerted hardly less influence on the thought of his time than his more renowned son, General Francis A. Walker. Amasa Walker was born in Woodstock, Connecticut; too feeble in health as a boy to be sent to college, he worked as a clerk in the village store, taught school in the Brookfield districts, and worked on the farm at home as his health permitted. In 1829 he went into business for himself and began to take a prominent part in the intellectual and political life of Boston. He

organised a Lyceum, and was its first secretary, and later its president.

He was identified with the railroad movement in America from the start. In 1835 he wrote articles and made speeches to secure railroad connection between Boston and Albany. In 1837 he was a director of the Western Railroad, and in 1839 he visited St. Louis and made a remarkable address and argument for railroad communication between Boston and the Mississippi. He also championed the anti-slavery movement from the beginning. In 1839 he became president of the Boston Temperance Society, and for thirteen years previously had been writing in support of total abstinence principles. Owing to ill-health he retired from business in 1840 on a moderate fortune saved from the financial wreck of 1837-1839, and from this time on for a period of thirty-five years he was prominent in public life. Several times he was a member of the Mass. state legislature, and once was sent to congress, where he devoted himself chiefly to monetary and financial questions. He was professor of political economy from 1842-1849 at Oberlin College, which he helped to found, and later (1861-1866) was lecturer on political economy at Amherst College, Mass. He was also a delegate to several peace conventions, and in 1851 was elected secretary of state in Mass., by the "free soil" and democratic vote. He had been brought up among federalists and was a Jacksonian democrat, but because of his views on paper money, banking, and the sub-treasury, he joined the liberty party in 1844 and helped to create the "free soil" party in 1848 and the republican party in 1856.

Amasa Walker published a pamphlet in 1857, *The Nature and Uses of Money*, in which he adhered to the views of the currency school of Overstone, Torrens, and Norman in England. He favoured bank notes only provided fluctuations were controlled by the movement of metallic money. His main book on economics, *The Science of Wealth*, was published in 1866. It passed through many editions, was translated into Italian and well received in Europe and America, in which latter country it became popular as a text-book, and a student's edition was specially prepared. The thought is of the Smith-Ricardian type. Much space was given to money, in which the author elaborated the views stated in his earlier pamphlet. No mention was made of the wages-fund doctrine, and on the tariff question the free-trade side of the controversy was taken. Throughout the book is optimistic, and the author's views were permeated with an enthusiastic and healthy moral tone which commanded general respect.

For biographical data see *Memoir of Hon. Amasa Walker* by Francis A. Walker, reprinted from *New England historical and genealogical register*, April 1888. In addition to the books already quoted, Amasa Walker published many magazine articles, and, together with Wm. B.

Calhoun and Chas. L. Flint, issued *Transactions of the Agricultural Societies of Mass.*, 7 vols., 1848-1854.] S. M'C. L.

WALKER, FRANCIS AMASA (1840-1897), son of the preceding, was born and died in Boston, Massachusetts. He graduated from Amherst College in 1860, and began the study of law, but in 1861 joined a volunteer regiment and served with distinction for the greater part of the civil war, retiring in 1865 with the brevet rank of brigadier-general. In 1869 he was made deputy special commissioner of the revenue, and placed in charge of the bureau of statistics at Washington. His efficiency in renovating the bureau proved his capacity both as administrator and as statistician, and led to his appointment to superintend the census of 1870, and ultimately that of 1880. Although his work in 1870, especially as regards the black population, was injured by the obsolete legislative provisions under which it was done, the general result was to gain for Walker a solid reputation both at home and abroad, which was heightened by the extraordinary scope and excellence of the monumental tenth census, directed by him in 1880.

In the midst of his statistical work, Walker was called into the general field of economics by an appointment as professor of political economy in the Sheffield Scientific School of Yale College in 1872. His aptitude for such studies was inherited; he had begun to write for the press upon money in 1857, had assisted his father, and had even lectured in his father's place in Amherst College as early as 1865. By his discussion of the results of the census of 1870, and by an excellent book on the Indian question, the fruit of a short service as commissioner of Indian affairs in 1871-72, he had secured the ear of the public, and his first important treatise, *The Wages Question* (1876), therefore attracted instant attention. In this book, as a part of his comprehensive review of the whole subject, Walker made a vigorous attack upon the wages-fund theory, arguing that wages are paid from the product of labour and not from accumulated capital. Neither Longe nor THORNTON had been so fortunate, either in the time or the manner of dealing with this question, and Walker had at once a large following, although the controversy was not ended. He also developed with great clearness the function of the *entrepreneur* as distinguished from the capitalist, and the distinction thus made between business profits and interest enabled him in his *Political Economy* (1888) to work out a law of business profits analogous to the law of rent, and thus to present a theory of distribution under which rent, interest, and profit, being severally determined each by a law of its own, labour is the "residual claimant" to all that remains, be it more or less. This bold generalisation became the subject of much

discussion, and was strongly defended by Walker in his later writings.

Walker's second important treatise, *Money* (1878), appeared at a critical moment in the history of the federal legislation upon currency, and by its broad and candid review of the whole field did much to establish opinion in favour of the specie standard, although neither in form nor intention a controversial publication. Its careful survey of the question of silver coinage, and its conclusions favourable to international bimetalism, together with his appointment in the same year as a representative of the United States in the International Monetary Conference at Paris, gave him an important place in the monetary discussions of the next twenty years. His efforts in favour of an international movement, as opposed to solitary action by his own country, ended only with his death, and the last year of his life was marked by the publication of his short résumé, *International Bimetalism* (1896).

In 1881 Walker was made president of the Massachusetts Institute of Technology, and for the rest of his life was occupied in developing the plan on which this important school was founded. His administration was brilliant, but did not diminish his activity as an economist. In 1882 he became president of the American Statistical Association, in 1885 was made president of the newly-formed American Economic Association, and in 1893 president-adjunct of the International Statistical Institute at its session in Chicago. Membership in many foreign learned societies, and honorary degrees from leading universities, both American and English, attested the scientific eminence which had long been freely accorded to him in every leading country.

Some persistent controversies will have to be settled before the permanent value of Walker's special contributions to economic theory can be determined. As a leader in economic discussion, and as a director and interpreter of statistical work, he must always hold a distinguished place. His influence in the promotion of economic study in the United States was of the first importance. His strong leaning toward a rational conservatism did not make him less ready to examine the basis of accepted theories. The ardour and strong conviction with which he took his part in debate were inspiring to others. His varied experience and knowledge of men gave him a rare familiarity with the actual movements of the world, and a vivid perception of the realities among which economic laws must work. As presented by him, therefore, theory seemed unusually practical and close to life, and commanded the attention of men of the most diverse scientific tendencies, and also of general readers. In personal intercourse, as well as in his written work, he was cheerful, courageous, and hopeful,

fitted by nature to grapple with large subjects and to hold a leading place among men.

[An exhaustive bibliography of Walker's writings is given in the *Publications of the American Statistical Association*, June 1897, from which the following leading titles are taken; *Ninth Census*, 3 vols. 4to, and Compendium, 8vo (1872); *Statistical Atlas of the United States* (1874); *The Indian Question* (1874); *The Wages Question* (1876); *Money* (1878); *Money in its Relations to Trade and Industry* (1879); *Tenth Census*, 22 vols. 4to, and Compendium, 8vo (1881-88); *Political Economy* (1883); *Land and its Rent* (1883); "The Eleventh Census" (in *Quarterly Journal of Economics*, January 1888); *International Bimetalism* (1896).] c. F. D.

WALKER, ROBERT J. (1801-1869). American statesman, graduate of the university of Pennsylvania, 1819, was a lawyer at Pittsburg, Pa., 1822-26, removed to Mississippi and took an active part in politics, and opposed nullification. He became United States senator in 1836, and supported Jackson's administration. He became secretary of the treasury under President Polk, and was the author of the tariff act of 1846, based, according to the secretary, upon the following principles:

1. That no more money should be collected than is necessary for the wants of the government, honestly administered.
2. That no duty be imposed upon an article above the lowest rate, which will yield the largest amount of revenue.
3. That below such a rate discrimination be made descending in the scale of duties, or for imperative reasons the articles may be placed on the free list.
4. That the maximum of revenue duties should be imposed on luxuries.
5. That all minimum and all specific duties should be abolished, and *ad valorem* duties substituted in their place, care being taken against fraudulent invoicing and undervaluation, and to assess the duty upon the actual market value.
6. That the duty should be so imposed as to act as equally as possible throughout the union, discriminating neither for nor against any class or section.

The repeal of the English corn laws in the same year, and the Mexican and Crimean wars, co-operated with the reduction of tariffs to open new markets, and the period of 1846-1857—in which year duties were still further reduced—is regarded as unusually prosperous.

Walker was the first to propose the annexation of Texas (1844); he opposed the repeal of the Missouri Compromise (1854), became governor of Kansas (1857), but soon resigned because of opposition to the measures in behalf of slavery in that territory which received the sanction of the administration. He earnestly supported the union on the outbreak of the civil war, and was appointed in

1863 financial agent of the United States in Europe, where he succeeded in negotiating \$250,000,000 (say £50,000,000) of the 5-20 bonds. He was for a time joint editor, and later contributor, to the *Continental Monthly*. He died in Washington, where he had acquired a large law practice on his return from Europe.

E. T. D.

WALLACE, ROBERT, D.D. (1697-1771), one of the royal chaplains for Scotland, and a statistical writer of some repute.

His principal work is, *A Dissertation on the Numbers of Mankind in Ancient and Modern Times, in which the Superior Populousness of Antiquity is Maintained* (1753). The *Dissertation*, which is vigorously argued both on historical and deductive grounds, was written before the appearance of D. HUME's essay, *Of the Populousness of Ancient Nations*, but in an appendix Dr. Wallace endeavours to answer it.

Though he "succeeded in pointing out a few errors in Hume's statements, which were rectified in subsequent editions of the essay, he wholly failed to shake its foundations, or to prove in opposition to Hume that Europe was more populous in ancient than in modern times.

Exclusive of the above, Dr. Wallace published the following works:—*Characteristics of the Present Political State of Great Britain*, 8vo, London, 1758, and *Various Prospects of Mankind, Nature, and Providence*, 8vo, London, 1761. "These works embrace sundry speculations, which evince considerable boldness and ingenuity, on matters connected with the condition and prospects of society, the influence of public debts and taxes, the increase of riches, etc. It has been alleged that MALTHUS was under considerable obligations to some of Wallace's speculations."—M'Culloch, *Literature of Political Economy*.

WALLACE, THOMAS (1769-1844), afterwards Baron Wallace of Knaresdale. Entered parliament 1790; privy councillor, 1801; a member of W. PITT's government, 1804. He was vice-president and chairman of the committee of the privy council formed to consider the state of foreign trade, 1818; master of the mint, 1823; raised to the peerage, 1828.

He had a high reputation as a politician well versed in industrial and commercial matters, and is referred to in M'Culloch's edition of the *Wealth of Nations*, vol. iv. p. 387, as having introduced, in 1821, several important changes into the navigation laws.

WALPOLE, SIR ROBERT, afterwards Earl of Orford (1676-1745), was a statesman conspicuous for his fiscal as well as his general policy. Entering parliament in 1701, he became secretary at war in 1708, and treasurer of the navy in 1710. But shortly afterwards, being found guilty by the House of Commons of "breach of trust and notorious corruption," he was expelled the House and sent to the Tower. By another rapid change of fortune, owing to the fall of Bolingbroke, he became chancellor of the exchequer and first lord of

the treasury in 1715. Difficulties soon arose, however, and in 1717 Walpole resigned office, bringing in a sinking fund bill on the day of his resignation. Three years later he accepted the post of paymaster-general, and after the collapse of the SOUTH SEA scheme the public looked to him to restore order in the national affairs. In 1721 he became first lord of the treasury and chancellor of the exchequer, and from this time until his final retirement in 1742 he was supreme, and practically sole controller of the destinies of England.

In some respects the economic measures of Walpole were in advance of his time, but his handling of the public debt and his exchequer schemes have been severely censured. When Walpole first came to the treasury in 1717, the national debt stood at £54,000,000, bearing an average interest of between 6 and 7 per cent. He produced a plan for reducing the interest and establishing a sinking fund for the redemption of the principal. But the net result in ten years was only a decrease of the debt by about two and a half millions. Professedly adhering to the policy of the sinking fund, Walpole effected a further reduction of interest from 5 to 4 per cent. Yet in contradiction to his own policy, he proposed in 1733 to take half a million from the sinking fund for the service of the year. To disarm opposition, he threatened parliament that if they would not let him have the money he would raise the land tax from one to two shillings in the pound. After this the sinking fund was constantly invaded, so that by the end of 1739—after seventeen years of peace—the whole sum extinguished was no more than £8,328,000, leaving a capital debt of nearly £47,000,000.

When Sir John BARNARD proposed in 1737 to reduce the interest on the national debt to 3 per cent, and to enforce the compulsory redemption of certain annuities existing at a higher rate, Walpole opposed the scheme. He not only argued that the reduction of the income of a considerable number of persons by one-fourth would prove a serious loss and embarrassment, but foreseeing an early war with Spain, he was anxious to keep on good terms with the moneyed interest, and to maintain the public faith with the national creditors.

Walpole's commercial policy was, generally speaking, wise and far-seeing. As early as 1721 he placed this important reference to the extension of commerce in the king's speech: "It is very obvious that nothing would more conduce to the obtaining so public a good, than to make the exportation of our own manufactures and the importation of the commodities used in the manufacturing of them, as practicable and as easy as may be." This is regarded as the first distinct assertion of those enlightened

trade principles which half a century later found expression in Adam Smith's great work. Moreover, in this same session of 1721 Walpole persuaded parliament to remove the export duties from one hundred and six articles of British manufacture, and the import duties from thirty-eight articles of raw material.

In 1730 Walpole passed an act allowing the Carolina and Georgia planters to export their rice direct to any port in Europe south of Finisterre, provided they sent it in British ships, manned by British sailors. Consequently, the rice of the American plantations beat the rice of Egypt and Northern Italy out of the markets of Europe. At a later stage Walpole carried a measure for allowing the West India traders to export sugar direct to foreign countries, provided it were in British bottoms, and without first landing it in British ports. The result of these and similar measures was, that in twenty-five years after Walpole left the treasury, the total export trade from England with all parts of the world had risen from £6,000,000 per annum to more than £12,000,000. The minister declared that his object had always been to encourage colonial commerce because the greater the prosperity of the colonies the greater would be their demand for English goods.

Walpole's scheme for extending the excise was the one which of all others was the most canvassed. Its most important feature, the facility for warehousing imported goods for re-exportation free of duty, had been for some time in operation in Holland.<sup>1</sup> The bill introduced to the House of Commons in 1733 was in effect one to turn the customs duty on the importation of tobacco into an excise duty on its consumption. Walpole claimed that this policy, besides simplifying rates and putting an end to frauds upon the revenue, would practically make London a free port, and constitute it the market of the world.

But the Tobacco Bill was violently opposed. The country rang with the cry of "no slavery, no excise, no wooden shoes." Members of parliament were blockaded at the House of Commons, and the whole nation was in an uproar. Yet such was the personal power of Walpole that the first resolution was carried by 266 to 205. The opposition waxed fiercer and fiercer, until on the main question the government majority sank to 17. Then, perceiving that the act could not be carried into execution without an armed force, the minister abandoned the bill. His sensible statesmanship came into play, for he knew that England could be governed without an excise on tobacco; and while he was perfectly convinced of the wisdom of his fiscal policy, he foresaw greater dangers to the state by insisting on its adoption than could possibly result from its postponement.

<sup>1</sup> The "famous excise scheme of Sir Robert Walpole" is commended by A. Smith (*Wealth of Nations*, bk. v. ch. ii.; McCulloch (*Literature, Pol. Econ.*, p. 324), speaks of it also in the highest terms, and says "its adoption would have been of the greatest advantage to the commerce and revenue of the country." (See BONDED WAREHOUSES; WAREHOUSING SYSTEM.)

Taking his fiscal policy as a whole, economic writers agree that Walpole was the greatest commercial minister that the country had seen down to his own time. Yet besides other rebuffs which he sustained, in 1723 he was compelled to withdraw the grants for Wood's halfpence on the storm raised by Swift's *DRAPIER'S LETTERS*, and he lost credit by his peaceful foreign policy. After he went to the Upper House charges of bribery were brought against him, but although a committee of investigation reported against him, the charges were ultimately dropped. There was in this great statesman a strange blending of personal power with liberal instincts.

[Coxe's *Memoirs of Sir Robert Walpole*.—John Morley's *Walpole* in "Twelve English Statesmen." The Histories of Stanhope and Lecky.—Somers's *Tracts*.] G. B. S.

WALRAS, ANTOINE AUGUSTE (1801-66) was born at Montpellier. In 1831 he became professor of rhetoric at the college of Évreux, and soon afterwards published his first book on political economy. In 1835 he went to Paris as professor of political economy at the Athénée, and was afterwards professor of philosophy and of French literature at Caen.

A. A. Walras was one of the first economists who perceived that value was not determined by utility. He was led to the study of economics from the study of the theory of property. The key to his system is clearly given in one sentence in his earliest book. "Mais l'idée de l'échange implique celle de la propriété, et la propriété elle-même suppose un fait très important et qui jusqu'ici a malheureusement échappé à l'observation des économistes; c'est la limitation de tous les objets qu'on peut s'approprier et qu'on peut donner ou recevoir en échange." He proceeds to explain that value does not come from utility or from cost of production, but from *rareté*, or as we should now say marginal utility (see FINAL DEGREE OF UTILITY, and MARGIN). But it is not quite certain that he completely appreciated exactly what this *rareté* or marginal utility is. His more precise description of it is not very satisfactory. "La rareté n'est et ne peut être autre chose que le rapport qui existe entre la somme des biens limités et la somme des besoins qui en réclament la jouissance." That is to say, in mathematical language, he regards final utility as a ratio rather than as a differential coefficient. On the other hand, there are many passages in his writings in which he appears to be on the point of enunciating in precise language the more correct views that are now associated with the name of his son LÉON WALRAS (*q.v.*) and JEVONS. It is difficult to form an estimate of the importance of his work, but it is probable that political economy would have got on the right lines at an earlier stage than it did if economists had been properly conversant with his works. As a critic of the works of others he is acute rather than sympa-

thetic, but always generous. His writings are unfortunately very rare; the subjoined list of his published economic writings is possibly very imperfect; but a perusal of his earliest book is quite sufficient to show that he was a man of great originality of thought, and that he expressed his views in a clear style. Probably some of his unpublished ideas are to be found in the writings of his son.

*De la nature de la richesse et de l'origine de la valeur*, Paris, 1831.—*De la connexité des connaissances humaines et des progrès scientifiques, en général, et en particulier de l'influence que l'étude de l'Économie politique est appelée à exercer sur l'avancement des sciences morales et historiques*, Evreux, 1833 (the opening lecture of his course on political economy).—*De la richesse sociale, ou de l'objet de l'Économie politique*, Paris, 1848.—*Théorie de la richesse sociale, ou résumé des principes fondamentaux de l'Économie politique*, Paris, 1849.—*Mémoire sur l'origine de la valeur d'échange ou Exposition critique et réfutation des opinions les plus accréditées chez les Économistes* (read at the Académie des sciences morales et politiques, 15th September 1849, and published in their proceedings).—*Considérations sur la mesure de la valeur et sur la fonction des métaux précieux dans l'appréciation de la richesse sociale* (published in the *Revue mensuelle d'Économie politique*, vol. 5). C. P. S.

WALRAS, MARIE ESPRIT LÉON (b. 1834), the son of A. A. WALRAS, was born at Evreux. He studied mathematics and published his first book on political economy in 1860, was professor of political economy at Lausanne from 1870 till 1892, when he resigned and was succeeded by Vilfredo Pareto. During the years 1866-68 he edited "*Le Travail, organ international des intérêts de la classe laborieuse revue de mouvement coopératif*," and wrote many articles in it.

M. Léon Walras may be justly considered as the heir to his father's ideas. How much he derived from his father is a matter of conjecture, because his own generous expressions in reference to his father's work probably overstate his indebtedness. Yet in his earlier writings it is clear that the debt is a large one in spite of the fact that he has succeeded in constructing and developing an economic system where his father failed. In spite of the lucid style of A. A. Walras's books, considerable doubt is still left in the mind of the reader as to the precise nature of *rareté*. M. Léon Walras, using mathematical symbols, succeeded in making the conception a clear one; and it is as a mathematical economist that M. Léon Walras is most widely known. It is difficult for the younger generation, at the present day, to realise what was the state of economic science in the days before W. S. JEVONS in this country, and M. Walras on the continent, familiarised students with the use of exact reasoning in economic science expressed in the elegant language of mathematics.

Errors in pure economics are due to either incorrect assumptions or invalid deductions. Many writers succeed in entangling their assumptions and deductions. The use of mathematical symbols enables the reader to see clearly what the underlying assumptions are, and then to follow easily the logical deductions from those assumptions. The use of mathematics is the best means of getting rid of both inaccuracy of assumption and looseness of deduction.

The greatest achievement of M. Léon Walras is his discovery of the fact that value in exchange is determined by marginal utility or *rareté* (see FINAL DEGREE OF UTILITY; MARGIN). He shares this honour with H. H. GOSSEN (*q.v.*) and W. S. JEVONS. The question of the priority of the respective discoveries of these three economists is unimportant because each made his discovery without being aware of the work of the others. M. Walras appropria the honours as follows:—

"Gossen et M. Jevons ont trouvé avant moi l'expression mathématique de l'utilité et formulé la condition d'un maximum d'utilité dans l'échange, par un individu, d'une marchandise contre une autre; c'est une chose incontestable. M. Jevons semble disposé à concéder à Gossen une certaine supériorité sur le premier point et à se l'attribuer à lui-même sur le second. Il a raison: Gossen n'a formulé que la condition du maximum absolu; c'est lui, Jevons, qui, le premier, a formulé la condition du maximum relatif coexistant avec l'égalité de l'offre et de la demande. Seulement ils se sont arrêtés là tous les deux en ce qui concerne même le cas de l'échange de deux marchandises l'une contre l'autre en nature. Ni Gossen ni M. Jevons n'ont même abordé la question de la détermination du prix courant de chacune de ces deux marchandises l'une en l'autre en supposant une nombre indéfini d'échangeurs en présence. Or c'est là précisément l'une des deux questions par moi résolues dans mon mémoire intitulé "Principe d'une théorie mathématique de l'échange" (Août 1873) et d'où il résulte que l'on obtient le prix courant par la hausse en cas d'excédent de la demande effective sur l'offre effective et par la baisse dans le cas contraire."

The equations of statical equilibrium are now the commonplaces of economic text-books, but in the matter of the dynamics of economics—how these equations are attained in practice—M. Léon Walras has been subjected to some criticism (see an article by Professor Edgeworth in the *Revue d'Économie Politique*, Jan. 1891).

M. Léon Walras's system of economics is contained in his *Éléments d'économie politique pure*, *Études d'économie politique appliquée* and *Études d'économie sociale*. It is difficult to exaggerate the advantage of making in this manner a vivid distinction between pure and applied economics, and also again between applied economics and what may be termed politics. If all economists had been careful to make this distinction, much of the abuse that has fallen on the "dismal" science would have been spared us.

On four subjects M. Léon Walras's views are of peculiar interest, because they are not altogether in agreement with those generally held.

On the question of land M. Walras is with the land nationalisers. He discusses Gossen's views most exhaustively, and then develops a scheme of his own by which the state is to purchase the land. His treatment may be commended to politicians.

On the question of currency he has a scheme of his own. It is that of a gold currency, supplemented by a token currency of silver in such a manner as to keep the level of prices steady. In M. Walras's own words "Tout serait pour le mieux si la rareté de la marchandise numéraire et monnaie variait comme la rareté moyenne de la richesse sociale. L'or, pas plus qu'aucune marchandise quelconque, ne saurait prendre naturellement une telle variation de rareté et de valeur; mais on peut la lui imprimer artificiellement en adjoutant à la circulation monétaire ou en en retenant, selon les besoins, des écus d'argent. Et c'est à quoi j'ai démontré qu'on arriverait précisément en faisant ces additions ou ces soustractions de façon à ce que le prix moyen de la richesse sociale en la marchandise numéraire et monnaie ne variât plus. Sans doute il est évident qu'on ne peut pas ajouter à la circulation monétaire ou en retrancher des écus d'argent de façon à prévenir toute variation du prix moyen de la richesse sociale en or; mais il semble qu'on pourrait le faire de façon à ramener périodiquement ce prix moyen à la constance en adjoutant des écus quand il tendrait à hausser."

Finally, on the allied questions of both justice and taxation M. Walras's views are of great interest. Roughly speaking, he attempts a synthesis of interest and justice, and would solve the question of taxation by the method of land nationalisation. Any account of his views on these points that could be given here would necessarily be so brief as to be misleading.

The general characteristics of M. Walras's writings are (1) the use of the mathematical method wherever additional clearness can be attained thereby; (2) great care in distinguishing theory and practice; (3) a great interest in what, for want of a better word, may be termed sociology. The subjoined bibliography will serve to indicate the great number of his interests, and the fact that many of his articles have appeared in newspapers is a guarantee of his interest in the topics of the day. M. Léon Walras cannot be considered to belong to any special school of economics, unless he is a founder of one; his attitude is scientific. In one of his latest publications he says, "We count to-day I do not know how many schools of political economy. . . . For me, I recognise but two: the school of those who do not demonstrate, and the school—which I hope to see founded—of those who demonstrate their conclusions." In every way this utterance is thoroughly characteristic of the man.

As to the final effect of M. Léon Walras's works, it is perhaps at present too early to judge; but whatever may be the judgment of posterity in regard to some of his views, it is clear that in the history of economics his name will always be

associated with those of Gossen and Jevons as one of the discoverers of the key to economic science.

*Note.*—In many cases M. Walras has incorporated in his books articles which have been previously published. The articles which are substantially incorporated in this way are referred to under the book, and are omitted from the list of separate articles.

*L'économie politique et la justice.* Examen critique et réfutation des doctrines économiques de M. P.-J. Proudhon, précédées d'une *Introduction à l'étude de la question sociale*, Paris, 1860.—*Théorie critique de l'impôt*, précédée de *Souvenirs du Congrès de Lausanne*, Paris, 1861.—*De l'impôt dans le canton de Vaud*. Mémoire auquel un quatrième accessit a été décerné ensuite du concours ouvert par le conseil d'État du canton de Vaud sur les questions relatives à l'impôt, Lausanne, 1861.—*Les associations populaires de consommation, de production et de crédit*. Leçons publiques faites à Paris en janvier et février, 1865, Paris, 1865.—*Des opérations de la Caisse d'escompte des associations populaires*, Paris, 1866.—*La Bourse et le Crédit à Paris*, Paris-Guide, 1867.—*Discours d'installation* en qualité de professeur ordinaire d'économie politique à l'académie de Lausanne, 1871.—*Éléments d'économie politique pure ou théorie de la richesse sociale*, Paris, 1st ed. 1st part, 1874; 2nd part, 1877; 2nd ed., Paris, 1889; 3rd ed., Paris, 1896. The second edition contains *Théorème de l'utilité maxima des capitaux neufs* (Revue d'économie politique, June 1889). The third edition contains *De l'échange de plusieurs marchandises entre elles* (Société des Ingénieurs Civils de Paris, 1890), *Théorie géométrique de la détermination des prix* (Recueil inaugural de l'Université de Lausanne, 1892), *Observations sur le principe de la théorie du prix de MM. Auspitz et Lieben* (Revue d'économie politique, 1890), and *Note sur la réfutation de la théorie anglaise de fermage de M. Wicksteed* (Recueil publié par la Faculté de Droit de l'Université de Lausanne, 1896).—*Théorie mathématique de la richesse sociale*, Paris, 1883, contains *Principe d'une théorie mathématique de l'échange* (Proceedings of the Académie des Sciences morales et politiques, Jan. 1874), *Correspondance entre M. Jevons et M. Walras* (Journal des Économistes, June, 1874), *Équations de l'échange*, *Équations de la production*, *Équations de la capitalisation et du crédit* (Proceedings of the Société vaudoise des sciences naturelles, Nos. 76 and 77), *Théorie mathématique du bimétallisme* (Journal des Économistes, 1876, 1881, 1882), *Théorie mathématique du billet de banque*, *Théorie mathématique du prix des terres et de leur rachat par l'état* (Proceedings of the Société vaudoise des sciences naturelles, Nos. 83 and 85). The first four of these articles have been translated into Italian, sub tit.: *Teoria matematica della ricchezza sociale* 1878, and into German, sub tit.: *Mathematische Theorie der Preisbestimmung der wirtschaftlichen Güter*, Stuttgart, 1881.—*Études d'économie sociale* (*Théorie de la répartition de la richesse sociale*), Paris, 1896, contains *Socialisme et libéralisme* (Le Travail, 1866, 1867), *Théorie générale de la société* (lectures delivered at Paris, 1867-68), *Méthode de conciliation ou de synthèse* (Revue Socia-

liste, 15 April 1896), *Théorie de la propriété* (Revue Socialiste, 15 June, 15 July, 1896), *La question sociale* (Gazette de Lausanne, 22 July, 1880). *De la propriété intellectuelle* (*Ibid.* 10, 11, 12 June, 1880), *Théorie mathématique du prix des terres* (see above), *Un économiste inconnu, H. H. Gossen* (Journal des Économistes, April, May, 1885), *De l'impôt sur le revenu et de l'impôt sur le capital* (part of the two brochures on taxation, see above, 1861), *Le cadastre et l'impôt foncier* (Bibliothèque universelle, Nov. Dec. 1873), *Le problème fiscal* (Revue Socialiste, 15 Oct., 15 Nov. 1896). — *Études d'économie politique appliquée*, Paris, 1898, contains *Monnaie d'or avec billon d'argent régulateur* (Revue de droit international, Dec. 1884), *Mesure et régularisation des variations de valeur de la monnaie* (Société vaudoise des sciences naturelles, 1885), *Théorie de la monnaie* (Paris, 1886), *Le problème monétaire* (Revue d'économie politique, 1887; Gazette de Lausanne, 24 July 1893, 27 Feb. 1894; and *Revue Socialiste*, 15 July 1895), *L'état et les chemins de fer* (Revue du droit public et de la science politique, May-June, July-August 1897), *De l'influence de la communication des marchés sur la situation des populations agricoles* (Société vaudoise d'utilité publique, 1874), *L'économie appliquée et la défense des salaires* (Revue d'économie politique, December 1897), *Théorie du libre-échange* (*ib.*, July 1897), *Théorie du crédit* (*ib.*, Feb. 1898), *Théorie mathématique du billet de banque* (Société vaudoise des sciences naturelles, 1879), *La Caisse d'épargne postale de Vienne et le Comptabilisme social* (Revue d'économie politique, March 1898), *La Bourse, la spéculation et l'agio* (Bibliothèque universelle, March and April 1880), *Esquisse d'une doctrine économique et sociale*. WALSH, SIR JOHN BENN (1798-1881), created Lord Ormathwaite (1868), an Irish, Welsh, and English landowner, and M.P. for Sudbury (1830-34) and Radnorshire (1840-68), wrote several Tory essays in which he combated De Tocqueville's fatalism and Macaulay's optimism with arguments resembling those afterwards used in Sir H. Maine's *Popular Government*. His economical work—*Poor-Laws in Ireland considered in their Probable Effects upon the Capital, the Prosperity, and the Progressive Improvement of that Country* (1830, 3rd ed., 1831), opposed the introduction effected in 1838 of poor-laws into Ireland; since (1) there was no middle class to work them properly, and as for landlords, "no man of education with the habits and feelings of a gentleman could submit to the endless drudgery, the constant sifting of unfounded claims" (p. 74); (2) therefore they would be used to spoil the landlords and drive away capital, and (3) increase improvident marriages, which were Ireland's bane. His positive remedies were: leave all to time; let the landlord do without the middleman lessee, and hire good small farmers, etc. Despite his aristocratic bias he was an able, judicious writer. J. D. R.

WALSH, RICHARD HUSSEY (1825-1862), born in King's County, Ireland, was educated altogether by his mother until he entered Trinity College, Dublin, where he highly distinguished himself in mathematics, obtaining a gold medal at the degree examination of 1846, when, it is interesting to observe, Cliffe Leslie also graduated with high honours in logic and ethics, and W. E. Hearn with like distinction in classics. In 1851 Walsh was elected by

competitive examination to the Whately professorship of political economy; his professorial term expired in 1856, when he was succeeded by J. E. CAIRNES. He afterwards went out to Mauritius as a commissioner of education, and, whilst there, was also employed in organising the postal service and taking the census of the island. He died at Port Louis in the 37th year of his age.

He was a man of sincere and earnest nature, and of great intellectual solidity, clearness, and force. He knew accurately whatever he professed to know. His most important publication was an *Elementary Treatise on Metallic Currency*, being the substance of a course of lectures delivered in Trinity College, 1853, which is still well worth reading for its statement and proof of the true doctrine of money. He was for some years an active member of the statistical and social inquiry society of Ireland, and contributed to its *Transactions*, besides other papers, the following: "The price of silver of late years does not afford an accurate measure of the value of gold" (read also before the British Association in 1855), and "Observations on the gold crisis, the price of silver, and the demand for it" (1856).

[This notice is founded on personal knowledge and family communications.] J. K. I.

WANTS. See DEMAND; LUXURY.

WARD, BERNARDO (died about 1760). Irish by descent, Ward travelled from 1750 to 1754 through Europe on a mission from King Ferdinand VI. of Spain to study the means of remedying the state of the poor, and to promote trade and manufactures in Spain. On his return he was appointed minister of trade and of the mint, and director of the royal glass works in San Ildefonso.

He published the results of his travels of economic exploration in the *Proyecto económico en que se proponen varias providencias (measures) dirigidas á promover los intereses de España*, published posthumously in 1762. It is, perhaps, the best digested and most methodical book written on these topics in Spain during the last century, giving a clear insight into the causes of the decay of the country, which, like his predecessors, UZTARZ and ULLOA (*q.v.*), Ward ascribes to the neglect of trade and industry, and to the absurd system of taxation which had prevailed for more than two centuries. Like them, Ward is a mercantilist, but more discriminating and less extreme; thus he allows that, Spain being a silver-producing country, consideration ought to be taken of this fact when examining the figures of the balance of Spanish trade (p. 131); he concludes that a wholesale prohibition of foreign articles ought to be deprecated.

As measures of reform, Ward suggests:—

1. The appointment of *Comisarios de Visita*, entrusted with the personal management of a thorough enquiry made on the spot throughout Spain and America, and directed to point out

the public works which ought to be done by the state, and those which ought to be left to the care of municipalities or private persons.

2. The foundation by the state of a Land Bank taking money on deposit at 4 per cent, and lending it out on mortgage.

3. The suppression of the exorbitant export duties levied on Spanish manufactures sent to the colonies.

4. Exemption of national manufactures from inland taxation.

5. Inviting industrious foreigners to settle in Spain.

6. The adoption of the English system of free inland trade in corn and bounties on export.

7. The suppression of crafts and brotherhoods (*Gremios y hermandades*), of the privileges of the MESTA, and of all exclusive privileges generally.

For America he proposes, amongst other measures, to grant natives the freehold of certain portions of land.

Ward's views on the poor were first made known in a tract called *Obra Pia*, published in 1750, and which is added as an appendix to the *Proyecto Económico*. He considers that the total sums distributed in Spain as alms would afford ample means to provide for the poor in a more rational and efficient way; excepting, perhaps, some initial funds needful to build hospitals in places devoid of these institutions, these might be obtained by state LOTTERIES. All the moneys thus collected, or hitherto given out to beggars, ought to be henceforth made over to the *Hermandad de la Obra Pia*, a brotherhood to be founded comprising all charitable people, especially the clergy, and to be locally managed by the parochial clergy. Disabled poor were to receive alms or outdoor relief in the place of their birth, under a law analogous to the English law of parish settlement, after a delay of six months. Able-bodied poor and vagrants ought to be shut up in hospitals and obliged to work for their livelihood.

Ward often holds up England as a model; thus he proposes the foundation of a *Junta de Mejoras* (board of improvements) on the lines of the Royal Society of Dublin.

E. Ca.

WARD-PENNY. This word has two entirely different significations. (1) The Customary of the Soke of Rothley (*Archæologia*, xlvii. 128) explains it thus: *Wardpenny. Hoc est cum animalia capta sint per ministros regis*. In this sense, therefore, it is a payment to free cattle impounded by the king's officers, and in the *Rotuli Hundredorum* (ii. 472) the lord of a certain manor pays probably on this account, *xxxiij de wardpenn domino regi*. (2) In Domesday Book (i. 190) there is an entry: *reddebant warpenam . . . aut custodiam faciebant*; but the Rothley Customary applies

the term *wardwyte* to the *nummus* . . . *pro warda*, the payment in lieu of keeping watch and ward. *Warda et Wardpani* occur in the charter of Henry II. to Waltham Abbey. (*Monast. Anglic.* (ed. 1673), ii. 14 b. 40.)

R. H.

#### WARDEN OF THE STANDARDS. See STANDARDS.

**WARDS.** Under the feudal system each knight's fee was held by the service of attending the overlord in war for forty days in each year if required, and therefore, on the death of the holder of a *feodum militare*, leaving children under age, some one was needed who could undertake the service due from the land during the minority of the eldest son, or until the heiress could be married to a husband who could perform the requisite knight-service. The person who assumed this lucrative responsibility, and became guardian in chivalry in the case of tenancies *in capite*, was usually the king himself, in other cases the overlord. The guardian took the profits of the land during the minority, providing for the performance of the required services, maintaining and educating the heir, and retaining for himself the surplus. When male heirs reached the age of twenty-one, or females that of sixteen, they could, on payment of half a year's profits, claim to be put in possession of their property.

For other details, see **KNIGHT'S SERVICE**; **MARRIAGE (FEUDAL SYSTEM)** and **MARITAGIUM**. R. H.

**WAREHOUSES.** See **WAREHOUSING SYSTEM**.

#### WAREHOUSING SYSTEM.

Warehousing System, p. 657; Warehousing System, United States, p. 658.

**WAREHOUSING SYSTEM.**—Technically speaking, warehoused goods are those which on importation or manufacture become liable to customs or excise duties, and hence are placed in bond for the safety of the revenue (see **BONDED WAREHOUSES**); and because it is to the interest of both importer and consumer that the duties should not be levied until the goods are wanted for consumption, the privilege of having the goods retained in the custody of the crown was highly valued, not only because the payment of the tax, which often far exceeded the original value of the article, was thus deferred, but because the arrangement saved the duty on that which was wasted or deteriorated. It also avoided the necessity for claiming a drawback on that which might be re-exported, and therefore was not amenable to payment of duty.

It hence became necessary that there should be set times and places at which the landing, examination, and assessment of duty should take place; naturally the goods would remain there until wanted by the retailer or ultimate purchaser. The maximum of security and convenience was attained in the docks (see

Dock), where spacious quays and warerooms were available and guardianship easily exercised. For many purposes, however, it was desirable to have readier access to the goods, and this would be obtained by their deposit at some of the numerous warehouses or bonding places, many of which had existed before docks were formed. As trade extended, a fierce competition, in London at least, sprung up between the legal quays or sufferance wharves and the docks. This pertained not only to goods on which the crown had a charge, but to all others as well, for it is evident that to secure such payments as were due on some things, the examination of all became requisite, otherwise none would have been taxed. The restriction, therefore, of absolutely free landing of even free goods was essential, and the saving of labour and expense led to the most convenient places being chosen, and the retention of the goods in the warehouses there, until they could be made use of, naturally followed.

It is in London, Liverpool, and the larger ports that the warehousing system has reached its greatest development. There the merchant or owner has his goods at all times practically as much under his own control as at his own door. For the purposes of sale they can be sampled or inspected, while every facility exists for speedy removal and distribution when sold. They can be stored in buildings or floors most suited to their proper preservation; insurance against fire or depredation can be effected completely, all this at a minimum of cost with freedom from the responsibility of personal supervision or the trouble of constant reception and delivery. It affords a good instance of **DIVISION OF LABOUR** (*q.v.*), without which the large and intricate operations of trade could scarcely be carried on. At the same time it has tended to the security of the revenue and lessened the cost of collection. It used to be thought necessary to have warehouses of "special security" carefully guarded by the customs or excise officers. Now the same care which is needed for the custody of the goods serves in great measure to save risk of dutiable goods from passing into the hands of those who evade payment of the duties. A comparatively cursory inspection serves to discover any error which has taken place in their removal, and should such occur it is easily traced and rectified.

The process is very simple. On the arrival of the ship the merchant or his agent having, on entering his goods at the custom house, declared the warehouse in which they are to be placed, they are either landed on the quay adjacent to the place of storage or transhipped into barges or trucks for conveyance to their destination. When wanted, a delivery order, preceded by payment of duty, where such is leviable, admits of ready despatch to any needed place at home or abroad, by any suitable or desired means of conveyance, with such economy of time and cost as either cheapens the price or enhances the profit of the transaction.

Two circumstances have contributed to the

removal of many of the warehouses to a distance from the place of sale. With the enlargement of trade it has been necessary to go further afield, and with the increased size of the vessels to build docks more suitable for their reception. For London ships there are warehouses as far down the river as Tilbury, 22 miles, and wharves close up to London Bridge. In Liverpool they are being driven further and further up the Mersey, and now, by means of the ship canal, are provided as far up as Manchester.

London has 7 docks with numerous warehouses, 8 legal quays, and 36 sufferance wharves, at which both free and dutiable goods may be landed and warehoused. It has also 38 up-town warehouses and vaults to which dutiable goods may be removed for warehousing—in all 112 such places for the deposit of goods on which the duties are not yet paid. Liverpool has 114, and other towns 476—making 702 for the United Kingdom.

The excise warehouses, 419 in number, are mainly for retaining beer and spirits produced at the breweries and distilleries until the duties are paid, but some of them are open for the reception of customs dutiable goods, and *vice versa*. British spirits can be bonded in customs warehouses (see BONDED WAREHOUSES). S. BO.

WAREHOUSING SYSTEM, UNITED STATES. Until 1842 importations of goods into the United States were given credit upon the entry of merchandise. By the Tariff Act of 30th August 1842, § 12, it was provided that the duties should be paid in cash. In case of failure the goods should be taken possession of by the collector of customs and deposited in public stores, to be sold at public auction if not redeemed before sixty days. A careful investigation was then made of the warehousing system as it existed in Great Britain, France, and Belgium, resulting in the act of 6th August 1846, establishing a complete warehousing system, and permitting goods to remain in bond in public warehouses for a period of not longer than one year (see *Report of Secretary of the Treasury*, 8th December 1847, where interesting facts are given in regard to the system as then developed in England; also *Report on the Warehousing System*, 22nd February 1849). This system was again extended 28th March 1854, providing for the establishment of private warehouses, and extending the period of deposit to three years. In 1861 "a severe attack was made on this system as merely another method of giving credits on imports." It was defended on the ground that "it gave our merchants the advantage of storing on this side instead of the other, and making our cities (instead of foreign ports) the great storehouse of the country's goods." In spite of certain modifications the principle prevailed. At the present time there are six classes of warehouses designated as follows:—

1. Stores occupied by the United States.
2. Stores occupied by importers exclusively

for the storage of goods imported by or consigned to them, or purchased by them in bond.

3. Warehouses occupied for the general storage of goods.
4. Yards or sheds for storage of heavy and bulky goods.
5. Bins or parts of buildings for the storage of imported grain.
6. Warehouses exclusively for the manufacture of medicines, cosmetics, and the like, and warehouses exclusively for the cleaning of rice.

[See for present administration, W. Elmes, *Law of the Customs*, ch. x., for early period.—Bolles, *Financial History of the United States, 1789-1861*, ch. ix.; also "History of Tariff Administration in the United States," by J. D. Goss, in *Studies in History, Economics, and Public Law*, Columbia College, New York, vol. i. No. 2.]

D. R. D.

WARRANTICE (Scots law). In a conveyance, an obligation to indemnify against loss arising from the act of the grantor or from defect in the title as the case may be. A. D.

WARRANTS are documents of title referring to goods stored in docks and warehouses. They are not, strictly speaking, negotiable instruments, but owing to the provisions of the Factors Act 1889, persons advancing money on the security of such warrants have been made more secure than they were under the former law (see COMMERCIAL INSTRUMENT; FACTORS ACTS). E. S.

WARRANTY. In the Sale of Goods Act 1893 warranty as regards England and Ireland is defined as an agreement with reference to goods which are the subject of a contract of sale, but collateral to the main purpose of such contract, the breach of which gives rise to a claim for damages, but not a right to reject the goods and treat the contract as repudiated. As regards Scotland a breach of warranty shall be deemed to be a failure to perform a material part of the contract.

[Anson, *Contracts*, Oxford, 1893, gives six different senses in which the word has been used.—Chalmers, *Sale of Goods Act 1893*, London, 1894, discusses the meaning of the term at length.] J. E. C. M.

WARREN, JOSIAH (1799-1874), was a citizen of the New Harmony of R. OWEN (1825-26). He then opened a "time store" or "cost grocery" in Cincinnati (1827); then in Tuscarawas; then in Mount Vernon; then (1842-44) in New Harmony. In 1847 he snatched four families from the Fourierist wreck at Clermont, and started an "equitable village" "on the principle," says M. Conway, "that each person shall mind his own business," first in Utopia, then (1851) in Modern Times, Long Island. The latter, in 1857, numbered "less than a hundred cottages" whose inmates "agreed only to differ." The civil war broke up this embodiment of *Mill On Liberty*, and in 1863 some had fled to South America; S. P. Andrews, the American Comte, was in New York; T. L. Nichols in England; while

Warren fulminated against nationalism and the Northerners from Boston. H. Edger was the only leader who remained, and he preached positivism to the desert air.

Warren's creed was formed in 1827, and expressed in many lectures and in two books—*Equitable Commerce* (1846, 1852) and *True Civilisation* (1863)—and consisted of two articles: (1) "The Sovereignty of the Individual to be exercised at his own Cost"—not at others' cost, for this was "encroachment," and should be restrained. Like H. Spencer (1857) he and Andrews (1846, 1851) deduced this maxim from a universal law of "disintegration," i.e. differentiation, whereby every function of the state would gradually peel off, each man would become a sect and nation to himself, and "may" would take the place of "shall." (2) The second article, "Cost the Limit of Price," was early-Owenite, and may be construed, "charge co-operative prices." Attendance, including the expense of preparatory education (Andrews, *The Science of Society* (1853), ii. 96), was often paid for by a time note (see LABOUR EXCHANGE). H. Edger treated this as a system for merely "moralising" industrial relations; but Warren, like Owen, hoped it would some day supersede money, interest on money, and unequal rewards for labour; though he confessed that its brief successes were due to "equitable competition," i.e. underselling, and "co-operation"; but the co-operative link was moral, not material; joint property was abhorred. As at New Lanark, stores, etc., were proprietary.

Conway, *Fortnightly Review*, i. 421. For remarks on these writers see Warren's and Andrews' works).—S. P. Andrews, *Basic Outline of University* (1872), pp. 31-34.] J. D. R.

WARREN. See FORESTS, MEDIEVAL.

WARVILLE. See BRISSET DE WARVILLE.

WASTE. A technical term of English law to signify certain acts beyond the competence of a tenant for life of real estate. Not merely wanton injury to the estate, but such acts as cutting down timber, ploughing up meadow land, or opening new mines, came under this description. If, however, the settlement declared that the tenant for life should be *unimpeachable for waste*, such acts were within his right. Even then, however, the court of chancery would hinder him from destroying ornamental timber, or pulling down or defacing the mansion. Acts thus inhibited by the chancellor in his equitable jurisdiction were comprised under the description of *equitable waste*. By the judicature act of 1873 the rules of equity prevail over the rules of common law in every case where they conflict (see Bewes, *On Waste*). F. C. M.

WASTE. See FORESTS, MEDIEVAL.

WASTE LANDS ENCLOSING. See ENCLOSURES.

WASTE PRODUCTS. See RESIDUAL AND WASTE PRODUCTS.

WATERING STOCK, a slang expression, used to denote a well-known device of company promoters. A company is made to sell its undertaking to a new company for a sum considerably exceeding the capital of the old company, and the part of the capital of the new company not required for the shareholders in the old company is issued to the public (e.g. a company having a capital of £20,000 sells the undertaking for £100,000, each shareholder in the old company receiving shares for five times the nominal amount of his former holding, and shares for £50,000 are issued to the public. In this case the new company has a capital of £150,000, of which £50,000 are represented by cash paid by the new shareholders, whilst the other £100,000 represent an original payment of £20,000 only). The expression "watering" is used by way of analogy to the addition of water to wine of which wine-merchants and inn-keepers are sometimes accused. E. S.

WATTEVILLE, ADOLPHE DE GRABE, BARON DE (1799-1866), inspector general of public charity in France, and one of the ablest administrators in that department. He supported decentralisation in these matters, and spoke, 10th February 1851, before the French society of political economy against state charity; though he would have allowed the state the right of supervision and control.

The principal of his works and numerous reports are:—*Codes de l'administration charitable*, 8vo, 1st. ed. 1841, 2nd ed. 1847.—*Législation charitable*, 1st ed. 2 vols., 1843-46, 2nd ed. 1 vol. 8vo, 1847.—*Du sort des enfants trouvés et de la colonisation agricole*, 8vo, 1848.—*Essai statistique sur les établissements de bienfaisance*, 1st ed. 1847, 2nd ed. 1849. A. C. F.

WAY, RIGHT OF. A right of way, in the strict sense, is the right of the owner of a specified piece of land (called the dominant tenement) to pass over another specified piece of land (called the servient tenement), but in popular language the expression is frequently used in respect of the right of the public to use a road, footpaths, or bridle-paths passing through enclosed property. These roads or paths are in legal phraseology called "highways," and are as much public roads as any main roads, except in so far as they cannot be used for certain kinds of traffic. A right of way, in the strict sense, is acquired by express or implied grant, or uninterrupted user during a period of at least twenty years. On the other hand, a highway is created by dedication to the public on the part of the owner, and such dedication is presumed from an uninterrupted use by the public during such period of time as under the circumstances appears reasonable. If the act of dedication be unequivocal, the right may arise immediately, in other cases six years, or even shorter periods,

have been held to be sufficient. The duration of the user is not as important as the nature of the acts done by the owner of the soil, and of the adverse acts acquiesced in by him. A highway, whether a footpath or carriage road, must not be used for any purposes except one of the usual purposes for which a highway is used by the public, and any one using it for any other purpose is a trespasser.

[See Gale on *Easements*, 6th edition, 1888.—Notes to *Dovaston v. Payne*, 2 Smith's *Leading Cases*.—*Harrison v. Duke of Rutland*, *Law Reports* (1893) 1 Queen's Bench, 142.] E. S.

WAYLAND, FRANCIS (1796-1865), teacher, clergyman, and author. He graduated from Union College (New York), in 1813, studied theology for one year in Andover Seminary, was a tutor in Union College (1817-21), pastor of the first Baptist Church of Boston (1821), professor in Union College (1826-27), and for twenty-eight years president of Brown University, Providence, R.I. (1827-55). Under his administration the university prospered, and rapidly adapted itself to modern needs. In 1850 the university was reorganised on the elective system. After resigning the presidency in 1855, he was for a year and a half pastor of the first Baptist Church of Providence.

President Wayland lectured on psychology, political economy, ethics, and allied branches of knowledge. His text-books in the subjects on which he lectured were widely used in schools and colleges throughout the country. His *Elements of Moral Science* (New York, 1835) required a second edition within five months. His *Elements of Political Economy* (New York, 1837) was published also in an abridged edition (Boston, 1840). The author expresses his belief that the works on the subject in general use present the doctrines of the science truly, but not in such order as would be most likely to render them serviceable, either to the general student or to the practical merchant. The work is, therefore, distinctly a text-book—not a contribution to science. As such it was very successful and obtained wide use. E. T. D.

WAYNAGE. The plough and plough team of a villein. These were protected from distraint by the 20th article of *Magna Carta*, and according to the true text of Bracton (f. 6) a villein had an action against his lord for deprivation of his waynage. R. H.

WAYS AND MEANS. See SUPPLY (PARLIAMENTARY).

WAYS OF COMMUNICATION. See COMMUNICATION, MEANS OF.

WEALTH is one of the words by defining which a knowledge of things may be acquired (cp. Sidgwick, *Pol. Econ.*, bk. i. ch. ii. § 1). The term is with universal consent applied to objects which are material and exchangeable (cp. Mill, *Pol. Econ.*, preliminary remarks, and bk. i. ch. 3). The question is what other things resembling that class in certain points ought to be termed

wealth. The debateable land may be contemplated by omitting now one, now another, of the four attributes comprehended in the definition above given: namely, (1) materiality, and—three attributes involved in exchangeability—(2) transferability, (3) limitation in quantity, (4) utility.

Omitting the first attribute, we have a class comprising personal services, such as those of the musician, teacher, physician, and so forth. Whether we call these unbodied utilities wealth or not, it is important to recognise that they form a part of the national income. The definition adopted by Mill in his *Political Economy* (bk. i. ch. 3) tends to obscure this, as pointed out by Mr. Cannan (*Production and Distribution*, p. 31). The class of immaterial wares might comprise persons, as well as personal services, in a régime of slavery. "Tutors, . . . physicians, poets, . . .—nay, sometimes philosophers, not to be sneezed at—were to be purchased in the Roman markets" (De Quincey, *Logic of Political Economy*, p. 81).

Omitting the second attribute, transferability, we have a class comprising useful natural objects which, though limited in quantity, cannot be appropriated, e.g. the moon.

Omitting both the first and second attributes, we have a class comprising personal faculties. We may with Mill (*Pol. Econ.*, bk. i. ch. 3) distinguish those industrial aptitudes which directly contribute to the production of material exchangeable wealth, and all other good qualities.

Omitting the third attribute, limitation in quantity, we have such goods as "the powers of wind and water which move our machinery and assist navigation . . . the pressure of atmosphere and the elasticity of steam which enables us to work the most stupendous engines" (Ricardo, *Pol. Econ.*, ch. ii.).

The general lesson to be derived from considering the class of goods which are not exchangeable is that they conduce, more than at first sight appears, not only to the higher elements of well-being, but even to the kind of welfare with which the economist is specially concerned (cp. Sidgwick, *Pol. Econ.*, bk. i. ch. iii. § 1).

The fourth attribute, utility, cannot be omitted; it is essential to wealth in any sense.

It may be required to determine the quantity—as well as to define the quality—of wealth. The problem appears to be of the same sort as the following: to determine the amount of food, or fuel, in a given mass of heterogeneous substances. Those problems would be solved by ascertaining in what quantities there was present the essential attribute, available nutriment, or heat. The corresponding essential attribute in the problem before us is utility.

The simplest course is to employ money-value as a measure of utility; correcting the imperfections of the measure by INDEX-NUMBERS. But it must be remembered that at best money measures only *marginal* utility (cp. Sidgwick, *Political Economy*, bk. i. ch. iii.).

Again, a valuation which includes goods of different "orders" ("producers' and consumers' goods") is liable to error in that the utility attained is not necessarily proportional to the amount of means employed. Wealth might seem to be diminished by an invention which reduced the amount of capital required for production. Money itself, considered as a means to effect exchanges, is an instance. If the coin in the world were doubled, the wealth of nations would not be increased in that proportion, but only so far as business might be stimulated by the change.

Again, debts and exclusive privileges, though reckoned by the creditor and monopolist as wealth, must not be included in the inventory of national wealth. True, a good system of credit is part of national wealth (in one of the secondary senses of the term). But the extent of that advantage is not to be measured by the amount of the instruments of credit employed.

Again, account should perhaps be taken of distribution; since inequality tends to diminish the sum total of utility (Sidgwick, *Pol. Econ.*, bk. iii. ch. vii. § 1).

Lastly, ought we to include with Petty the "value of the people"? Prof. Nicholson has estimated the "living capital" of the United Kingdom at £47,000,000,000. But "it seems doubtful whether an estimate of the capital value of the population as a whole can serve any useful purpose" (Marshall, *Principles of Economics*, p. 644, 3rd ed.). "In propriety of classification the people of a country are not to be counted as its wealth," thought Mill. Perhaps a man may count as wealth, of the unexchangeable variety, to others—though not to himself; for instance an immigrant into a country where the law of increasing returns is active.

F. Y. E.

WEBER, FRIEDRICH BENEDICT (1774-1848), professor at Breslau:

Was author of an *Einleitung in das Studium der Cameralwissenschaften*, 1803, and of a *Systematisches Handbuch der Staatswirtschaft*, 1804. Though much more under the influence of former German cameralists, such as JUSY and SONNENFELS (*q.v.*), than of Adam SMITH, he expressed great admiration for the latter. For instance, his ideas on the efficiency of usury and sumptuary laws followed the old traditional pattern. He apprehended an over-population of producers, but not of idle consumers, as these determine a demand for labour. He considers that CAMERALISTIC SCIENCE should be taught in special academies. In universities, he only admits it as a secondary branch of the faculty of law.

[Roscher, *Gesch. der Nat. Oek.*, pp. 472 and 602.] E. Ca.

WEBSTER, DANIEL (1782-1852), statesman, "expounder of the American Constitution," graduated at Dartmouth College, 1801, studied law in Salisbury, N.H., taught school for a few months in Maine, and then finished his preliminary law studies in the office of Christopher Gore of the Boston bar. He was admitted in 1805, and practised his profession successively in Boscawen and Portsmouth, N.H., and in Boston, Mass. He criticised the Embargo in 1808, and was opposed to the war of 1812, drawing up the Rockingham memorial, a protest against the war. He was elected to congress in 1813, from New Hampshire, favoured the strengthening of the navy, but opposed a bill for encouraging enlistments and similar measures.

His first important case was that of Dartmouth College, 1818. John Fiske says that the decision in this case "went further, perhaps, than any other in our history, toward limiting state sovereignty, and extending the jurisdiction of the supreme court." In 1822 Webster was elected to congress from Boston. Until 1828 Webster was opposed to the protective tariff policy, and made one of his best speeches in opposition to the tariff of 1824. When, however, manufactures had become established in New England and an attempt was made to overthrow the protective system, he became and remained a protectionist, supporting the "American system" of Henry Clay. He supported the "tariff of abominations" (1828) in the senate to which he had been elected in the preceding year. In the matter of internal improvements, Webster had already favoured a liberal construction of the powers of the national government, and his change of attitude on the tariff issue brought him into sympathy in all important points with the "loose constructionists."

The summit of his political fame and public service was reached in the great debate on nullification in January 1830. Webster's reply to Hayne on this occasion is the greatest speech ever delivered in the American congress. Its chief sentiment, as of Webster's speeches throughout, is that of loyalty to the union of the states and to the constitution, in the interpretation made necessary by the national growth of half a century. His support of Jackson's administration in the conflict with the nullification doctrine of Calhoun and South Carolina was no less vigorous than his opposition to the administration, in its policy with regard to the bank and the removal of the deposits. His speech on the president's protest of 1834 is second only to the reply to Hayne. He supported Harrison for the presidency in 1840, and became secretary of state, in which position he negotiated the ASHBURTON

treaty with England, settling the north-east boundary, and removing other complications which threatened a disturbance of peaceful relations. At the same time the two countries entered into the "cruising convention" for the more complete suppression of the slave trade.

Webster re-entered the senate in 1845, and in 1850 delivered the famous "seventh of March" speech in support of Clay's compromise for the complete settlement of the slavery question. This measure, with its provision for the return of fugitive slaves, was extremely obnoxious to the north, and Webster's assistance in passing it was severely condemned. Whittier's bitter poem "Ichabod" expressed the sentiments not only of abolitionists, but of the majority of Webster's constituents. He became secretary of state under Fillmore later in the same year.

Webster's occasional addresses have very high rank. Among the best are the Plymouth address in commemoration of the landing of the Pilgrims, 1820; the Bunker Hill Monument address, 1825; and the Eulogy on John Adams and Thomas Jefferson, 1826.

[See the article on Webster, by John Fiske in Appleton's *Encyclopædia of American Biography*.—George Ticknor Curtis, *Life of Webster*, 2 vols., New York, 1870.—Webster, *Works*, 6 vols., Boston, 1851.—Webster, *Private Correspondence*, 2 vols., Boston, 1856.—*Great Speeches of Webster*, Boston, 1879.—Henry Cabot Lodge, *Life of Webster*, in "American Statesmen Series," Boston, 1883.] E. T. D.

WEBSTER, PELATIAH (1725-1795), born at Lebanon, Connecticut, graduated at Yale College, 1746; was for a short time a preacher; about 1755 became a merchant in Philadelphia, and acquired a large estate; being an active Whig, he was, in 1778, thrown into prison by the British during their occupation of the city.

Webster published an essay urging the redemption of continental paper money in 1776, and subsequently issued: (1) *An Essay on Free Trade and Finance*, Phila., 8vo, Nos. 1-7, 1779 et seq. (2) *A Dissertation on the Political Union and Constitution of the Thirteen United States of North America*, 1783, 8vo. See Madison Papers, 706. (3) *An Essay on Credit, in which the Doctrine of Banks is considered*, 1786, 8vo. (4) *Reasons for Repealing the Act of the Legislature of Pennsylvania which took away the Charter of the Bank of North America*, 1786, 8vo. (5) *Political Essays on the Nature and Operation of Money, Public Finances, and other Subjects*, published during the American War, and continued up to the present year, 1791, 8vo, pp. 504: London, 1791, 8vo. F. A. W.

WEEK-WORK. The *wic-weorce* of the *Rectitudines singularium Personarum* (Kemble, *Ancient Laws*, p. 185). In ancient manorial extents it is usual to find a statement that the villeins were bound to work for three or four days in each week from Michaelmas to the 1st

of August. The nature of the work varied according to the season, but it consisted chiefly of ploughing, harrowing, and other farm labour.

For the villein's special duties at harvest and at the spring and autumnal ploughings, see *PRECARIE and SERVICES (PRELIAL and MILITARY)*. R. H.

WEIGHTED OBSERVATIONS. In combining the results of a series of observations, it frequently happens that some of the results deserve a greater importance to be attached to them, that they should exert greater influence on the result, than do others. This is achieved by a process of *weighting* the observations. A particular example of the process occurs in forming averages of prices. The prices of the commodities which occupy the most important places in national consumption are allowed greater importance, since changes in these prices affect a wider range of persons and affect them more deeply, than changes in price of commodities on which but little is expended. If  $w_1$  be the amount expended on a commodity whose price undergoes a variation in the ratio of  $p_1$  to unity and similarly for  $w_2, p_2$ , etc., the average price-variation will be given by

$$\frac{w_1 p_1 + w_2 p_2 + \dots + w_n p_n}{w_1 + w_2 + \dots + w_n}$$

which is called the weighted arithmetic mean of the prices  $p_i$  for the weights  $w_i$ . A geometric mean might also be formed for the same price-variations and weights. In the practical work of calculating price-averages, it has been proved by experience that if the commodities whose prices are used are thoroughly representative, and the level of price taken for reference is not affected by extraordinary special variations, the course of price movements, as reflected in weighted and unweighted price-averages, exhibits but few considerable or important differences (see INDEX NUMBERS; TABULAR STANDARD).

[On the theory of the effect of weighting price-averages see the reports to the British Association, 1886-7-8, by Professor F. Y. Edgeworth.—For example Royal Commission, Depression of Trade, Appendix B, R. H. Inglis Palgrave, Memorandum on Standard of Value.] A. W. F.

WEIGHTING. See WEIGHTED OBSERVATIONS.

WEIGHTS AND MEASURES. See MEASURES AND WEIGHTS.

WEITLING, WILHELM (1808-1871), has been called the father of German communism. Born at Magdeburg, he was a tailor by trade, and imperfectly educated. After travelling through Germany for some time, he went to Paris, where he resided four years, and became imbued with the doctrines of the French socialists, especially FOURIER and CABET. In 1841 he removed to Switzerland, where he formed some communistic associations, and issued at Vevay a paper entitled *Hilferuf der deutschen Jugend*. In 1843 he was imprisoned by the Swiss government, and afterwards ex-

pelled from the country. He was also obliged to leave Berlin and Hamburg. In 1849 he came to England, and, after a short stay, went to America, and founded a colony in Wisconsin entitled *Communia*, which soon failed. He died at New York, having continued his political agitation to the end.

His first publication was *Die Welt wie sie est und sein solle* (1838). His principal writings are—*Garantien und Harmonien der Freiheit* (1842), and *Das Evangelium eines armen Sinders* (1845, of this there is now a cheap reprint). MARK contrasts "the jejune and feeble mediocrity of the political literature of the German bourgeoisie with the incomparable and brilliant debut of the German working man" in the *Garantien*. In the *Evangelium*, Weitling represents communism as a deduction from the doctrines of the New Testament.

In his view, as long as there was an abundance of unoccupied land, the institution of property was not inequitable, since it did not deprive any one of the prospect of becoming a land-owner; but, afterwards, it became a gross injustice, and is the cause of the misery of the poor, it being impossible for every free man to appropriate a portion of the soil. It was therefore to be abolished, and a system substituted for it which seems to be one of the most chimerical of all the socialist Utopias (see SOCIALISM; UTOPIAS). Families were to be associated in groups embracing the whole human race, each group being governed by an elective head, who should be charged with the distribution among them in equal shares of all necessary and useful things in return for a certain number of hours of labour; those who gave a larger amount of time receiving objects of special enjoyment, but under the condition of their consumption within a short fixed interval, so as to prevent the reappearance of economic inequalities through the agency of accumulation and hereditary transmission. Weitling advocates the introduction of this new order of things, if necessary, by violent revolution, and sets out an elaborate scheme of legislation for the reformed community.

[Lippert in *Handw. der Staatsw.*—Cossa, *Introd. allo studio dell' E. P.*, p. 541.—W. H. Dawson, *German Socialism*, p. 42.] J. K. I.

WEST, HON. SIR EDWARD (1783-1828), chief justice of Bombay, educated at Oxford, M.A. 1807, fellow of University College until 1823, called to the bar in 1814, published a *Treatise on Extents*, appointed recorder of Bombay, knighted 5th July 1822, and on the establishment of the supreme court was made chief justice. He died at Poonah.

It was in the following pamphlet that West formulated his law of DIMINISHING RETURNS, *An essay on the application of Capital to Land, with Observations showing the Impolicy of any great Restriction of the Importation of Corn, and that the bounty of 1688 did not lower the price of it. By a Fellow of University College, Oxford*, London, 1815, 8vo. He said: "The chief object of this essay is the publication of a principle in political economy which occurred to me some years ago. . . simply this, that in the progress of the improvement of cultivation, the raising of rude produce

becomes progressively more expensive, or, in other words, the ratio of the net produce of land to its gross produce is continually diminishing. . . . Each equal additional quantity of work bestowed on agriculture yields an actually diminished return; and, of course, if each equal additional quantity of work yields an actually diminished return, the whole of the work bestowed on agriculture in the progress of improvement yields an actually diminished proportionate return" (pp. 1, 2, 6). Mr. Cannan remarks: "It is impossible to read West's pamphlet without seeing that the form in which the 'law of diminishing returns' was subsequently taught, and the phraseology in which it was expressed, are far more due to him than is imagined by those who only know him as the subject of a civil reference in Ricardo's preface" (*History of the Theories of Production and Distribution in English Political Economy, 1776 to 1848*, London, 1894, p. 160; for the question of the priority of the date of publication of the pamphlets of West, Malthus, and Ricardo, see *ib.* p. 161, n.).

West's other pamphlet was: *Price of Corn and wages of Labour, with observations upon Dr. Smith's, Mr. Ricardo's, and Mr. Malthus's Doctrines upon those subjects; and an attempt at an exposition of the causes of the fluctuations of the price of corn during the last 30 Years*, London, 1826, 8vo. In the preface he complains, without reason, that Ricardo had not given to his former *Essay* the credit of the discovery that "the diminution of the net reproduction, or the profits of stock, which is observed to take place in the progress of wealth and improvement, must necessarily be caused by a diminution of the productive powers of labour in agriculture." On pp. 83-85 he refutes the wage-fund theory.

WEYLAND, JOHN (early 19th century), one of the contemporary critics of Malthus, wrote *A Short Inquiry into the Policy, Humanity, etc., of the Poor Laws*, 8vo, 1807.—*The Principles of Population and Production as they are affected by the Progress of Society*, etc., 8vo, 1816.

[Malthus, *Essay*, Appendix, 1817; Bonar, *Malthus and his Work*.]

WHATELY, RICHARD (1787-1863), for thirty-two years archbishop of Dublin, entered Oriel College, Oxford, in 1805, where he owed much to the influence of his tutor Copleston, afterwards bishop of Llandaff. He had been the tutor of N. W. SENIOR (*q.v.*), whom he succeeded in 1829 in the Drummond chair of political economy. In accepting the post Whately considered that "the occupying of the office by one of my profession and station may rescue" political economy at Oxford "permanently from disrepute" . . . "it seems to me that before long political economists, of some sort or other, must govern the world." His introductory course of lectures is concerned with establishing the real

scope and purpose of the science, which are "to enquire into the nature, production, and distribution of wealth, not its connection with virtue and happiness." For the term "political economy" he would have substituted the term "catalactics," or the science of exchanges. His intention was to make a sort of continuation of Paley's *Natural Theology*. "Extending to the body-politic some such views as his respecting the natural." In 1831 we find him suggesting to Senior the starting of a political economy society. The term of his professorship was, however, abruptly cut short by his promotion, in the same year, to the see of Dublin. In his new sphere he did not forget his old tastes, and one of his first acts was the founding of a professorship of political economy at the university of Dublin. In 1833 he published in the *Saturday Magazine* some attempts to give plain instruction in political economy to children and poor people. In a letter to Senior, Whately suggested the publication of a statistical dictionary, on the lines, though on a smaller scale, of the present work. He was also one of the founders of the Dublin statistical society.

It was, however, in the active field of social questions that Whately's activity was most marked. He was a member of the commission of inquiry into the condition of the poor in Ireland, which reported against the introduction of a poor law modelled on the English system, and later he opposed the out relief clause, in the Poor Law Extension Act of 1847 (see POOR LAW). No one spoke with more authority on questions of church reform; and he was one of the earliest and ablest opponents of the system of transportation. It was in the application of the most lucid common sense to the facts of life that Whately's real greatness lay. It was observed of him by J. S. Mill that his reading was singularly scanty, in proportion to his intellectual capacity, though one may note that among his six favourite authors was included ADAM SMITH (*q.v.*). Whately himself, with his usual acumen, described his own bent of mind as being towards an elementary knowledge of a great many subjects. "I resemble one whose trade is to make instruments for others to work with." But if the saying "wisdom is justified of her children" applies to political economy, there are few sons of whom she has more reason to be proud than of Richard Whately.

Among Whately's very numerous publications the principal ones, connected with the object of the present work, are *Introductory Lectures on Political Economy*, London, 1832, 8vo. (The 4th ed., revised and enlarged, contains "Remarks on Tithes and on Poor Laws and on Penal Colonies," 1855.)—*Easy Lessons on Money Matters*, 1833, 16mo (passed through at least fifteen editions).—*Thoughts on Secondary Punishments in a letter to*

Earl Grey, London, 1832, 8vo.—*Remarks on Transportation in a second letter to Earl Grey*, London, 1834, 8vo.—*Speeches on Transportation*, 1840, 8vo, and on *Irish Poor Laws*, 1847, 8vo.—[*Life of Archbishop Whately* by Miss Whately, 2 vols., London, 1866, 8vo.—*Miscellaneous Remains from Commonplace Book*, 1864, 8vo; and *Addenda to the above*, 1865, 8vo.] H. E. E.

WHEATLEY, JOHN (fl. 1803-22), wrote three books:

*Remarks on Currency and Commerce*, 1803; *An Essay on the Theory of Money and Principles of Commerce*, vol. i. 1807; vol. ii. 1822; *A Letter to Lord Grenville on the Distress of the Country*, 1816. The second volume of the *Essay*, except chapters 6 and 7, was inspired by the later editions of MALTHEUS'S *Essay*, but recommended large farms, primogeniture, and a squirearchy after the English pattern as a panacea for Ireland, India, France, etc. All his other works dealt with money. He ascribed all the money troubles 1797-1819 to bank notes, and opposed H. THORNTON'S theory that foreign payments were to blame, as W. PITT by limiting over-issues "might have caused the influx of money to any extent at the same time that" he sent the money abroad.—*Essay*, i. 194: Thornton saw the fallacy of the italicised words, Lord Overstone (see JONES LOYD), *Tracts*, ii. 221. For the rest he united an implicit belief in Sir G. Schuckburgh Evelyn's misleading INDEX NUMBERS as to the depreciation of money (*Phil. Trans.*, 1798, pp. 174-176) with Thornton's revival of D. HUME'S view that credit paper, though convertible, affects prices—compare Lord OVERSTONE, *Tracts*, i. 442. Indeed his paper key unlocked every monetary secret of the past century. Since 1689 depreciation was caused by bank notes, and bank notes by taxation. His notion that revenue and paper money increase *pari passu* was hinted at by Sir J. STEWART, *Pol. Ec.*, ed. 1770, iii. 251, 340, and formed a link between him and the apostles of inconvertible paper—Pearse, SINCLAIR, and ATTWOOD, and the sworn foes of paper, PAINE and COBBETT. His notion that a tax on one commodity tended to raise the price of every commodity—*Remarks*, p. 202—was shared by Locke, Massie, M. DECKER, Fauquier, Dr. Price, G. Crawford, and many others; but to the question "how then have taxes on commodities been paid?" LOCKE'S followers answered "by the landlord," Stewart "by increased industry," FAUQUIER "by the man of fortune," Wheatley "by depreciation," and this he thought an ugly fraud on creditors of the national debt, though better than the ruin boded by Hume, Blackstone, and A. SMITH. As for the future—mines being then quiescent—stable prices might be maintained if the Bank of England had a monopoly of note-issues, and foreign governments acted likewise. If foreign governments increased their currency we should have to follow suit. Dread of falling prices, inspired perhaps by Malthus, prompted his conviction that the Bank ought not to have resumed cash payments until prices rose to the high-water mark of 1812-13—here, again, his policy and language, *Essay*, ii. 134, recalls T. Attwood,—and though he wrote that "a high price of corn is the best test of prosperity," *Essay*, ii. 110, unlike Malthus he saw in the importation of foreign corn a sign only of

manufacturing prosperity, and opposed the corn laws. He was a consistent free trader—*Essay*, ii. ch. vii. Other political questions did not interest him. This man of one idea was after all one of the earliest exponents of the CURRENCY DOCTRINE.

J. D. R.

WHEWELL, JOHN (17th century) secretary to the society of Merchant Adventurers: was the author of a *Treatise of Commerce*, 1601, written to show the superiority of the Merchant Adventurers over unorganised traders (see ADVENTURERS, MERCHANTS). He argued that competition among merchants was minimised, that the large fleets employed by such a company secured commerce, increased exports, cheapened imports, raised the customs revenue, and benefited the nation in time of war. Much of the interest of the book consists in a detailed account of English alliances with the Low Countries, with special reference to our trade with Antwerp, and in a survey of the trade between England and the Hanse towns, and of Elizabeth's negotiations with the latter, with a refutation of their charge against the Merchants Adventurers of being monopolists.

[Cunningham, *Eng. Indus. and Commerce*, *Mod. Times*, 24, 88, 119, 120.—Cossa, *Introduction*, trans. Dyer, 1893, p. 200.]

E. G. P.

WHEWELL, WILLIAM (1794-1866), was born at Lancaster, the son of a master-carpenter. Educated at Lancaster Grammar School and Heversham School, Westmoreland, he went up, in 1812, to Trinity College, Cambridge, where he soon earned marked distinction, not only in mathematics, but in other branches of learning also. In 1816 he graduated as second wrangler, and the following year was elected a fellow of his college. From that time his rise was rapid and continuous. He became fellow of the Royal Society in 1820, and in 1828 professor of mineralogy, a post he resigned a few years afterwards. In 1838 he was chosen to fill the chair of casuistry or moral philosophy. In 1841 he was president of the British Association. In the autumn of the same year he was appointed by the crown master of Trinity College.

All Whewell's mature life was associated with Cambridge. He quickly won for himself a position of commanding influence in college and university affairs. His vast ability and enormous industry were always at the service of a masterful disposition and a strong will. He seldom failed to carry his point; and, when he became head of the greatest and most influential of the foundations of Cambridge, it is hardly too much to say that he dominated the university, in spite of the opposition sometimes aroused by a brusque manner and a habit of magnifying his authority. His position was that of a conservative reformer. He believed that the university should reform itself from within, but strenuously objected to legislative interference from without. It was mainly owing to his influence that the natural and moral sciences obtained due recognition in the

Cambridge curriculum. Political economy was one of the many subjects dealt with by him, and its study received a strong impetus when in 1861, under his guidance, a B.A. degree in honours was offered for proficiency in it and a group of kindred sciences.<sup>1</sup> International law

<sup>1</sup> Whewell's mathematical exposition of certain doctrines of Pol. Econ. in the *Cambridge Philos. Trans.*, vol. iii. pp. 191-280 is referred to in the art. on POLITICAL ECONOMY: METHOD, vol. iii. p. 186.

The principal contribution, however, which he made to economic literature was the volume of *Six Lectures on Political Economy*, delivered at Cambridge in Michaelmas Session 1861 (printed at the Univ. Press, 1862). These lectures, which were never published, were prepared for the use of the present Prince of Wales, to whom they were delivered while he was resident at Cambridge. Dr. Whewell, who had been requested by Prince Albert to prepare the course "as the matter of the lectures required repeated thought," desired, for his "own satisfaction at least, to put it in a more permanent form than a spoken lecture."

Besides the interest which the volume possesses as being prepared for the use of the heir to the throne, it possesses a special attraction to economists as showing the manner in which the main subject presented itself to a thinker of considerable power, as Whewell undoubtedly was, and who, as the editor of the works of R. JONES (q.v.), may be regarded as being abreast of the economic thought of his time.

The scheme of the lectures was necessarily limited by the conditions under which they were composed. They are six in number, entirely elementary in character, and, in the words of the preface, do not "aim at any originality beyond that which selects the best passages of writers of acknowledged authority, and weighs them against one another." The works principally referred to are:—Smith's *Wealth of Nations* (McCulloch's ed.),—The *Principles* of McCulloch, Ricardo, and J. S. Mill,—Malthus, *Definitions* (ed. 1891),—Chalmers, *Pol. Econ. in connection with the Moral State and Prospects of Society* (1832),—Harriet Martineau, *Illustrations of Pol. Econ.* (1832, etc.),—Senior, *Appendix to Whately's Elements of Logic*, 1848,—Travers Twiss, *View of the Progress of Pol. Econ.*, 1847,—Jones, *On Wealth and Taxation*, pt. i., "Rent," 1831,—De Lavergne, *Essai sur l'Economie Rurale de l'Angleterre*, 1858,—F. Bastiat, *Essays on Pol. Econ.* (English translation, 1853). This list precedes the lectures. Besides the writers named, De Quincey is referred to, through the quotations in J. S. Mill, on difficulty of attainment. DAVENANT is mentioned, as quoted in T. TOOKER, and Dr. JAMES ANDERSON and Sir Edward West (as also Malthus) as quoted by McCulloch in connection with "the theory of rent."

This list itself is of interest as showing the English writers regarded as authorities at that time, and the selection of foreign writers is equally curious. The subject matter of the lectures is entirely elementary. The first three are wealth, productive and unproductive labour; price, the different effects of fixed and circulatory capital on price; that profits are not the result of labour; that profits are justifiable; on value in use and value in exchange; on demand and supply. The last three are on rent in different aspects. The theory of rent as set forth by R. Jones is explained, and "that tenants may be divided . . . into four classes—métayers, serfs, ryots, and cottiers—in addition to farmers." That cultivators of the land were thus divided was probably but little known in England at the time. Commenting on it Dr. Whewell observes, "that we have, in this new view of the subject, an example of the *inductive* method applied to political economy, in distinction from the *deductive* method, which is that of Ricardo and his school," and he goes on to further illustrations. The illustration of the subject from this point of view is slight, but the treatment is worthy of the writer of the *History of the Inductive Sciences*.

Read in the light of recent events these lectures have an interest of their own. Particularly the reference by Whewell to "the great problems which I have had to deal with in lectures V. and VI., namely, the nature of the recent agricultural progress of England." In lecture V. itself Whewell speaks with even more force on the same subject, and considers that the proportion of the non-agricultural to the agricultural population

also occupied a large share of his attention; and by his will he made liberal provision for the foundation of a professorship of that subject at Cambridge, and also for no less than eight university scholarships in it. Fighting man as he was to the last, he had the deepest reverence for the college and university of which he was the most conspicuous ornament. His services and his means were given to both ungrudgingly; and in all his conflicts he strove for what he deemed to be right without any thought of personal advancement or private interest. He was a man of strong family affections, and in his domestic circle loving and tender to a degree that seemed incredible to those whose relations with him were merely official.

Dr. Whewell was a most voluminous author. Reports, articles, sermons, pamphlets, books on a vast variety of subjects issued in rich abundance from his untiring pen. His chief works were his *History of the Inductive Sciences* (1837); his *Philosophy of the Inductive Sciences* (1840); and his *Elements of Morality including Polity* (1845). In philosophy he belonged to the intuitive and a *priori* school, and strongly opposed the utilitarian view of morality. He founded no new school of thought, but his writings and lectures roused interest in speculative problems and formed striking contributions to many of the controversies connected with them.

[Mrs. Stair Douglas, *Life of William Whewell*, (1881); Todhunter, *William Whewell* (1876).]

T. J. L.

**WHITE BONNET.** One who in an auction bids for his own goods, or is employed by the owner to bid for them (Jamieson, *Scott. Dict.*).

[For analogous term, see **VERT**.]

**WHITTINGTON, SIR RICHARD** (c. 1350-1423), mercer, the son of a Gloucestershire gentleman, was apprenticed to Sir John Fitzwarren of the Mercers' Company, and afterwards married his daughter. Whittington's name first occurs in an assessment of 1379, where he is put down for 5 marks, the lord mayor of that day contributing £10. Ten years later Whittington was able to contribute his share of £10 towards civic defence, so that during this time he had probably made his fortune, as this was the contribution of only the richest citizens.

In 1393 Whittington was elected alderman and sheriff, and in 1396 shared the mayoralty "proves, in the most conclusive manner, that the course of events by which England has come into its present condition, has been an increase in the productive powers of its agriculture, such as has placed it in advance of other countries." England remains in advance of other countries in respect of the yield from the soil, but in the present position of agriculture no one could speak of its influence on the national welfare in the same terms. Reading the lectures causes a feeling of regret that Whewell did not give a closer attention to their subject. The remarks on Ricardo, McCulloch, and Travers Twiss show that Whewell could bring considerable critical power, as well as very extensive reading, to bear on the questions dealt with.

for several months with Sir Adam Bammie, whom next year he succeeded in the office, as Sir Richard Whittington. In 1406 he was again elected mayor, and ten years later he represented the city in parliament. Whittington maintained his popularity to the last, so much so that in 1419 he was elected mayor for the third, or if we count his joint occupation of that office for a few months in 1396, for the fourth time. It was during this his last tenure of the office that he so magnificently entertained Henry the Fifth and his wife at a banquet where, on a fire of cedar wood, he burnt the bonds he and others held of the king to the value of £60,000, equivalent to upwards of a million of our money.

Whittington's name has deservedly come down to us as an example of the just and prosperous merchant. His continued popularity among those of his own generation is the best proof of his equitable dealings. His vast fortune was without doubt amassed by a system of bold but honest speculation in the most varied kind of merchandise. We know that he was what his modern biographers style "the court mercer" (Besant and Rice, *Sir Richard Whittington*, London, 1881), and supplied precious silks, cloths, and jewels to the king's daughters, but, like the great merchants who preceded him, he was probably more than this—he was doubtless purveyor to the crown of food stuffs, apparel, and household appliances (see **PURVEYANCE**); doubtless also a large cloth merchant, and contractor for "sea-coal." Most probably, as has been suggested, the story of the "cat" originated from his early and successful ventures in this last-mentioned article of commerce, then in universal demand, as the "coal" vessels of that period were styled "cats." Whittington was also one of the largest money-lenders of his time; and as money was usually advanced only on reliable security, these were not necessarily risky investments.

Among Whittington's bequests to the City were a library at Grey-Friars, the enlarging of the Guild Hall, an Alms House—God's House—for thirteen poor men, and a college to be called after him.

The *Liber Albus* was compiled at Whittington's instigation and completed during his last mayoralty, in 1419. The initiation of such a work proves Whittington to have been not only a man of business and a prosperous merchant, but one who had the honour of his city and the right understanding of its unique liberties very near to his heart. Whittington left instructions in his will for the rebuilding of the gaol of Newgate. A. L.

**WILL, GEORG ANDREAS** (1727-1798), lectured in the university of Altdorf on history, poetry, political science, and logic.

He wrote a *Versuch über die Physiocratie, deren Geschichte, Literatur, Inhalt und Werth*, Nürnberg, 1782. The doctrines of the physiocrats

had, in Germany, been both hailed with enthusiasm and severely criticised; Will takes a rather sceptical attitude. He considers that the doctrines of the IMPÔR UNIQUE, the *produit net*, unrestricted free trade, and of the sterility of manufactures and money, are the really new contributions of the Physiocrats to political economy, but that whenever the natural consequences of these premises occur, the PHYSIOCRATS exclaim that they have been misunderstood.

[Roscher, *Gesch. der Nat. Oek.*, p. 496.] E. ca.

WILL, BEQUEST BY. The right of the owner of property to determine by his will who is to take such property after his death is by many persons assumed to be part of the law of nature, and any interference with this right a dangerous attack on the institution of property itself. Yet this right, as it exists now in England and elsewhere, has been developed by a very slow process, and by the help of impulses which in our days would not be thought worthy of much consideration. There seems to be a universal rule in all countries that what is now called succession "ab intestato" is more ancient than testamentary succession. In the first stages of the development of the law of property the right of some members of the family of the deceased to take his property cannot be displaced by any testamentary succession. The necessity of appointing a successor arose in cases where there was nobody who might inherit under the ordinary rules. In such a case there would be no one to perform the religious rites incumbent on the successors of a deceased person, and a remedy had to be found to avoid a consequence which in these early stages of history was looked upon as a terrible disaster. The first step to meet this difficulty appears everywhere to have been the custom of creating an artificial family by the adoption of a stranger. Such an alteration in the composition of a family was generally impossible without the concurrence of the other members of the community to which the parties belonged; this was undoubtedly the case in ancient Rome, and accordingly, when, in course of time, by the side of adoption pure and simple, we find the "institution of an heir"—that is to say "an adoption, the effect of which was to make the *heres institutus* the son of the testator—not indeed immediately, but as from the testator's death" (Sohm's *Institutes*, translated by Ledlie, p. 449), the concurrence of the *comitia calata* was required in the same way as in the case of an ordinary adoption. It was probably due to the desire of the plebeians to acquire the benefits of testamentary succession without the concurrence of the aristocratic assembly, in which they were unrepresented (see Sir H. S. Maine, *Ancient Law* (4th ed. p. 201), that a new mode of appointing heirs came subsequently into use which received recognition by the law of the XII Tables (450 B.C.). The form of the testament thus in-

troduced was that of a sale of the inheritance to a purchaser: *familiae emptor*, who on the vendor's death took the place of his heir, and administered the property according to the vendor's directions. The sale was carried out in the form known as *mancipatio*; five Roman citizens were present as witnesses as well as the *libripens*. The *familiae emptor* having expressed his readiness to purchase the inheritance, and having had the purchase money weighed and handed to the testator, the testator, holding the tablet on which the will was inscribed, said the words: "Haec ita ut in his tabulis cerisque scripta sunt, ita do, ita lego, ita testor, ita que vos Quirites testimonium mihi perhibetote."

At a subsequent stage the *familiae emptor* became a mere dummy, the heirs being named in the will itself; and afterwards, through the influence of Prætorian law, a private will was accepted as authentic if signed and sealed by seven attesting witnesses. In this latter form private wills must still be executed in some parts of Germany at the present time (1898).

As mentioned before, a will had two functions: the disposal of the testator's property, and the institution of an heir who became the testator's universal successor and performed his funeral rites, but did not necessarily take much of his estate beneficially, being liable to satisfy the testator's debts as well as his legacies and trust dispositions. The latter were, however, by successive enactments, subjected to certain restrictions, the latest being the *Lex Falcidia* (40 B.C.) and the *S. C. Pegasianum* (75 A.D.) which provided that an heir must receive at least one-quarter of his share of the inheritance free from legacies and trust dispositions. Originally, as mentioned above, a testamentary heir was instituted in the event of their being no natural heir; if there was a natural heir the latter became heir by right of descent; but as time went on it became sometimes desirable to exclude the natural heirs and to appoint strangers, or to give larger shares to some of the natural heirs or some of them; but a will which neither instituted the natural heirs as heirs nor expressly disinherited them was treated as an invalid testamentary disposition.

This rule did not affect the beneficial rights of the natural heirs, as it was quite sufficient for its purpose to appoint them heirs for a much smaller share than the share to which they were naturally entitled; but another rule soon grew up which gave natural heirs, who did not receive their proper share, the right to have the will declared invalid on the ground that the testator, by omitting to benefit his relatives, had proved to be of unsound mind (*querela inofficiosa testamenti*). This right was, however, excluded if the testator gave each natural heir one-quarter of the share to which he would have been entitled if the testator had died intestate. This quarter was called *legitim portio*. There was therefore the formal right to be instituted heir, which could be displaced by express disinheritance, and the material right to receive at least the *portio legitima* which could not be displaced. The law of Justinian, *Novella 18* and *Novella 115* (542 A.D.), which is still the existing law in some parts of Europe, modified the two rules in the following manner:—

(1) A testator must appoint his issue, or if he leaves no issue his ancestors, as heirs, or expressly disinherit them, but he cannot disinherit any of them except on certain specified grounds. If any of them is not instituted heir or disinherited on insufficient grounds, the person so passed over is entitled to claim the full share to which he would have been entitled if the testator had died intestate, but subject to the diminution of the estate resulting herefrom, the will is treated as valid. If any person entitled as aforesaid is appointed heir, but not to the extent of his legitim portion, he is entitled to claim the difference between the share bequeathed to

him and the legitim portion. (*Actio ad suppleendam legitimam*.) The amount of the legitim portion is increased to  $\frac{1}{2}$  and in some cases to  $\frac{2}{3}$  of the intestate portion.

(2) As regards collaterals the ante-Justinian law remains unchanged.

The development of the rules relating to testamentary dispositions in Roman law, may therefore be summed up as follows:—

1. Originally only the members of the family inherit.
2. Strangers are allowed to inherit if no member of the family can inherit; this result is obtained (a) by adoption of the strangers; (b) by a will made in the assembly of *gentes* in the form of a modified adoption.

3. Under the influence of those classes of the community who took no part in the assembly of *gentes*, the same result was attained by the fiction of a sale of the inheritance. This fiction was sanctioned as the regular form for making a will by the law of the XII. Tables. Its traces remain in the private will, attested and sealed by seven witnesses, which in later Roman law became common and is still used in some parts of Europe.

4. The custom of burdening the inheritance with legacies and trust dispositions leads to legislation which secure to the heirs one-fourth of the estate clear of legacies and trusts, *Quarta Falcidia*.

5. As the custom springs up to institute strangers as heirs, even when natural heirs are in existence, it becomes necessary to protect the natural heirs (a) by preserving their formal right to be instituted as heirs; (b) by preserving their material right to receive at least one-fourth of the share to which they would have been entitled in case of intestacy. Both rights are safeguarded in a modified way by Justinian's *Novella*, 115, which still governs the law on the subject in some parts of Europe.

A similar development may be traced in Germanic countries on the Continent, but there the process is modified by the interference of the feudal system and also by the influence of the church, and finally by the reception of Roman law. In England the same modifying influences existed, subject, however, to the circumstance that Roman law was not "received" here in the same sense as it was "received" on the Continent. In any event the final result is entirely different from the result of the continental development. Our space is not sufficient for an account of the latter, but the following short sketch of the English history of wills enumerates a number of facts which, as to part thereof, also existed on the Continent.

In Germanic countries, as in Rome, a person's property was in his death originally given to his natural heirs, and it was not in his power to deprive them of this right by any testamentary disposition. The process by which this right was gradually interfered with was different in many ways from the development of testamentary capacity in Roman law, but the motive power was the same in both cases—the solicitude for the donor's fate after death. As the citizen of Rome wanted an heir whose duty it was to perform the funeral rites, so the Anglo-Saxon landowner altered the regular course of succession in order to devote part of his property to pious uses, so as to secure the welfare of his soul. In Anglo-Saxon times gifts for the benefit of the poor and the church were made in two ways; either by the conveyance of land to the donees, but so that the donor remained in possession during his life, or by death-bed confession, including a gift of his chattels to his confessor for pious uses (Pollock and Maitland, vol. ii. p. 317). At a later period the two kinds of disposition became blended together in a written document, which was called "cwiðe" (from which word the modern "bequeath" is derived), and the practice of making such dispositions became very common and was continued for several centuries after the conquest.

FEUDALISM interfered with the custom to a certain extent, inasmuch as the lord had a right to object to all gifts of land made without his consent, either during the donor's lifetime or on his death, but when the lord's consent could be obtained the gift was recognised. The Royal Courts, however, which during the energetic reign of Henry II. had been newly organised and acquired a large extension of powers, began to invalidate death-bed gifts of land, the reason being that a man was not supposed to be in full possession of his faculties when making such gifts, an argument which, to a certain extent, reminds us of the *querela inofficiosi testamenti* of the Roman law. About the same time (12th century) the right of PRIMOGENITURE was established in

England with reference to land; the realty went henceforth to the heir-at-law, that is to say, the person entitled according to the rules of primogeniture, and became on the owner's death severed from the movable property, to which another course of devolution was applicable. Testamentary gifts of land were no longer recognised.

As the chattels bequeathed by a testator's will were generally given to pious uses, the administration of this part of a testator's estate had already been for some time in the hands of the ecclesiastical authorities; and when the devolution of land was finally separated from the devolution of chattels, all questions relating to the validity of wills were taken over by the ecclesiastical courts. This led to the introduction of wills more akin to the wills of Roman law, and to the appointment of an Executor, a mode of procedure derived from Germanic sources, but adopted by the CANON LAW. The executor was not, however, to dispose of the entire property of the testator in accordance with the direction contained in the will. These directions do not seem at any time—except under special custom—to have displaced the rights of the testator's widow and children.

It appears that the general rule was that one-third went to the widow, one-third to the children, whilst the remaining third was called the dead man's part, and went according to the direction of his will. If there were no children, or if there was no wife surviving the testator, the property was divided into halves. During the early stages of the law of primogeniture the heir-at-law seems to have claimed the children's part (Glanville, vii. 5), but already in 1215 the children's right is definitely recognised (Magna Charta, 27).

In most of the southern parts of England the rule according to which the wife and children had indefeasible rights in respect of a part of the husband and father's chattels, gradually fell into disuse, but it remained in force in the city of London with respect to freemen, in the principality of Wales, and in the ecclesiastical province of York, until it was repealed by statutes respectively passed in 1724, 1696, and 1692. The act relating to the city of London recites that many wealthy inhabitants refuse to become freemen of the city "by reason of an ancient custom within the said city restraining the freemen of the same from disposing of their personal estates by their last wills and testaments."

In the meantime the rule according to which real estate could not anywhere—except under local custom—be disposed of by will, but went to the heir-at-law, had also been repealed by the Wills Act of Henry VIII. in 1540, the result being that from the beginning of the 18th century absolute freedom existed throughout England of disposing of real and personal estate by will.

It deserves mention that the wills gradually introduced into England in the manner described above, originally differed in several essential respects from the wills of Roman law (see Pollock and Maitland, vol. ii. pp. 312-314), and that the last remaining important difference did not disappear until the 1st January 1898. According to Roman law the whole of a testator's property became vested in universal successors, or one universal successor, called the heirs or the heir. According to English law there was from an early period a universal successor as regards personal property, viz. the executor or administrator, but the real estate, from the time that wills disposing of real estate were sanctioned by statute, did not necessarily vest in one person, but passed in respect of each part of it to the person to whom it was devised by the will, whilst such parts of the real estate as were not disposed of by the will passed to the heir-at-law. By virtue of the Land Transfer Act 1897, which came into force on the 1st January 1898, real estate now passes to the executor or administrator in the same way as personal estate; the executor or administrator being now exactly in the same position as an heir who had accepted the inheritance subject to the *BENEFICIUM INVENTARIUM* (q.v.).

The development of the English law of wills may be recapitulated as follows:—At first there are no regular wills, but only gifts in contemplation of death, mainly for ecclesiastical purposes. Under the influence of the clergy, regular wills appointing executors are gradually introduced, but such wills dispose of personality only, the realty, except under special local customs, goes to the heir-at-law, until in 1540 wills disposing of realty are sanctioned. Universal succession as regards personality and singular succession as regards realty continue

to exist until 1898, when universal succession is established for the whole estate. To this extent English law has now become assimilated to the laws derived from Roman law, but on the other hand the gradual abolition of the rights of legitim originally existing in favour of wife and children, which occurred in England, have created a new difference between England and Ireland and the rest of Europe including Scotland.

The following table illustrates the rights of children as to legitim in a number of European countries, it being understood that the issue of deceased children represent their deceased parent or ancestor. The widow or widower has no claim to legitim except in Scotland, where she is entitled to one-third if there are children, and to one-half if there are none; but the widow or widower has in many countries other claims on the estate. In many countries the parents or more distant ancestors of a testator are entitled to legitim if he leaves no issue, but the ancestor's portion is generally smaller than the children's portion.

Amount of Legitim in case of Survival of

Countries governed by	1 child	2 children	3 or 4 children	5 or more children
Scotch Law	$\frac{1}{3}$ *		$\frac{1}{3}$ *	$\frac{1}{3}$ *
German Common Law	$\frac{1}{2}$		$\frac{1}{3}$	$\frac{1}{4}$
Prussian Code	$\frac{1}{2}$		$\frac{1}{3}$	$\frac{1}{4}$
Saxon Code	$\frac{1}{2}$		$\frac{1}{3}$	$\frac{1}{4}$
Baden Code	$\frac{1}{2}$		$\frac{1}{3}$	$\frac{1}{4}$
French Code	$\frac{1}{2}$	$\frac{2}{3}$	$\frac{1}{3}$	$\frac{1}{4}$
Austrian Code	$\frac{1}{2}$	$\frac{2}{3}$	$\frac{1}{3}$	$\frac{1}{4}$
Swedish Statute	$\frac{1}{2}$	$\frac{2}{3}$	$\frac{1}{3}$	$\frac{1}{4}$
Italian Code	$\frac{1}{2}$	$\frac{2}{3}$	$\frac{1}{3}$	$\frac{1}{4}$
Portuguese Code	$\frac{1}{2}$	$\frac{2}{3}$	$\frac{1}{3}$	$\frac{1}{4}$
Spanish Code	$\frac{1}{2}$	$\frac{2}{3}$	$\frac{1}{3}$	$\frac{1}{4}$

\* If no parent survives,  $\frac{1}{2}$ .

†  $\frac{1}{2}$  must go in equal parts; the remaining  $\frac{1}{2}$  may be appointed in unequal parts.

Many codes contain elaborate provisions as to the calculation of the shares, and as to the grounds on which children may be disinherited (e.g. certain crimes committed against the testator, immoral or dishonourable conduct, etc.).

The undesirable economic effects of the exaggerated rules as to legitim existing in countries governed by French law have been frequently discussed, but a moderate restriction of the power to give property by will to strangers, or to some children to the exclusion of others, is thought advantageous in countries where such restrictions exist. On the other hand, the complete freedom of English law does not seem to have caused discontent, and it is quite possible that the greater spirit of enterprise which has hitherto distinguished the English race is not unconnected with the fact that, except in so far as any settlement provides to the contrary, no child is of right entitled to any part of his parent's fortune. It is, however, clear, from the historical sketch given above, that the difference between the English and the continental rules was not caused by deliberate choice, but by a combination of accidental circumstances.

WILSON, GLOCESTER, may be regarded as the wildest of all the writers on currency. This is evinced in his doctrines that "gold is no more essential to the guinea than the brass or ivory of the ruler is to its inches. . . ." "Paper, as the more abstract expression of value, is more likely to be uniform in value

than gold." It is charitable to surmise that beneath these phrases there may have lurked some rudiment of the conceptions which we now connect with a TABULAR STANDARD.

*Defence of Abstract Currencies in Reply to the Bullion Report and Mr. Huskisson*, by Gloucester Wilson, F.R.S., 1811.—*A Further Defence of Abstract Currencies*, by Gloucester Wilson, F.R.S., London, 1812.

WILSON, Rt. Hon. JAMES (1805-1860), financial member of the council of India. He went into business early in life, but retired in 1844, after having started the *Economist* to represent free-trade principles. The first number appeared 2nd September 1843; he was the sole editor, down to his departure for India, when he was succeeded by Walter Bagehot, who married Wilson's eldest daughter. In 1847 he became M.P. for Westbury, between 1848 and March 1852 was secretary to the board of control, and was financial secretary to the treasury in the Aberdeen coalition ministry until March 1856. In 1859 he was vice-president of the board of trade. He resigned in order to take the post of financial minister in India, and died at Calcutta.

"Wilson dealt with political economy like a practical man . . . [His] predominating power was what may be called a business-imagination. He had a great power of conceiving transactions. Political economy was to him the science of buying and selling, and of the ordinary bargains of men he had a very steady and distinct conception" (W. Bagehot, "Memoir," *Economist*, 17th Nov. 1860, p. 1289).

*Influences of the Corn Laws as affecting all Classes of the Community, and particularly the Landed Interests*, London, 1839, 8vo (3rd ed., 1840. "One of the best and most reasonable of the late tracts in favour of the unconditional repeal of the corn laws," McCulloch, *Lit. P. E.*, p. 80).—*Fluctuations of Currency, Commerce, and Manufactures referable to the Corn Laws*, London, 1840, 8vo.—*The Revenue; or, what should the Chancellor do?* London, 1841, 8vo (foreshadows the financial policy commenced by Peel and continued by Gladstone).—*Capital, Currency, and Banking; being a collection of a series of articles published in the Economist in 1845, on the Principles of the Bank Act of 1844, and in 1847, on the recent Monetary and Commercial Crisis; concluding with a plan for a secure and economical Currency*, London, 1847, 8vo (advocating severe bullionist views).—*Financial Measures for India: a Speech*, London, 1860, 8vo (the principal proposal was the introduction of the income tax, severely criticised in Sir W. Trevelyan's minute).

[Biography by Bagehot in *Economist* (ut supra) and shorter life by the same writer in *Ency. Brit.*, 8th ed.—*Annual Register*, 1860, pp. 500-509.—*Gent. Mag.*, October 1860, p. 432.] H. R. T.

WILSON, THOMAS, LL.D. (about 1520-1581), was a statesman and divine under Elizabeth; he sat in parliament in 1563 for Mitchell in Cornwall, and in 1571 and 1572 for Lincoln city; he was master of requests, secretary of state in 1577, and after holding the post of master of St. Katherine's Hospital, then on its original site near the Tower of London, for several years, was made dean of Durham in 1579.

Besides treatises on rhetoric and logic he was the author of a *Discourse upon Usury* (published, according to the title-page, in 1584, though the prefatory epistle is dated 1569), a dialogue between a preacher, a lawyer, a merchant, and a civilian. The preacher, supporting his position by Scripture and the Fathers, utterly condemns all interest on every kind of loan, and would have usurers punished like thieves or murderers; the lawyer, with other texts of Scripture, and a law of Justinian to bear him out, draws a distinction between fair interest and "biting" usury, between business investments and charitable loans; and points out that interest is not merely a reward for the kindness of lending, but compensation for risk and for foregoing the use of the money. The merchant takes his stand on the argument that trade would stop if nothing were to be gained by it, but the civilian in a tedious oration supports the preacher's position with quotations from the canon law, and like him allows no interest on loans except when the principal money is not repaid at the date originally fixed. To solve the merchant's difficulty, however, he seems to allow interest to be paid on capital lent for business purposes, evading inconsistency by calling such lending letting out to hire, on the ground that the capital, if lost by the borrower, will not be restored to the lender. To the surprise of the modern reader the preacher's final rejoinder entirely converts his audience, and the penitent merchant engages to lend freely in future, and even to restore all he has taken by usury in the past.

WINCHCOMBE, JOHN. See NEWBURY, JACK OF.

WINDING-UP. This expression is used as a general term for the transactions necessary on the dissolution of a partnership or company, to realise the assets, to pay off the liabilities, and to divide the surplus among the parties entitled. In the case of companies, the winding-up also takes the place of bankruptcy proceedings. A company may be wound up voluntarily or by the court, but in the case of a voluntary winding-up the court may, on application, make an order placing the liquidation under the supervision of the court, and a voluntary winding-up may also at any time be transformed into a compulsory winding-up by the court.

[See companies acts generally, and more particularly *The Companies* (Winding-up) Act, 1890.—Palmer's *Company Precedents*, pt. ii. (Winding-up) 6th edition, 1896.] E. S.

WINDOW TAX. See TAXATION.

WINKELBLECH, K. G. See MARLO, KARL.

WITT, JOHAN DE (1623-1672), born at Dordrecht, murdered at the Hague, was without doubt one of the greatest, if not the greatest statesman of his age. Descended from a very able family, whose members served their country in several different capacities, the young De Witt very early distinguished himself by his extraordinary ability and perspicacity. The mathematical sciences especially interested him. Notwithstanding, however, his early predilections, he studied law at the university of Leyden, and in 1647 became an advocate at the court of Holland at the Hague. His capacity, however, procured him as early as 1650 the position of "pensionaris" of Dordrecht, one of the oldest and richest cities of Holland, and in 1656 that of "raadpensionaris" of Holland. In this capacity he was for about twenty years the leader of the internal and external politics of the united provinces, and he intended to make the republic fully independent of the authority of the House of Orange (the stadtholder William II. died in 1650 without leaving an adult successor), and to secure a place for it at the head of the nations of Europe. His opposition to the restoration of the stadtholdership was the cause of many a conflict with the people, and afterwards with England after Charles II.'s accession to the throne.

His policy as a statesman falls out of the scope of this dictionary. Into the region of theoretic political economy De Witt, who wrote but little, never entered. His opinions on the practical financial and economic questions of his time may be gathered from the little book of P. DE LA COURT entitled *Interest van Holland*. This book contains a complete defence of De Witt's policy, and the manuscript, corrected by De Witt himself in a number of places, and enlarged by two chapters, was published at his instigation. Chapter xxxix., written by De Witt, contains an ample defence of his financial policy, and of the conversion of the debt, at that time amounting to 140 million florins, in 1655, from a 5 per cent into a 4 per cent stock. The amount thus saved was reserved for amortisation of the debt, and this amortisation-fund would every year be augmented by the saved interest, in order to pay off the whole debt in forty-one years. In consequence of this conversion and amortisation, maintained until 1665, the burden of the interest was, notwithstanding the raising of new loans to an amount of about 15 millions, diminished in 1672 by nearly 1½ millions.

De Witt's pamphlet on *Waardijc van lyfrente in proportie tot losrente* appeared in 1671, and

contains, for that time, a very remarkable demonstration of the desirableness of negotiating life annuities as a means of borrowing money, for, on the basis of a payment of  $6\frac{1}{2}$  per cent, it proved even more advantageous to the state than an ordinary loan at 4 per cent. De Witt did not fear a diminution of the national capital as a consequence of his proposal, trusting that it would give his countrymen a strong inducement to save. And the rapid amortisation of life annuities was an advantage to the state when compared with ordinary loans. His calculations were based on the hypothesis that, beginning from the third year, the chance of life for 50 years more was 1:1; at the age of 53 years the chance to live still 10 years was  $\frac{2}{3}$ :1; at the age of 63 years  $\frac{1}{2}$ :1; at the age of 73 the chance to live further 7 years  $\frac{1}{3}$ :1; and at the age of 80 years the chance of death 1:1.

[From the very numerous books about De Witt and his age, we mention: James Geddes, *History of J. de Witt* (English), the Hague, 1879.—A. Lefèvre Pontalis, *John de Witt*, translated by A. Stephenson, London, 1885, 2 vols.] c. a. v. s.

WOLFF, CHRISTIAN VON (1679-1754), professor of mathematics in Halle, 1706-23, 1740-54, and Marburg, 1724-40, and of the law of nature and nations in Halle, 1740-54:

Wrote a system of philosophy speculative, i.e. cosmological, psychological, and theological, and practical, i.e. ethical, economical, and political, which held its own until superseded by that of KANT. He was an eclectic follower of LEIBNIZ, and therefore an individualist and an idealist. He derives society from the contract or quasi-contract of its members, but sometimes omits quasi-contract (*P. G.*, § 2). The object of the contracting parties is to attain their own "perfection" (*J. N.*, vii, § 144), not "happiness," though the two ideas are closely allied. The motives and means to attain perfection can be deduced from "human nature," as the successive propositions of Euclid are from Euclid's axioms and definitions; and each proposition contains a duty. This code of duties is called, after PUFENDORF, *The Law of Nature*, and contains an inextinguishable tissue of moral and social maxims, and of legal enactments, in which no allowance is made for social and legal growth.

He is quite devoid of the historical faculty, and the Chinese government, the praise of which caused his exile, 1723-40, figures alongside of the current prejudices of his time as expressions of the law of nature. In politics he is an absolutist, but justifies passive resistance. In economics, in the modern sense, he writes that the law of nature (1) fixes the price of such things and services as conduce to the "necessities, conveniences, and amusements of life" (cp. A. SMITH) so that none may want for necessities; (2) therefore necessities common to all have no price; (3) it determines value by the labour and expense of production; (4) plus interest on money proportionate to the returns on *res fructuosae*. We might on reading this be tempted to think of (1) living profits and wages; (2) modern ideas as to cost and use-value; (3) and scarcity and value; and (4) the productivity of capital; but Wolff meant by a law of nature not what happens, but what ought to happen, and his only notion of bringing these "laws" into operation is to make them state-laws. He is a high priest of the Police School (see POLICE). He is a mercantilist, and calls that state the strongest which has most men and money, and especially the latter—for there cannot be too much money, and money can buy men, but men who want for food are too many—and he calls that man rich who has "money to spare," and writes of trades and other pursuits as "ways of making money" (*Oec.*, index s.v. *pecunia*), and condemns gold and silver plate as making money less, besides being luxurious. But he does not identify wealth and money. Thus money, he

writes, when used as the test of wealth, is used in a loose sense, and includes debts that are due, *res fructuosae*, and all things having money value (*J. N.*, pt. iv, § 352); and one of his works cites the fable of Midas (*Oec.*, § 791). Money in the strict sense "represents" things for the purpose of measuring their value, and is general purchasing power. At least these things are written in the book of natural law; and natural law is not a social tendency, but a counsel of individual perfection. He does not discuss economical problems from any other point of view than that of an all-pervading didacticism.

Works by Wolff connected with political economy belong to his practical, not his speculative philosophy; and are—*Vernünftige Gedanken von dem gesellschaftlichen Leben der Menschen*, 1721, 1756 ("society" includes "economics" and politics).—*Jus Naturae methodo scientifica pertractatum*, 1740-48, 1764-66; 8 parts; *Jus Gentium* m. s. p. 1749, being the ninth part: these works are abridged in *Institutiones J. N. et G.*, 1751, trans. German, 1754, also in a French version by Forney, 1758. Pt. i. states duties to self, others, and God; pts. ii. and iii. rights of ownership; pts. iv. and v. contractual rights, including iv. 2 *De Pretio rerum et pecuniae*; pt. vi. is miscellaneous; pt. vii. gives laws of societies less than states; pt. viii. of states.—*Oeconomica*, 1754, ed. and partly written by Hanovius; "economics" is used in Aristotle's sense as the policy of societies less than states.—*Discovery of the cause of the multiplication of Corn*, 1734, an Engl. trans. of the first of two treatises on scientific agriculture, 1718 and 1730.—*The real happiness of a People under a philosophical King*, i.e. Chinese Emperors, 1750, an Engl. trans. of his *Oratio*, 1726, which caused his exile when delivered in 1729; see Carlyle, *Frederick the Great*, in his *Works* (1882), xxii. p. 179, vol. xxiv. p. 207.

[Erdmann, *History of Philosophy*, trans. by W. S. Hough, 1892, vol. ii. p. 219.—W. ROSCHER, *Geschichte der National Oekonomie in Deutschland*, p. 347.] J. D. R.

WOLOWSKI, LOUIS FRANÇOIS MICHEL RAYMOND (1810-1876), born at Warsaw, died at Paris. He was educated in France, returning, at the age of eighteen, to Warsaw, to graduate at that university. The revolution of 1830 excited violent emotion and baseless hopes among the youth of Poland. Wolowski's French education and his personal popularity caused him to be suspected, imprisoned, and condemned to death by the Russian government. When the revolution broke out he regained his liberty, took up arms, and was sent to Paris by the provisional government as secretary to the legation. When the rebellion was suppressed he remained in Paris, where his family joined him. He quickly passed his examinations in law, and was employed in the office of the famous lawyer Dalloz. He was naturalised in 1834, began to write, and started the *Revue de Législation et de Jurisprudence*.

The government in 1838 attempted to suppress all limited companies. Wolowski opposed this severe measure with such force that it did not pass. This success rendered him popular, and in 1839 he was placed in the chair of *Législation Industrielle*, recently established at the *Conservatoire des arts et métiers*.

Wolowski's eloquence enabled him to instruct his hearers without wearying them. He spoke several languages, was familiar with foreign literature, especially that connected with moral and political science, and soon won for himself a distinguished place among French economists.

After the revolution of 1848, he boldly attacked

the socialist doctrines of Louis BLANC who presided over the Government commission on labour. Unfortunately his arguments were not all equally good—that on the limitation of competition being lamentably weak. With DUNOYER he believed in immaterial capital. The reforms, though incomplete, in the mortgage system of France, were due to Wolowski, who proposed that there should be an open syndicate of all the landed proprietors in France, this syndicate to issue, with or without government guarantee, but with its approval, mortgage bonds like those employed in Germany and Poland, which was only effected after the *coup d'état* of 1851. In 1852 a decree was issued authorising the establishment of the *Banques Foncières*, replacing the costly and difficult notarial contract of circulation of bonds payable to bearer. A *Banque Foncière* was established at Paris of which Wolowski was director, and he formed two others at Nevers and Marseilles.

There were troubles at the outset, and the necessity of unity was immediately perceived. Wolowski, who had originally thought of only one syndicate, desired the reunion of the three into one, working throughout France—and, appointing a governor, became himself simply an administrator in his own institution. He soon after became interested in the monetary question, supporting the system in existence before the suspension of the coinage of silver. He considered the ratio of 15:1 between gold and silver to be fixed by nature, or to be one which would vary but slightly. With regard to banks of circulation he approved of unity, and considered that where the state did not itself issue notes to bearer payable at sight, it should directly supervise this operation. The creation of bank notes was, in his eyes, coining money, and he highly admired the Bank Act of 1844 of Sir Robert PEEL. In 1848 he was elected to the constituent and legislative assemblies. A sincere republican, he held no office during the empire, but in 1871 he again offered himself for election, and became a member of the national assembly. He was a vigorous supporter of the income-tax as preferable to the semi-protectionist system of taxation proposed by M. Thiers. In 1876 he was, shortly before his death, appointed senator for life.

In 1855 he succeeded to the chair vacated by Blanqui's death at the academy of moral and political science. He wrote much, and early showed a great predilection for the historical over the deductive method—he believed all masters of the science to be of that way of thinking, except J. B. SAY, whom he reproached with dogmatism. He translated the *Principes d'économie politique* of Roscher, 1855, 2 vols. Svo. into French, and the *Économie politique* of G. A. L. Cibrario, 1859, 2 vols. Svo, writing introductions for both. That to Roscher's book is an economic manifesto in favour of the HISTORICAL METHOD (*q.v.*). This perhaps is the best thing he wrote. He supported free trade without reserve, but too often allowed himself to lean on official regulations and centralisation.

His first book, *Études d'économie politique et de statistique*, Svo, 1848, is made up of separate works. In 1864 he brought out *Les finances de*

*la Russie*, Svo, which, supporting as it did the Polish view, excited loud complaints in Russia, and *La question des banques*, Svo, the reproduction of his lectures at the *Conservatoire des arts et métiers*, followed in 1867, by *La Banque d'Angleterre et les banques d'Écosse*, Svo (trans. into English by Somers), another form of the same subject, *La Liberté commerciale et les résultats du traité de commerce de 1860* (1869), Svo, appeared at the time when the commercial treaties with England and other countries began to be given up, and *Le change et la circulation*, 1864, Svo, when the bank question and the monetary question were being discussed. The latter subject was treated on more directly in *L'or et l'argent* (Svo, 1870). He also translated two remarkable and original works, *Petit traité de la première invention des monnaies*, by Nicholas ORESME, Bishop of Lisieux, written in 1376, and *Traité de la monnaie*, by Nicholas COPERNICUS, the celebrated astronomer (1526)—the two form a large volume, published in 1864. We need only notice among many pamphlets on subjects of the day, *Résultats économiques du payement de la contributions de guerre en Allemagne et en France*, 1874, which consisted mainly of extracts from different publications with which he was connected and which are quoted below. He also wrote in *Revue de législation et de jurisprudence* (1834-50), and for *Le siècle* a daily paper, from 1837 to 1848, for the *Revue des deux mondes*, from 1857 to 1868; finally for *Journal des économistes* and the *Compte rendu des séances de l'Académie des sciences, morales, et politiques*, from the date of their commencement (1842) till his death. From 1843 onwards he was one of the most industrious and distinguished members of the society of political economy, of which he became vice-president in 1858; and was one of the founders of the statistical society of Paris, and president from 1874.

WOOD, W. (fl. about 1724), a Bristol iron merchant, notorious through his purchase of a patent for the issue of copper coins in Ireland. The agitation thus produced, and fanned by the DRAPIER'S LETTERS (see also SWIFT, JONATHAN), was stopped by cancelling the obnoxious patent with compensation to Wood, who at first refused to yield up his privilege.

## WORKHOUSES.

Workhouse, p. 672; Workhouse Test, p. 674.

WORKHOUSE.—A workhouse may be defined as an institution supported by the poor-rate

for the necessary relief of the aged, sick, casual, and able-bodied poor and their children. By considering the history of poor relief in regard to these classes, we may trace how the workhouse has been developed.

Before any legal system of relief for the "impotent" was introduced, the aged and infirm poor were in some measure provided for in hospitals or by alms. Legislation (12 Rich. II. c. 7) first required the impotent to abide in the place where they were; then (22 Hen. VIII. c. 12) licensed them to beg within appointed limits; then (27 Hen. VIII. c. 25) provided that alms should be collected for them; then (1 Ed. VI. c. 8) ordered that they should be lodged in convenient houses and employed, "if not so lame and impotent but that they may work"; and then (14 Eliz. c. 5) no longer suffered them to beg, but provided for them "in hospitals or other abiding or working houses," or (39 Eliz. c. 3) supported them by necessary relief out of the rates. This act, and the Poor Law Act (43 Eliz. c. 2) still in force, provide generally for raising competent sums of money for the "necessary relief" of the "lame, impotent, old, blind, and such other among them being poor and not able to work." It did not provide "hospitals or other abiding or working houses" for them; but, apart from outdoor relief, they would continue to be lodged in such houses and in almshouses. (The Hospitals, part of the system of ecclesiastical relief, were in many instances municipalised. Cp. in Henry VIII.'s and Ed. VI.'s reigns, St. Bartholomew's and St. Thomas's, and St. Peter's Hospital at Bristol, which became the workhouse.) In the workhouses of 9 Geo. I. 7, they would be maintained and possibly employed (cp. GILBERT'S ACT). At the present time workhouses are, in fact, in great part "hospitals" or almshouses for the "impotent." To a limited extent employment or occupation is provided for them. The sick are provided for in sick wards, or, in the larger towns, in separate poor-law infirmaries. They are not specially referred to in 43 Eliz., but are included in the "others not able to work."

The casual poor, or vagrants, were punished in various ways, and subsequently (18 Eliz. and 39 Eliz.) committed to work in houses of correction, which also bore the name of workhouses—the word now applied to a house of correction in the United States. Afterwards, in its later form, the workhouse of the poor law, with its casual ward, met the needs of the casual poor or vagrant. The house of correction became and remained a prison for offenders under the vagrancy acts.

Next, as to the able-bodied poor: poor relief is closely related to labour questions. At any time of difficulty the questions of wage, vagrancy, and the care of the aged or "impotent" arise almost simultaneously. Statutes and the history of the workhouse indicate this. The able-bodied poor person, "not exercising any craft, nor having whereon to live," under a system of regulating wages by law, was required (28 Ed. III.) to serve at the accustomed wage, with commitment to jail as a penalty. And on this system, if employment were scarce, he would, on the other hand (as in 18 Eliz. c. 8), be provided with work if willing to labour. Accordingly (39 Eliz.), he was to be supplied with work on profitable terms without or within a house of correction possessed of the necessary stock. This general provision is limited by the Poor Law Act (43 Eliz.) to the setting to work of children and "such persons as, being married or unmarried, having no means to maintain them, use no ordinary or daily trade of life to get their living by." In that act no mention is made of a workhouse; but, as has been shown, the thing already existed.

Two interpretations of the Poor Law Act, and two theories, have dominated at different times. One, which accorded rather with 39 Eliz., would impose on the overseers the provision of work to all poor and needy persons being willing to labour. This coincided with a theory that the labour of the poor might be made profitable as well as educational and disciplinary, and thus led to the workhouse being adapted to a "house of industry" or, as in Gilbert's Act, 22 Geo. III. c. 83, which excluded areas incorporated under it from the operation of the Poor Law Act, it harmonised with the view that employment should be provided for the poor outside the house, and that the workhouse should be used only for the aged and infirm—i.e. as an abiding or

working house, which, as it happened, was its old, possibly its original use. These two conceptions had great influence at different times, but especially in the latter part of the 18th century. The failure of the house of industry and industrial farm was due to the following amongst other causes. The work depended on contracts, and the failure to obtain contracts—especially at times of commercial depression—threw the whole organisation of indoor relief out of gear. The contracts were accepted on terms of pauper labour, and were often of little or no profit. Thus the workman outside was effectively undersold. The labour in the workhouse was frequently undisciplined and bad; and the paupers were so troublesome to manage that they were often left absolutely idle. To carry on a farm, outside labour had at times to be procured, while in winter work enough could not be provided, and the people had to be put on the roads. There was a disinclination to refer people to the workhouse as a house of industry, and thus after a few years it failed to serve as a test.

The other theory relied on a strict interpretation of the words quoted above from the Poor Law Act. It insisted that the position of the pauper should be less eligible than that of the independent workman, and that the poor law had to provide necessary relief to the able-bodied on this condition, and had not to furnish employment to the poor at large. On this theory the workhouse became a poorhouse for the maintenance and employment of those who would accept "the offer of the house," i.e. relief on the less eligible condition. The plan succeeded in several parishes for a time about the year 1722 (9 Geo. I. 7), and in other instances here and there, proving its efficacy at the period of extreme pauperisation at the beginning of the present century. It was afterwards revived under new conditions in 1834 under the new Poor Law Act (4 & 5 Will. IV. c. 76), when pauperism was wide-spread, and the administration of poor relief was in the greatest confusion. The union workhouse was then established (see UNIONS, POOR LAW), and by the outdoor relief prohibitory (1844) and regulation (1852) orders, framed under § 52 of the new Poor Law Act, relief to able-bodied men was refused except in the house, while a central authority, the poor-law commission or board, was established to give unity and guidance to the new administration. By the outdoor labour test order (1842) permission was given to the guardians, at times of distress, to relieve able-bodied men out of the house in return for a task of work, on the understanding that half the relief at least was given in kind; and in the regulation order, which applies to most large towns, this plan was adopted without the proviso required by the test order that it should apply only to times of distress, and subject to report to the poor-law board. Thus the rigour of the new poor law was modified conditionally at the discretion of the guardians. The result, towards which no doubt other causes have co-operated, has been an enormous reduction of able-bodied pauperism. Thus in 1850, when already it had been largely diminished, it was 1·2 per cent of the population above fifteen years of age; but in 1891 it was only 0·5. With regard to the aged the test was not pushed, but the poor-law commissioners advised its use to prevent "partial" relief, i.e. relief to persons who have "some," not "no," means. The commissioners advised the erection of workhouses for different classes, and recent reform appears to be taking that direction.

It is difficult to see how, from the economic standpoint, any other policy of relief to the able-bodied than that of 1834 is defensible. There is now no state regulation of wage to justify as its counterpart the provision of work to the poor and needy generally; and if relief in aid of wages, or in substitution of wages, is injurious, it follows that, in the main, those relieved should be so assisted as to be, as far as possible, industrially a negative quantity. The offer of the house ensures that, if they accept relief, this will be the result.

With regard to the workhouse for children—in the "house of industry" the labour of children was of great importance. Now education in district or separate schools, or in country unions at the public elementary schools, has taken its place.

**WORKHOUSE TEST.** By the workhouse test, as it is called, relief is granted by the poor-law guardians on the condition that the applicant accepts an order for admission to the workhouse or poorhouse. The method appears to have come into vogue in the early part of the 18th century. By 9 Geo. I. c. 7 (1723) parishes were enabled to combine to provide a workhouse, and “any poor person” who refused to enter the house lost his title to relief. Wherever and so long as the test was applied, it reduced pauperism.

The poor-law commissioners of 1834 adopted as “the first and most essential of all conditions” applicable to all administration of poor relief, for which funds were levied compulsorily, the principle that the situation of the “individual relieved” should “not, on the whole, be made really or apparently so eligible as the situation of the independent labourer of the lowest class.” They based this principle both on evidence which showed that necessary relief given conditionally on admission to a well-regulated workhouse, or under similar restrictions, tended to reduce pauperism; and on the observation, that, while others applied freely for relief, non-parishioners—who could only obtain it after they had been passed back to their parish,—did not apply for it, since relief subject to removal was less “eligible” than self-maintenance. In their report they applied the principle more particularly to able-bodied men, and advised its adoption in the form of an offer of maintenance to them in a well-managed workhouse, where the necessities of life only would be provided, and where, in

general, as much labour would be required as would be done by the independent labourer outside. The applicant is thus made the arbiter, and has to make his choice between relief under unattractive conditions and maintenance by his own exertions. If the two restrictions just mentioned be neglected the test will lose its efficacy. Residence in the workhouse may then become more eligible than independence—a danger that cannot be considered altogether visionary if the standard of comfort in the house tends to rise above that of the independent labourer of the lowest class. Since 1834 the policy sketched by the commissioners has, with limitations, been enforced under the orders of the poor law, now the local government, board.

For results, see article **WORKHOUSES**. c. s. L.

**WORKMEN'S BUDGETS** are statements compiled from information furnished by workmen of their income, its sources, nature, and amount, and their expenditure with details of the nature and quantity of commodities purchased. Such budgets have long been regarded as forming the basis of social statistics, giving the only means of knowing the economic condition of a people, and of tracing the relative progress of different nations towards civilisation and economic independence, of studying the effect of climate on custom, and of estimating the incidence of indirect taxation. Much attention has been given, especially by the school of Le Play (see **LE PLAY**) and at international congresses, to the collection of budgets in their most scientific and easily comparable form. The following budget, which shows the approved method of tabulation for international comparisons, and indicates the chief points to be studied, is from *Les ouvriers des deux mondes* (see **LE PLAY**).

*Budget (for one Year) of a Nottingham working-tanner's family, 1888 (condensed). Reduced from French currency and weights.*

*Budget (Week) of a shepherd (Dorset). From the Labour Commission, 1893, The Agricultural Labourer, vol. i. part v. For other budgets see the Reports of the Assistant-Commissioners, passim.*

Family: a shepherd, wife, and three children, aged one to six years.

Receipts per week—	s.	d.
Man's wages (house, garden, wood, and potato-patch free)	12	0
Expenditure per week—		
Six loaves	3	0
Milk, 7 pints	0	7
Tea, $\frac{1}{4}$ lb.	0	6
Sugar, 2 lbs.	0	$\frac{1}{2}$
Bacon, 3 lbs.	1	0
Butter, $\frac{1}{2}$ lb.	0	6
Cheese, 4 lbs.	1	0
Meat (for Sunday)	1	0
Salt, etc.	0	2
Lights	0	4
Coal, $\frac{1}{2}$ cwt.	0	8
Soap, soda, and starch	0	5
	<u>10</u>	<u>0<math>\frac{1}{2}</math></u>

This is typical of a simple budget useful for furnishing data for rough calculations.

Collections of budgets are distinguished as intensive and extensive. An intensive budget or monograph is shown in the tanner's budget here given, the table being accompanied with minute descriptions of the social and economic circumstances of the class represented. The extensive method is best illustrated by the mammoth collections of the American labour bureaux. Numerous "blanks" are issued asking for income and expenditure under a limited number of headings, and an average budget of an average family is obtained. All the detailed accuracy of Le Play's method is lost, but compensation is found in the broadness of the view obtained, and in the elimination of individual errors by virtue of the general properties of large numbers. The two methods are held to be complementary to each other. Inaccuracies chiefly arise from the neglect of subsidiary earnings, the difficulty of allowing for income from capital and subsidiary earnings, and the wrong grouping of items, expenditure on luxuries being badly entered. There is also a risk that budgets may give too favourable a view of the thrift and consequently of the well-being of the working classes.

The general results obtained by a comparative study of budgets are summed up by Dr. Engel thus:—The greater the income, the smaller the relative percentage of outlay for subsistence. The percentage of outlay for clothing is approximately the same, whatever the income. The percentage of outlay for lodging, or rent, and for fuel and light, is invariably the same, whatever the income. As the income increases in amount the percentage of outlay for "sundries" becomes greater (quoted from *16th Annual Report, Bureau of Statistics of Labour, Mass.*, p. 152).

A. L. B.

Workmen's Budgets are detailed statements of the income and expenditure of working men classified in such a way as to show the sources of income and the expenditure (absolute and relative) for the satisfaction of various wants such as food, clothing, shelter, education, etc. The primary object is to give a picture of the condition of the working class, and to compare its well-being among different nations and at different times in the same country (progress of the working classes). A

secondary object is to provide data for a theory of consumption by measuring the relative expenditure in different directions, and the variations due to differing size of income and of family. Practical use may be made of the budgets in estimating the burden of taxation on different classes, in considering the possibility of excluding women and children from factories, in inaugurating measures to encourage thrift and saving, etc.

*Method.*—There are various methods of preparing workmen's budgets; they are commonly classified as *intensive* and *extensive*. The intensive consists of the detailed study of a single working man's family by some person intimately acquainted with its condition, and who gets his information at first hand. The most famous example of this method is the Le Play monograph (see LE PLAY). Such a monograph gives the history, character, and social environment of each family, as well as an estimate of the sources of income and the items of expenditure. These minute biographies give us interesting pictures of social life, but they depend for their truthfulness upon the tact and knowledge of the observer, and are so few in number that it seems rash to regard them as typical of the whole working class. Out of the one hundred budgets published by Cheysson and Toqué, there is only one from the United States, a miner in California. A second method, advocated by Engel and explained in great detail by Landolt, may also be classed as intensive. It consists in persuading a workman to keep an exact account for a certain period (say a year) of all items of income and expenditure, giving quantities and prices of commodities purchased. These items are then classified by the observer, who must also add explanations in regard to the character and habits of the family (Landolt, *Haushalt-Statistik*).

The extensive method is to collect from a large number of families statements of their income and estimates of their chief items of expenditure. Merely sending out schedules to be filled out by working men is almost sure to result in failure. Thus in 1887, 730 schedules were sent out by the labour correspondent of the board of trade (England) to selected workmen, trade-union officials, and co-operators, asking for information upon their family income and expenditure. Only 36 returns were received, of which 2 were too imperfect for publication. An important modification of the extensive method is to have the schedules filled out under the supervision of an official who makes a personal visit to each family. By this method the United States department of labour in 1890 collected budgets of 5284 families, representing 27,577 persons. Of these 3265 could be treated as normal families, and the results analysed and tabulated.<sup>1</sup> The investigation covered families employed in nine industries (cotton, woollen, glass, pig iron, bar iron, steel, bituminous

<sup>1</sup> "By normal family is meant one with the following attributes. It has no boarders or dependents; it does not own its dwelling-place; it has an expenditure given for rent, fuel, lighting, clothing, and food; it has both a husband and a wife; it has not more than five children, no one of whom is over fourteen years of age." *Seventh Annual Report of the Commissioner of Labour*, 1891, pt. ii. p. 888.

coal, coke, and iron ore), and distributed among 24 states of the United States, and Belgium, France, Germany, Great Britain, and Switzerland. In the United States families were also distinguished according to nationality.

The advantage of the extensive method is that it gives us material for comparing the expenditure of families with different incomes, of different size, of different country, of different nationality living in the same country (e.g. American, Irish, German, etc. in the United States), of the same nationality at home and in a new country (e.g. British iron workers in England and the United States), and in different occupations. The intensive method (Le Play) gives the best picture of the actual life of the labourer, and is undoubtedly the most accurate. But the extensive method has its use in the directions just mentioned.

For most of the comparisons mentioned above it is necessary to have some common basis, for it is obviously absurd to compare the expenditure of a family composed of two adults with that of a family with from two to five children. The famous Belgian inquiry of 1853 (Ducpétiaux) sought typical families composed of a man, wife, and four children of the age of sixteen, twelve, six, and two years. This greatly embarrasses the investigation, for it is not always easy to find families exactly so constituted which lend themselves to the investigation in other respects. A second method is to count two children as equal to one adult and use the adult as the standard. The American department of labour uses a rough system of weights. A consuming power is attributed—

To husbands of . . . . .	100 units
To wives of . . . . .	90 "
To children from 11 to 14 years inclusive of . . . . .	90 "
To " " 7 " 13 " . . . . .	75 "
To " " 4 " 6 " . . . . .	40 "
To " " 1 " 5 " . . . . .	15 "

For purposes of comparison 100 units is taken as the standard. Engel takes as basis 1 for the infant and adds  $\frac{1}{10}$  for each year, making 3 for the age of twenty which is a maximum for women, and 3.5 at the age of twenty-five which is the maximum for men. A family composed of man, wife, and four children, of the ages ten, eight, six, and four years, would count as 13.3 units or "quets" (from Quetelet), as Engel calls them; while another family with four children, but of the ages eighteen, sixteen, fourteen, and twelve years, would count as 16.5 units or "quets." By this convention, comparison may be made between budgets from different sources, however various the size of the family.

*Results.*—The chief results obtained from family budgets thus far is to show certain relations between expenditure for food, clothing, rent, fuel, and other objects, and that these proportions vary for incomes of different size according to fixed rules. This was shown clearly by Engel in 1857 on the basis of the Belgian budgets of 1853, and his results may be reproduced here as the earliest of these comparative tables. The Belgian budgets were divided into three classes:—

- I. Class—Very poor families with average income of 648.68 francs.
- II. Class—Poor families with average income of 845.44 francs.
- III. Class—Well-to-do families with average income of 1214.44 francs.

Items.	The Proportionate Expenditure of a Family of			
	I. Class.	II. Class.	III. Class.	All Classes.
	%	%	%	%
Food . . . . .	70·89	67·87	62·42	65·82
Clothing . . . .	11·74	13·16	14·03	13·26
Dwelling . . . .	8·72	8·83	9·04	8·75
Fuel, etc. . . .	5·63	5·51	5·41	5·49
Furniture, etc. .	0·64	1·16	2·31	1·58
Education . . .	0·36	1·06	1·21	0·98
Public burdens .	0·15	0·47	0·88	0·58
Care of health .	1·63	2·73	4·30	3·25

Total . . . . .	100·00	100·00	100·00	100·00

(Republished in *Bulletin de l'Institut de Statistique*, tome ix. Annexe I. p. 27.)

On the basis of this table, and the budgets published by Le Play, Engel formulated the following law since known by his name—that, “the poorer a family is, the larger the proportion of its income necessarily spent on bare subsistence,” and still further, “that under similar circumstances, the proportion of the income spent for food is an unfailing index of the material well-being of a community” (*Bull.*, etc., ix. p. 26).

This earliest table may be compared with the latest, that of the American department of labour, which distributes the expenditure as follows: (*Seventh Annual Report*, vol. ii. p. 865.)

#### EXPENDITURES IN NORMAL FAMILIES: UNITED STATES.

Income.	Food.	Rent.	Cloth- ing.	Fuel and Lighting.	All other Purposes.
	%	%	%	%	%
Under \$200	40·64	15·48	12·82	8·58	18·98
\$200-300	44·26	14·85	14·33	7·55	19·21
300-400	45·50	14·98	14·14	7·02	18·27
400-500	45·08	15·29	14·38	6·62	18·63
500-600	43·84	15·15	15·27	6·60	19·14
600-700	41·18	15·34	15·86	5·86	21·56
700-800	38·89	15·60	16·38	5·80	23·88
800-900	38·09	16·09	15·09	5·25	25·48
900-1000	34·34	14·96	16·84	4·74	29·12
1000-1100	34·74	15·12	17·53	4·50	28·11
1100-1200	30·65	12·23	18·51	3·89	36·72
1200 & over	28·63	12·59	15·71	3·02	40·05
All sizes	41·05	15·05	15·31	5·91	22·68

The proportionate expenditure for food decreases with increasing income; that for fuel and lighting also decreases; rent remains about stationary; clothing increases with increasing income; and a constantly increasing proportion of the income is set free for expenditures outside of the necessities of life.

In all cases the absolute expenditure increases, but it increases in varying proportion, that is, the demand is more elastic in some cases than in others. Engel has illus-

trated this by giving in great detail the absolute expenditure for different objects in different incomes, from under 600 francs to over 2000 francs. The expenditure for animal food is 6·77 times as great in the higher as in the lower income, while that for vegetable food is only 3·08 fold. Clothing increases by 7·05 fold, while expenditure for shelter is only 3·88 times, and for fuel and lighting only 2·73 times as great. The expenditure for moral and intellectual needs increases faster still; and income increases faster than outgo. (The complete table is given in the note.)

#### PROPORTIONATE EXPENDITURE OF DIFFERENT INCOMES (ENGEL, p. 41).

	Under 600 fr.	600- 900 fr.	900- 1200 fr.	1200- 2000 fr.	Over 2000 fr.

Deficit . . . . .	1·00	1·46	1·14	1·42	1·57

In few cases also is there any detailed record of the furniture, the condition of which shows perhaps more clearly than anything else the prosperity or the reverse of a family. The information as to the incomes would be more useful if the occupations also were generally stated. With the incomes any supplementary earnings should be included, but it is difficult to secure the particulars of these.

The United States tables enable us to trace consumption in a different direction, viz., as affected by increasing size of family. The budgets were arranged according to the number of children, giving the following results (*Sixth Report*, p. 679):—

Size of Family.	Average expense per family for						
	Food.	Cloth- ing.	Rent.	Fuel.	Light- ing.	Sun- dries.	Total.
No children	\$ 178·39	\$ 64·33	\$ 68·75	\$ 19·78	\$ 4·61	\$ 107·73	\$ 448·59
One child . . .	159·20	77·17	64·96	21·56	4·29	110·66	467·84
Two children . .	211·10	83·64	76·23	23·59	4·56	94·63	492·80
Three children .	227·56	80·15	73·79	24·42	4·77	103·89	524·53
Four children .	233·21	100·12	70·91	24·01	4·61	92·50	525·36
Five children .	252·72	109·14	73·95	27·03	4·80	104·94	572·59
Total and average	206·37	82·07	70·87	22·43	4·57	103·13	489·44

With increasing family, expenditure for food and clothing increases very rapidly—faster than income, while rent, fuel, and lighting increase comparatively little or vary irregularly.

We have thus instituted two comparisons on the basis of the expenditures of families differing either in income or in size of family. By these means we have thrown some light upon the theory of consumption. It appears that food requires an expenditure among the lower classes of more than one-half of the total income. Still further, that the demand for food is inelastic, the proportionate amount devoted to it decreasing with increasing income. Although inelastic, the demand for food is very pressing, increasing with the increasing number of children, and increasing faster than the total income. The demand for clothing is both elastic and pressing, increasing with increasing income, and increasing with increased size of family, and very much faster than the total increased income. The demand for shelter is inelastic, and not pressing, decreasing with increasing income, and remaining nearly stationary even with increasing family. The same may be said to be true in regard to fuel and lighting.

*Other Uses.*—Workmen's budgets suggest many other comparisons, as, for instance, between the labouring classes of different countries and of different nationalities. Some comparisons of this sort may be found in the United States Report. It must be said, however, that the material seems hardly accurate enough for safe generalisation. So, too, we have not sufficient material yet to compare budgets of successive periods, in order to show whether income is increasing, and how increasing income is spent. Engel found that incomes of the working classes had nearly doubled in Belgium from 1853 to 1891, but that about the same proportion was still spent on food, which seemed to show that the food-supply in 1891 must have been very insufficient. For further practical application of the facts learned from budgets, the reader is referred especially to the writings of Engel and Cheysson.

[The most exhaustive treatment of the whole subject is that begun by Ernst Engel under the title "Die Lebenskosten belgischer Arbeiter-Familien," published in the *Bulletin de l'Institut international de Statistique*, tome ix. 1895. This contains an introduction on Method, a critical examination and elaborate analysis of Belgian budgets, and a reprint of his original essay published in 1857 on *Die Productions und Consumptions-Verhältnisse des Königreichs Sachsens*. Engel intended to extend the examination to all countries, but his death (1896) will probably make the work a torso. Cheysson and Toqué, "Les budgets comparés des cent monographies de familles publiées dans 'Les ouvriers Européens' et 'Les ouvriers des deux mondes,'" published in the *Bulletin de l'Institut international de Statistique*, tome v. 1890. Landolt, "Haushaltstatistik." Bauer in Conrad's *Handwörterbuch der Staatswissenschaften*, s.v. "Konsumption," with exhaustive bibliography. Higgs, "Workmen's Budgets," *Journal of Statistical Society*, vol. lvi. June 1893. Sixth and Seventh Annual Reports of the Department of Labour, Washington, 1890 and 1891. Numerous

budgets have been collected by state bureaus of labour statistics in the United States, especially Massachusetts, and by private individuals in various countries. Perhaps the latest is *Family Budgets, being the income and expenses of twenty-eight British Households, 1891-94*, compiled for the Economic Club, London, 1896.] R. M. S.

WORKMEN'S LIVRET. See LIVRET.

WORKSHOP. This term first acquired a definite legal meaning on the passing of the Workshop Regulation Act 1867. A workshop is there defined to be "any room or place whatever, whether in the open air or under cover, in which any handicraft is carried on by any child, young person, or woman, and to which and over which the person by whom such child, young person, or woman is employed has the right of access and control"—factories and bakehouses being alone excepted (30 & 31 Vict., c. 146, §§ 4, 5). A later statute, Factory and Workshop Act 1878 (41 Vict., c. 16), distinguishes several kinds of workshops. These are domestic workshops, workshops in which neither children nor young persons are employed, where adult men only are employed, and where the labour is performed "in a private house or private room by the family dwelling therein," and "exercised at irregular intervals, and does not furnish the whole or principal means of living to such family" (sec. 98); concerning the conduct of which different regulations were made, further revised, and in some respects altered, by the Factory and Workshop Act 1891 (54 & 55 Vict., c. 75) and the Factory and Workshop Act 1895 (58 & 59 Vict. c. 37). This definition of a workshop is in some respects wider, in some narrower, than that of the cognate term factory. It is wider in respect of the extensive signification assigned to the term "handicraft," and of the circumstance that the definition of a factory requires that the process of production shall, with some named exceptions, be aided by mechanical motive power. In the words of the act, "Handicraft shall mean any manual labour exercised by way of trade or for purposes of gain in or incidental to the making any article or part of an article, or in or incidental to the altering, repairing, ornamenting, finishing, or otherwise adapting for sale any article"; the condition of producing for sale being a condition common to both categories. It is narrower by reason of the qualification that this handicraft must be carried on by a child, young person, or woman (not by men), and in a place "to which and over which the person by whom such child, young person, or woman is employed has the right of access and control."

The enforcement of the legal regulations as to workshops was at first vested in local authorities, but was transferred by the Factory and Workshop Act 1871 (34 & 35 Vict., c. 104) to the inspectors of factories. Some

further alterations of administration were made afterwards. The present system is the following: the sanitary inspection of workshops rests with the local authority in the first instance, but where this obligation remains unfulfilled the factory department has power to intervene. Their inspection for all other purposes, *i.e.* as to hours of labour, education of child workers, etc., is the duty of factory inspectors, as in factories; and a sort of reciprocal action is instituted between these two authorities, according to which it is the duty of either to assist the other.

Llewelyn Davies, *The Law relating to Factories and Workshops* (Eyre and Spottiswoode).] R. W. C. T.

#### WORLIDGE, JOHN (17th century),

published in 1669, under the name of J. W., Gent., a work entitled, *Systema Agriculturae: the Mystery of Husbandry Discovered*, a compendious treatise, ranging more or less systematically over the whole field of agriculture, but not very discriminating, and, except in the remarks on bee-keeping, seeming to be compiled from earlier books and from hearsay, rather than founded on independent observation. The views propounded at the beginning of the book on the principles of life savour of alchemy, and those at the end on the weather of

superstition; but there is plenty of sound sense in the practical chapters. The comparison of enclosures with champion or "chilterne" lands is interesting, especially the suggestion that enclosures discouraged drinking, because barley had been grown more easily than wheat in the open fields. The recommendation to grow clover, sainfoin, and lucern—more than a century before Arthur Young—as well as hemp and flax, shows that Worlidge was in the van of his age; and his advice to extend the cultivation of silkworms, and to imitate the Egyptians in the artificial hatching of eggs, prove him to have been readier than practical farmers usually are to try experiments.

[Cunningham, *Eng. Indus. and Commerce*, *Modern Times*, pp. 182, 183, 205.] E. G. P.

**WORSENESS** (in Assaying). The deficiency below standard fineness expressed in carats and carat grains is recorded by an assayer under the title of worseness (see ASSAY; FINENESS OF COINS).

F. E. A.

**WRIT**. This word is generally used for documents by which proceedings are initiated in the courts of law. An action is begun by "writ of summons." A judgment is enforced by a "writ of execution," which may be a writ of *FIERI FACIAS* (*q.v.*), or of *LEGIT* (*q.v.*), or some other specially named "writ." A writ of "Habeas Corpus" is issued when a person is alleged to be imprisoned without justification; a writ of "Mandamus" when an official is alleged to have omitted to perform some act which he ought to perform. A writ of "certiorari" is used when proceedings are to be removed from one court into another court.

E. S.

**XENOPHON**. As is the case with so many of the celebrated men of antiquity, the exact date of the birth of Xenophon cannot now be determined. The date most commonly received is 445 B.C. Xenophon's father, Gryllus, seems to have been in easy circumstances, and Xenophon doubtless received the usual education of an Athenian gentleman. He was one of the young men who gathered round Socrates. Serious, but not speculative, he was impressed rather by the philosopher's homely wisdom and strenuous virtue than by the subtler qualities of his genius. Soon after the close of the Peloponnesian war, Xenophon was induced by a friend, Proxenus the Boeotian, to join the expedition of the younger Cyrus against his brother Artaxerxes. The battle of Cunaxa, in which Cyrus was slain, was followed by the treacherous arrest of the Greek generals, which left the Greek army without a leader. In consequence Xenophon was chosen, together with the Spartan Chirisophus, to conduct the retreat. Its success is proof of his warlike energy and resource. But Cyrus had been the close ally of Sparta, the bitter enemy of Athens, and after the retreat had been accomplished Xeno-

phon, like most of his comrades, took service with the Spartans in Asia. It is not surprising, therefore, that about the year 399 B.C. he should have been sentenced to banishment by the Athenians. Xenophon continued to serve with the Spartans, returning into Greece with Agesilaus and taking part in the battle of Coroneia (B.C. 394) against his countrymen and their allies. Subsequently he settled at Scillus in Triphylia, recently emancipated by the Spartans from the Eleans, where he devoted himself to literature and country occupations. He was married and had two sons, Gryllus and Diodorus, whom he is said to have brought up in the Spartan fashion. Upon the overthrow of the Spartan power at the battle of Leuctra B.C. 371, Xenophon was expelled from Scillus when it was re-conquered by the Eleans. The Athenians, who had transferred their jealousy from Sparta to Thebes, seem to have revoked his sentence of banishment soon afterwards, but he did not return to Athens, preferring to reside at Corinth. His sons served in the Athenian force sent to the assistance of Sparta in 362 B.C., and Gryllus was slain in the skirmish which preceded the battle of Mantinea.

Xenophon lived to a ripe old age, it is said upwards of ninety years, but the date of his death is unknown.

Xenophon was a man of action and of letters, but in no sense a man of science. His surviving works are numerous and range over a wide field. The *Cyropaedia* is a historical novel; but Book viii. 2 (see Bonar, *Philos. and Pol. Econ.*, p. 31) "shows us a more 'modern' Division of Labour and Separation of Trades in full operation"; the *Hellenica* is a set history; the *Anabasis* an account of the expedition of Cyrus, including the retreat of the Greeks; the *Memorabilia* a collection of reminiscences of Socrates. Two of his works can be said to relate to economics, though in an indirect way. The *Oeconomicus* is not, as its title might suggest to English readers, a treatise on political economy. *Oconomics* (Gk. *oikonomikē*) signified simply the art of housekeeping. The *Oeconomicus* is a Socratic dialogue designed to show that there is such an art, and to illustrate its character, partly by conversations between an

Athenian husband and his wife. It contains much good sense and sound morals, and gives a conception of Greek domestic life, but little or nothing that is economic in the technical sense. The treatise on the revenues of Athens is equally practical in its character. It contains suggestions for improving the revenue which the state derived from resident aliens under its protection, and for increasing the returns from the famous silver mines at Laurium, which were public property. It is interesting to the student of Greek history, and also to students of the history of public finance.

[See Smith, *Dictionary of Classical Biography and Mythology*, art. "Xenophon." The editions of Xenophon's writings are numerous. The treatise on the revenues of Athens has been illustrated by Hildebrand, *Xenophontis et Aristotelis de oeconomia publica doctrinae illustrantur.*—Boeckh, *Public Economy of the Athenians.*—Schömann, *Athenian Constitutional History.*—Gilbert, *Greek Constitutional Antiquities*, etc.]

F. C. M.

YANTAR, the Spanish equivalent of the English royal right of PURVEYANCE (*q.v.*). It had been commuted into money in Castile as early as the 13th century. It was called *Cena* in Aragon. E. Ca.

YARDLAND, a virgate, the amount of land usually held by a villein.

[See VILLANUS and VIRGATE.]

R. H.

YARDLING OR YERDLING. One of the English designations of a villein, whose typical holding was a virgate or YARDLAND (*q.v.*). The holder of half a virgate was a Half-yerdling.

[See VILLANUS and VIRGATE. In the north of England husband was the equivalent.]

R. H.

YARRANTON, ANDREW (? 1616-1685) He gives a sketch of his own life. "I was apprentice to a linen draper when this king was born [Chas. II., 1630], and continued at it some years . . . but the shop was too narrow for me . . . I took leave of my master . . . lived a country life some years . . . was a soldier, and sometimes had the honour and misfortune to lodge and dislodge an army. In 1652 I entered on iron works for several years . . . surveyed the three great rivers of England and some small ones, and made two navigable and a third almost completed . . . next, studied ryelands . . . and wrote two books (on clover), on which the country-men fell pell-mell, and in great part of five shires it doubled the value of the land, and I served the countries with the seed for many years."

Some time before 1660 Yarranton was commissioned by eleven gentlemen to travel through Germany and the Netherlands to make observations on husbandry and trade. He went on a second commission about 1663, to discover the mode of manufacturing tin-plates in Bohemia, and was also at Dresden in 1667, when the news came of the Dutch attack on Chatham. This

suggested to him the idea of his second book. His first work was published 1661. Its second edition in 1663 was called *The Improvement Improved, or the great Improvement of Land by Clover*. It claims that 6 acres in clover are worth 80 in natural grass; gives rules for sowing it, for choice of soils, for feeding cattle on it, and a list of twenty-nine places, all in the West Midlands, where good seed may be had cheap. Incidentally he reviews the four obstacles to husbandry: they are ignorance, custom, "penny-wise, pound-foolish," and taking more land than one can manage. His second book, 1677, bore a title which, as he said himself, reads like a romance, and might stamp him as a projector and a hot-brain. *England's Improvement by Sea and Land, to outdo the Dutch without fighting, to pay Debts without Money, to set at work all the Poor of England with the Growth of our own Lands, to prevent unnecessary Suits in Law, with the Benefit of a Voluntary Register: Directions where vast Quantities of Timber are to be had for the Building of Ships, with the Advantage of making the great Rivers of England navigable; Rules to prevent Fires in London and other great Cities, with Directions how the several Companies of Handicraftsmen in London may always have cheap Bread and Drink*, by Andrew Yarranton, Gentleman, London, printed for the author 1677.

In the three and half years before the second part of this book was issued (1681), he somewhat altered the scheme he had laid down for it in 1677. The second part as it stands is a little less irregular in plan than the first part. It is divided into chapters, and has a table of contents, and more elaborate plates. There are several dialogues inserted, to bring out the secrets of the timber-trade, the iron manufacture, and even a lengthy outburst of poetry in praise of a land register. The pamphlets against him 1679-81 sprang out of the Popish plot agitation. Yarranton, as a Presbyterian and old commonwealth soldier, had himself been imprisoned 1661 on a "Presbyterian sham-plot," which he describes with some spirit in his tract of 1680 bearing that title. But for all the odium theologium as well as odium politicum that inspired them, the pamphleteers can find little serious to attack in him. They are reduced to jeering at him, on the ground that his navigation projects had to be abandoned; his land-register bill was "kicked out" by the Commons; his club of threescore gentlemen, "the improvers of England," which met twice a week, had been broken up. His title page was parodied; "to make the streets navigable rivers, to harbour ships on a hill," and so on. All this, according to a sturdy champion on the other side, betrays "the Popish pettifogger," and "only made Yarranton's deserts more public, and England's improvements more honoured."

Yarranton's originality lies in his faculty of popularising and making practical the ideas current at the time. It was not he but (as he says himself), Sir R. Weston who brought in clover "about thirteen years ago," from Brabant; but it was Yarranton who by five years' careful experiment detected the causes of its failure at first—bad and dear seed, sowing too thin, choice of unsuitable soils, etc. His scheme of land registration was not new, it was often proposed in the projects of land-law reform encouraged by the great act of 1660; and in a debate in the Lords 1669 the decay of rents was traced to the want of a register. Indeed the same object had been aimed at in the statute of enrolments 1536, and only defeated by the later device of lease and release, which reintroduced secrecy of conveyance, a practice repugnant to the whole course of our law in ancient and in mediæval times (see LAND REGISTRATION).

As the advocate of a state bank, he was only one of many writers, beginning with Heath in 1632, who wanted a bank of credit on the Venetian model, rather than a bank chiefly of deposit on the Dutch model, proposed by LAMBE in 1659. The further idea that the fund of this bank might be the land itself, had already been urged by POTTER 1659 in *The Tradesman's Jewel*, and CHADOCKE 1660, who promised by this means to lend landowners nearly the full value of their land, to make these land bills pass as current money, and thus to increase trade, to raise a revenue without taxes, and yet to incur no hazard.

When he guaranteed "to set all the poor of England on work," he was equally following in the steps of other writers. His panacea was the development of the manufactures of linen and iron. The others had prescribed a similar development either of fishing (Goffe, 1625), or of spinning (Taylor, 1652), or of crown lands (CHAMBERLEN, 1649), or of enclosures, or even the identical things Yarranton was recommending—iron, Dudley, 1661; linen, HAINEs, 1649.

His proposals for making rivers navigable had been often anticipated, as in a bill 1635 to deal with the Bristol Avon, and in other cases which he himself describes to us. The study of foreign countries had been already illustrated by Sir W. TEMPLE, *Observations on the Netherlands* (1672). The very title of Yarranton's book, *England's Improvement*, was a common formula, and had been appropriated by more than one of his predecessors; e.g. JOHN SMITH, *England's Improvement Reviv'd*, 1673, to oust the Dutch from the fishing trade, and BLITH's book, *The English Improver Improved, a new survey of husbandry*, 1652.

In fact, Yarranton was eminently a man of his time; an adapter rather than an originator; a man of practical insight rather than a theorist; a "projector" within sound business limits. What makes him attractive is his own character. He had exceptional versatility; he could turn his hand to anything, and in everything he had some success. He had a healthy curiosity and keen observation. He was eager and alert for the material welfare of his country. He had an affectionate zeal for his "children," as he calls them, "all poor men in England that labour in mechanic arts." His manifold interests, his resourcefulness, his optimism, his zeal for material progress, his readiness to learn from the foreigner, his belief in England's future, his combination of shrewd practice with imperfect theory, his half-vision of great principles, all are characteristic marks of the 17th century.

He has no literary pretensions. His writing is full of tautologies and repetitions; his argument is extraordinarily discursive; he is always going off at a tangent as soon as he sights one of his favourite topics. But what he has to say is said in a clear and unaffected way; and he is not cursed with the ambition to write in the tedious "high style" of the time. He is no scientific economist, and very far from being "the genuine founder of political economy in England" (DOVE); but he has an unrivalled eye for detail, and a great skill in vivid presentation of it.

Not a few of Yarranton's contemporaries surpassed him in grasp of economic truth. He cannot claim to have seized the true function of money like CHILD, the need of statistics like DAVENANT, or the grounds of free trade like DUDLEY NORRIS. There is in him none of the penetrating analysis which led PERRY to the true nature of value and of rent, or which enabled BARBON to lay down the essential definitions of wealth, price, and exchange. Yet guided solely by native wit and by business experience, Yarranton often comes near to the

light. Our climate and soil, the character of our people, and our constitution should, he says, make us great beyond any nation in the world. The prosperity of our neighbours is a gain to us and need not be a cause of envy. The lands of England ought to rise to thirty years' purchase. The use of a bank is to facilitate credit, not so much to hold deposits. The great obstacle to improvement in husbandry is obstinate custom. Honour, honesty, riches, strength, and trade are five sisters. The way to deal with the poor is by increasing employments. To secure this and to provide cheap food for the people, are the two things to study. "I appeal to every unprejudiced man if cheap corn, beef, wool, and candles will not make cheap cloth." Patents, as now granted, drive trade out of the kingdom. Most pamphlets miss the mark because their authors are not practical men and have never travelled. The Turk has failed because he never got the power of the seas. "It is the navy that must, under God, save this nation." His criticism of the working of corn-bounties, and of the Irish cattle acts, is almost worthy of Adam SMITH.

In Saxony he saw not a single beggar; so much employment was there, by the linen-tape, thread, and tinplate trades. In Holland he saw that we could never beat the Dutch in fighting; their sands defend them, and enable them to use ships which draw five feet less than ours. Trade is their mistress, whom we never woo away for long; she loves "that dull and flegmatic air." The reasons are that their land is registered, their banks make paper as good as money, they have "lumber houses"<sup>1</sup> attached which lend money on goods at easy interest, they have "cut rivers" to aid traffic, and merchants' courts to determine cases. When he says, "every acre of Dutch land is as good as ready money," "land registered will equal cash, and will do in trade what ready money does," we can scent the land bank fallacy 1693-96. But when he goes on, "if here a man of £1000 a year wants a loan of £4000 he can hardly get it," and traces this to the difficulty of proof of title, he is right. Not for nothing had he been commissioner (probably 1653-54) for settlement of estates in Worcestershire. He would have had all the houses in London registered as they were rebuilt after the fire, and three or four similar registers in different parts of England. Then London would have as great a bank as Amsterdam, fishing would revive at Bristol and Hull, cloth trade at Lynn, wool at Exeter, and interest would sink from six to four per cent. Lawyers and debtors will oppose the scheme, but the register will be voluntary. There is such registration in Scotland, and land there is at twenty-four years' purchase; and in some copyhold manors as Taunton, and there it is twenty-three; but not in England generally, and land therefore goes for only sixteen.

Next in importance comes the linen trade; he would have flax grown in the counties of Oxford, Warwick, Leicester, Northampton; on an acre there would be 8 cwt. flax, which would make 400 ells of cloth at 8s. "I and my wife to employ the poor did promote the making of much fine linen." We might save the £2,000,000 a year now spent on foreign linen. Spinners, bleachers, weavers, fullers, should be brought over from Friburg, Harlem, Dort, Dresden. Children can hardly begin too young. Similar measures should be taken for the iron manufacture; the neighbouring commons should be enclosed and planted to supply fuel. There are 100,000 poor now costing 4d. a day who might instead be earning 8d.

The new manufactures should be protected for seven years by import duties on Dutch and German linen, and on Swedish, Flemish, and Spanish iron. They should be further aided by establishing, on the Saxon model, bank granaries for corn, at the head of rivers, e.g. Banbury, Witney, Radcot, Stratford. This would give the manufacturing populations and all the London handicraftsmen plenty of cheap food and drink, which should be prepared in public bakehouses and brew-houses at each populous centre. The rivers must be made navigable, particularly Trent, Thames, Cherwell, Stour, Avon, Wye, Dee. He had surveyed these rivers, and himself experimented with the Avon and the Stour successfully. His plans seem to be in a transition stage to the later age of canals; he is sanguine that the rivers only want some dredging and a few lock-

<sup>1</sup> Lumber houses, i.e., Lombard houses, where advances on goods were attainable.

gates; the only canal he names is one to join Severn at Welshpool to Thames at Lechlade. In this connection he draws out plans for harbours, *e.g.* at Kingstown and Newhaven, and for new and cheaper dockyards at Wexford and at Christchurch. Other projects sketched in this book are a plan to prevent fires in London by providing special watchmen and stations for the supply of water and a sort of rude fire engines; "a university to improve art by endowing travelling students, as is done in mechanics at Nuremberg" (Nuremberg); a factory and water wheel for the manufacture of pins; the establishment of "a sea city" at Blackwall to accommodate a fishing population; the encouragement of the fisheries by improving the supply of cheap timber, iron, and salt, by registering and harbouring the fishing busses, by giving to the trade several years' exemption from taxes, by naturalising immigrants, by creating an old-age and pension fund; and, finally, two full descriptions of the proper way to cut out the foreign tin plate and linen-bleaching trades by superior materials and by the superior methods which had already been demonstrated by him in actual working.

[Eden, *State of the Poor*, p. 285.—McCulloch, *Literature of Pol. Econ.*, p. 350.—Cunningham, *The Growth of English Industry and Commerce*, ed. 1892, vol. ii. pp. 190, 202, 220-253, 356.—Dove, P. E., *Elements of Political Science* (Edinburgh, 1854) has in an appendix a diffuse but readable account of Andrew Yarranton's chief book, and a eulogy of him as the "genuine founder of political economy in England."—*Social England* (Cassell and Co.) vol. iv. c. xv. pp. 439-60; c. xvi. pp. 517-31.] A. L. S.

YEARS, ESTATE FOR. See TERM OF YEARS.

YEN. 1. A gold yen weighs 25.72 grains; purity 0.9.

2. A silver yen weighs 416 grains; purity 0.9.

3. A Nippon Ginko (*Nippon*, Japan; *Ginko*, Bank) yen bank-note, always exchangeable there for one silver yen.

4. A paper yen must be accepted by all government offices, and for all payments as "one yen." Its redeemable value in silver or gold is not expressly stated.

In 1876 (at the time of a great excess of exportation) the paper yen was at a premium of 4 per cent above the silver yen; after the Satsuma rebellion, at a time of an increased issue of paper money, and a great excess of importation of paper money, it fell greatly in value below par; during the last few years, under favourable conditions, with a less amount of paper money in circulation, and after the intervention of the bank-notes of the Nippon Ginko, issued in consideration of the needs of the money-market, the paper yen has been always at par with the silver yen. The fluctuations of the relations of the values of gold and silver naturally affect the value of the paper yen.

5. Silver yen = 2 silver florins, formerly always reckoned equal to about 4 marks, now in reality worth three marks only.

[P. Mayet, *Agricultural Insurance*, London, 1893.]

YEN. The money of account in Japan, and also gold and silver coins bearing the same name.

The Japanese mint at Osaka was opened in December 1870, the currency system then introduced being as follows:—

10 rin = 1 sen

100 sen = 1 yen (or dollar)

The coins to be struck were:—

Gold:—

20 yen 514.41 grains 900 fine

10 yen 257.20 " "

5 yen 128.60 " "

2 yen 51.44 " "

yen 25.72 " " (the standard of value).

Silver:—

50 sen 193.00 grains 800 fine

20 sen 77.2 " "

10 sen 38.6 " "

5 sen 19.3 " "

Copper Coins:—

1 sen 110 grains

$\frac{1}{2}$  sen 55 " "

1 rin 14 " "

Trade Coin (silver):—

yen 416 grains 900 fine

Gold was the standard of value, and the gold coins were legal tender to any amount. Silver coin was limited in legal tender to ten yen in any one payment, and copper coin to one yen.

The issue of the trade dollar, or *silver yen* (coined either for Japanese or foreign applicants), was intended to facilitate the operations of foreign trade. So far as Japan itself was concerned, this silver coin was only legal tender for the payment of import and export duties, and of other taxes at the open ports. It could not be tendered in payment for any internal taxes, and was not current throughout the country. It was also ordered that "in payment of duties and taxes at the open ports, the relative value of the silver yen and the standard gold coin will be for the present at the rate of 100 silver yen for 101 gold yen."

On the 28th February 1876, the weight of the silver yen was altered to 420 grains, in order to conform with that of the United States trade dollar, a coin which at that time largely circulated throughout the coast towns of China, and at Hong-kong. Subsequently, however, by a notification of 26th November 1878, the coinage of yen of this increased weight was discontinued, and the original weight 416 grains, reverted to.

On the 27th May 1878, a notification was made by the prime minister of Japan to the effect that "the trade dollar which has hitherto been coined for the convenience of commerce at the open ports, will henceforth be made universally current, and may therefore be used in making and receiving payments of taxes, and in all other public and private transactions."

From the 12th September 1879 the silver yen became the standard of value, the text of the notification of this further change in the currency system of Japan being as follows:—

"The Japanese silver yen of 416 grains weight and 900 fineness will henceforth be received at par with Mexican dollar by every department of the imperial government when tendered in payment of custom duties or on any other account opened, in Mexican dollars."

"On and after the 19th instant, aforesaid yen shall, when tendered in payment of any sum payable in Mexican dollars now due, or hereafter to become due, be received by all Japanese subjects in full payment thereof."

The number of silver yen coined and issued from the Japanese mint from the time of its opening, December 1870, to the 31st March 1896, was 151,210,000. During the same period the gold yen pieces struck had amounted to 2,037,055 only. The total value, however, of the five and ten yen gold pieces struck, being 45,890,000 and 18,710,000 yen respectively.

The Japanese government have announced their intention to revert to the gold standard of value, and a currency law has been passed giving effect to this decision. This law came into operation on the 1st October 1897.

The principal provisions of the new law are as follows:—

The standard of value is to be a gold yen weighing 11·574 grains of pure gold.

Coins will be issued in gold, silver, nickel, and bronze of the weights and fineness given below. The nickel coins will contain 75 per cent of copper and 25 per cent of nickel, the bronze pieces being of the composition of 95 per cent copper, 4 per cent tin, and 1 per cent zinc.

#### Gold Coins:—

	Weight.	Fineness.
20 yen	257·2 grains	900
10 yen	128·6 "	"
5 yen	64·3 "	"

#### Silver Coins:—

50 sen	208·0 grains	800 fine
20 sen	83·2 "	"
10 sen	41·6 "	"

#### Nickel Coins:—

5 sen	71·9 grains
-------	-------------

#### Bronze Coins:—

sen	110·0 grains
5 rin	55·0 "

Gold coins will be legal tender to any amount, silver coins to 10 yen, and nickel and bronze coins to 1 yen.

Worn coins diminished in weight by fair wear and tear will be exchanged by the government free of charge.

As regards coins now in use, it is provided that the "gold coins already issued shall circulate at twice the value of the gold coins issued under the provisions of this law." The silver yen "shall be gradually exchanged for gold coins according to the convenience of the government, at the rate of one gold yen for one silver yen. Pending the completion of the exchange . . . silver one yen coins shall be legal tender to an unlimited extent, at the rate of one silver yen for one gold yen; and the suspension of their circulation shall be notified six months in advance by imperial ordinance. Any of these coins not presented for exchange within a period of five full years reckoned from the day on which their circulation is suspended, shall be regarded thenceforth as bullion."

The five sen silver coins, and the copper coins of the old currency, will continue to circulate as before.

The coinage of silver yen has been brought to a close from the date of the promulgation of the new law.

YEOMANRY OF CRAFTS. See JOURNEYMAN and JOURNEYMEN'S SOCIETIES.

## YEOMEN

Meaning of the Term, p. 684; Their Numbers, p. 685; Their History, p. 686.

*Meaning of the Term.* Students of social history may be misled if they rely only on Macaulay's description of the yeomanry as "petty proprietors who cultivated their own fields with their own hands without affecting to have scutcheons, and enjoyed a modest competence." It is wiser to follow, point by point, Sir T. Smyth (*De Republica Anglorum*, 1583, I. xxiii.) and W. Harrison (*Description of England*, II. v. in *Holinshed's Chronicle*, 1577). The second edition of Holinshed, 1587, pp. 163b, 164b, which blends Smyth's and Harrison's views, states that yeomen have (1) "free land" (2) worth £6 annually, or in times past 40s.; and are (3) not entitled to a crest, being (4) "for the most part farmers to gentlemen." (1) includes "free tenants" of manorial lords, although W. Hale Hale insinuates that free tenants became yeomen on exchanging prædial for pecuniary dues (*Domesday of St. Paul's*, p. 1v.). Again it would be difficult to exclude copyhold and customary tenants who are not freeholders in an age like that of Harrison, when it required an expert to distinguish them apart. Chamberlayne includes them (*Angliae Notitia*, 1669, pt. i. p. 179, ed. 1755), and so does Logan in Guilleim's *Heraldry* (1679), and so does W. Marshall (*Norfolk*, 1787, vol. i. p. 7, and most Cumberland and Westmoreland "statesmen" were customary freehold tenants. Again Smyth's and Harrison's words directly recall those of the statute of 1429 which created those 40s. freeholders whose votes ruled England for 400 years, and of whom lessees for life were important members. In 1726 Swift (*Gulliver's Travels*, pt. iii. ch. 8) and in 1765 Blackstone (*Commentaries*, bk. i. ch. 12) identified yeomen with duly qualified rural voters. Chamberlayne's "yeomen freeholders" who were "more in number and richer than in any country of the like extent in Europe," refer largely to lessees for life. The wide prevalence of the lease for life was due partly to the fact that it had been substituted for a copyhold for life (E. Laurence, *Duty of a Steward*, 1727, pp. 59, 60), but chiefly to the fact that it conferred a vote (E. Wakefield, *Ireland*, 1812, ii. 300). Further, Harrison's "these are they that in times past made all France afraid," is unintelligible if it means that Frenchmen quailed before a lessee for life while they viewed a lessee for years with indifference; and (4) suggests that, like Bacon, he drew no hard and fast line between farmer and farmer. Bacon, too, attributes the French conquests to our yeoman infantry,

whom he defines as "the middle people between gentlemen and peasants," and he writes of the "tenancies for years, lives, and at will whereupon much of the yeomanry lived" (*Works*, vi. 94). In the great rebellion "the middle people" in this sense fought on the same side, so probably in the French wars. Latimer's first sermon before Edward VI., "My father was a yeoman, but had no land of his own," at £4 rent (ed. Arber, p. 39), clearly dubs a tenant farmer yeoman. The author of *Britannia Languens* wrote, in 1680, "our late wealthy yeomanry are forced to sink their rents or . . . fling up their farms" (*Early English tracts on Commerce*, 1856, p. 377; cp. Massie, *Ways and Means*, 1757, p. 45); and Lord Taaffe uses the word of leaseholders only (*Observations*, 1766, p. 13). If these writers could not, still less could strict economists consistently exclude the general body of tenant farmers once they included lessees for life—a class whom they unanimously put on a lower level than other lessees (Defoe, *Tour through Great Britain*, 1725, ed. 1753, ii. 46; A. Smith, *Wealth of Nations*, bk. iii. ch. ii. and iv., pp. 174a, 186a, ed. McCulloch; Jas. Caird, *English Agriculture*, 1851, p. 50). Consequently, there has been a tendency during the last century either to include or to exclude every one who could be called a tenant farmer. A. Smith calls all English farmers yeomen, adding that "a great part" of them are lessees for life (*l.c.*). A. Young's yeoman rarely occurs, but is always owner pure and simple. But the wide prevalence down to 1832 of the political sense of the term has caused much confusion; thus Caird, while rejoicing over the promotion of Devonshire lessees for life into lessees for years, never dreams that yeomanry are being extirpated (*l.c.*); indeed all writers since 1832 exclude all tenant farmers from the privileged category, and then wonder why yeomen have disappeared. (2) Every writer draws only a lower limit. Chamberlayne gives as their income £40 to £50, £100 to £200, or £200 to £400, the first class being commonest. In Cumberland and Westmoreland they have £5 or £10 to £50; in Surrey £200 to £400 (see *Reports to the Board of Agriculture*, 1793-1817, presided over by Sir J. Sinclair, Westmoreland, p. 18, Surrey, p. 73).

One of Marshall's Midland yeomen had £2000 a year. A. YOUNG wrote "Of all the divisions of landed property, that which is most to be approved is small and middling proprietors occupying their own estates, but not being gentlemen," and instances Suffolk yeomen of £200 to £400 per annum (*Annals*, vii. 523). "Respectable," "independent" are the Homeric epithets applied to them. Kay uses "yeomen" as something more than "peasant proprietors" (*Free Trade in Land*, 1879, pp. 106, 113, etc.). These qualifications ought perhaps to exclude

the Wiltshire "yardlanders" (Marshall's *Abstract of the Reports. Southern Counties*, p. 206; contrast J. Phillip, *Memoirs of W. Smith*, 1844, p. 1), and the 144 co-owners of 3500 acres at Kirton (*Abstract. Eastern Reports*, p. 101), and those peasant owners of Axholme, who still thrive and multiply; and we should look for the analogue of yeomen in the middle-sized owners of foreign countries. In a recent report this middle class (23 to 115 acres) were said to own more of France than either large owners or peasant proprietors, and to have increased between 1862 and 1882 from 636,309 to 727,222, while the letting of land decreased from 27.49 to 27.09 per cent (*Parl. Reports*, 1890-91, vol. 83, p. 52). (3) This point has little importance after the last visitation of the Heralds (1686), but survives in A. Young who, in his *Southern Tour* (pp. 47, 70) and *Rural Economy* (Essay V.), refers to owner-farmers who are not called yeomen, and in modern reluctance to class farming squires and clergy as yeomen. It should be added to (4) that all writers by tacit consent exclude lessors except Brodrick (*English Land*, 1881, p. 173).

*Their Numbers.* (1) Domesday book, which omits the four northern counties, and possibly all who paid rent only (Nasse, p. 35), estimates English lords at 9271, villeins at 108,407, free tenants at 35,474. (2) Gregory KING (misquoted in C. DAVENANT, *Works*, ii. 185, Macaulay, Rae, Prothero, and others) in his *Natural Observations, etc. upon the state of England*, 1696, says there were 26,586 nobles, esquires, clergy, and gentlemen, 40,000 larger and 140,000 lesser "freeholders," and 150,000 "farmers." Assuming that "farmers" do not, then "freeholders" must mean farmer-owners and lessees for life, and must also mean copyholders and customary tenants, including lessors and owners of minute patches upon those common fields which, according to J. Laurence (*System of Agriculture*, 1726, p. 45), covered one-third of the land. But it is useless to make critical assumptions about a vaguely-expressed guess for which the author gives no grounds. (3) A. Young selected some 250 farms at random, and generalising to the kingdom at large, estimated English farmers once as 111,498 (*Northern Tour*, iv. 341, 364), later at 57,040 (*Eastern Tour*, iv. 462), and so on (cp. *Letters to the Yeomanry*, pp. 37, 60). (4) BEEKE says there were "at least 200,000 proprietors" in England and Wales in 1800 (*Observations on the Income Tax*, 1801, p. 21). (5) Our "New Domesday Book" (1874, vol. lxxii.) filled in owners from the rate-books in each parish, urban and rural; but it was not the business of rating authorities to fill in owners' names; so that the return being founded on irresponsible local hearing is worthless for our purpose. (6) According to our "agricultural statistics" for England (1887-97)

rented farms were, in 1895, 313,478; owned farms 48,601; farms partly rented and partly owned were 18,100; and 14 per cent of English farm lands were farmed by owners. "Owners" include squires with farms in hand, clergy with glebe lands over an acre, and possibly some copyholders. These are the only trustworthy general statistics since Domesday Book; (2), (3), and (4) ought never to have been or to be quoted by social historians.

*Their History.* (1) In the 16th century hereditary copyholders were cajoled out of their holdings or commonable rights (Strype's *Eccles. Mem.* II. i. 172 and 439), and yardlands were purchased (W. Stafford's *Compendious Examination, etc.*, 1581, *Pamphleteer*, v. 297), but the first process must have been rare since 43 Edw. III. and 7 Edw. IV., when villeins vindicated their rights as copyholders; and the second process may or may not mean that cottagers grew up into yeomen. Further, Latimer and More (*Utopia*, ed. Arber, 38, 41, etc.) do not inveigh against these evils, but against the evictions and rack-rents of lessors, and the adding of farm to farm by tenants (Strype, II. i. 167); and all the acts which directly limit the size of farms refer exclusively to "letten farms" (4 Hy. VII. c. 16 and c. 19; 25 Hy. VIII. c. 13 §§ 7-14; 27 Hy. VIII. c. 22; 2 & 3 Phil. and M. c. 2); so that their effect was to make squires farm their own land, a process which Mr. Leadham has vividly illustrated (Royal Historical Society, *Domesday of Enclosures*, 1517-18, ed. Leadham, 1897, p. 70), and which a second series of acts (6 Hy. VIII. c. 5; 7 Hy. VIII. c. 1; 5 and 6 Ed. VI. c. 5; 39 Eliz. c. 1 and c. 2), aimed at arresting. The crisis which was caused by the substitution of large pastoral for small agricultural farms affected tenant-farmers mainly if not solely. "Tenant-farmers," of course, include those who held for life, whether by freehold or copyhold tenure. (2) *In the 18th and 19th centuries* two contradictory myths obscure history. (a) "There existed a race of men in the country, besides the gentlemen and husbandmen, called yeomanry, men who cultivated their own property, consisting chiefly of farms . . . the pride of the nation in war and peace; hardy, brave, and of good morals; by the influx of riches and a change of manners they were nearly annihilated in the year 1750, and are now but faintly remembered" (Letter to Sir T. C. Bunbury, 1795, British Museum, T. 1466), comp. Marshall's *Abstract. Western Counties*, p. 125), is a mere echo of Rousseau's primitive man, but suggested to Karl Marx, Laveleye, and numerous others, sober history. (b) The second myth is that the end of last century witnessed the heyday of the since vanished yeomanry, and the *Sinclair Reports* are cited as evidence. But their references to Devonshire and West Dorsetshire (Marshall's *Abstract. Southern Counties*, 268, 554, 570), to

the 9000 "freeholders" of Kent<sup>1</sup> (Boys, ed. 1813, p. 28), and 5790 freehold voters for Gloucestershire (Rudge, p. 34), and North Riding freehold electors (Tuke, pp. 28, 30), refer to districts in which life lessees were exceptionally numerous; and Homer's "there is scarce any county in which the number of freeholders does not turn out upon an election poll much more considerable than formerly" (*Essay on Inclosure*, 1766, p. 15), very likely refers to similar districts. Mavor (*Berks*, 1808, p. 113) wrote that "one-third of the whole county is occupied by the proprietors of the soil"; but he assumed that the remaining two-thirds were occupied by yearly tenants or lessees for years, consequently under "proprietors" he must have included copyholders, etc., who were doubtless one-third of the county. Bishton's "infinite yeomen's estates" in Shropshire (*Shropshire*, 1794, p. 31) dwindled down on a closer inspection to "3000 copyholders and freeholders" (Plymley, *Shropshire*, 1803, p. 91). Brown's Derbyshire yeomen (*Derbyshire*, 1794, p. 14), and Kent's Norfolkshire yeomanry (*Norfolk*, 1796, p. 125), meant tenant farmers. To come now to history. A. Young perhaps thought that owner-farmers of a certain class were diminishing: "there are some parts of England (where small yeomen still remain) that resemble Bearn" (*Travels in France*, ed. 1889, p. 61); "small" means 40 to 80 acres (ed. 1794, ii. p. 412), and he means enclosed land; "still," of course, may mean that A. Young believed the Rousseauesque myth. He adds, "small properties are found everywhere" in France "to a degree we have no idea of in England," where they were "exceedingly rare" (*ib.* 402). John Arbuthnot (*Inquiry into the Price of Provisions*, 1773, pp. 126, 139, cited by TOYNBEE as A. Young) deploras "the loss of our yeomanry," by which he means the absorption of small by large hereditary freeholders, a phenomenon noted too by A. Hunter (*Georgical Essays*, 1803, vol. iv. p. 108); but ARBUTHNOT derives his facts from Dr. PRICE's figures (*Observations on Reversionary Payments*, published the year after Goldsmith's *Deserted Village*), which eventually proved the opposite of what they were meant to prove (Chalmers's *Estimate*, 1803, p. 216), and, as Arbuthnot admitted, were meant to prove the very different thesis that where wealth accumulates men decay, and that tenant-farmers were turning pluralists. This pluralising tendency of tenant-farmers is also deprecated by S. Addington (*Enquiry into enclosing open fields*, 1772) and T. Wright (*Short address on the Monopoly of Small Farms*, 1795),

<sup>1</sup> "A Gentleman of Wales,  
A Knight of Cales,  
And a Laird of the North Countree,  
But a Yeoman of Kent  
With his Yearly Rent  
He will buy them out all three."

*Old Rhyme.*

and the *Sinclair Reports* (*Abstract. Southern Counties*, 157, 247, 330, *Midlands*, 33) in certain districts; and for a reason obvious to us, but not to them, this tendency is sometimes noted as most active in those counties where there was money going and wages were high (*Abstract. Northern Counties*, 259, 282; cp. W. Stafford's pamphlet, *i.e.* p. 260). Consolidation, too, was the necessary preliminary and avowed object of the enclosure of intermingled copyhold estates (Davis, *Wiltshire*, 1813, pp. 48, 49). It is difficult to suppose that this movement did not implicate farmer-owners in some districts. In two large and four small districts this implication of farmer-owners can be traced. In Cumberland and Westmoreland the small "statesmen" disappeared with the disappearance of the hand-loom (Wordsworth in *Prose Works*, ii. 263, 286, and in Sir H. Bunbury's *Correspondence of Hammer*, 440, and in *The Brothers*; cp. *Gentleman's Magazine*, 1806, p. 871; Pringle's *Westmoreland*, p. 40), and are now nearly extinct (Caird's *English Agriculture*, 1851, p. 360; *Parl. Reports*, 1881, vol. xvi. p. 236; 1895, vol. xvii., "Cumberland," p. 32). Marshall's 300 of Pickering (*Yorkshire*, p. 20); Stevenson's Portland Colony (*Dorsetshire*, p. 76); Th. ROGERS' Hampshire village (*Six Centuries*, p. 502). A. Young's yeomen of the redland district of Oxfordshire (*Oxfordshire*, p. 16) have followed in their wake. Further, in Kent and Essex, farmers are mentioned in the *Sinclair Reports* as purchasing their holdings; and yeomen owners existed in Lincolnshire; they are still as numerous as ever they were in Kent and Lincolnshire (*Parl. Reports*, 1881, xvi. 385 *et seq.*; 1882, xv. 299); and still exist in Essex (*Parl. Reports*, 1894, xvi. pt. i. p. 52). A. Young's accounts of Norfolk and Suffolk, and Vancouver's accounts of Hampshire yeomen still hold (*Parl. Reports*, 1894, vol. xvi. pt. iii. pp. 203, 204; 1895, vol. xvii., "Norfolk," p. 36). Add that individuals have withered here and there, and their place has been inadequately supplied by gentlemen farmers on the one hand, and by allottees under inclosure acts since 1845 on the other hand (Caird's *Landed Interest*, 123 *et seq.*), and beyond this farmer-owners (if we except the squire of Coke's type and the VILLEIN who passed through the stage of copyholder into that of labourer) have not played a great part in our history, and have only been important when inextricably intermingled with the great body of tenant-farmers or voters. They have for the most part kept outside the main stream of development, which has been from the manor to the triple system of to-day.

YOUNG, ARTHUR (1741-1820), the most noteworthy of English writers on agriculture, came of a Suffolk family. After being engaged in farming for a few years, he began his career as a writer on agricultural subjects with *The Farmer's Letters* in 1767. For the next thirty-eight years an increasing stream of books and pamphlets, many of which passed into several editions, and were translated into French and German, poured from his pen. He travelled up and down England for months at a time, making the careful observations published in his series of *Tours*; and for the same purpose he travelled in Ireland in the years from 1773 to 1776; he founded the *Annals of Agriculture* in 1783, and contributed largely to its forty-six volumes; his journeys in France in 1787-1790 produced his most considerable work, the *Travels in France*, since recognised as the best authority for the condition of that country on the eve of the revolution; and in 1793 he became secretary of the newly-established board of agriculture.

Young's place in history is due, first, to his remarkable qualities as a keen observer, which give his works a permanent value as sources of information on the conditions of his time; and, secondly, to his own considerable share in stimulating the movement for the substitution of large farming for small, of enclosures for open fields, and of rotation of crops for periodical fallows. It would be a mistake to regard him as an economic theorist; his utterances on such subjects as rent and wages are all determined by his desire to increase the produce of agriculture; and he was no stickler for system or consistency. His best known phrase "The magic of property turns sand to gold"—which has been repeated incessantly since J. S. Mill quoted it in his chapter on peasant proprietors—is a thoroughly characteristic one.

[*The Autobiography of Arthur Young*, with selections from his correspondence, has recently (1897) been printed under the editorship of Miss Betham-Edwards. The most important of his works were the following: *The Farmer's Letters to the People of England* (1767).—*A Six Weeks' Tour through the Southern Counties of England and Wales* (1768).—*A Six Months' Tour through the North of England* (1770).—*Rural Economy* (1770).—*The Farmer's Tour through the East of England* (1771).—*The Farmer's Calendar* (1771).—*Political Arithmetic* (1774); pt. ii. (1779).—*A Tour in Ireland* (1780).—*Travels in France* (1792).—*General Views of the Agriculture of Suffolk* (1794), *Lincoln* (1799), *Hertfordshire* (1804), *Norfolk* (1804), *Essex* (1807), *Oxfordshire* (1809), *Sussex* (1793) was the work of his son, Rev. Arthur Young.—*General Report on Inclosures* (1807). There has been a new and inexpensive edition of the *Tour in Ireland*, ed. A. W. Hutton (1892);

to the second volume of the latter is appended an exhaustive bibliography by J. P. Anderson.

Among the numerous comments and critical essays upon Young may be mentioned T. R. Malthus, *The Principle of Population*, 8th ed. pp. 449-455.—J. S. Mill, *Principles of Political Economy*, bk. ii. ch. vi. § 7.—H. Baudrillart in *Publicistes modernes* (1868).—R. E. Prothero, *Pioneers and Progress of English Farming* (1888), ch. vi.—F. S. Stevenson in *The Westminster Review*, exxxix. (1893), p. 109; and, above all, for Young's personality, Leslie Stephen in *The National Review*, xxvii. (1896), p. 489.] W. J. A.

The first and foremost feature of A. Young's two great books on France (ed. 1794) and Ireland (ed. 1892) is that utility in a materialistic sense is their ideal. He prefers turnips to "fat ecclesiastics" (*Fr.*, i. 77), and writes in the very spirit of MANDEVILLE, that "a king had better make love to a handsome woman," like Louis XV., "than to his neighbour's provinces," like Frederick the Great (pp. 82, 265). He hates military history (p. 255), distant dominions (pp. 193, 437), war debts (p. 576), the middle ages (p. 67), *grands seigneurs* (p. 62), jobbing gentlemen, and idlers, too feudal in their ideas to occupy themselves with trade (*Ir.*, ii. 26, 248), with the hatred of TUCKER, and for the same reason—they are so much waste. But utility, though the test of political and social health, is not with him the sole spring of individual action; "prejudice and habit govern mankind as much even as their interest" (p. 128), and though he loves the naturalness of ROUSSEAU (*Fr.*, i. 22, 72), like BURKE he condemns "natural right" as unhistorical (p. 119). Secondly, he traces economic evils to political causes; the French and Irish had a better soil than the English, but no spirit of freedom, and were therefore backward (*Fr.*, i. 80; *Ir.*, ii. 55). LAVERGNE pointed the converse moral as to England (1855). The French Land Tax discouraged improvements, and, as T. Campbell (1777) said, *Phil. Survey*, p. 251, the Irish anti-Catholic laws penalised industry but not religion (*Ir.*, ii. 66). His belief that "government" was the "one all-powerful cause" (*Fr.*, i. 43) of that misery which he saw, is the secret of his optimistic forecast; and sometimes he expresses pure LAISSEZ-FAIRE doctrines. Thus he writes: "The sole policy . . . is freedom; let the state take no party" as between agriculture and manufactures (p. 437); he argues for "absolute freedom" (pp. 573, 625), and his proofs that French measures, meant to avert, created famine (pp. 489-498, 625, etc.), and that Irish measures, meant to stimulate, discouraged the wool and silk trade (*Ir.*, ii. 133), and that the Irish bounty on linen was an impertinence, and that on inland carriage of corn was an extravagance (pp. 157-188), are worthy of A. SMITH at his best; but he does not quote A. Smith here, nor, we believe, elsewhere, except as a historian of prices. He wishes the state to be neutral as to small farms (*Fr.*, i. 407, but see p. 417; comp. *Annals*, vii. 510), and "diffused," i.e. integrated, village industries (*Fr.*, i. 573; *Ir.*, ii. 216), although both, he thought, weakened Ireland and France. Segregated or town manufactures were his ideal as well as that of STEUART. But all this wisdom illustrated by example came

to him only through his eyes; and when it clashed with another empiric truth, e.g. the truth—traced by him to DAVENANT (why not Sir W. TEMPLE?), but based on his own English, Irish, and French comparative statistics—that high rents, prices, and wages are signs (he once wrote "causes," *Northern Tour*, iv. 343, 376) of wealth, the man who wrote "a free import and export" of corn "would be the very best police of that commodity" (*Annals*, iii. 419; *Ir.*, ii. 338) began to dread American competition (*Pol. Ar.* (1774), p. 279), and with MALTHUS resisted the free-trade movement championed by RICARDO. The comparative statistics referred to demonstrated what J. TUCKER argued *a priori* that "labour is generally in reality the cheapest where it is nominally the dearest" (*Fr.*, i. 565), i.e. in England; and so with rents.

Young's English, like his French and Irish tours, fall roughly into two divisions: first a diary, then a summary. But the English tours are non-political, and are rather notes for books than books. The English tours suggested those of MARSHALL and SINCLAIR, and all these suggested the English Reports, the *enquêtes* of the French directorate, and the surveys authorised by the Irish House of Commons, 10th March 1800. The Reports contain a summary and no diary. Most of each report treats of practical husbandry, including ch. vi. on enclosures. Of the rest the first chapter is on physical geography; chaps. ii. and iv. are juristic, and relate but somewhat meagrely to tenures, leases, YEOMEN, etc.; chaps. xiv. and xv. are economical in title, and give statistical data as to wages, e.g. of the boarded farm servant whom he preferred, and who was then disappearing; population, which he thought increasing; farmers' capital, which he thought should be £5 an acre; rent, usually  $\frac{1}{3}$  of the gross produce; and net profits, i.e. the amount taken "free" of rent, tythe, rates, etc., to market. Apropos of poor rates, he notes that "box clubs" and the policy of "three acres and a cow" did, and that workhouse manufactures and pauper allotments did not, decrease poor's rates. Apropos of population, he proposed a census in his *Proposals to the Legislature for Numbering the People*, 1771; and believed that no country had too few, though some, e.g. France, had too many people (cp. WALES). On slave-labour, parish settlement laws, relief to large families, and radicalism as opposed to whiggery, his conclusions are those of Tucker, but his method is always different.

[Young was a Suffolk man, he passed his boyhood and much of his later life at Bradfield, near

Bury St. Edmunds, an estate which remained in his family till 1896. The influence of his surroundings is visible in all his writings.]

YOUNG, MAJOR GAVIN, of the Bengal army, described by McCulloch as "a gentleman of talent and varied attainments" (*Literature of Political Economy*, p. 109), wrote:

*Observations on the Opinions of several Writers on various historical, political, and metaphysical Questions*, Calcutta, 1817, 8vo (contains articles on "Funding System," "British Finance," and "Distinction between Productive and Unproductive Labour").—*An Inquiry into the Expediency of applying the Principles of Colonial Policy to the Government of India*, London, 1822, 8vo.—*A Further Inquiry into the Expediency, etc.*, London, 1827, 8vo (both anonymous; to induce Englishmen to settle in India).—*An Essay on the Mercantile Theory of Wealth*, Calcutta, 1832, 8vo (defending the theory). H. R. T.

ZACCHIA, L. (17th century). An Emilian jurist.

Zacchia was the author of a Latin treatise on wages which deserves mention for the rarity of the consideration of that subject in the days when he wrote. He distinguishes different forms of wages, but he was unable to make a comprehensive study of a phenomenon, such as wages, which was the exception at that time; the two distinct classes—workmen and employers—not being then fully formed. Zacchia regards wages as the reward for any description of work, and he gives very little thought to workmen's wages. He limits himself to the statement that an adequate wage is fixed by a monarch or by law, by custom or contract, and failing these by a judge, who in fixing them should take account of the ability of the workman, the quality of his work, and the price of food. Zacchia studies the judicial effects on wages of alterations in the value of money.

*Tractatus de salario seu operariorum mercede*, 1658.

[See Graziani, *Le idee economiche degli economisti emiliani e romagnoli*, 1893.] U. R.

ZACHARIAS, OTTO (19th century), a doctor in Silesia, wrote:

*Die Gefährdung der socialen Wohlfahrt durch die zu frühen Eheschliessungen der Besitzlosen* (1880).

ZANON, ANTONIO (1696-1770), was born at Udine, and was a merchant, a manufacturer, and student of economics. In Friuli he improved the cultivation of the mulberry-tree and the silk trade, and established a silk manufactory in Venice. He founded the *Società Georgica* in Udine for the promotion of agriculture.

Zanon left many letters and works on agrarian economics, agriculture, and commerce, and the silk industry; all his works were reprinted in nine volumes in Udine (1828-1831). Theoretically he followed the school of GENOVESI, that is to say, he advocated a moderate mercantilism, but his writings are chiefly of practical importance.

*Dell' agricoltura, arti, commercio, ec., Lettere*, 1763-67.—*Della utilità morale, economica e politica delle accademie di agricoltura, etc.*, 1771.—[See Errera, *Storia dell' economia politica nei secoli XVII e XVIII negli Stati della Repubblica Veneta*, 1877; Piemonte, Antonio Zanon, *economista friuliano*, 1891.] U. R.

ZECCHI, LELIO (1532-1610).

A political writer and theologian of Brescia.

In his writings he discusses various economic subjects; his treatise on usury traces usury in different contracts and in its different forms, according to the strict ideas prevailing in his day.

His work on the political method to be followed by a monarch bears on the question of food-supply—he advocates encouraging agriculture, the import of provisions, fixed prices for food, and the infliction of penalties on monopolists; further he would promote the arts, forbid the export of raw material and the emigration of skilled artisans.

On the subject of taxation and its different forms he gives the preference to the CENS (*q.v.*) or general taxation of hereditary estates; this opinion was also held by MANCINI, and was traditional in Italy, based on the still surviving conception of the Roman census and the theory of taxation as interpreted and carried out by the Italian communes in the middle ages. He perceives without thoroughly understanding it, the fact—so obvious to us—that increase of population depends on the increase of the means of subsistence.

*Tractatus de usuris*, 1598.—*Politiconum, sive de principe et principatus administratione*, 1600.—*Libri tre, autore Lelio Zecchio, theologo*, Verona, 1600.—*De jurebus principatus*, Verona, 1603.

ZECCHINO. See SEQUIN.

ZEMINDAR (literally "landholder"), denotes the Indian farmer of a LAND-TAX, who between the Mughal and British conquests

claimed lordship over the soil. The land-tax was, in the laws of Manu (500 B.C.), a right to  $\frac{1}{4}$ th produce, under the Mughal laws to  $\frac{1}{3}$ rd value of the produce of the soil. The farmer retained, say  $\frac{1}{10}$ th the land-tax, and was appointed for life, but his son or sons succeeded on paying fines. As the central power decayed he usurped hereditary rights, rights to the soil, and to make arbitrary levies on its occupants.

The first British land settlement was that by Lord Cornwallis (1793) of Bengal; in which he treated with large zemindars, each of whom was regarded as owning a village or several villages, including the waste, but excluding certain free, or nearly free estates, called "taluk," carved out of the larger unit. The chief flaws in this scheme were that (1) it was permanent (permanent settlements were finally condemned in 1882); (2) it alienated the waste (see Sir J. Caird, *India, the Land and the People*, p. 95); and (3) ignored (a) the status of the Ryot—whom it regarded as an English tenant prior to the Agricultural Holdings Acts, but whom subsequent legislation in 1859 and 1885 has turned into something like the English copyholder; (b) and the relation of co-proprietors in village communities.

In the village community—from which Sir H. Maine tries to derive other forms of tenure, but which is unknown in the laws of Manu—a group of families are found who take rent or services from the artisan officials; and sometimes the dominant group employ others to plough, etc. They exist all over the North-West Provinces and Panjab. There the state treats with the community—represented by its council of elders,—but usually makes one member stand surety for the rest. The state reserves a fraction, usually  $\frac{1}{3}$ , of what we should call the total fair rents of the village, including waste. This tenure is called "Zamindāri mushtarka"; settlements like that of Bengal being called Zamindāri Khālīs; but the settlement is usually called "Mahāl," village, to distinguish it from the individualism of the normal "Zamindāri" settlements. In Oudh both forms of settlement are sometimes applicable to the same area.

Economists adduce facts such as these to show that in the beginning there was no difference "between the power which gives the right to tax and the power which confers the right to exact rent" (H. Maine, *Village Communities*, 1876); that "the distinction between a tax and a rent is merely "a matter of amount" (Sir G. Campbell in *Systems of Land Tenure* (Cobden Club), p. 219); that is to say, either to deduce rents from taxes, or, with Richard Jones, *Literary Remains* (1859), pp. 279-290, taxes from rent.

[B. H. Baden Powell, *Land Revenue and Tenure in British India* (1894) (the best short account); *Land Systems of British India*, 3 vols.

(1892); *Indian Village Community* (1896); and Sir G. Campbell, *ibid supra*. Yule and Burnett's *Hobson Jobson*, a glossary of Anglo-Indian words.]

J. D. R.

ZERBI, GIOVANNI ANTONIO (16th century). A Milanese merchant.

During his travels he studied the Spanish and Sicilian banks, especially the bank of San Giorgio of Genoa (BANKS, EARLY EUROPEAN), and conceived the idea of establishing a similar bank in Milan; he wrote three dialogues on this subject. In the first, Zerbi proposes the establishment of banks in general, in the second he explains their organisation, and in the third he completes his explanation by illustrating the advantages of the institution he proposes. On the general theory of money he falls into serious errors. The results of the bank of Sant Ambrogio, promoted by Zerbi, were very unsatisfactory; it was started in 1598, and was almost bankrupt in 1630; it was then converted into an office in connection with the public debt.

*Dialogo del Banco de Santo Ambrosio*, 1593 (and two other dialogues on the same subject, 1597 and 1599).

[See Cossa, *Introduction to the study of Political Economy*, 1893. — Gobbi, *L' economia politica*, etc., 1889. — Greppi, *Il banco di S. Ambrogio*, 1883.] U. R.

ZINCKE, Rev. FOSTER BARHAM (1817-93), vicar of Wherstead, near Ipswich, from 1847 to his death; greatly interested himself in educational and latterly in economic and agricultural questions, to which his books of travel are specially devoted; wrote:

*Last Winter in the U.S.*, Lond., 1868, Crown 8vo.—*Egypt of the Pharaohs and of the Khedive*, 2nd ed., Lond., 1873, 8vo.—*A Month in Switzerland*, Lond., 1873, crown 8vo.—*Swiss Allmends, or a Walk to see Them*, Lond., 1874, crown 8vo (an investigation into the Swiss commonable land).—*A Walk in the Grisons, being a Third Month in Switzerland*, Lond., 1875, crown 8vo (the industry, thrift, and helpfulness of the Swiss peasant proprietors).

[*Athenæum*, Aug. 26, 1873, p. 290.] H. R. T.

ZINCKE, GEORG HEINRICH (1692-1769), was born in the neighbourhood of Naumburg. After a complete theological course he studied law and cameral science, and entered first the Prussian service, and afterwards that of Weimar, where, however, he fell into disgrace, and suffered imprisonment with confiscation of his property. From 1740 to 1745 he delivered lectures in the university of Leipzig, and in 1746 was appointed curator of the recently established Collegium Carolinum at Brunswick, where he died.

Zincke has the distinction of having founded and conducted the first valuable economic journal which appeared in Germany, the *Leipziger Sammlungen von wirthschaftlichen, Polizei- und Finanz-Sachen*. Besides the many articles he contributed to this journal, he published, amongst other works, *Grundriss einer Einleitung zu der Cameralwissenschaft*, 1742; a cameralistic bibliography 1751, and two dictionaries, one of *General Economy*, 1742,

of which the 7th ed. appeared in 1820, and the other of *German Trade and Manufactures*, 1745.

Zincke exhibits a reformed mercantilism, such as was preached in France by FORBONNAIS; he even shows tendencies towards the new doctrine which was destined to supplant it. He holds that a country does not necessarily lose by the export of the precious metals. He sets himself against the extravagances on the subject of population which afterwards prevailed in his school, and accentuates the importance of agriculture as a source of national wealth more than the members of that school commonly did.

[Roscher, *Gesch. der N. O.*, p. 432.] J. K. I.

ZOLLVEREIN (*Customs Union*), a word practically adopted into the English language to express the idea of a customs union. The name was originally given by the Prussians to the union which, under the treaty of March 1833, they formed with various independent German states (in the first instance Hesse Cassel, Hesse Darmstadt, Bavaria, and Würtemberg) for the purpose of establishing a uniform tariff against the outside world. Up to that time each of these states had levied its own customs duties, and had treated the neighbouring states just as it treated the most distant countries. Under the compact on which the Zollverein was based all these states undertook to abolish import duties between one another, and adopt a common tariff of import duties as against the rest of the world. This is the essence of a customs union, which is designed to break down interprovincial restrictions, and to simplify commercial intercourse. The Zollverein is still one of the best instances of a customs union, because it comprised several states, and the effect at which it aims is clearer, the greater the number of restrictions abolished.

There are, however, several instances where a small state has grouped itself with a larger state for customs purposes. There is a customs union of San Marino with Italy under treaty of 22nd March 1862; of Monaco with France under treaty of 9th November 1865; Lichtenstein with Austria under treaty of 11th December 1875; Portuguese India with British India, 26th December 1878.

The most complete attempt to form a customs union in recent years has been the South African customs union of 1889. The original members of this were two only, Cape Colony and the Orange Free State, but British Bechuanaland, Basutoland, the British Bechuanaland Protectorate, and the Transvaal and Southern Rhodesia (1903) successively joined. In this case there is no continuity of land-frontier, and one of the members was a foreign state; but the essence of the union is the same—free trade between the members of the union, and on the external boundary of the union one customs tariff as against the rest of the world.

The terms "Zollverein" and "Customs Union" have been frequently used during the

past ten or twelve years in connection with projects for the closer commercial union of the British Empire; but they have almost always been used loosely without any true sense of the conditions which they import. No definite proposal has as yet been publicly formulated for placing all the parts of the empire under one tariff. In 1887, at the colonial conference, Mr. Hofmeyr for the first time developed a scheme for a uniform extra differential duty upon all foreign imports. In 1891, in the House of Lords, Lord Dunraven formally pressed the same sort of scheme. In 1894 at the Ottawa conference the possibility of special customs arrangements for the empire was discussed at length. These discussions belong rather to the question of FEDERATION, COMMERCIAL (*q.v.*). C. A. H.

ZUCCOLO, LODOVICO (17th century), a political writer of Faenza.

His *Dialoghi* form an interesting discussion on socialistic ideas; he asserts, with some spirit, that moderate wealth is essential for citizens, and in order to maintain this, he would prohibit the sale or mortgage of farms on the part of citizens with small fortunes. He understands the relations between the division of wealth and the increase of population, and points out the rapid increase of the latter; he considers that to equalise wealth would be an adequate remedy for the difficulties which might arise from over-population. Zuccolo criticises the *Utopia* of Thomas MORE, expressing the opinion that such a republic could only exist if all men were good and just; he gives a plan of an ideal state of things, as he would desire to see them—but not based on economical communism.

*Dialoghi*, 1625.

[See Gobbi, *L' economia politica*, etc., 1889.—Graziani, *Le idee economiche degli scrittori emiliani e romagnoli*, 1893.] U. R.

ZUNFT is the term commonly employed by modern German writers for what English writers usually call a "craft gild"; and "Zunft-System" is used in the same general sense as "gild system" (see CORPORATIONS OF ARTS AND TRADES, *Germany*; and GILDS). The word itself, however,—which is variously explained as originally meaning "order" or "gathering,"—was specifically High German, and was unknown in North Germany until the Reformation. In North Germany its place was taken by *Ami*, *Gilde*, and other terms. In South Germany, moreover, if we may generalise from the policy of the authorities of Nuremberg in the 16th century, *Zunft* was understood to imply a degree of autonomy in matters of trade regulation which the organised craft or *Handwerk* was not always allowed to exercise, and in such cases the term was sedulously avoided.

[An excellent brief account and history of the *Zunftwesen* will be found in the article under that title by W. Stieda in Conrad's *Handwörterbuch der Staatswissenschaften*, vi. On the term itself cp. Ashley in *Political Science Quarterly*, xii. 129.]

W. J. A.

## INTRODUCTION TO APPENDIX

THE necessity for reprinting the third volume of the Dictionary, caused by the continued demand for the work, has, through the liberality of the publishers, Messrs. Macmillan, allowed the opportunity for the addition of a short appendix. Fully fourteen years have elapsed since the publication of the first volume, while many more have passed since the foundations of the work were laid.

Meanwhile many changes have taken place in the Economic conditions of life in the United Kingdom and in our Colonies, especially among those which are self-governing. The power, the wealth, and the population of many foreign countries have greatly expanded during the same period. So far as space has permitted, I have endeavoured to chronicle the changes which have occurred. At no period of the history of the world has applied science done more to assist industry, to facilitate the means of communication, and to promote the developments of business than during recent years. Meanwhile the unprecedented addition to the stock of the precious metals has enlarged the medium for negotiating the increased commercial exchanges resulting from the greater industrial activity.

Nor has the study of Economics stood still. While we still have to lament that it does not form a more serious part of the general education of the country, the development of Academic teaching has favoured the extension of the university system—principally in the North of England, the Midlands, and Wales, and in that system Economics has taken a definite place. The recognition of the importance of the study by the establishment of the new Tripos devoted to it at Cambridge and the corresponding Diploma at Oxford, with the work of the London School of Economics and our other Academic centres, is all encouraging. With this we may specially mention the Faculty of Commerce in the University of Birmingham. A remarkable proof of the hold which Economic Teaching has secured in that centre is shown by the establishment of the Advisory Board of Business men there, which marks a desire to join practical work with scientific study. The carrying out of this plan may be very useful for both sides. We have, however, still to regret that Economic training is at present extended only to a very small proportion of the rising youth of the country. The general teaching may be merely elementary, but it ought to be as useful as the grounding in first principles given in other branches of knowledge.

Together with the increase in the opportunities for instruction there has been a development of Economic Libraries. I have been able to collect some information about these both in the United Kingdom and elsewhere. The Free Libraries in our towns and larger industrial centres should encourage the growth of such collections. When united with statistics of local industries, the collection of which is best conducted on the spot, the volumes become more

interesting to the inhabitants, and should be useful towards obtaining the information desired for the Census of Production which has recently been established.

I have endeavoured to give some reference to subjects of the day—as of the slackening increase of population in some countries, the development of municipal and government trading, the tariff reform movement, the deliberations at the Hague Conferences, and the extension of Socialistic ideas. Among matters of domestic concern the greater enterprise shown by the Board of Trade gives hope that wider official assistance may be given to the industrial activity of the country, while the encouragement to the co-operation of Labour and Capital through the system of Copartnership commemorated in the following pages shows a valuable opening for improvement in the relations between employers and their work-people.

These points have throughout been dealt with as far as possible from the Economic and not from the political sides of the questions concerned.

Economic questions which affect the well-being of our people as much, perhaps more than any other social problems, require to be examined under the dry light of scientific research. It is impossible that such matters should receive due consideration when attempting to measure their importance in the midst of popular clamour.

In the notices of the lives of Economists, some have been commemorated whom we have lost since the last volume of the Dictionary was completed. In other cases an effort has been made to chronicle the work of the less known Economists of this country who laboured during the days when the teaching of Ricardo and James and John Stuart Mill was supreme, and who have been, in some instances, but imperfectly recognised, owing to the fact that their opinions were not in harmony with the orthodox teaching of the day. In arranging these I have had the assistance of Professor E. R. A. Seligman's papers "On some neglected British Economists" in the *Economic Journal*, London, 1903. Such scattered notices are almost the only recognition that many of these writers have received. Those who are interested in Economics have much for which to thank Professor Seligman. There is much work of the same class to be done, to which I trust our younger scholars will turn their attention.

In conclusion, while expressing my sorrow that so many of my old friends whose kind assistance was of great service to me in my earlier volumes have passed away, I am thankful that many still remain. From these I have received much valuable help, which, with the welcome aid of fresh contributors, will, I trust, render this work of service to those interested in Economic Study.

R. H. INGLIS PALGRAVE.

# APPENDIX

## ACCOUNTANCY—ALIEN IMMIGRATION

ACCOUNTANCY. See COMMERCE, FACULTY OF, IN THE UNIVERSITY OF BIRMINGHAM, Appendix.

ADVISORY BOARD OF BUSINESS MEN. See COMMERCE, FACULTY OF, IN THE UNIVERSITY OF BIRMINGHAM, Appendix.

AGRICULTURAL HOLDINGS ACTS. The Agricultural Holdings Act, 1883, was extended with some slight modifications in favour of the tenant to market gardens by the Market Gardeners' Compensation Act, 1895, and market gardeners may now obtain compensation for improvements made by them during their tenancy, and are otherwise entitled to the benefits of the principal Act. By the Agricultural Holdings Act, 1900, provision was made for the assessment of compensation by arbitration.

The Agricultural Holdings Act, 1906, which does not come into force until Jan. 1, 1909, makes some serious changes in the law. Its principal provisions fall under three heads: (a) game; (b) cropping and disposal of produce; (c) compensation for unreasonable disturbance.

(a) A tenant who has sustained damage to his crop from game is entitled to recover from his landlord compensation for such damage, if it exceeds the sum of one shilling per acre of the area over which such damage extends. Any agreement negating the right to compensation or limiting its amount is void.

(b) Notwithstanding any custom of the country, or any agreement to the contrary, a tenant is entitled to practise any system of cropping of the arable land on his holding, and to dispose of the produce of his holding in such manner as he thinks fit. The tenant is bound, however, to exercise his rights so as not to deteriorate the holding in any way, and during the last year of his tenancy he must comply with the custom of the country or the terms of his agreement.

(c) The right of a tenant to recover compensation from his landlord for expenses incurred by him on quitting his holding is extremely limited. The amount recoverable is confined to the direct loss unavoidably incurred in connection with the sale or removal by the

tenant of his household goods, farm stock, and implements of husbandry. Further, the tenant has no right to recover any compensation except where the landlord has given notice to quit, or has refused to renew, without good and sufficient cause, and for reasons inconsistent with good estate management, or where the landlord has demanded an increased rent on account of improvements executed by the tenant, for which the tenant is not entitled to recover compensation, and the tenant has quitted his holding by reason of such demand. The right of the tenant cannot be excluded by agreement. The onus of proving that a claim to compensation has arisen falls on the tenant, and the nature of the facts to be proved will render it extremely difficult, if not impossible, for him to establish his claim.

The Agricultural Holdings Acts, 1900 and 1907, and the Market Gardeners' Compensation Act, 1895, apply to Scotland. A. A. U.

ALIEN IMMIGRATION. By the Aliens Act, 1905, it is enacted that no "immigrant" as defined in the Act shall be landed in the United Kingdom from an "immigrant ship" (also there defined), except at a port at which there is an immigration officer appointed under the Act, or shall be landed at any such port without the leave of that officer given after an inspection of the immigrants made by him on the ship, and that the immigration officer shall withhold leave in the case of any immigrant who appears to him to be an "undesirable immigrant," as therein defined; but that the Secretary of State for the Home Department may, subject to such conditions as he thinks fit to impose, make "exemption orders," relieving particular immigrant ships from the above-mentioned provisions, if he is satisfied that a proper system is being maintained for preventing the embarkation of undesirable immigrants on these ships, or if security is given to his satisfaction that undesirable immigrants will not be landed in the United Kingdom from those ships except for the purpose of transit; and he may also, if he thinks fit, make "expulsion orders," requiring particular aliens to leave

the United Kingdom within a time fixed by the order, and thereafter to remain out of the United Kingdom on certain prescribed facts being proved in a certain prescribed manner. The expression "immigrant" is defined as meaning an alien steerage passenger (not being a "transmigrant"), who is to be landed in the United Kingdom, and the expression "steerage passenger" as including all passengers except such persons as may be declared by the Secretary of State to be "cabin passengers," by order made either generally or as regards any special ships or ports. Pursuant to the Act, the Secretary of State has made numerous exemption orders relieving second-class passengers from inspection, upon the shipowners giving security by bond not to land any undesirable immigrants from among such passengers, and has also made a general order declaring all such passengers as are entitled to use the cabins, state-rooms, or saloons, where the accommodation is superior to that provided in any other part of the ship devoted to the carrying of passengers, to be cabin passengers for the purposes of the Act (Aliens Act, 1905). It appears from the parliamentary return showing the result of the first year's working of the Act, that for the twelve months ending 31st December 1906, out of a total of 465,500 alien passengers, 493 were finally refused leave to land, and expulsion orders were made in 287 other cases. And it appears from the first annual report of H.M. Inspector under the Act that, after making the necessary deductions for cabin passengers, exempted second-class passengers, transmigrants, and others who are not within the Act, only 38,527 of the 465,500 alien passengers are left unaccounted for. Of these, 22,986 were males, 11,049 females, and 4492 children. Russians and Poles numbered 12,832; French, 10,116; Italians, 5360; Germans, 3186; Norwegians, Swedes, and Danes, 1295; Austrians, Hungarians, and Bohemians, 1223; Swiss, 983; Dutch, 798; Spaniards and Portuguese, 572; Americans (U.S.), 552; Belgians, 380; and other nationalities, 1230. The total number of aliens who received Poor Law relief during 1906 in London and certain provincial unions was 6050, and the number sent to lunatic asylums was 266. As pointed out in the report, the statistics of convicted prisoners already yield indications that the liability to expulsion created by the Act is exercising considerable influence. For the alien prison population, which had reached its highest point in 1904, having increased ever since 1893, and at a greater rate than the total prison population, suddenly dropped in 1905 by 7·01 as compared with a fall of only 1·12 per cent in the total number of prisoners, and this change, which is suggested to have been due to the shadow of the coming Aliens Act, was continued and accelerated in 1906, the first year of the operation of the

Act, when the total number of convicted persons received into prison fell by 6·32 per cent, while the number of aliens among them fell by 16·85 per cent, leaving the proportion of aliens to the total number at 1·85 per cent, the lowest figure since 1899. (*Aliens Act, 1905, First Annual Report of H.M. Inspector under the Act, c. 3473.*) (*Parl. Papers, c. 3316 of 1907.*)  
T. G. S.

**AUTUMNAL DRAIN.** In continuation of the statement contained in vol. i. of this Dictionary, the table which follows shows that the movement of coin there mentioned continues, and on the whole increases in amount:—

*Beginning of September to about middle of November, years 1901-06.*

(000's omitted.)

Year.	Gold Coin.						Silver Coin.	
	Received from or taken for abroad on balance.	Taken for Scotland on balance.	Taken for Ireland on balance.	Received from or taken for home circulation on balance.	Total Decrease.		Increase.	Decrease.
1901	.. 2237	342	65	27	.. 2617	232	..	..
1902	.. 3714	772	525	350	.. 4661	49	..	..

1904	.. 2933	480	210	.. 451	4074	..	85	..
1905	.. 5517	550	170	60	.. 6177	..	83	..
1906	.. 5648	482	350	778	.. 5702	..	185	..

BANK OF ENGLAND, 13th March 1907.

In connection with this subject, the estimate made by the Deputy-Master of the Mint as to the extent to which the summer holidays affected the transfer of silver coin from one locality to another, should be mentioned. In order to see how far the summer holidays affected the transfer of silver coin from one locality to another, he obtained through the Central Association of Bankers a return showing the amount of silver coin held by banks in the United Kingdom on September 30, 1905. The returns showed that on the latter date the amount held by banks in England was some £660,000, and by banks in Wales some £21,000 less than on the 30th June, whereas Scotland showed an increase of £26,000, and Ireland remained practically the same.

The following table shows the distribution of silver amongst banks on the two dates in 1905:—

Date.	London.	England.	Wales.	Scotland.	Ireland.
June 30	£ 1,490,926	£ 2,389,601	£ 153,016	£ 735,530	£ 506,821
Sept. 30	£ 1,195,381	£ 2,019,062	£ 181,728	£ 761,484	£ 508,487

[*Thirty-Sixth Annual Report of the Deputy-Master and Comptroller of the Mint, 1906, p. 15.*]

It appears thus that about £680,000 was withdrawn from the banks in England and Wales to meet the requirements of the holiday season. The greater part of these figures must be taken into consideration with those included in the autumnal drain.

The rate of discount charged by the Bank of England was raised in the period of the year affected by the movement described in this table in five out of the six years covered by it. The dates are as follows:—

Dates.	Bank Rate.	Dates.	Bank Rate.	Dates.	Bank Rate.
1901. Jan. 3	5	1903. May 21	3½	1906. April 4	3½
" Feb. 7	4½	" June 18	3	" May 2	4

Although one cannot ascribe the whole of the influence which caused the rate to be raised at the dates given to this drain of specie, it is obviously a point to be reckoned with. The movements of silver coin are very considerable. "The returns for the 30th June, 1906, showed that on that date the banks in the United Kingdom (excluding the Isle of Man and the Channel Islands) held £4,713,233 as against £5,275,894 in 1905. The large difference may be attributed to the activity of trade which had correspondingly increased the amount held by the public" (*Thirty-Seventh Ann. Rep. of the Mint, 1906*, p. 12).

The following table recapitulates the distribution on the 30th June 1905 and 1906:—

Year.	London.	England.	Wales.	Scotland.	Ireland.
1905	£ 1,490,926	£ 2,389,601	£ 153,016	£ 735,530	£ 506,821
1906	1,429,091	2,026,478	125,901	671,780	459,983

AVERAGE, UNWEIGHTED. See AVERAGE, WEIGHTED.

AVERAGE, WEIGHTED (in Statistics). When we seek to take an average of a number of figures, it is frequently the case that the importance attached to the different figures ought not to be the same throughout, but that some of them ought to be *weighted* relatively to others. Suppose, for example, that in a given market the price of corn on one day is thirty-two shillings, and on the following day thirty-six shillings a quarter, but that the amount of corn bought and sold on the first day is three times as much as on the second. Then, if we consider simply the prices, the average for the two days will be thirty-four shillings; while, if we also take into account the amount sold, the average will be thirty-three shillings. The former is the *unweighted average*, the latter the *weighted average*; and the latter will for most purposes have the greater utility. An important case in which a weighted average is desirable is in the construction of an index-number for measuring changes in the purchasing power of money. It is clear that, if we wish to measure the value of money for the average consumer, a commodity which is in general consumption in large quantities should have greater weight attached to it than one which is consumed by certain classes of the community only, and by them perhaps in small quantities.

[See INDEX NUMBERS, and cf. Bowley, *Elements of Statistics*, pp. 111-118.]

BAUDRILLART, HENRI JOSEPH LÉON (1821-1892), was in 1852 appointed deputy professor to Michel CHEVALIER in the Collège de France; in 1866 he was called to the chair of history of economic doctrines in the same collège. He was also Professor of Political Economy in the *École des ponts et chaussées* and a member of the *Académie des sciences morales et politiques*.

An untiring and well-informed investigator of historical, philosophical, and economic matters, it may be said that as an economist his ruling preoccupation has been to demonstrate that no contradiction exists between the doctrines of the liberal school, to which he belonged, and the rules of conduct as laid down by moral science. These views he already defended in one of his first and principal works, *Les Rapports de la morale et de l'économie politique* (Paris, 1860), and thirty years later, in the article "Morale" which he contributed to Léon Say's

*Nouveau Dictionnaire d'économie politique* (1892).

The first book, by which he attracted the notice of learned circles, is his volume on *Jean Bodin et son temps; tableau des théories politiques et des idées économiques au seizième siècle* (Paris, 1853), describing after an introduction on the leading economic and political ideas of the period, the life and writings of Bodin, and giving a full analysis with commentaries of his *République*. It remains the standard book on the subject.

Baudrillart's *Histoire du luxe public et privé depuis l'antiquité jusqu'à nos jours* (Paris, 4 vols., 1878 and 1880) is another outcome of his favourite studies on the reciprocal influences having existed and existing between ethics and social economics; it is a sort of encyclopedic and historical account of the character of public and private luxury from the dawn of history to our own times.

The three volumes of his *Populations agricoles de la France* (Paris, 1880 to 1893) were written as the report of an extensive inquiry entrusted to his

care by the *Académie des sciences morales et politiques*. The first volume comprises Normandy and Brittany; the second Maine, Anjou, Touraine, Poitou, the country around Paris, Picardy, and Artois; the third volume on Central France was published by his son after his death, and is in fact as much the work of the son as of the father. The object of his inquiry was, not cultivation itself, but the moral and material situation of the agricultural populations; to reach his aim, he combined direct observations of the present with the study of the past.

Bandrillart was also a frequent contributor to the *Journal des économistes*, to the *Revue des deux mondes*, and to Franck's *Dictionnaire des sciences philosophiques*. Besides the four large works mentioned above, he published: *Manuel d'économie politique* (1857); *Études de philosophie morale et d'économie politique* (1857); *Publicistes modernes* (1862); *La liberté du travail, l'association et la démocratie* (1865); *Éléments d'économie rurale, industrielle et commerciale* (1867); *Economie politique populaire* (1869); *La famille et l'éducation en France* (1874). E. ca.

**BILLS OF EXCHANGE ACT 1882, AMENDMENT AND INTERPRETATION OF, 1906.** In the case of Capital and Counties Bank v. Gordon [1903], A.C. 240, the House of Lords decided that where a banker credited a customer with a crossed cheque as cash before receiving payment thereof, he did not subsequently receive payment only for the customer, but for himself, so that in the event of a forged endorsement, he lost the protection of sec. 82 of the Bills of Exchange Act 1882, and was liable for conversion, or money had and received, to the true owner. To obviate the risks and inconvenience occasioned to bankers by this decision, the Bills of Exchange (Crossed Cheques) Act 1906 was passed, after several previous futile introductions. It enacts that "a banker receives payment of a crossed cheque for a customer within the meaning of sec. 82 of the Bills of Exchange Act 1882, notwithstanding that he credits the customer's account with the amount of the cheque before receiving payment thereof." Presumably crediting in the pass-book is included, not only the uncommunicated entry in the bank-books. The effect of the Act appears to be confined to cheques, i.e. bills of exchange drawn on a banker payable on demand, excluding orders for payment conditional on signature of an annexed receipt and drafts drawn by a branch on head office of the same bank, or *vice versa*, both of which were held in the Gordon case not to be cheques. The new Act further affects only the position between the collecting banker and the true owner, leaving untouched the other rights and liabilities arising from such crediting as cash. These, as deducible from the Gordon case, include the right of the customer to draw against uncleared cheques credited as cash, in the absence of any agree-

ment to the contrary express or implied, and the right of the banker to debit his customer with such cheques, if returned unpaid, or to sue the parties thereto, irrespective of the state of the customer's account.

Two other points were finally decided by the above case: First, that a collecting banker can acquire no protection by crossing to himself, under sec. 77 (6), a cheque received by him uncrossed. Second, that a banker's draft, of the nature before mentioned, though not a bill or cheque, is a draft or order drawn on a banker within the meaning of sec. 19 of the Stamp Act 1853, so that the banker is not liable for paying such documents on a forged endorsement. Again, apart from legislation, sec. 7, subsec. 3, of the Bills of Exchange Act received a somewhat narrow interpretation in the two cases of *Vinden v. Hughes* [1905], 1 K.B. 795, and *Macbeth v. North and South Wales Bank* [1906], 2 K.B. 718, affirmed by C.A. Oct. 16 [1907], 123 L.T. p. 529, in which it was held that the payee of a cheque who is existing and intended to receive the money is not fictitious or non-existing within the meaning of the subsection, though the drawer was not indebted to him, and his name was suggested or even inserted by a third person merely to give colour to the transaction for his own ends. In *Colonial Bank of Australasia v. Marshall* [1906], A.C. 557, the Judicial Committee of the Privy Council decided that the leaving blank spaces when drawing a cheque is not a sufficient breach of the customer's duty to his banker to justify the latter in debiting the customer with more than the original amount of the cheque, should that amount be fraudulently raised and the larger sum paid by the banker innocently and without negligence. The old, but somewhat discredited case of *Young v. Grote*, it was held, can no longer be regarded as of any authority. (See BILL OF EXCHANGE, Vol. I.) J. R. P.

**BLOCK, MAURICE** (1816-1901). Born in Germany, but educated in France, he became a Frenchman by naturalisation as soon as he was of age, and was attached from 1843 to 1861 to the statistical department of the ministry of Agriculture, Industry, and Trade; in 1880 he was elected a member of the *Académie des sciences morales et politiques*.

An untiring worker in the field of statistics, Block edited during forty-four years (1856-1900) the *Annuaire de l'économie politique et de la statistique*; he also published the *Statistique comparée de la France* (2 vols., 2nd edit. 1875); the *Traité théorique et pratique de la statistique* (1886), and several works of reference, such as the *Dictionnaire de l'administration française* (4th edit. 1898), the *Dictionnaire général de la politique* (1874), and the *Petit dictionnaire politique et social* (1896).

Conversant with most European languages, Block from 1866 to the end of his life wrote for the *Journal des économistes*, a quarterly review

of periodical economic publications issued out of France (*Revue des principales publications périodiques de l'étranger*). He condensed the fruits of his extensive reading and of his lifelong interpretation of foreign thought in the two volumes of his *Progrès de la science économique depuis Adam Smith* (two editions, 1890 and 1897). The plan adopted is the treatment of each subject (nature, labour, capital, credit, etc.) in a distinct chapter; at the beginning the present state reached by science is exposed, and at the end the views of the leading French and foreign economists are summed up, mostly in their own words.

A clear and exact thinker, with a tendency to sarcastic humour, Block remained faithful to the doctrines prevalent at the time of his youth, and considers reason a safer scientific guide than feeling and ethics. E. ca.

BOCCARDO, GIROLAMO (1829-1904), born in Genoa, died in Rome. He began his career as a journalist in 1848, but refused to enter into political life when CAVOUR offered him the under-secretaryship of the ministry of Agriculture, Industry, and Commerce. He was president of the Technical Institute of Genoa and professor at the university. In 1877 he was appointed senator, and in 1888 councillor of state. As an economist he was a very learned but not original thinker. He worked for the diffusion of economic science by writing in 1853 a very concise and clear manual of political economy, substantially on the lines of JOHN STUART MILL and his French contemporaries, a manual which had a great success, especially among students preparing for examinations in public offices where political economy was requisite and amongst students of technical institutes. In 1859 he published a *Universal Dictionary of Political Economy and Commerce*, which was republished 1875. But Boccardo influenced the studies of political economy more particularly when he succeeded FERRARA in the editorship of the *Biblioteca dell' Economista*. Ferrara used to say he knew of no German economist worth reading except ROSCHER, and would not publish translations of German economists; Boccardo went in the opposite direction and opened the *Biblioteca* to all dissenters from the so-called classical school (see CLASSICAL ECONOMISTS). He published, besides Roscher, Schäffle, Wagner, Schönberg, MARX, LASSALLE, and amongst the English MACLEOD and OWEN. Boccardo, very naturally, considering his receptive mind, was under the sway of SPENCER's evolutionism, and strongly inclined to sociological studies. His prefaces to the economists whose works he published are easy and interesting reading, like articles in the *Revue des Deux Mondes*; but they are very far from being comparable to those of Ferrara, his predecessor. The principal subjects they discuss are: the economic and social problem in Germany; the heretics of political economy and social legislation; the principles of science and art in finance; quanti-

tative methods applied to economics, statistics, and social science; the philosophical principles of political economy; method and limits of political economy; man and animal; sociology in history, science, religion, and the Cosmos; credit and banks. In these essays he tried to render classical and political economy more complete and correct by utilising mathematics, biology, and history. Boccardo published also JEVONS and WALRAS. Besides these purely scientific publications, he took a very active share in questions of the day, concerning the Italian banks of issue, forced currency, mercantile marine, labour problems. He was a free trader and opposed socialism on many occasions. When wearied with economic studies he used to turn to physical geography, and wrote on earthquakes and volcanoes, and also on the physical structure and formation of our globe. He was a man full of character, and esteemed for his strong sense of duty. M. P.

BUREAU OF LABOUR. See Vol. I., and UNEMPLOYED, Appendix.

BUTT, ISAAC (1813-79), born at Glenfin, Donegal, scholar of Trinity College, Dublin, during his collegiate course showed great ability in classical studies. He succeeded M. Longfield as Whately professor of Political Economy at Dublin 1836-41, and accepted his predecessor's conclusions on the productivity theory of wages and the marginal productivity theory of interest in economic science. (See LONGFIELD, vol. ii., and in Appendix.)

Butt repeated and developed the doctrine in a monograph entitled *Rent, Profit, and Labour*. Professor Seligman tells us that the theory of marginal productivity as applied to capital and labour "seems obvious and simple enough, but until the appearance of Dr. Longfield's letters it was not thought of." Butt was called to the Irish Bar in 1838, and to the English Bar, Inner Temple, in 1859. Of his ability and brilliancy as an advocate, or of his association with politics and his parliamentary career, we cannot speak at any length here. He is stated to have been the first to have used Home Rule as an effective election cry, and to have been probably the inventor of the phrase. Latterly he found himself unable to manage the party he had created. The treatment he received almost broke his heart.

Butt wrote—*Rent, Profits, and Labour: A Lecture delivered before the University of Dublin in Michaelmas Term, 1837* (Dublin, 1838), and a larger *Introductory Lecture delivered before the University of Dublin in Hilary Term 1837*, Dublin, 1837. In this he follows SAY in defining production as the "creation of utility," rather than the "creation of value," and is especially severe on those economists who wish to limit the term wealth to material objects. Immaterial, like material,

objects are equally forms of wealth. He also objects to identifying capital with the instruments of production. His writings on other subjects are numerous and able.

[Prof. E. R. A. Seligman—"On some Neglected British Economists," in the *Economic Journal*, London, 1903.—*The Dictionary of National Biography*.]

**CENSUS OF PRODUCTION IN THE UNITED KINGDOM.** The census of production to be carried on under the Act of 1906 will give statistics of considerable importance on the economic activity of the country. But the difficulty of making the inquiry in such a manner as to secure an accurate statement is very great, for it is only too easy to add in the value of the constituent portions of many productions two or three times over. Take, for instance, so simple an industry as that of the basket-maker. If the basket-maker buys osiers from a grower, the grower should return, say, £500, as the value of his osiers sold to the basket-maker. When the basket-maker makes his return he enters, we will say, £1500 as the value of his finished productions, the difference between the two being made up by the cost of the labour employed. As the cost of the osiers is part of this value, they have been counted twice if the osiers have been purchased—though once only if the grower of the osiers makes them himself into baskets. Again, in textile manufactures, if the spinning and weaving industries are separated the yarn is counted twice; if the wool is produced in the same country, and the census include agriculture, it is valued three times.

The whole difficulties are referred to in a very careful paper by Mr. G. Udny Yule, printed in vol. lxx. (31st March 1907) of the *Proceedings of the Royal Statistical Society*. Here we can only call attention to the fact of the inquiry being made. When one remembers the great objection felt by both producers and traders to giving any information as to their businesses, some idea may be formed as to the difficulty of this part of the work. And the further difficulty as to getting clear information must also be borne in mind.

Agriculture is not included in the British Census of Production Act, as the Board of Agriculture and Fisheries already covers the ground very completely. Statistics of the mining industry are also given by the Home Office. As these returns are already made in a satisfactory manner by the departments to whom they are entrusted, there was no need to include them.

The first census is to be taken in 1908. The intervals at which the census will be repeated have not at present been determined. It is desired first to obtain some experience as to the working of the Act. The value of the materials used, whether purchased or partly manufactured, will be included, with the numbers of

the workpeople and the days they have worked, and the horse-power employed. When the whole arrangements have been brought into working order, we shall have far better information than exists at present as to the real condition of the industry and internal trade of the kingdom.

**CERNUSCHI, HENRI** (1821-1896), born at Milan, is principally known by his writings on finance, and as a strong adherent of bimetalism, holding that the ratio should stand unalterably at 15½, notwithstanding variations in the market price of silver. He is regarded as the originator of the term "Bimetallism." He was educated for the legal profession, but his studies were interrupted by the revolutionary movement of 1848, in which he took part. He sat in the National Assembly at Rome in 1849-50, till the revolutionary government fell, when he escaped to Paris. There, naturalized as a French subject, he made a considerable fortune in banking, and took a strong interest in politics. He opposed the Socialist movement, and especially the *plébiscite* of 1870, spending large sums of money in doing this, as well as in putting into practice his theories of co-operation.

He wrote: *Mécanique de l'Échange*, 1865.—*Illusion des Sociétés Co-opératives*, 1866.—*Or et Argent*, 1874.—*La Monnaie Bimétallique*, 1876.—*La Bimétallisme en Angleterre*, 1879.—*La Bimétallisme à quinze et demi nécessaire*, 1881.—*Le grand procès de l'Union Latine*, 1884.

**CLAMAGERAN, JEAN JULES** (1827-1904). Although born in New Orleans, he was in 1850 admitted as a member of the Parisian bar, and later on made himself known as an opponent of the Imperial Government and an adherent of republican opinions. During the siege of Paris in 1870-1871 he superintended the service of public subsistence as *adjoint* (deputy) of the *Maire* of Paris. In 1879 he was appointed a councillor of state, and in 1882 he was elected a life senator.

Clamageran has largely contributed to periodical publications on questions of the day, both juridical, economical, and even religious (he was a Protestant). In 1873 he published a volume of constitutional, economic, and administrative essays under the title *La France républicaine*, and in 1874 another entitled *L'Algérie, impressions de voyage, avec une étude sur la Colonisation*, but his main claim to be remembered as an economist is his great history of taxation: *Histoire de l'impôt en France*, 3 vols., 1867-1868 and 1876. It is the only extant general work on the subject, beginning

with Roman Gaul, and ending at the accession of Lewis XVI. It is full of detailed and extensive information, and although no trained mediæval scholar, the author leads the reader safely through the maze of mediæval financial policy. His last volume, devoted to the last century of the *Ancien régime* (1683-1774), acknowledges the improvement of French finance since the death of Lewis XIV., but concludes that monarchy, fallen into disrepute by the vile reign of Lewis XV., had lost the moral power necessary to bring the task of reform to a satisfactory close.

Immediately after his death his widow collected and issued a volume of *Études politiques, économiques et financières* (1904), amongst which should be mentioned a Study on French finance from 1814 to 1889. E. CA.

**CLEARING HOUSE, THE LONDON BANKERS'.** Little is known of the early history of the London Bankers' Clearing House. Tradition says that the clearing system had its origin in the daily meeting in their luncheon hour of certain bankers' clerks at a chop house, probably the Five Bells in Dove Court, Lombard Street, between St. Mary Woolnoth and Smith's Bank, where the clerks used to lunch and exchange the cheques they had upon each other's firms.

The convenience of the system was evident, and the meeting in the public room was officially recognised by the joint renting by the bankers of a room in the chop house.

In 1773 we find entries in bankers' books: "To quarterly charge for use of the clearing room, 19s. 6d."

The next step, probably taken about 1784, was the renting of a larger room at Mrs. Irving's, next door to the Five Bells. Complaints being made that the room was too small, the first floor was taken out to make the light better and the room cooler.

In 1800 there were forty-three banks in the Clearing House, and some five years later a larger room was taken next to Messrs. Smith Paynes, and two inspectors were appointed, Mr. Thomas and Mr. White, the wine merchant of Lime Street.

In 1810 Mr. Thomas stated in his evidence before the Bullion Committee, that there were forty-six banks in the Clearing House, and that the average amount cleared was £4,700,000 daily, or on Stock Exchange settling days about £14,000,000, but it seems probable that the amounts quoted were for both sides, received and paid.

In early days the differences were paid by bank notes and gold, but later only notes of £50 and upwards were used, the balance in excess of the last £50 being carried forward to the next day's account. In 1839 the average amount of bank notes thus used was £213,100, the largest amount used in one day being £593,300, the smallest £108,000.

In 1829, when the house became too small

and was rebuilt, there were thirty-nine banks clearing. By 1841 these had been reduced to twenty-nine. Until 1854 the private banks alone shared the control of the Clearing House, and refused with scorn the repeated applications for admission made by the joint stock banks, which had come into existence after 1833, and were regarded as scarcely respectable by the private banks. By 1854, however, it had become obvious that the joint stock banks had come to stay, and would, if perpetually repulsed from the Clearing House, start a Clearing House of their own, and in that year the following joint-stock banks were admitted, London and Westminster (founded 1834), London Joint-Stock Bank (1836), Union Bank of London (1839), London and County Bank (1839), Commercial Bank of London (1840), followed shortly afterwards by others, most of whom were admitted on amalgamation with a private clearing bank.

Another important change took place in this year 1854, for on May 11th the system of paying the balance due to or from the Clearing House in bank notes ceased, and the accounts have since been settled by cheque on the Bank of England, with which it is essential that each of the clearing banks should have an account. In 1858, as a countermove to the Country Bankers, who were proposing a separate Clearing, the Country Clearing was established on the lines of a scheme proposed by Mr. John Lubbock, now Lord Avebury, with the result that country cheques, being henceforth easily collected, took the place of notes and bankers' drafts, and became part of the currency system of the country, thus effecting an enormous saving in the use of notes and coin.

In 1864 the Bank of England entered the Clearing House, but clears on one side only, the outside, for while the bank presents to the clearing bankers at the Clearing House all cheques payable by them, all cheques and bills drawn on the bank are presented by the clearing bankers direct to the bank. In 1907 the Metropolitan Clearing was established.

The totals for the years of the paid clearing were:—

1839 . . . . .	£954,401,000
1868 . . . . .	3,425,185,000
1876 . . . . .	4,968,480,000
1886 . . . . .	5,901,925,000
1896 . . . . .	7,574,853,000
1906 . . . . .	12,711,384,000

Owing to trade conditions, the periodical recurrence of trade payments, and of Stock Exchange and Consol settling days, the averaged daily total of the clearing has, taken by itself, little or no statistical value. The returns are therefore divided into four groups: Stock Exchange Settling Days, Consol Settling Days, Fourths of the months, and Ordinary Days. The averages being:

Dates.	1868.	1876.	1886.	1896.	1906.*
Stock Exchange Settling Days . . .	21,806,200	31,712,100	49,939,800	48,452,700	84,649,200
Consol Settling Days . . . . .	11,212,600	18,829,000	21,958,800	31,606,100	53,711,200
Fourth of the Month . . . . .	12,922,300	18,828,000	17,959,900	24,223,400	43,734,700
Ordinary Days . . . . .	9,637,800	14,162,600	15,869,800	21,633,000	36,479,000
Daily Average . . . . .	10,978,200	16,167,700	19,224,500	24,593,700	41,405,000

\* N.B.—Country Clearing returns not included in these figures for 1906.

A total of over £100,000,000 for one day's working has been reached on more than one Stock Exchange Settling Day, and for the first ten months of 1907 the daily total of the clearing had only on four occasions fallen under £30,000,000, and that only by a few thousands. Such growth as is shown above is amazing in the vastness of its figures, and has been steadily continuous for some years. In the past twelve years the work has doubled. Indeed, did the old conditions, when the figures of all cheques

had to be taken down by hand, still obtain, the present Clearing House would be far too small for the staff of clerks that would be necessary. However, mechanical ingenuity has solved the difficulty, and by the aid of the Burroughs machine cheques are not only listed, but the amounts totalled at one operation, and all errors, save those caused by taking down the amount of a cheque wrongly, are eliminated.

The actual figures of the returns are as follows :—

Dates.	1868.	Proportion to Total.	1876.	Proportion to Total.	1886.	Proportion to Total.	1896.	Proportion to Total.	1906.	Proportion to Total.
	£		£		£		£		£	
On the 4th of the Month	155,068,000	4·5	225,926,000	4·5	215,519,000	3·7	290,681,000	3·3	524,816,000	4·1
On Stock Exchange Account Days	523,349,000	15·3	761,091,000	15·3	1,198,557,000	20·3	1,162,866,000	15·3	2,081,582,000	16·0
On Consols Settling Days	134,552,000	3·9	225,948,000	4·5	263,473,000	4·5	380,354,000	5·0	644,534,000	5·1
On Ordinary Days	2,612,216,000	76·3	3,750,505,000	75·7	4,224,376,000	71·5	5,740,952,000	75·9	9,510,402,000	74·3
Totals for the years	3,423,185,000	100	4,963,480,000	100	5,901,925,000	100	7,574,853,000	100	12,711,334,000	100

In comparing the above figures with those of other Clearing Houses, it must be remembered that the Bank of England clears only on one side. Did it clear on both sides, the annual amount would be very largely increased.

The Clearing House is situated in Post Office Court, Lombard Street. Of the building itself little need be said ; it possesses no architectural features within or without, but has been added to and altered as the work has increased, till it now, 1907, consists on the ground floor of a large room of irregular shape, in which the town clearing is conducted, and of other rooms upstairs in which the country and metropolitan clearings are carried on.

Desks are placed round the walls and in the centre of the rooms, a certain number being allotted to each bank, according to its requirements. The banks are arranged more or less in alphabetical order, and sufficient space is left between the central and wall desks to enable the clerks to pass round the room and deliver their charges as the bundles of cheques are called. For the working of the Clearing House each bank has, in principle, though modified by the use of the Burroughs machine, two special sets of books ruled in columns, in which the cheques are entered under the head of each of the clearing banks. One set of these books,

the out-clearing books, are written up at the office ; the other, the in-clearing books, at the Clearing House. It must be remembered that "out" and "in" clearing are only relative terms, and that what is sent to the Clearing House by Bank A as out-clearing, becomes when delivered to B at the Clearing House the latter's in-clearing.

The first step in the clearing is the sorting, in the office of each bank, of the cheques drawn on the other clearing banks under the names of those banks. Each parcel of cheques so sorted is entered by the out-clearer in his books at the bank under the head of the paying bank. If the list is a long one casts are made at intervals, and the total of these casts recorded as a check to accuracy on the back of the last cheque of each cast, which is turned over to draw the attention of the receiving clerk at the Clearing House to the cast, so that he can agree as he completes each cast. From the bank a clerk takes the charges to the Clearing House, and delivers them at the desk of each paying bank. The process is now repeated. The paying bank's in-clearing clerk takes down the charges in his books, or on the type-written rolls of the Burroughs adding and listing machines, taking care to see that the casts agree, and the cheques when taken down are sent to

the office of the paying bank for verification or return.

At the close of the clearing each bank sends down its out-clearing books to the Clearing House, in order that they may be agreed with the in-clearing books of the banks there.

If the totals do not agree the books are compared and mistakes rectified. If the mistake is in the cast, the bank making the mistake corrects it; if the figures differ, the out-clearers alter their books to agree with the in-clearers; and should it ultimately prove that the mistake was the other way, the draft is produced and the difference claimed.

When the totals of the out- and in-clearing books are agreed, a sheet, having the printed list of the clearing banks in the centre, and a cash debtor or creditor column on either side, is drawn up by the head clearer of each bank, showing the balance due from or payable to each other bank; the two sides are then cast up, and the balance receivable or to be paid entered on a green ticket if the former, and a white if the latter. This ticket, which has to be signed by the inspector of the Clearing House, is an order to the Bank of England, either to transfer from the money at the credit of the account of the clearing bankers to the receiving bank's account, or from the money at the credit of the paying bank's account to the account of the clearing bankers, the amount of the balance, according as the balance is debtor or creditor.

As described above, the clearing will have taken place without any difficulties, but in practice certain other factors have to be reckoned with.

In the first place, every cheque that passes through the clearing cannot be paid by the banker it is drawn on; some have to be returned from lack of funds on the customer's account, or because the drawer has stopped the cheque, or because the endorsements are not in order, as well as for other reasons.

Such cheques, which must bear a written statement as to the reason for which payment is refused, on being returned to the Clearing House, are distributed so soon as the in-clearer has entered them on the debtor side of his sheet in the same way as the charges, and are included in the balance-sheet before the final balance is struck.

The day's work at the Clearing House now, 1907, commences with the newly established *Metropolitan clearing*. This opens at 9 A.M. on ordinary days, and 8.45 A.M. on Saturdays, and closes at 10.30 A.M. on ordinary days, and 9.50 A.M. on Saturdays.

By the institution of this clearing the necessity for each bank to send out walk clerks to collect payment for cheques drawn on clearing bankers in the Metropolitan area has ceased. Each bank receives at the Clearing

House all cheques drawn upon its Metropolitan branches, and forwards them direct to each branch, getting back the returns before 4.5 P.M. on ordinary days, and 1.30 P.M. on Saturdays.

All differences in the Metropolitan clearing are adjusted through the Town clearing.

The total of the "in" and "out" charges of the Metropolitan clearing are added to the amount of the Town clearing sheets.

In order to simplify the sorting of the cheques into the three clearings—Town, Country and Metropolitan—the letters T, C, or M, as the case may be, are now added at the bottom left-hand corner of the cheques.

To render the Metropolitan clearing more effective, the numerous branches within the Metropolitan area of the London and Provincial Bank, which is not in itself a clearing bank, clear through their agents Messrs. Glyn and Co., and it is probable that before long the West End and Smithfield Banks will be invited by their clearing agents, subject to the consent of the committee of clearing bankers, to clear in the same way.

Following on the Metropolitan clearing comes the Country clearing from 10.30 A.M. to 12.30 P.M., except on Saturdays, when the work begins at 10 A.M. and closes at 11.30 A.M. Owing to the fact that cheques in this clearing have to be forwarded to the country, and any returned cheques notified, it is impossible to adjust the balances the same day, or indeed until the next day but one, when they are entered on the Town clearing sheet.

Until 1902 the figures of the Country clearing were merged in those of the Town, but since that year they have been given separately.

The total for 1902 was £870,189,000, which had increased to £992,313,000 for 1906.

The Town clearing commences in the morning, but the heavy work begins at the opening of the afternoon clearing at 2.30 P.M., and increases in volume till 4.5 P.M. on ordinary days, when the doors are shut, and no more articles can be received that day. The next half-hour is spent in receiving returns (returned cheques) and adjusting the balances, and shortly before 5 P.M., if the day is not a very heavy one, the work is done. On Stock Exchange settling days and other busy days the work continues for some little time longer.

R. M. H.

COGNETTI DE MARTIIS, SALVATORE (1844-1891), born at Bari, died in Turin. When still a student of law at Pisa, the war of 1866 broke out. Cognetti marched with Garibaldi and was wounded at the battle of Condino. In 1868 he was appointed teacher of political economy in the Technical Institute of Mantua, and stayed there till 1878, when he obtained the chair of political economy at the University of Turin.

Cognetti considered economics as a branch of sociology. His mind was completely under the

sway of Darwin (see DARWINISM and SPENCER). He also thought that economics was not in its proper place in the curriculum of faculties of law, as is the case at all Italian universities, unless taught so as to connect it with other branches of social science, history, ethnology, morals, law, politics, etc. The publication which gained for him his position at Turin was a book on *The Primitive Forms of Economic Evolution* (*Le forme primitive dell'evoluzione economica*), 1881, Loescher, Turin. In this book he discusses economic phenomena—and other social phenomena—among savage tribes and even among animals. His use of the latter illustration was often laughed at. But the book contains many interesting particulars, and became more appreciated in course of time. Among questions discussed therein, and later taken up again by Cognetti himself, I may mention the *origin of barter*, and consequently descriptions of *silent barter*. This topic was then a very novel one. In 1889 he published a book on *Ancient Socialism* (*Socialismo Antico*), Bocca, Turin, in which he traces socialism in ancient legends of Greece and Rome, of India and China, and gives summaries of doctrines of Chinese socialists, such as Mih Teih and Uang Ngan Shi, of Persians, such as Mazdac, and Hindus, such as Vishnu Das Kavi, besides going through all the Greeks. This book, again, was rather unusual, as coming from an economist, but had a better success than the former. It will be explained if I say that Cognetti was a passionate student of literature, and translated Plautus into very good Italian verses, and wrote historical essays. As an economist he wrote in 1891 an interesting book on *Socialism in the United States* (*Il Socialismo negli Stati Uniti*), Turin, a book which is eminently a history of the many socialist sects which have tried experiments in the States. He continued the *Biblioteca dell'Economista*, a collection of translations of foreign authors, which had been started by FERRARA. His prefaces, however, to the various authors whose works are translated, fall very far short from the excellency of those of Ferrara. When a discussion turned on what may be called economic niceties, he was soon out of his depth; very close reasoning was less agreeable to him than historical research. He wrote two more books, one in his true line: *On the Formation, Structure, and Life of Commerce*, and one on *Protectionism and Free Trade*, for which he was less fitted. Cognetti created at Turin a laboratory of political economy, collecting for it funds and a very large library. In this seminary of economic studies he trained some distinguished scholars. He had an extremely genial character, and his house was of an evening open to many friends. He was still full of vigour when he died of pneumonia. A complete bibliography of his writings is to be found in the *Riforma Sociale*, Anno viii. vol. xi. p. 705. M. P.

**COLONIAL POLICY—RECENT DEVELOPMENTS.**—This article does not purpose to give a history of the growth of self-government in the British Colonies, a good account of which will be found in Professor Egerton's *Short History of British Colonial Policy*. Neither does it deal with the basis and limits of colonial

self-government from the point of view of constitutional theory. For that aspect of the case the reader may be referred to Professor A. V. Dicey's admirable work on *The Law and the Constitution*. The present inquiry is neither historical nor technical nor legal. It is an attempt to examine the relations at present existing between the self-governing Colonies and the United Kingdom, and between these Colonies *inter se* from a purely political and practical point of view.

The inquiry is confined to the Colonies which are commonly described as having "complete self-government" or "responsible government," *i.e.* an Executive responsible to a popularly elected Legislature, and requiring a majority in at least one of the chambers of that Legislature in order to remain in power. This system, which is a reproduction *mutatis mutandis* of the existing unwritten, but none the less unquestioned, constitution of the United Kingdom, prevails in all the larger and more populous Colonies of the Empire mainly inhabited by people of European race. These are the Dominion of Canada, the Commonwealth of Australia, New Zealand,<sup>1</sup> Newfoundland, and three of the South African Colonies, *viz.* Cape Colony, Natal, and the Transvaal. By the time this article is in print a fourth South African Colony, *viz.* Orange River, will have been added to the list of the "completely self-governing" Colonies.

Enormously as these communities differ *inter se* in size, wealth, and population, they are all equals in constitutional status, and they are all intensely jealous of their right to manage their own affairs without interference from the United Kingdom or from one another. So strong has this feeling grown that even the term "Colony" is now objected to, as implying some degree of dependence, and it would, no doubt, conduce to a good understanding if we could all agree to abstain from describing these communities as "Colonies," and call them by some more dignified and appropriate title, such as "States of the Empire."

But this designation at once brings us face to face with the anomalous character of this so-called "Empire," which, as a political entity, has no analogy in history. It is, indeed, far less misleading to describe Canada, Australia, and the other self-governing communities above referred to as "States," than to describe them and the United Kingdom collectively as an "Empire." The United Kingdom and its dependencies, such as India, our various "Protectorates," and the Colonies which are not completely self-governing, may indeed be described as an "Empire" in the ordinary sense of the word. But when we extend the term "British Empire" to include the self-governing

<sup>1</sup> Since this article was written, New Zealand has received the title of "Dominion," like Canada.

States, it is necessary to remember that we are stretching language, and using the word "Empire" in a novel and, etymologically, indefensible sense.

But this abuse of language is justified by practical considerations. It serves to indicate the continued existence of a political bond between the genuine Empire and the self-governing States, which is not the less real because it is exceedingly difficult to analyse and define. And it is worthy of note that the self-governing States are, as a rule, no less jealous of their claim to be regarded as members of the Empire than they are jealous of their "independence" of the United Kingdom and of one another. The word "Empire" is as popular with the people of these States as the word "Colony" is unpopular, and this fact is of immense significance. It testifies to an underlying sense of unity, an enduring desire to remain, in some way or other, though the way is seldom formulated or clearly thought out, members of a single body politic distinct from the rest of the world.

The problem of the future, as far as the British Empire is concerned, is how to satisfy that desire without curtailing the autonomy or hampering the individual growth of a number of self-governing States. Independence on the one side, Imperial unity on the other—are these irreconcilable ideals? Undoubtedly they are if we push the idea of independence too far. There is no binding relationship, however voluntary, no alliance, no partnership, no contract even, which leaves the parties to it absolutely independent of one another. Every form of union implies some limitation to freedom of action on the part of its individual members. But then it is not independence in the sense of the absence of any binding relationship with other parts of the Empire, which the people of the self-governing "Colonies," or at least the majority of them, really desire. They are determined to be independent in the management of their local affairs. And even with regard to affairs not purely local, they have a growing dislike of subordination to any external authority except that of the Crown. But it does not follow that they would not fall in with, and indeed welcome, any arrangement for the management of affairs not purely local, even though it limited their freedom of action, provided that it was based on the principle of co-ordination, not of subordination. It is perfectly evident that any common institutions, and even any common action, embracing the self-governing Colonies and the rest of the Empire, must start with the idea of partnership, of the voluntary combination of a number of units, equal in status, though no doubt greatly varying in strength, and not with any idea of tutelage or dependence.

The very fact, already referred to, that the

self-governing Colonies accept, and even glory in the authority of the Crown, is sufficient evidence that they do not desire independence in the sense of absolutely separate existence. It may be said that they accept that authority only because it is nothing more than nominal; and there is some truth in this argument, but it is not the whole truth. That strong loyalty to the sovereign, which is undoubtedly felt in the self-governing Colonies, is due to something more than gratitude for non-interference. It is due to a feeling of pride in the Crown as an august institution, common to the whole Empire, in which they have just as much lot and part as the people of the United Kingdom. The traditional relationship between the King and his subjects is just the same relationship, whether these subjects are born and reside in Canada, or Australia, or in Great Britain. He is their sovereign, just as much as he is the sovereign of the people of these islands. This is not mere theory. It is the actual sentiment of the people of the self-governing States, and in such a matter sentiment is everything. Wholly different is the Colonial attitude towards every other institution of the "Mother Country," not excepting the British Parliament. That body enjoys and always will enjoy a certain prestige with the younger States of the Empire as being the progenitor and archetype of their own Parliaments, but though they may regard it with respect, they do not feel that they owe it any allegiance. It is in no sense theirs as the Crown is. It does not represent them, but only the people of the United Kingdom. And still less do they feel disposed to bow to the authority of the British Ministry of the day, deriving its power, as it does, solely from the British Parliament in which the Colonies are not represented.

Here then is the problem in a nutshell. The self-governing Colonies, speaking broadly, are "loyal to the Empire." They desire to remain in some sort of political union with the United Kingdom and its dependencies, and with one another. They gladly recognise the authority of the King as the head of that union. But, according to constitutional theory and practice, "the King reigns, but does not govern." And there is no governing power, no actual executive authority, under the King, which commands the complete allegiance of the self-governing Colonies, because there is no such authority in the constitution of which they have any share—no common Parliament, no common Minister.

No doubt in theory the Parliament of the United Kingdom is supreme throughout the Empire. It could legislate for the self-governing Colonies as well as for any other part of the dominions of the Crown. But in practice it no longer does so, except at the request of these Colonies themselves, because it recognises its non-representative character as far as they

are concerned. The British Ministry, on the other hand, does from time to time take executive action affecting even the self-governing Colonies, as in the case of treaties and negotiations with Foreign Powers, and that action may be not only independent of, but actually contrary to the desires of the Colony or Colonies concerned. In the recent case of the Newfoundland fisheries the action of the British Government was contrary to the wishes of Newfoundland; in the case of the New Hebrides it was contrary to the views of Australia and New Zealand.

Such incidents are clearly injurious to good relations between the mother-country and the Colonies, and even fraught with danger to the unity of the Empire. Yet under present conditions it may be difficult to prevent their recurrence. They are not due to any want of good-will on the part of British Ministers, but to a difficulty inherent in the loose political organisation of the "Empire." There must be some authority capable of representing the Empire as a whole in dealing with Foreign Powers. As matters stand, the only possible authority is the British Foreign Office, which is a branch of an executive Government in which the Colonies have no part. The practical justification for that government, the government of the United Kingdom, acting on behalf of the Colonies, which it does not truly represent, as well as of the United Kingdom which it does represent, must be sought in the fact that the burden of the defence of the Empire rests almost wholly on the people of the United Kingdom. It is they who would have to bear the brunt of any difference with Foreign Powers, even if it arose over some question directly affecting only one or more of the self-governing Colonies, and in which the United Kingdom itself had only an indirect interest. There is thus a genuine and permanent dilemma. It is only natural that that part of the Empire which is responsible for the safety of the whole should control the relations of the Empire with Foreign Powers. Yet it can never be satisfactory that the United Kingdom should take action affecting the other "self-governing" States without their consent. In so far as it does that, it treats them, not as partner States, but as dependencies, and that, as we have seen, is a position to which they are no longer inclined to submit, and to which, having regard to their growing strength and importance in the world, it is not reasonable or desirable that they should submit.

The only logical solution lies in a federal system, under which the "self-governing" States would share, to the extent of their ability, the burden of the common defence, and would receive in return a proportional share in the control of policy. But the adoption of anything like a complete federal system is beset

with difficulties, which are certainly at present, and may be at all times, insuperable. On the other hand, the pressure of circumstances will certainly necessitate the introduction of makeshift arrangements having a federal tendency. And it is possible that the ultimate result may be the creation of a network of special arrangements between the mother-country and the self-governing Colonies, and between these Colonies *inter se*, providing for the co-operative regulation of various common interests. The alternative is complete separation, to which, however, as we have seen, the sentiment of the majority of the people in all parts of the Empire is opposed.

Recent history, no doubt, contains evidence of a movement in both directions—a movement towards separation, and a movement towards closer union, and there is room for difference of opinion as to which is the stronger of the two. On the one hand, the dissatisfaction felt in the Colonies with the manner in which their external relations have been handled by the Imperial Government has led (notably in Canada after the unpopular settlement of the Alaska Boundary question) to a demand for "the treaty-making power." Great latitude is already enjoyed by the Colonies in dealing with the commercial relations between themselves and Foreign States. But if this tendency were to be carried to the length of giving to each self-governing Colony the right to make treaties with Foreign Powers irrespective of the United Kingdom and of the other self-governing Colonies, it is difficult to see how their position could be differentiated from that of a number of wholly separate States. On the other hand, recent years have witnessed not only a remarkable increase in the sentiment of relationship and community of interest, but a series of attempts, so far not very successful, yet persistently renewed, to provide some means for enabling the governments of the United Kingdom and of the self-governing Colonies to act together in matters of common concern. The most important of these have been the meetings in 1887, 1897, 1902, and again in the spring of the present year, 1907, of the body formerly known as the "Colonial" and now as the "Imperial" Conference. These meetings, at first occasional and informal, have now, by virtue of a resolution unanimously adopted at the latest of them, held in London in April and May 1907, acquired a more definite and permanent character, and the "Imperial Conference" may therefore be regarded as having become part of the institutions of the Empire. It is, in fact, the only live political institution common to the United Kingdom and the self-governing Colonies, with the exception of the Crown. Its nature and functions were defined by the resolution just mentioned, which, in view of the importance of

the matter, it may be desirable to quote in full. The resolution runs as follows:—

*"That it will be to the advantage of the Empire if a Conference, to be called the Imperial Conference, is held every four years, at which questions of common interest may be discussed and considered as between His Majesty's Government and His Governments of the self-governing Dominions beyond the seas. The Prime Minister of the United Kingdom will be ex officio President, and the Prime Ministers of the self-governing Dominions ex officio members of the Conference."*

*"The Secretary of State for the Colonies will be an ex officio member of the Conference, and will take the chair in the absence of the President. He will arrange for such Imperial Conferences after communication with the Prime Ministers of the respective Dominions."*

*"Such other Ministers as the respective Governments may appoint will also be members of the Conference—it being understood that, except by special permission of the Conference, each discussion will be conducted by not more than two representatives from each Government, and that each Government will have only one vote."*

*"That it is desirable to establish a system by which the several Governments will be kept informed during the periods between the Conferences in regard to matters which have been or may be subjects for discussion, by means of a permanent secretarial staff, charged, under the direction of the Secretary of State for the Colonies, with the duty of obtaining information for the use of the Conference, of attending to its resolutions, and of conducting correspondence on matters relating to its affairs."*

*"That upon matters of importance requiring consultation between two or more Governments which cannot be conveniently postponed until the next Conference, or involving subjects of a minor character, or such as call for detailed consideration, subsidiary Conferences should be held between representatives of the Governments concerned specially chosen for the purpose."*

The importance of this curious resolution consists almost entirely in its implicit homage to the conception of the United Kingdom and the "self-governing dominions beyond the seas" as a potential confederation, and in any case standing to one another on some exceptionally intimate relation of a permanent kind. Apart from this its practical value is small. The function of the Conference does not go beyond the "discussion" and "consideration" of "questions of common interest." Any decision it may arrive at will still require to be confirmed by each of the States individually before common action can result. And even as a purely consultative assembly the Conference is of very limited utility. "Questions of common interest" are growing in number and importance. They cannot be disposed of in a discussion limited to a few weeks every four years, nor can they be

expected to be obliging enough only to crop up, or only to become acute, when such a meeting is impending. Clearly, if the consultation is to be serious, it must be entrusted to some body capable of more continuous activity. An "Imperial Council," not indeed constantly sitting, but capable of being summoned at any time as occasion requires, would appear to be indispensable, if the idea of the several Governments habitually taking counsel together on questions of common interest is to be realised in practice.

But for the establishment of such a Council, even though limited to purely consultative duties, the recent Conference was not prepared. No doubt there was a forward party, consisting of the representatives of Australia, New Zealand, and Cape Colony, who would have been ready to go that length. But the Prime Ministers of Canada and of the Transvaal decisively hung back, and they were supported in that attitude by the representatives of the United Kingdom. And for so important a step as the creation of a common council, unanimity, or at least a great preponderance of favourable opinion, was evidently necessary. So, on the principle that "the pace of a squadron is the pace of its slowest ship," the Conference confined itself to the creation of what may best be described as an Imperial Information Office, in the shape of a "Secretariat," the duties of which would seem to consist in keeping up some sort of touch between the members of the Conference in the four years intervening between any one session of that body and the succeeding session. No doubt such an office, energetically worked, would be capable of considerable development. And the forward party at the Conference were anxious to give it the maximum of influence and prestige by making it an institution common to the whole Empire, independent of any one Government, and responsible to the Conference alone. But conservatism again prevailed, and in the end the Secretariat was made a department of the Colonial Office. Its existence can, therefore, only be regarded as a small concession to the principle of continuous common consultation between the several Governments.

Time alone can show whether these tentative first steps in what has been not inaptly called "Imperial organisation" will lead hereafter to important results. Generally speaking, it is the mass of the people in the different parts of the Empire who are most favourable, if not very deliberately or articulately, to the idea of closer union. It is in government and political circles that there is opposition or reluctance. And this is perfectly natural. The bulk of the people, where they are of British origin, are dimly conscious of the ties arising from community of race, history, and traditions, as well as of the advantages of a common citizenship, and it would appear to them unnatural to

find themselves wholly separated from their fellow-Britons across the seas. Politicians, on the other hand, even when not playing up to the non-British elements, which in some of the Colonies form a large or even preponderant part of the population, are more alive to the practical difficulties which closer union presents. And they are not uninfluenced by the feeling that the independent Governments and Parliaments, to which they respectively belong, would suffer some diminution of individual importance by entering into a real Imperial partnership. Here and there statesmen of exceptional originality and largeness of mind may rise superior to considerations of that nature. But the average politician is certainly affected by them, alike in the Colonies and the United Kingdom. Indeed, it is especially in the United Kingdom that statesmen of the older school, whether Liberals or Conservatives, seem to find a difficulty in conceiving how the foreign policy of the country could be carried on, if it were complicated by the necessity of acting in conjunction with the self-governing Colonies. And yet it is certain that, as these communities grow in importance and play an increasing part in the world, we must "call them into our counsels," if they are not to develop foreign policies of their own and so to become in time wholly separate States, as the British statesmen of fifty years ago, almost without exception, expected and desired that they ultimately should do. Nowadays such a desire is felt by few and avowed by none. But "he who wills the end must will the means." And if we seriously desire the United Kingdom and the self-governing Colonies to remain one body politic, it follows that, whatever its difficulties, the policy of deliberate co-operation in matters of common interest, of which the Imperial Conference and the proposed Secretariat are the first rudimentary expressions, must be steadily pursued, and pursued on lines which in the long-run will entirely transform the present constitution of the Empire.

But that transformation will be gradual, and it is impossible to forecast the exact course of it. Whatever the new institutions which may be evolved to meet the new needs, they are likely to be very different from anything which political theorists have yet imagined. It is only possible here to glance at one or two of the common interests which may compel the creation of common institutions. Among projects tending to promote communication between different parts of the Empire there are none which find more general favour than an all-British steamship route and an all-British system of submarine cables. If either of these were established, it could only be by contributions from the several portions of the Empire directly interested; and, indeed, it is probable that, either in the first instance, or ultimately,

the ships and the cables would be the property of the contributing States. The administration of that property would require a Board on which all the owners must be represented. But the common property would not only have to be administered, it might need to be defended. It would only be logical that all the owners should combine to guarantee its protection from external interference. Another and an even more important case for co-operation is in future likely to arise in connection with the dependencies of the Empire. At present the dependencies, from the great dominion of India down to the smallest coaling station which is not situated in one of the self-governing Colonies, are under the exclusive control of the United Kingdom. But there are some of them in which certain of the self-governing Colonies are even now more directly interested than the United Kingdom is, and with regard to others the interest of the self-governing Colonies is certain to increase. Australia and New Zealand are bound to make themselves felt in respect of the British islands of the Pacific. A Federated South Africa will certainly have something to say about the Protectorates beyond the Zambesi. But Great Britain is not likely to abdicate her authority in either of these quarters. The necessities of the case will involve the conclusion of some arrangement by which the burden and the responsibility will be shared between the mother-country and the self-governing Colonies immediately concerned. The above are only a few instances of the way in which the growing complexity of Imperial relations is calculated to compel changes in the machinery of government.

In this brief review of the tendencies making for or against the closer union of the different portions of the Empire nothing has been said on the subject of Preferential Trade. In the opinion of many—and it is an opinion shared by the present writer—the adoption of preferential trade arrangements between Great Britain and the self-governing Colonies would be a powerful factor in promoting Imperial consolidation. But the question is too large to be treated within the limits of the present article, and the history of the movement has received special consideration under another head. [See *TARIFF REFORM MOVEMENT*.]

The object of the preceding observations has been to direct attention to other aspects of the situation, which are at present liable to be thrown into the shade by the concentration of public interest on the question of preference and the acuteness of the controversy which has arisen with regard to it.

COMMERCE, FACULTY OF, IN THE UNIVERSITY OF BIRMINGHAM. This faculty began work in October 1902 under the direction of Professor W. J. Ashley, whose varied experience at Oxford and at Harvard University, U.S.A., specially qualifies him for the task of making the first attempt in this country to systematise the preliminary teaching requisite for the higher positions of commercial and financial responsibility, and to raise such teaching to a university standard. As the scheme is entirely new in this country it will be advisable to commence with a description of the method proposed. Its objects are (1) to provide a course of training for men destined for business, and intending to become principals, directors, managers, secretaries, heads of departments, etc., in business firms; (2) to prepare men for the consular service, for masterships on the modern sides of schools, for work in the service of municipalities, or as accountants.

The programme of study includes courses on *Commerce*, on *Accounting*, and on *Finance*, arranged to extend over three years.

(1) *Commerce*. These courses deal with the present condition of trade and of the chief industries of Great Britain and the Empire, and of the leading countries of the world, and include recent industrial history, commercial geography, and training in economic analysis; and further on, the economics of transport, dealing with railway rates, ocean freights, etc. In the third year the courses are different and far more

difficult. They are concerned with such subjects as: the Location of Works; Capitalisation; Production on Large and Small Scale; Differentiation and Consolidation of Manufactures; Capitalist Combinations; Limited Companies (Private and Public), their Advantages and Disadvantages; Factoring and Manufacturing; Machinery, its Financial and Industrial Consequences; Works Management; Relations of Employers and Employed, Methods of Remuneration, Hours of Labour; Markets; Advertising; Relation of Selling Price to Cost; Fixed Charges; Methods of Sale and Purchase; Credit and Trade Cycles. The study of these subjects involves the discussion of large questions of business policy with which merchants and manufacturers have to grapple in the conduct of their affairs.

They are supplemented by a short course on the *Methods of Statistics*, the advantage of which will be appreciated by all who have to deal with the history of any industry.

(2) *Accountancy; Accounting*. In this course the first year is devoted to the simpler systems of book-keeping. In the second instruction is given in the method of drawing up accounts to suit different classes of undertakings, so that a set of books may be planned for a particular enterprise. It then enters into an analysis of accounts in order to compute earnings and values. The third year is devoted to departmental accounts and cost accounts. Many concrete illustrations and practical examples of balance sheets are used for purposes of instruction in this course. As Professor Ashley says in his paper entitled *A Science of Commerce and some Prolegomena*, accounting deserves a large place in any scheme of higher commercial education. "Properly taught, it is a subject of great educational value; for it makes its appeal in the last resort not to arithmetical dexterity, but to a sound judgment of a business situation. Moreover, accounting, adequately taught, will handle in a thorough manner the whole difficult question of 'costing.'" And though it is true that cost accounts are mere tools in the hands of their users, "yet they are tools which possess the quality of themselves stimulating reflection. To determine the wise policy to adopt with regard to selling price at a particular juncture is a different thing, it is true, from the mere knowledge of what the thing cost to make. But there is nothing so likely as a knowledge of what a thing costs under varying circumstances, and of the proportion to be assigned to fixed charges, to promote a wise decision as to the price to be asked for it."

Those who have experience in business know how important a good system of accounts is to the prosperity of the particular business, and hence in the natural course of affairs to the general business prosperity of the country.

Although in a small retail business accounts are very simple things, yet in a large manufacturing concern employing expensive materials imported from great distances, and exporting the finished products to many foreign countries, with different tariffs and charges on the imported goods they receive, accountancy becomes a difficult study, and one which affords in itself the basis of a large part of commercial education.

(3) *Finance*.—These courses are given to students only in their third years. They deal with Banking, the Money Market, and the Foreign Exchange, the Stock Exchange, etc.; there is also a short course on Public Finance.

*Commerce Seminar*.—"All the students working for the degree of B.Com. are brought together once a week at the *Commerce Seminar*, the purpose of which is to train students in independent investigation and reasoning. A subject is assigned some weeks beforehand to each member of the Seminar. He consults the literature of the subject, and makes such inquiries from men in business as the professor may suggest, and then prepares a paper, which is read in the Seminar, and there discussed and criticised. Incidentally, an effort is made to give the members of the Seminar some practice in the art of clear and vigorous exposition, and to accustom them to the preparation of terse and business-like reports."

There are besides a large number of subjects from which students taking the degree of B.Com. must choose. The selection is made according to aptitude and future requirements. One modern foreign language (German, Spanish, French, or Italian) must be studied throughout the course, so that facility may be gained in correspondence and also a knowledge of foreign commercial, financial, statistical, and industrial literature. "It should be as usual for a business man who has dealings with Germany to read the *Industrie-zeitung* or the *Wirtschafts-zeitung* as the *Iron and Coal Trades' Review* or the *Statist*, and no more difficult." A choice is allowed between a second foreign language and a science applicable to manufacture, such as engineering, chemistry, electricity, etc. Students are also allowed to take up any course that they may have time for during their first two years in any of the departments under the Faculties of Science or Arts, such as the courses on British Institutions, European History since 1789, or to enter upon courses with a view to acquiring further scientific knowledge of the main branch of study they have undertaken.

The aim of these courses is (a) "to make business more interesting to those engaged in it; (b) to enable them to follow the general movement of technological progress, and to realise the directions in which changes of process are probable or possible; (c) to show them when they ought to call in an expert, and how much weight they should attach to his opinion."

An account of the institution and aims of the Faculty of Commerce is given by Professor Ashley in a paper, "A Science of Commerce and some Prolegomena," published in *Science Progress*, July 1906; and in his pamphlet, *The Faculty of Science in the University of Birmingham: its Purposes and Programme*, he says, "It was believed that a training could be devised which, while strengthening the powers of judgment, widening the sympathies, and stimulating the imagination—tho aims of all really liberal education—would yet be of real value as a *preparation for the practical duties of business life*," and it was desired thus to "gather, arrange, and present the lessons of practical experience," and to "explain the interrelation of those conclusions which, in actual affairs, are arrived at singly and in isolation one from another; and to show that they are not merely accidental happenings, but the natural outcome of the situation."

In connection with the Faculty of Commerce the Council of the University has established an Advisory Board of business men, "believing that the active co-operation of such a body with the academic staff will tend to bring those who control large undertakings throughout the country into closer touch and sympathy with the aims of this section of the University."

[See INDUSTRIAL EDUCATION IN THE UNITED STATES; and in the Appendix, ECONOMICS, TEACHING OF.]

**COMMERCIAL INTELLIGENCE BRANCH (BOARD OF TRADE).** To meet the desire expressed by the British commercial community for greater assistance by the Government in the development of their trade abroad and in the Colonies, a committee was appointed by the Board of Trade, July 1897, to inquire into and report upon "the dissemination of commercial information, and the collection and exhibition of patterns and samples." The Report was published in 1898 (Cd. 8962).

As a result of this report, the Commercial Intelligence Branch was opened, October 1899, at offices in Parliament Street, with satisfactory results, but in April 1904, in order to be of greater advantage to business men, it was transferred to the City, to 73 Basinghall Street, E.C., where information on all subjects of commercial interest is collected and focussed in a form convenient for reference. The offices of the Branch contain an Inquiry Room where personal inquiries can be made on the subjects dealt with; a Sample Room for the exhibition of specimens of interest received from the Imperial Institute, India, and the Colonies, or illustrative of reports of H.M. Consuls or of the correspondents or special commissioners of the Board of Trade; and a Reading Room, where the latest official publications—British, Colonial, and Foreign—and the latest issues of Trade Directories may be consulted. In the same building special Trade Inquiry Offices have been opened for India, Canada, Transvaal and Orange River Colony, and Queensland, by the Governments concerned, whose representatives attend daily to deal with inquiries and applica-

tions in connection with Colonial trade matters. On application being made to the Commercial Intelligence Branch, either personally or by letter, information is supplied on commercial statistics, Foreign and Colonial import, excise, and consumption duties; port, harbour and tonnage dues and other charges on shipping; customs regulations; consular fees; certificates of origin; regulations concerning commercial travellers and their samples; trading licences; Foreign and Colonial contracts open to tender; firms abroad engaged in particular lines of business, and likely to become purchasers of British goods; sources of supply and prices, etc., of trade products, and other matters of interest to British trade. Information of general interest to British trade, apart from that obtained in response to specific applications, is communicated by the Branch to Chambers of Commerce, and in some cases to individual firms, or, if desirable, is published in the press. The Commercial Intelligence Branch also forwards to Chambers of Commerce, for the confidential use of their members, but not for publication, information to which it has appeared desirable in the interests of British trade to draw attention confidentially. This latter plan met with general approval, and the Board of Trade have continued and extended it. In order to reach all British manufacturers or traders interested, it was decided to supplement the existing system, by opening, 1st January 1907, a Register of British firms who desired to receive confidential information relative to their respective trades. British firms desiring to have their names registered must apply to the Commercial Intelligence Branch on the form which has been prepared for the purpose, copies of which may be obtained on application at the offices of the Branch. (See *BRITISH CONSULAR REPORTS*.) No charge is made for information supplied, but every firm admitted to the Register is required to subscribe to the *Board of Trade Journal*, in order to ensure that those who wish to receive confidential information should first be in possession of all the information relating to their particular trade published in that journal. The Commercial Intelligence Branch also co-operates with the Imperial Institute, where scientific investigations are carried on with a view to the commercial utilisation of the economic products of the British Empire. This object is supplemented by arranging comprehensive exhibitions of natural products, and providing for their examination and valuation, and by the collection and dissemination of scientific and technical information relating thereto.

The organ of the Commercial Intelligence Branch is the *Board of Trade Journal*, published weekly (price 3d.), containing notices relating to openings for British trade, tariff changes, actual and proposed, shipping and transport, including port and dock dues, railway rates, etc., minerals, metals, and machinery, agriculture, etc., besides statistical tables, notes on important Government publications, and information on other matters of commercial interest. In addition to editing the *Journal* the Branch prepares indexes to the Consular Reports, special reports on particular industries, regulations relating to

commercial travellers, etc., and by arrangement with the Foreign Office, a commercial expert attached to the Branch edits the Consular Reports from a commercial point of view. Information on the subjects dealt with at the Intelligence Branch is received chiefly through the Foreign Office and the Colonial Office, or direct from H.M. Diplomatic or Consular officers in foreign countries, and from specially appointed commercial correspondents in British Colonies. Correspondents have been appointed by the Board of Trade in Australia, New Zealand, and South Africa. Some of them are officials in the service of the Colonial Governments in close touch with commercial matters, appointed in conjunction with the Colonial Office. Others are non-official correspondents specially conversant with conditions of trade in their particular districts. Their primary duty is to send information to the Commercial Intelligence Branch with a view to promoting and fostering British trade.

As regards foreign countries, the Branch is in constant communication with His Majesty's diplomatic and consular officers, who have been instructed to forward without delay information of interest to British commerce. Further, with a view to consular officers becoming better acquainted with commercial matters, and with the nature of the information they are expected to supply, all Vice-Consuls (by arrangement with the Foreign Office) now spend some time in the Branch before proceeding to their posts abroad. The Board of Trade further despatches to various countries special trade commissioners to ascertain both the nature and extent of foreign competition which British goods have to meet in those countries, and the means by which such competition may best be met, and to report on possible openings for British trade abroad, and on the selection of suitable correspondents. Commercial missions have been despatched to Persia, Siberia, South Africa, Australia, and New Zealand, Canada and Newfoundland, and Asiatic Turkey, and proposals to despatch missions to other countries are considered from time to time.

In carrying out the objects of the Branch the Board of Trade are assisted by an Advisory Committee, known as the Commercial Intelligence Committee, first appointed in May 1900 for a period of five years, subsequently reconstituted and enlarged, now consisting of twenty-six members, including representatives of the Board of Trade, the Foreign, Colonial, and India Offices, of the principal self-governing Colonies, and of the commercial community. Much valuable work has been performed by the committee in suggesting improvements in the means of collecting and disseminating commercial information, in the selection of suitable trade commissioners and correspondents, and in reporting, after consultation with the leading Chambers of Commerce, on the probable effect of changes in foreign tariffs.

T. G. G.

**COMPANIES, INCREASE OF.** The following table, compiled from the last return of the Board of Trade, shows the number of limited companies registered in each year, since

1890, under the Companies Acts, and brings down to date the figures comprised in the original article under the same title in Vol. I. of this *Dictionary* :—

Year.	England.	Scotland.	Ireland.
1891	2363	153	81
1892	2279	157	69
1893	2238	184	93
1894	2593	203	89
1895	3458	258	89
1896	4219	304	135
1897	4675	328	145
1898	4550	379	136
1899	4444	323	112
1900	4408	336	115
1901	3069	203	86
1902	3526	247	77
1903	3620	257	115
1904	3421	241	103
1905	3872	284	97
1906	4331	323	112

A. A. U.

CONIGLIANI, CARLO, died in 1901, little more than thirty years old. His death was much deplored. He began his scientific career under Prof. Ricca Salerno and Cossa. He was considered, together with MAZZOLA, the most talented of the younger Italian economists. Notwithstanding his early death, he had accomplished a task which will not soon be forgotten, viz. to write the best book on Italian local taxation, *La riforma delle leggi sui tributi locali*, Modena, 1898, *Società tipografica*.

His first publication was a book on the theoretical effects of taxation (*Effetti economici delle imposte*), 1890, principally discussing the difficult problem of the incidence of taxation. This book is certainly not his best work and forms no real contribution to the progress of science. It is nevertheless remarkable for the acuteness of many of the observations and strength of reasoning, and surprised all who knew how very young the author was when he wrote it. Conigliani then took to writing essays, collected after his death under the title, *Saggi di Economia politica e di Scienza delle Finanze*, 1903, Turin, Bocca. In these essays he principally discusses financial problems, such as are dealt with in the works of Sax, of Wagner, and of De Viti, placing before the public the theoretical aspects of public finance. His economic essays deal with questions connected with the functions of capital. Conigliani, as economist, was a scholar of the AUSTRIAN SCHOOL (*q.v.*). M. P.

#### CONSULS, BRITISH, DUTIES OF. A

British Consul is required to advise H.M.'s trading subjects and others in his district, to avert and compose differences among them, or between them and the natives of the country, to check the evasion of local revenue laws by British traders, to uphold the treaty rights of British subjects in a temperate manner, to

report on the trade of his district, and to send home promptly items of important commercial information.

\*Births and deaths occurring among British subjects are registered by him, and some Consuls are also empowered to celebrate marriages.

He may grant certificates of naturalisation to aliens and issue passports to British subjects. He may also advance for the erection or upkeep of Anglican churches, hospitals, and places of interment, sums equal to the amounts subscribed for the purpose by British subjects.

A Consul's duties with regard to British shipping are very important. Consuls are bound to send to the Board of Trade such reports and returns as they may require, and to see that all British vessels carry the documents and colours prescribed by law, and he may grant terminable and provisional certificates of registry as British ships.

If a Consul suspects that the shipping laws are being evaded, he may require the production of the official log-book or other ship documents, muster the crew, and demand explanations with regard thereto.

Every British ship not carrying passengers on entering a port must deposit with the Consul the agreement with the crew, indentures, etc.

The Consul superintends the engagement and discharge of British seamen abroad, investigates complaints made by crews as to the quality and quantity of the provisions on board, collects the property and arrears of wages, if any, of British seamen or apprentices dying abroad and remits them to the United Kingdom, and provides, out of public funds, for the maintenance and repatriation of seamen who are shipwrecked, discharged, or left behind. He issues money orders to seamen, receives deposits and pays withdrawals from the Seamen's Savings Bank, and conducts, at certain ports, the transmission of seamen's wages home.

Masters of passenger vessels are bound to give the Consul facilities for the inspection of the ship and the passenger list, and for communication with the passengers. The Consul may defray costs of maintaining and forwarding to their destination passengers taken off or picked up from wrecked or injured vessels.

The Consul makes inquiry on oath into offences committed by British seamen on the high seas or abroad ashore, and may send home the offender and witnesses by a British ship, at the same time reporting the facts to the Board of Trade.

He may detain a foreign ship which has caused injury to a British vessel until satisfaction or security therefor has been given, and when a salvage claim is made against a British vessel he takes evidence as to the services rendered and the remuneration claimed, and endeavours to effect a settlement.
